HUNTER, DAVID, an American soldier; born in Washington, District of Columbia, July 21, 1802. After he became a captain of dragoons in 1833, he was assigned to frontier duty, and twice crossed the plains to the Rocky Mountains. In the Mexican War (1846), he was chief paymaster of General Wood's command. When President-elect Lincoln went to Washington in February, 1861, Hunter accompanied him. On May 14, 1861, he became colonel of the Sixth United States Cavalry. During the war he commanded a division at Bull Run, where he was wounded. In August, 1862, he became major-general of volunteers, and successively commanded the Western and Southern military departments. To provide for the fugitive slaves, General Hunter organized the First South Carolina Volunteers, which was the first regiment of black troops in the national service. Upon this, Jefferson Davis issued a proclamation declaring Hunter an outlaw, who, if captured, should not be treated as a prisoner of war, but held in close confinement and executed as a felon. In May, 1864, Hunter was placed in command of the department of West Virginia. He defeated a Confederate force at Piedmont on June 5, 1864; served on various courts-martial and presided over the commission which tried the conspirators who were engaged in the assassination of Lincoln. He was retired from active service in 1866, and died in Washington, District of Columbia, Feb. 2, 1886.

HUNTER, ROBERT MERCER TALIAFERRO, an American statesman; born in Essex County, Virginia, April 21, 1809. After studying law at the Virginia University, he was elected to Congress in 1837 and was chosen Speaker in 1839. In 1845 he was again returned to Congress, and in 1847 he entered the United States Senate, where he was a leading advocate of states' rights till July, 1861, demanding the right of the slaveholder to carry his slaves to any United States territory. He proposed the reduction of the value of subsidiary silver to prevent its exportation. Being an active secessionist he became Secretary of State in the Confederate Cabinet, but was soon superseded by J. P. Benjamin. After this he was elected to the Confederate Senate, and became an opponent of Jefferson Davis's administration. In 1885 he was appointed a collector of customs by the United States government. He died in Essex County, July 18, 1887.

HUNTINGBURG, a village of Dubois County, southwestern Indiana, on the Louisville, New Albany and Corydon railroad, 40 miles E.N.E. of Evansville. It is situated in a region where tobacco, grain and fruit are raised extensively, and where block and cannel coal, plumbago, iron ores, potter's clay, mineral paints, lime and sandstone are obtained. Carriages, wagons, lumber, furniture, saddlery, brick, terra-cotta, flour, woolen goods and tobacco are manufactured. Population 1890, 3,167; 1900, 2,527.

HUNTINGDON, a borough and the capital of Huntingdon County, southern central Pennsylvania, located on the Juniata River, on the Pennsylvania railroad and on the Juniata division of the Pennsylvania canal. Lead, coal, iron, fire-clay, limestone and timber abound in the region. Brooms, boots and shoes, furniture, stationery, sewer-pipe and reed and rattan goods are manufactured, and there are planing-mills, flour-mills, a foundry, machine-shop, car-works, a brickyard and several printing-offices in the vicinity. It is the seat of the State Industrial Reformatory and a normal college. Population 1900, 6,053.

HUNTINGDONSHIRE. See HUNTINGDON COUNTY, Vol. XII, pp. 397, 398.

HUNTINGTON, a city and the capital of Huntington County, northeastern Indiana, on both sides of Little River, and on the Chicago and Erie and the Wabash railroads, 25 miles S.W. of Fort Wayne. This is the center of the famous Huntington whitelime-burning region, fifty kilns being constantly in operation. There are several factories for working wood into various shapes, railroad-shops, a woolen-mill and other manufactories. The city has water-works, electric lights and a public library. Population 1890, 7,328; 1900, 9,491.

HUNTINGTON, a village of Suffolk County, southeastern New York, on Huntington Bay, and on the Long Island railroad, 38 miles from New York City. Bricks, pottery and thimbles are made here, and the place is a fashionable summer resort. Located here are an academy and a public library, the ruins of British fortifications, and the town has a street-railway and water-works. Population 1890, 3,028; 1900, 7,689.

HUNTINGTON, a city of Cabell County, western West Virginia, on the Ohio River, and on the Chesapeake and Ohio and the Ohio River railroads, 46 miles W. of Charleston. It has manufactories of car-wheels, lumber, glass, cigars and iron castings, a state normal school, and it is the seat of Marshall College. Coal, iron, lumber and salt are shipped. Population 1890, 10,108.

HUNTINGTON, COLLIS P., capitalist and railway magnate, was born in Litchfield, Co., Conn., Oct. 22, 1821, and died at his camp in the Adirondacks, Aug. 13, 1900. In 1848, when gold was discovered on the Pacific coast, Mr. Huntington proceeded thither by way of Panama and settled at Sacramento, where he went into business. One day he was approached by Leland Stanford, who suggested the construction of an overland railway. In June, 1861, the Central Pacific R. R. was organized, with a capital of \$8,500,000. The development of this line, the Southern Pacific R. R., and other profitable enterprises, returned large fortunes to Mr. Huntington, and with his steamship ventures, etc., ultimately made him a multi-millionaire.

HUNTINGTON, DANIEL, an American painter; born in New York, Oct. 14, 1816. He studied painting under Prof. S. B. F. Morse at the National Academy of Design, and produced *The Barroom Politician*; *A Topper Asleep*; and

some landscapes in 1835. In 1839 he went to Italy; there he painted *The Sibyl*; *Early Christian Prisoners*; and other works. After returning to New York he painted many portraits and some historical scenes, such as *Queen Mary Signing the Death-Warrant of Lady Jane Grey*. In 1851 he visited England, and in 1882 Spain. He was president of the National Academy almost continuously from 1862 to 1891. Among his portraits are ones of Presidents Lincoln and Van Buren, William Cullen Bryant, and Louis Agassiz.

HUNTINGTON, FAYE. See FOSTER, MRS. ISABELLA H., in these Supplements.

HUNTINGTON, FREDERICK DAN, an American theologian; born at Hadley, Massachusetts, May 28, 1819. He was at first a Unitarian pastor of a church at Boston. In 1855 he was chosen professor of Christian morals at Harvard College. His theological

views then underwent a gradual change, and finally, in 1860, he entered the Episcopal Church. In 1864 he became rector of Emmanuel Church in Boston, and in 1869 was elected and consecrated bishop of central New York, locating at Syracuse. In 1861 he helped to found the *Church Monthly*; and published *Lessons on the Parables* (1856); *Christian Believing and Living* (1860); a pamphlet on strikes (1891); also many other articles and pamphlets.

BISHOP HUNTINGTON.

HUNTINGTON, SAMUEL, an American statesman; born at Windham, Connecticut, July 3, 1731. He learned the trade of a cooper, but became a lawyer in 1758, after which he was made king's attorney and also associate judge of the superior court of Connecticut. He was a signer of the Declaration of Independence. From 1779 to 1781 he was president of the Congress, and in 1784 he became chief justice of Connecticut. In 1785 Huntington was elected lieutenant-governor of Connecticut, and in 1786 he became governor of that state, which office he retained until his death. He died at Norwich, Connecticut, January 5, 1796.

HUNTSVILLE, a city and the capital of Madison County, central northern Alabama, called, on account of its beautiful situation on a spur of the Cumberland Mountains, and because of its enterprise, the "Queen City of the Mountains." It is on the Nashville, Chattanooga and St. Louis and the Memphis and Charleston railroads. It has a brass and iron foundry, railroad machine-shops, cotton and cottonseed-oil mills, an ice factory and lumber-mills. It contains an institute and business college for men, a state normal school, a Methodist Episcopal college and a Presbyterian Seminary, both for women, and a normal school for colored pupils. It has gas and elec-

tric lights and city water. Population 1880, 4,977; 1890, 7,995; 1900, 8,068.

HUNTSVILLE, a town and the capital of Randolph county, northern central Missouri; on the Wabash Railroad, five miles W of Moberly. It has a college for both sexes, and in the vicinity are flour-mills, a woolen-mill, machine-shops, a rake and stacker factory, a tobacco factory and coal-mines. Population 1900, 1,805.

HUNTSVILLE, a city and the capital of Walker County, southeastern Texas, on the International and Great Northern Railroad, 70 miles N. of Houston. It is in a cotton, lumbering and stock-growing section; has the state prison, where clothing, carriages and wagons, etc., are manufactured; the Sam Houston State Normal School, which has 320 students, Andrew Female Seminary and Austin College. The place has also corn-mills, cotton-gins, and ice and other manufactories. Population 1900, 2,485.

HUNYADY, JÁNOS. See **HUNGARY**, Vol. XII, pp. 367, 368.

HUPEH OR **HOOPEH**, a province of central China, between lat. 29° and 33° N., and long. 108° and 116° E.; one of the richest and most fertile provinces of China, being well watered by the Yang-tse-Kiang and its tributaries. It is rich in several minerals, among them coal; has an area of 70,000 square miles and a population of over 33,000,000. Its capital is Wu-Chang, one of the largest trading centers in China.

HURA, a tropical American genus of the family *Euphorbiaceæ*. *H. crepitans* is a tree, well known from the fact that its large woody capsule explodes with a loud detonation, and called by the natives the "monkey's dinner-bell." The name "sand-box tree" refers to the fact that the capsules were used to make sand-boxes.

HURD, JOHN CODMAN, an American author and traveler; born in Boston, Nov. 11, 1816. Between 1840 and 1887, Mr Hurd made extensive journeys in India, China, Japan and Egypt. He took an active interest in the theory of American politics, and contributed, on this and kindred subjects, several works of recognized value. He wrote *The Law of Freedom and Bondage in the United States* (1858); *The Theory of Our National Existence as Shown by the Action of the Government of the United States Since 1861* (1881).

HURLBUT, JESSE LYMAN, an American clergyman and author; born in New York City, Feb. 15, 1843; received his education at Wesleyan University; became a Methodist Episcopal minister, and held several pastorates in New Jersey and New York; in 1879 was agent of the Methodist Sunday School Union; and in 1884 assistant editor of Sunday school literature. He held various other offices under the church, and published several books; among them, *Manual of Biblical Geography* (1882); *Studies in the Four Gospels* (1889); and *Outlines in Old Testament History* (1890).

HURLBUT, STEPHEN AUGUSTUS, an American general and politician; born in Charleston, South Carolina, Nov. 29, 1815. He entered the volunteer service early in 1861, and became brigadier-

general, was promoted major-general after Shiloh, and succeeded General Banks in command of the department of the Gulf. General Hurlbut was minister to the United States of Columbia from 1869 to 1872; served in Congress from Illinois, from 1873 to 1877; and in 1881 was appointed minister to Peru, where he died a year later, March 27, 1882.

HURLEY, a village and the capital of Iron County, northern Wisconsin, on the Montreal River, and on the Chicago and Northwestern and the Wisconsin Central railroads, 38 miles E. of Ashland. Iron-ore and lumber are extensively shipped. The village has an academy. Population 1890, 2,267.

HURLSTONE, FREDERICK YEATES, an English painter; born in London in 1801; was trained at the Royal Academy, which he joined in 1820; traveled in Italy and Spain. His paintings are mostly scenes in southern Europe and illustrations of Byron and other poets. He was president of the Society of British Artists for 34 years, and exhibited almost exclusively in its gallery. Among his best known works are *The Prisoner of Chillon*; *Constance and Arthur*; *Italian Peasant Boys*; and *Boabdil's Farewell to Granada*. He died in London in 1869.

HURON, a city and the capital of Beadle County, eastern central South Dakota, on the James or Dakota River, and on the Chicago and North-Western and the Great Northern railroads. On account of its situation and railroad facilities, it is a leading commercial center of the state. The region is rich and prosperous. The city has an excellent system of public schools, a complete equipment of water-works and electric lights, and many handsome commercial buildings and private residences. The city contains a United States land-office, and a United States weather-station, railroad repair-shops, and manufactories of ornamental wood-work, flour, carriages and wagons, and cigars. Population 1890, 3,038; 1900, 2,703.

HURON, LAKE. See **ST. LAWRENCE**, Vol. XXI, pp. 178, 182.

HURONIAN SYSTEM. See **GEOLOGY**, Vol. X, p. 328.

HURON INDIANS, a tribe of North American Indians who were known to the French pioneers as Hurons, but who called themselves Wendats, or Yendats, or Wandots, or Wyandots. The tribe was known throughout colonial times as the Huron, but since 1751 has borne the name Wyandot. The Hurons lived in the lake region of Ontario, where they were in constant warfare with the more powerful Iroquois, by whom they were almost exterminated in the middle of the seventeenth century and driven westward in the Lake Superior region. The Jesuit missionaries under Marquette gathered the Hurons together at Mackinaw in 1670. The last appearance of the Hurons in warfare was at Detroit in 1812, under the British. Gradually the tribe now known as the Wyandot was driven westward, until in 1832 they were given a reservation in Kansas, on the present site of Kansas City, Kansas. From there the larger part of the tribe

was moved to the Indian territory on the Quapaw Reservation, where, in 1895, they numbered 297. A few who remained in Ontario are gathered near Quebec. See *Wyandot*, under INDIANS, Vol. XII, p. 827.

HURRICANES. See METEOROLOGY, Vol. XVI, pp. 154, 155, 180, 181; WEST INDIES, Vol. XXIV, p. 511; POLYNESIA, Vol. XIX, pp. 421, 422.

HURST, JOHN FLETCHER, an American Methodist Episcopal bishop; born near Salem, Maryland, Aug. 17, 1834. He studied theology at the Universities of Halle and Heidelberg, Germany. Having returned home in 1858, he was pastor of Methodist churches in Passaic and Elizabeth, New Jersey, till 1866, after which he took charge of the Methodist missionary institute at Bre'nen, Germany. Here he remained for three years, as teacher and director of the institute.

JOHN FLETCHER HURST.

In 1871 he again returned to the United States, became professor of historical theology at the Drew Seminary, in Madison, New Jersey, and in 1873 was made president of that institution. In 1880 he was elected bishop at the General Conference at Cincinnati. He published a *History of Rationalism* (1865); *Outlines of Bible History* (1872); *Martyrs of the Tract Cause* (1873); *Life and Literature in the Fatherland* (1874); *Bibliotheca Theologica* (1883); *Short History of the Reformation* (1884); *The Country and People of India and Ceylon* (1891); and several others.

HURTER, FRIEDRICH EMANUEL VON, a Swiss historian; born at Schaffhausen, Switzerland, March 19, 1787. He studied theology at Göttingen and became a minister at Schaffhausen in 1824, but resigned in 1841, and embraced Catholicism in 1844; two years afterward he was appointed historiographer to the Emperor of Austria. Some of his works are *Geschichte des Ostgothischen Königs Theodorich und seiner Regierung* (1807); *Geschichte Kaiser Ferdinands II und seiner Eltern* (1862); *Geburt und Wiedergeburt* (1845). He died at Gratz, Aug. 27, 1865.

HUSBANDRY, PATRONS OF. See FARMERS' ORGANIZATIONS, in these Supplements.

HUSH OR HUSI. See HUSCH, Vol. XII, p. 402.

HUSSEY'S REAPER. See HARVESTING MACHINERY, in these Supplements.

HUTCHINS, THOMAS, an American geographer; born in Monmouth, New Jersey, in 1730; was in the British service as engineer until the Revolution, when he was imprisoned in 1779 on account of his American sympathies. On his release he became geographer-general on the staff of General Greene in South Carolina. Besides other works he published *A Topographical Description of Virginia, Pennsylvania, Maryland and North Carolina* (1778); *History, Narrative and Topographical Description of*

Louisiana and West Florida (1784). He died in Pittsburg, Pennsylvania, April 28, 1789.

HUTCHINSON, a city, railroad center and the capital of Reno County, southern central Kansas, situated on the Arkansas River, and on the Atchison, Topeka and Santa Fé, the Chicago, Rock Island and Pacific, the Hutchinson and Southern and the Missouri Pacific railroads. It has a state reformatory, electric lights, Holly water-works, street-railroads and a telephone system. The surrounding country is an agricultural one, but it also has great beds of pure rock-salt, which is extensively mined. Sorghum sugar, flour, starch, soda, barbed-wire, soaps, ice and carriages are manufactured. It was founded in 1871. Population 1900, 9,379.

HUTCHINSON, ANNE, an American religious enthusiast; born at Alford, Lincolnshire, England, in 1591. She was the daughter of a clergyman, and married Edward Hutchinson. In 1634 she removed to New England. Her doctrine was that those who were in the covenant of grace were entirely freed from the covenant of works. She gave lectures twice a week, which were well attended. Her adherents were called "Antinomians," and included many prominent men, as Sir Henry Vane, the governor, and the powerful preacher Cotton. Boston was soon divided into two hostile theological camps. Mrs. Hutchinson was then tried for heresy and sedition and banished from Massachusetts, with several of her followers. She then bought, for forty fathoms of wampum, the island of Aquidneck from the Narragansett Indians, and founded the town of Portsmouth. After the death of her husband in 1642, she left Rhode Island and settled upon some land to the west of Stamford, Connecticut, then supposed to be within the territory of the New Netherlands. There, in the following year, she was cruelly murdered by Indians, together with her family, sixteen victims in all.

HUTTON, FREDERICK REMSEN, an American mechanical engineer; born in New York City, May 28, 1853; was educated in Columbia College and in the mining school of the same institution; received an instructorship and was assigned in 1891 to the professorship of mechanical engineering of the School of Mines. He did much work for the government, especially in 1880-82, when he prepared census monographs on machine-tools, wood-working machines, steam-pumps and pumping-engines. He was elected secretary of the American Society of Mechanical Engineers in 1883.

HUTTON, LAURENCE, an American author; born in New York City, Aug. 8, 1843. He was educated in New York and spent part of each year abroad; wrote for the press from an early age, and contributed much to periodicals.

He was for some time dramatic critic on the *New York Evening Mail*, and in 1886 became editor of

LAURENCE HUTTON

Literary Notes in Harper's Magazine. He published *Plays and Players* (1875); *Artists of the Nineteenth Century*, with Clara Erskine Clement (1879); *Actors and Actresses of Great Britain and the United States*, with Brander Mathews (1886); *Literary Landmarks of London* (1885); *Literary Landmarks of Edinburgh* (1890); *Edwin Booth* (1893); *Portraits in Plaster* (1894); *Literary Landmarks of Jerusalem* (1895); *Other Times and Other Seasons* (1895); etc.

HUTTON, RICHARD HOLT, an English journalist and critic; born in 1826; took up journalism and became editor of the *London Spectator*; published *Essays, Theological and Literary* (1871); *Essays on Some Modern Guides of English Thought in Matters of Faith* (1887); and *Life of Scott* (1878). He died Sept. 9, 1897.

HUTTON, WILLIAM RICH, an American civil engineer; born in Washington, District of Columbia, March 21, 1826. He was educated at private schools in Washington; was engaged on government undertakings at different times; and was a member of the Society of Civil Engineers of France; was either directing or consulting-engineer in many important works, among them being the Washington aqueduct 1863, the Chesapeake and Ohio canal 1869-72, and the Hudson River tunnel.

HUXLEY, THOMAS HENRY, an English naturalist and philosopher; born in Ealing, a suburb of London, England, May 4, 1825. His early education was obtained in the school in which his father taught. Lack of means deprived him of the advantages of a university training, but he progressed rapidly, through his own efforts. His reading covered a wide range of topics, and his first choice of a calling was that of a mechanical engineer. Circumstances turning him

PROF. T. H. HUXLEY.

toward medicine, he studied for three years at Charing Cross Medical School, and received in 1845 the degree of M.B. from the University of London, with high honors in physiology. His ambition was to obtain a post as professor of physiology, but in this he met with disappointment. Soon after graduating in medicine he received an appointment as assistant surgeon on H.M.S. *Rattlesnake*, and spent four years in the South Pacific. In this cruise he visited various parts of Australasia, and sent home several papers upon marine biology. One of them, on the *Affinity of Oceanic Hydrozoa*, was published by the Royal Society, and resulted in making him a fellow of the society upon his return in 1851. In 1854 he was appointed Fullerian professor of physiology in the Royal Institute, and also professor of natural history in the Royal School of Mines, connected with the Geological Survey of England, which post he held for 31 years. After the appearance of Charles Darwin's *Origin of Species* in 1859, he became a warm and able defender of the doctrine of organic evolution, during which his remarkable gifts for leadership speedily became recognized.

In 1869 he was made president of the Geological Society; in 1870 president of the Ethnological Society, president of the British Association for the Advancement of Science, and a member of the Royal Commission on Scientific Instruction. In 1873 he was made secretary of the Royal Society, and ten years later was elected its president, the highest honor attainable by an Englishman of science. Public offices and a shower of honors and degrees fell upon him, many of them from foreign societies and governments. Failing health compelled him, in 1885, to resign all offices, including the presidency of the Royal Society. But during the next ten years it seemed as though freedom from official duties but liberated his mind and his pen. Addresses upon scientific, literary and philosophical subjects, together with essays and reviews, kept him constantly before the public, adding to his reputation for extensive knowledge and argumentative vigor.

Among scientists Professor Huxley is known as a great zoölogist—Haeckel places him before all other Englishmen in that branch. Among the more important of his contributions to the literature of zoölogy are *Oceanic Hydrozoa* (1859); *Theory of the Vertebrate Skull* (1859); *Anatomy of Vertebrated Animals* (1871); and *Anatomy of Invertebrated Animals* (1877). Naturally some of these works are so purely technical that scientists alone can properly appreciate them; but, among men of letters, theologians and laymen generally, he obtained recognition as a scientist of unusual powers, marvelous controversial gifts and great versatility.

In his theological controversies with the Duke of Argyll, Mr. Gladstone and others, he gave a clear meaning to the term *agnostic*—a term to which he himself gave currency as applying to any person who refuses to adopt a statement which is not susceptible of scientific proof. That he was not a pure materialist he demonstrated in his *Physical Basis of Life* (1868), and for Comte and the entire positivist school he had a profound dislike. The best known of his works are the ones wherein his marvelous lucidity of style and acute reasoning powers are made use of to render abstruse scientific problems intelligible to the masses. Of these, his *Man's Place in Nature* (1863); *Elementary Physiology* (1866); and *Lay Sermons* (1870), are the most popular.

Huxley's life was lived and his work was performed during the storm and stress period of the struggles of modern science. Prejudices of the ignorant and of conservative or bigoted sectarians opposed its advance from every quarter, during which Huxley stood out fearlessly and foremost as an enthusiastic believer in and champion of the Darwinian theory of natural selection. Such an attitude required not only thorough belief, but great courage and firmness. He lived through the storm, and saw evolution recognized as a working hypothesis by nearly all scientists. His tenacity of purpose (some have termed it obstinacy), his acute powers of perception and his perfect integrity of thought and action are the most marked of his characteristics. His life-purpose can be best stated in his own words: "The objects which I have ever had in view have been to promote the increase of natural knowledge,

and to forward the application of scientific methods of investigation to all the problems of life to the best of my ability, in the conviction—which has grown with my growth and strengthened with my strength—that there is no alleviation for the sufferings of mankind except veracity of thought and action, and the resolute facing of the world as it is, when the garment of make-believe by which pious hands have hidden its uglier features is stripped off.”

When, in the future, the qualities of those who have led in the intellectual progress of our century are summed up, it cannot be doubted that he will hold rank upon at least as high a level as such great original investigators as Faraday, Darwin, Le Verrier, Lyell and Humboldt; while none will be found more deserving of admiration for qualities of fearlessness and truth. Professor Huxley is the author of articles in this *ENCYCLOPEDIA ON ACTINOZOA; AMPHIBIA; ANIMAL KINGDOM; BIOLOGY; EVOLUTION*; besides which, and the others of his works already mentioned, the more important of his works are *Introduction to the Classification of Animals* (1869); *Physiography* (1877); *Introduction to Zoölogy* (1879); *Science and Culture* (1882). He died at Eastbourne, on the Sussex coast, June 29, 1895. An interesting account of Huxley appeared in 1900 in his *Life and Letters*, edited by his son.

HUYDECOPER BALTHASAR, a Dutch author and scholar; born in Amsterdam, Holland, 1695. He held many distinguished offices, but it is as a writer who has done much to purify and enrich the Dutch language that he is best known. He wrote *Proeve van Taal-en Dichtkunde, in Veijmodige Aanmerkingen op Vondels Virtaalde Herscheppingen van Ovidius* (1730) and an edition of the *Rijmkronek van Melis Stoke, met Historie-Oudheid en Taalkundige Aumerkingen* (1772), both of which are learned books. He tried poetry and dramatic writing, but they were notable chiefly for the rhetorical ability displayed, although one, *Achilles*, was long a favorite. He died in Amsterdam, Sept. 21, 1778.

HUYSMANS, JORIS KAHL, a French novelist; born in Paris, Feb. 5, 1848. For some time he held a position in the Department of the Interior, but later devoted himself entirely to literature, particularly cultivating the field of the short story and novel. He displayed a rapidly increasing tendency toward naturalism in *Le Drageoir aux Épices* (1874); *Les Soirées de Médan* (1879); *En Ménage* (1881); and *À Vau-l'Eau* (1883). But in *À Rebours* (1885), he turns from naturalism toward a sort of uncertain spiritualism, which he kept up in *Là-bas* (1889).

HVITFELD, ARILD, a Danish historian; born in 1549; was at one time a Senator (1586); and afterwards Chancellor of the kingdom. He compiled the *Lives of Danish Kings*, beginning with Christian III and working back to earlier times; but it is as author of a *Chronicle of the Kingdom of Denmark* that he is most noted, the work being exceptionally useful to students of Danish history. He died in 1609.

HWANG-HO OR **HOANG-HO**. See *CHINA*, Vol. V, pp. 630, 631.

HYACINTHE, PÈRE. See *LOYSON*, CHARLES, in these Supplements.

HYALEA. See *MOLLUSCA*, Vol. XVI, p. 366.

HYALINE, a newly manufactured composition, described as horny, translucent, possessing great tensile strength, and having considerable elasticity. It is used as a substitute for celluloid, and can be worked, dyed, pressed, denitrated and rendered incombustible or fire-proof. It is composed of about equal parts of gun-cotton and colophony, or shellac, copal, dammar, turpentine, or of any mixture of any of these resins.

HYALITE OR **MULLER'S GLASS**. See *MINERALOGY*, Vol. XVI, p. 390.

HYANNIS, a post village and seaport of Barnstable County, Massachusetts, on the south side of Cape Cod, and on a branch of the New York, New Haven and Hartford railroad, 79 miles from Boston. It has a high school, an iron-foundry, a shoe factory and several churches. Its outer harbor is protected by a breakwater, and has a fixed light with an elevation of seventy feet above the level of the sea. Population 1895, 1,237.

HYATT, ALPHEUS, an American naturalist; born in Washington, District of Columbia, April 5, 1838; studied at Yale and the Lawrence Scientific School; was connected with the Essex Institute, Peabody Academy of Science as curator, and was a member of most of the scientific societies in the United States. In 1887 he became professor of zoölogy and palæontology in the Massachusetts Institute of Technology. His principal works are *Fresh-Water Polyzoa; Genera of Fossil Cephalopods* (1883); *Larval Theory of the Origin of Cellular Tissue* (1884); *Genesis of the Arctide* (1889). He accomplished much work on the fossil cephalopoda, of great value to the evolutionist. The first and only monograph on American sponges is his *Revision of the North American Porifera*. He wrote a series of small books for use in the public schools, entitled *Guides to Science-Teaching*.

HYDE, EDWARD. See *CLARENDON*, Vol. V, pp. 804, 809.

HYDE DE NEUVILLE, JEAN, GUILLAUME, a French statesman; born at La Charité-sur-Loire, Jan. 24, 1776. He was an extreme royalist, and, after engaging in several unsuccessful schemes for restoring the Bourbons, went to the United States, where he remained until after the restoration. He was a Deputy in 1815, and from 1816 to 1821 was minister to the United States; was minister to Portugal in 1824, and in 1828 became Minister of the Navy. In 1830 he retired from public affairs on the accession of Louis Philippe. He was created baron in 1821. He died in Paris, May 28, 1857.

HYDE PARK, an inclosure of nearly four hundred acres, which is one of the most popular pleasure parks in London. It adjoins Kensington Gardens. It derives its name from having been the manor of Hyde, belonging to the Abbey of Westminster. See *LONDON*, Vol. XIV, p. 824, and in these Supplements.

HYDE PARK, a district of Chicago, Illinois, annexed in 1889, within which is the University of

Chicago; and Jackson and Washington parks, the first-named being the site of the World's Columbian Exposition.

HYDE PARK, a town in Norfolk County, eastern Massachusetts, on the Charles and Neponset rivers, and on branches of the New York, New Haven and Hartford railroad; seven miles S. of Boston. It has excellent graded schools, a public library and various manufactories. It is chiefly a place of residence for persons who carry on business in Boston. Population 1890, 10,193; 1900, 13,244.

HYDE PARK, a village in Dutchess County, on the Hudson River, New York, about 80 miles N. of New York City, and on the New York Central and Hudson River railroad. It is beautifully situated and is a favorite place of residence. The town (1900) had a population of 2,806.

HYDE PARK, a village in northern Vermont, capital of Lamoille County, on the Lamoille River, and on the St. Johnsbury and Lake Champlain railroad, 23 miles N. of Montpelier. It has carriage, lumber and other industries. It has a copper-mine, limestone-quarry, beds of mineral paint, saw-mills, good water-power, much timber, and it is the seat of Lamoille Central Academy. The surrounding country is famous for its exceptional beauty. The population in 1900 was 1,472.

HYDRA, in Greek mythology, a monster, the offspring of Typhon and Echidna, brought up by Juno (Hera). It dwelt in a swamp, and ravaged the country of Lerna near Argos. It had nine heads, the middle one being immortal. Hercules struck off its heads with his club, but in the place of each head cut off, two new ones grew forth. With the assistance of his servant Iolaus, Hercules burned away the heads of the Hydra, and buried the ninth or immortal one under a huge rock. After thus conquering the monster he poisoned his arrows with its bile, in consequence of which the wounds inflicted by them became incurable.

HYDRA. See *Hydroida*, under **HYDROZOA**, Vol. XII, pp. 560, 561; and **PHYSIOLOGY**, Vol. XIX, pp. 16-19.

HYDRASTIS CANADENSIS, a common herbaceous plant of early spring, indigenous in the United States in rich woods throughout the middle and central states. It belongs to the family *Ranunculaceae*, or crowfoots. It sends up a broad five to seven lobed root-leaf, and a stem about one foot high, bearing one or two small leaves just below the solitary flower. The sepals fall off in the bud, leaving a cluster of white stamens and a head of carpels, the latter maturing into a fruit resembling a raspberry. On account of its yellow root-stock it is known as orange-root or yellow puccoon.

HYDRATE OF CHLORAL. See **CHLORAL**, Vol. V, pp. 677, 678.

HYDRATES, a name sometimes given to hydroxides, but should be confined to those compounds formed by the addition of water to other substances, in which the water retains to some extent its individuality, and is easily driven off by heating a little above its boiling-point. Chlorine, for instance, forms at low temperatures a solid hydrate which

decomposes at ordinary temperatures. See **CHEMISTRY**, Vol. V, pp. 556-562.

HYDRAULIC CRANE. See **CRANE**, Vol. VI, pp. 547, 548.

HYDRAULIC ELEVATORS. See **LIFTS**, Vol. XIV, pp. 574-576.

HYDRAULIC MACHINERY. The tendency to use hydraulic power for operating large machines has kept pace with the use of individual electric motors and compressed-air apparatus, all of them coming more into use as improvements over the older methods of conveying power by gearing, belts or other mechanical means. Hydraulic power has special advantages which render it more suitable than anything else for certain lines of work. Where enormous power is required for only short intervals, this is usually the form preferred, since it costs nothing while idle. That remarkable mechanism, the Emery testing-machine, which is capable, in the larger sizes, of exerting a pressure of one million pounds, would not have been possible without hydraulic mechanism. The massive dock-gates built within a few years in several European cities are moved invariably by hydraulic apparatus. It has come into general use for riveting-machines, because the final pressure exerted is the greatest, which is exactly what is wanted in riveting. Punching and shearing machines of large size are now made to operate almost wholly by hydraulic pressure, because it has been found that the geared machines break down much more frequently, owing to the sudden strains.

Large hydraulic presses (see **CALENDER**, Vol. IV, p. 683) for forming wrought-iron and steel are, to some extent, taking the place of the steam-hammer. (See **HAMMER**, Vol. XI, p. 426.) They are built of a capacity up to four thousand tons, and will take in the largest forgings. A mammoth press which has been put in at the Bethlehem (Pennsylvania) Iron Company's works commonly exerts a pressure of six tons to the square inch, and has occasionally been used with a pressure of twenty tons to the square inch. Nearly all the heavy machinery in large steel-works is now operated hydraulically. The most recent electrotypers' presses are built for this power. The wheel-presses with which car-wheels are forced on and off their axles use hydraulic mechanism; so, also, the gigantic coining-press at the Philadelphia mint, which is capable of exerting a pressure of two million pounds.

The use of the hydraulic shield in tunneling operations has increased steadily since its introduction in 1869. As used in the St. Clair River tunnel at Sarnia, on the Grand Trunk railway, it consisted of a cylindrical shield 21½ feet in diameter and 15¼ feet long. This was formed of one-inch steel-plate, and was forced forward by the application of a series of hydraulic jacks pressing against its rear edge. As the total pressure from the jacks was three thousand tons, no difficulty was experienced in pushing aside small bowlders. The advances were made in stages of a foot and a half, and if there was any tendency to work out of line, it was corrected at once by applying more force from the jacks on one side. This shield was built with rear doors, forming locks, so

that the workmen might escape if accident should flood the entrance. The Blackwall tunnel, in course of construction in 1896, under the Thames, in London, employed a shield of 27 feet diameter. Within this are four levels for the workmen to stand upon, and to prevent sand and loose dirt from falling too far into the shield. The hydraulic jacks are supplied with water by steam-pumps, which are moved forward as the work progresses. The jacks are supported in the rear by pressing against the metal rings which form the body of the tunnel. When the shield is pushed forward one stage, the hydraulic jacks are moved up and one more ring added to the tunnel. After this is in place, the jacks again are braced in position, and the work proceeds. The jacks, of course, are spaced equidistant around the circumference of the shield; but in order to provide for unequal pressure, there are separate valves for each jack, allowing the pressure to be distributed as found desirable. The hydraulic shield is now the standard apparatus for tunneling, where the nature of the ground permits its use.

C. H. COCHRANE.

HYDRAULIC PRESSES. See IRON and STEEL, in these Supplements.

HYDRAULIC PROPULSION. See MOTORS, in these Supplements.

HYDRAULIC RAM. See HYDRO-MECHANICS, Vol. XII, pp. 532, 533.

HYDRAULICS. See HYDRO-MECHANICS, Vol. XII, pp. 459-535.

HYDRAZINE. See CHEMISTRY, in these Supplements.

HYDRAZOIC ACID. See CHEMISTRY, in these Supplements.

HYDROCARBONS, compounds containing only carbon and hydrogen. They occur in many plants as essential oil or wax, in petroleum, in natural gas, and are formed by the dry distillation of coal and many other substances. They are insoluble or little soluble in water, and are neutral bodies, some very stable, others easily acted on. Almost all petroleum products (gasoline, benzine, coal-oil, vaseline, paraffine) are hydrocarbons. Benzine, toluene, naphthalene and anthracene are used to make artificial dyes. Acetylene is used as a substitute for coal-gas, the luminosity of which is, however, largely if not entirely due to hydrocarbons. Toluene and some others are used in medicine, naphthalene for keeping out moths, and so a hundred other uses to which they are put might be given. See CHEMISTRY, Vol. V, pp. 556-562.

HYDROCELE (Gr., *hydor*, "water," and *kele*, "a swelling"), a dropsy of the tunica vaginalis, the serous membrane investing the testis. It occurs as a smooth, pear-shaped swelling, painless, but sometimes causing uneasiness from its weight. The quantity of fluid in the sac may amount to forty ounces. Hydrocele most commonly comes on without any apparent local cause, and is most frequently met with about or beyond the middle period of life, and generally in persons of feeble power; sometimes, however, it occurs in young children. The treatment may be palliative or curative. The palliative treatment consists in

the use of suspensory bandages, and tapping from time to time. The curative treatment consists in setting up inflammation in the tunica vaginalis by the injection of tincture of iodine, so as to obliterate the cavity, or by excision of the whole or part of the sac.

HYDROCHLORIC ACID, called also CHLORO-HYDRIC. See CHLORINE, Vol. V, p. 678.

HYDROCHÆRIDÆ, a family of South American rodents, represented by only one species, the capybara (*Hydrochærus*). The capybara, or water-pig, is the largest living rodent. See CAPYBARA, Vol. V, p. 80.

HYDROCOTYLE, a genus of umbelliferous plants, having simple umbels, flattened, more or less orbicular fruit, and simple rounded leaves, either kidney-shaped or peltate. The species are numerous, growing in water or wet places, and mostly with creeping or rooting stems.

HYDROCYANNIC ACID. See PRUSSIC ACID, Vol. XX, pp. 22-25.

HYDRODYNAMIC ENGINES. See HYDRO-MECHANICS, Vol. XII, pp. 520, 521.

HYDRODYNAMICS. See HYDRO-MECHANICS, Vol. XXII, pp. 445-458.

HYDROFLUORIC ACID. See FLUORINE, Vol. IX, p. 349.

HYDROGEN, LIQUEFACTION OF. When hydrogen is surrounded by nitrogen boiling in a vacuum it may be condensed to a colorless liquid. At ordinary pressure it boils at -243.5 and its critical temperature is -234.5, so that it cannot be liquefied at any pressure above -234.5. Liquid hydrogen may be used to obtain the lowest temperatures yet reached.

HYDROGEN PEROXIDE, a compound of hydrogen and oxygen usually obtained in solution by the action of a dilute acid on barium peroxide. The solution may be concentrated to fifty per cent in the air, and then by distillation in a vacuum the pure hydrogen peroxide obtained as a water-clear, syrupy liquid with an acid reaction. It decomposes readily in contact with many substances, especially when heated. Discovered by Thenard in 1818, it seems to be extensively distributed in nature, though in minute quantity. The solution is usually sold as containing a certain number of volumes of available oxygen, on the theory that it decomposes into water and oxygen. Thus a ten-volume solution means one that may be made to give up ten times its volume of oxygen. It is used for bleaching silk, feathers and hair, as an antichlor, and in medicine as an antiseptic. See BLEACHING, Vol. III, p. 823; and CHEMISTRY, in these Supplements.

HYDROGRAPHY. See *Flow in Rivers and Canals*, under HYDRO-MECHANICS, Vol. XII, pp. 492-510.

HYDROMINÆ. See MAMMALIA, Vol. XV, pp. 418, 419.

HYDROPHOBIA AND RABIES. The researches of M. Louis Pasteur led him to the conclusion in 1884, that by inoculation with prepared virus absolute protection against rabies and hydrophobia could be secured. He considered rabies

a disease of parasitic origin, although the particular parasite was not isolated securely. His method of treating people bitten by mad dogs was as follows: He found that, if he exposed the spinal cords of rabbits affected by the rabies in glass jars which had been freed from all moisture by caustic potash, and were kept at a constant temperature of 23° C., these spinal cords lost in virulence with each day of such exposure until, after a period of fourteen days, no poisonous effect resulted from their inoculation into a healthy rabbit or dog.

An animal bitten by a mad dog, if inoculated daily with gradually stronger and stronger virus taken from the spinal cords of rabbits, was found to be proof against the outbreak of hydrophobia. Pasteur concluded that a person thus treated must likewise be proof against the disease. On July 7, 1885, when a boy, Joseph Meister, who had recently been bitten by a mad dog, presented himself at his laboratory, Pasteur inoculated him first with weak virus. Each succeeding day he inoculated him with a gradually stronger virus, ending this treatment on the 16th of June. The boy was cured, without any deleterious effects from the treatment.

After that time Pasteur performed hundreds of similar preventive inoculations. It is asserted generally that of 100 persons bitten by mad dogs, about 18 to 20 become rabid and die of hydrophobia. By Pasteur's treatment this percentage was reduced to one half, or even less. Some physicians, who were opposed to Pasteur, maintained that there was danger of death being caused by his inoculations, without reference to the effect of the dog's bite. An English commission investigated this point, but could not find a single case of death from this cause alone.

A large hospital, called the Pasteur Institute, was established in Paris and another in New York, where dog-bitten patients received treatment under Pasteur's personal supervision. Of the few who succumbed to the disease, it is asserted that there were other complications involved. The efficacy of the Pasteur system, which at first encountered much opposition came to be generally recognized. See Vols. XII, pp. 545-547 and Vol. XX, 199-202.

HYDROPHYLLACEÆ, a family of dicotyledonous plants, containing numerous species, natives chiefly of the colder parts of America. The order includes some small trees and bushes, as well as herbaceous plants, and is related most closely to the *Borraginaceæ*. The largest and best known genus is *Phacelia*.

HYDROPTEREDÆ, a family of cryptogams. See VEGETABLE KINGDOM, Vol. XXIV, p. 129.

HYDRORHACHIS. See MONSTER, Vol. XVI, p. 763.

HYDROSTATICS. See HYDRO-MECHANICS, Vol. XII, p. 435.

HYDROTROPISM, a term in physiological botany, indicating that certain plant-members are influenced in the direction of their growth by the presence of moisture. Roots are notably *positively*

hydrotropic; that is, a moist body causes them to turn toward it.

HYDROXYLAMINE. See CHEMISTRY, in these Supplements.

HYGEIA or **HYGIEIA**, in Greek mythology, the goddess of health and a daughter (or according to some traditions the wife) of Æsculapius, in whose temple she usually was worshiped. She was worshiped at Athens, Corinth, Argos and other important cities, and in works of art usually is represented as a virgin with a snake, the symbol of health, which drinks from a cup held in her hand.

HYKSOS. See EGYPT, Vol. VII, p. 735.

HYLÆOSAURUS, a genus of dinosaur, remains of which have been found in England. There were large spines along the median line of the back. The length of the animal has been estimated at 25 feet.

HYLAS. See ARGONAUTS, Vol. II, p. 496.

HYLIDÆ, the family of tree-frogs or tree-toads. Most species are arboreal. The toes are dilated into suckers at the extremities, thus enabling the animals to climb easily. These frogs are well known on account of their loud and peculiar voices. Many species are beautifully colored. *Hyla*, the typical genus, contains 175 species, mostly from tropical America. There are many similar forms in other countries. See FROG, Vol. IX, pp. 795, 797.

HYLOBATES. See APES, Vol. II, pp. 150, 151.

HYMENOPHYLLACEÆ. See FERNS, Vol. IX, p. 104.

HYMETTUS. See ATTICA, Vol. III, pp. 58, 59.

HYNDMAN, HENRY MAYERS, an English socialist; born in 1842, in England. He was educated at Trinity College, Cambridge, and entered the Inner Temple in 1863. He was special correspondent of the *Pall Mall Gazette* during the war between France and Italy in 1866, receiving the special thanks of his paper at the close of hostilities. He was a founder of the Social Democratic Federation, and was the author of *The Indian Famine and the Crisis in India* (1877); *England for All* (1881); *Historic Bases of Socialism in England* (1883); *The Social Reconstruction of England; Socialism and Slavery; A Summary of the Principles of Slavery; and Will Socialism Benefit the English People?* (1884).

HYNOBIDÆ, a family of salamanders composed of the genus *Hynobius*, peculiar to Japan. The affinities with the *Amblystomidæ* are so marked that some authors include *Hynobius* in this family.

HYOID BONES. See ANATOMY, Vol. I, p. 825.

HYOPSODUS, a small mammal, one of the Lemuroids, remains of which are found in Eocene formations in Wyoming.

HYOSEYAMUS. See HENBANE, Vol. XI, p. 650.

HYPERBOLA. See CONIC SECTIONS, Vol. VI, pp. 278-282.

HYPERBOLOID. See GEOMETRY, Vol. X, pp. 418, 419.

HYPERICACEÆ, a family of numerous species, trees, shrubs and herbaceous plants, widely distributed and in very different climates, but particularly numerous in North America. The species of *Vismia* yield a substance resembling gamboge. Many of the *Hypericaceæ* belong to the genus *Hypericum*.

HYPERION, a Titan of Greek mythology, son of Cœlus and Terra, and married to his sister Thia; was the father of Helios (Sol), Selene (Luna) and Eos (Aurora). The name is used as a patronymic by Homer, and his example is followed by later poets.

HYPEROARTIA AND HYPEROTRETA, the two orders of Marsipobranchs or Cyclostomes. In the *Hyperoartia* the nasal cavity is a blind tube, without connection with the pharynx. The order comprises the petromyzonids, or lampreys. In the *Hyperotreta* the nasal cavity connects with the pharynx through the palate. This order is composed of the myxinoids, or hog-fishes.

HYPERSTHENE. See MINERALOGY, Vol. XVI, p. 415.

HYPNOTISM. See MAGNETISM, ANIMAL, Vol. XV, pp. 277-283.

HYPNUM, a genus of mosses belonging to the family *Bryaceæ*, a group of the *Acrocarpi*, where capsules are borne terminally upon the main axis. Many species are remarkable for their beauty, and are often used for decorative purposes. Their distribution is universal. See MUSCINEÆ, Vol. XVII, pp. 70-73.

HYPOCHÆRIS, a genus of plants of the family *Compositæ*, of which one species (*H. radicata*) is common in meadows and pastures in Britain. Its rough leaves spread on the ground, and resemble in form those of the dandelion; the stem is branched; the flowers are like those of the dandelion, but smaller.

HYPOCHLORITES OR BLEACHING-SALTS. See CHEMISTRY, Vol. V, p. 494.

HYPOGENE. See GEOLOGY, Vol. X, p. 240.

HYPONITROUS ACID. See CHEMISTRY, Vol. V, p. 514.

HYPOPHOSPHOROUS ACID. See CHEMISTRY, Vol. V, p. 517.

HYPOPHYSIS. See BOTANY, Vol. IV, p. 155.

HYPOPTHALMIDÆ, a family of cat-fishes (Siluroids) peculiar to the rivers of South Amer-

ica. They resemble the cat-fishes of the United States.

HYPOSULPHITE, a salt of hyposulphurous acid, or frequently called simply hypo. It should be called sodium thiosulphate, as the true hyposulphites are rare, and not easily made. Sodium hyposulphite is used in photography as a solvent. See SULPHUR, Vol. XXII, p. 636.

HYPOXANTHINE, called also SARCINE or SARKINE (C⁵H⁴N⁴O₆) an immediate derivation of uric acid. It is a white crystalline powder found in the spleen, liver, muscles and other organs of man, and in the spleen and blood of the ox. See NUTRITION, Vol. XVII, p. 683.

HYPOMETRY. See SURVEYING, Vol. XXII, p. 713.

HYRACEUM, a blackish-brown viscid material, product of the South African hyrax, not unlike soft pitch, found in the crevices of the rocks of Table Mountain, Cape of Good Hope. It has an offensive taste, and is not unlike castoreum, for which it has served as a substitute in medicine.

HYRACOIDEA. See MAMMALIA, Vol. XV, p. 422.

HYRTL, JOSEF, an Austrian anatomist; born at Kis Márton, Hungary, Dec. 7, 1811; studied at Vienna, and acquired eminence as a scientific anatomist. He became professor of anatomy in Prague in 1837, and at Vienna in 1845. He contributed not a little to the progress of comparative anatomy, especially that of fishes, and made the anatomy of the ear a subject of very particular investigation. He produced many books and articles on the subjects above indicated. Hyrtl formed a museum of comparative anatomy at Vienna, and became rector of the university. He was the author of *Topographische Anatomie* (1847); *Handbuch der Praktischen Zergliederungskunst* (1860); *Ueber Ampullen am Ductus Cysticus der Fische* (1868); *Das Nierenbecken der Säugethiere und des Menschen* (1870); *Das Arabische und Hebräische in der Anatomie* (1879); *Die Alten Deutschen Kunstworte der Anatomie* (1884), and other works. He died in Vienna, July 17, 1894.

HYSTERECTOMY OR CÆSAREAN OPERATION. See SURGERY, Vol. XXII, p. 691.

HYSTERESIS, MAGNETIC. See ELECTRICITY, § 62, in these Supplements.

HYSTRICIDÆ. See PORCUPINE, Vol. XIX, p. 518.

I ABADIUS—ICARUS

I ABADIUS, a large fertile island in the East Indies, described by Ptolemy. It was said to be near the Golden Chersonesus, and it produced much gold and grain. It is now thought to be identical with Java, but Humboldt took it to be Sumatra.

IACCHUS (*Greek, Iakchos*), a name for the god Dionysus at Athens and Eleusis. On the sixth day of the Eleusinian mysteries a decorated statue of Iacchus was carried from Athens to Eleusis, where the votaries were initiated into the last mysteries. Some think that Iacchus is identical with the Roman Bacchus, the son of Jupiter and Semele. See **MYSTERIES**, Vol. XVII, p. 188.

IALYSUS. See **RHODES**, Vol. XX, p. 526.

IAMBIC METERS, a meter in which the verse is composed of iambic feet. It was used originally in Greece for satirical writing, but afterward was employed in any case where pointed expression for a thought was wanted. See **GREECE**, Vol. XI, p. 139.

IANTHINA, a genus of gasteropod mollusks, typical of the family of purple shells or violet snails. They swim near the surface of the sea in warm waters. The foot secretes a gelatinous substance, full of air-bubbles, which hardens and forms a support for the eggs. This float remains attached, and does not allow the animal to sink below the surface. Great numbers are often blown ashore during storms. The shells are purple at the base and white at the apex.

IAPETUS, a satellite of Saturn. See **TIDES**, Vol. XXIII, p. 379.

IATROCHEMISTRY. See **MEDICINE**, Vol. XV, pp. 810, 811.

IBEA. See **AFRICA**, in these Supplements.

IBERA OR **YBREA**, a marshy lake in the province of Corrientes, eastern Argentine Republic, between the rivers Paraná and Uruguay. It averages 50 miles in length and 30 in width, though its size and shape vary much with the seasons.

IBERIA. See **SPAIN**, Vol. XXII, p. 304.

IBERNIA. See **IRELAND**, Vol. XIII, pp. 214, 272.

IBERVILLE, PIERRE LE MOYNE, SIEUR, a French-Canadian explorer, founder of Louisiana; born in Montreal, Canada, July 16, 1661. He entered the French navy as midshipman when 14 years old. In 1690 he was one of the leaders in the retaliatory expedition against Schenectady. In October, 1694, he captured Fort Nelson, on Hudson Bay. In 1696 he took nearly all of Newfoundland from the British, whom he defeated in the naval fights of 1697. In March, 1699, he entered the Mississippi River and ascended it as far as the mouth of the Red River. He then built old Fort Biloxi at the head of Biloxi Bay. This was the first post established in Louisiana.

After going to France and returning to Louisiana in 1701, he found the settlement reduced by disease, and thereupon transferred it to Mobile, thus beginning the colonization of Alabama. He also occupied Dauphin or Massacre Island. After being made captain of a line-of-battle ship, he captured, in 1706, the island of Nevis from the English. He was suddenly attacked by a malady, of which he died, at Havana, Cuba, July 9, 1706.

IBSEN, HENRIK, a Norwegian poet and dramatist; born at Skien, in southern Norway, March 20, 1828. In 1842 he was apprenticed to a chemist at Grimstad, but abandoned that business to devote himself to literature. In 1850 he became a student in Christiania University, but did not remain to complete the course. After two years of journalistic work he was appointed director of Ole Bull's theater at Bergen, for which he wrote *The Banquet at Solhaug* (1856) and *Lady Inger at Östråt* (1857), his first works of note. In 1857 he undertook similar duties for the National Theater in Christiania. His next dramas, *The Warriors in Helgeland* (1858), *Love's Comedy* (1862), and *The Rival Kings* (1864), placed him in the first rank of Scandinavian dramatists. He left Norway in 1864, and afterward lived abroad, chiefly in Rome, Dresden and Munich. The Norwegian Parliament granted him a pension in 1866. In that and the following year appeared the lyric dramas *Brand* and *Peer Gynt*, in many respects the finest things he produced. Other works are *Emperor and Galilean* (1873); *Pillars of Society* (1875); *A Doll's House* (1878); *Ghosts*; *An Enemy of the People* (1882); *The Wild Duck* (1884); *Rosmersholm* (1886); *The Lady from the Sea* (1888); *The Master Builder* (1892); and *Little Eyolf* (1894). His later plays aroused a storm of controversy in England in 1889, as they had done shortly before in Germany and in the Scandinavian countries. Up to that time he was practically unknown and unread in the United States, but he suddenly achieved an extraordinary popularity, and his plays were produced and his works perused in many sections of the country. Ibsen is a naturalist or realist, and writes for moral purposes. See also **NORWAY**, Vol. XVII, p. 591.

HENRIK IBSEN.

ICA, a river. See **COLOMBIA**, Vol. VI, p. 153.

ICARIUS OF ATTICA. See **DIONYSUS**, Vol. VII, p. 249.

ICARUS. See **AERONAUTICS**, Vol. I, p. 185.

ICEBOATS AND BOATING. The iceboat is built to go on runners, with which each end of its center and crossbeam is fitted. The machine is supplied with sails, and can attain great speed, a mile a minute being a common thing in a good breeze. In America the sport is enjoyed greatly on the Hudson, and in all Northern states on small lakes and rivers, and regattas are held every winter.

ICE-CUTTING TOOLS. Ice is harvested from the rivers and ponds in the northern United States and in Canada by gangs of men assisted by horses. For clearing the snow from the ice, they make use of the snow-planer, or ice-plane, as it also is called. This is usually a one-horse scraper which looks much like a boy's hand-sled, on which a man rides to give it weight in clearing off the snow. When a field is cleared, the ice-marker is brought into use to lay out the cutting. Parallel lines are marked out, about twenty inches apart, the implement used being a sort of plow with several short shares, which scratch the ice. This plow is drawn by a horse, and, the first line being laid out straight and accurately, the rest is easy, as the marker has a guide which runs in the groove of the first scratch, keeping the lines parallel. The ice-cutter is another one-horse implement, with shares that cut deeper than those of the marker, and it finishes the cut, several trips being required if the ice is thick. The cross-cuts, which sever the ice into blocks, are usually made by hand, with a long saw having a cross-bar for a handle. Striking-off bars and chisel-bars are used to loosen the blocks when insufficiently sawed or cut. As the blocks of ice are loosened, they are seized with a combined hook and pick, mounted on the end of a long handle, and directed toward the icehouse. Various tongs, hatchets, spades, etc., also, are used in handling the ice. The work is usually begun at the foot of an elevator leading to the ice-house, and as the ice is taken away the channel left in the water is used to float the blocks up to the elevator. This elevator is usually a conveyer, set at an angle of perhaps thirty degrees, and having slats mounted on an endless chain. These slats carry the blocks of ice up the incline to the icehouse. Elevators have also been built on the principle of an upright spiral, whose rotating flanges carry up the ice, but the conveyer form is the most common.

C. H. COCHRANE.

ICELANDIC LANGUAGE AND LITERATURE. See ICELAND, Vol. XII, pp. 621-628.

ICELAND SPAR. See CALC-SPAR, Vol. IV, p. 653; and LIGHT, Vol. XIV, p. 609.

ICE-MACHINE. Various types of ice-machines have been manufactured, but the only practical successes have been those employing the expansion of a compressed gas, or of a liquefied vapor cooled during compression. The gaseous ammonia frigorific machines are used most widely, being so called because they employ anhydrous ammonia. In principle, such machines consist of an evaporator or congealer, in which the vapori-

zation of the ammonia takes place; a pump for aspirating the gas as formed in the evaporator; a liquefier or condenser, where the gas is compressed by the pump, the liquefaction being aided by a condensing stream of cold water. This last-named portion of the apparatus serves simply to restore the ammonia to its original state, that it may be used over and over again. In order to utilize the low temperature obtained by this apparatus for making ice, the usual practice is to run the ammonia into coils for evaporation. These coils being led into tanks of brine, the evaporation robs the brine of its heat, and cans of water, being set into the brine-tanks, are frozen. The usual sizes of can-molds are for containing one hundred to three hundred pounds of ice, but within a few years the manufacture of plate-ice has come to be preferred in many quarters to can-ice. These plates of ice are about eight by sixteen feet in size and twelve to sixteen inches thick. From eight to twelve days' time is required to freeze them.

The most recent ice-machines, built on the principles described, will produce about thirty-two pounds of ice per pound of coal consumed, the proportion depending somewhat on the outside temperature at the time.

C. H. COCHRANE.

ICE-PLANT, a name given to *Mesembryanthemum crystallinum*, a genus of the family *Aizoaceae*. It is a native of South Africa, frequent in cultivation, and is remarkable for the glistening little excrescences which cover the foliage, like frost. It is prostrate, with broad leaves, and sessile white or purplish flowers.

ICHTHYOL, a dark-brown liquid obtained by the distillation of a bitumen found in the Tyrol. It has a tarry smell and taste. As it contains 15 per cent of easily assimilated sulphur, it is used as a medicament, both internally and externally.

ICHTHYOPSIDA. See REPTILES, Vol. XX, pp. 437, 438.

ICHTHYORNES, a genus of toothed birds (*Odontornithes*), whose remains were found in the Cretaceous strata of Kansas. The name, signifying fish-bird, refers chiefly to the vertebræ, which are biconcave, like those of fishes. The teeth were set in sockets. This bird was little larger than a pigeon.

ICHTHYOSIS. See SKIN DISEASES, Vol. XXII, p. 121.

ICO, a town in the state of Ceará, Brazil. It ships cattle, grain, cotton, etc. Its trade is mostly with Aracaty, and the population is about 7,000.

ICONOCLAST, an image-breaker; especially one of the party in the Eastern Church which rejected the worship of images and pictures. See IMAGE-WORSHIP, Vol. XII, pp. 712, 713.

ICTINUS, a Grecian architect; a contemporary of Pericles. In connection with Callicrates, he built the Parthenon in the Acropolis at Athens, the temple of Apollo Epicurius in Arcadia, and the temple in which the Eleusinian mysteries were performed.

ID. See HEREDITY and IDE, in these Supplements.

IDA, MOUNT. See TROAD, Vol. XXIII, p. 578; and CRETE, Vol. VI, p. 569.

IDA GROVE, a town and the capital of Ida County, Iowa, in an agricultural and stock-raising district, and on the Chicago and North-Western railroad, and the Maple river, 48 miles E. S. E. of Sioux City; has factories of corn-planters, flour, and machinery. Pop. 1900, 1,967.

IDAHO, one of the extreme Northwestern states of the Union, extends from the Dominion of Canada on the north to Nevada and Utah on the south, a distance of 441 miles, and from Montana and Wyoming on the east to Oregon and Washington on the west, the width varying from 44 to 306 miles, the average being about 250 miles. The area is 84,290 square miles, or 54,272,000 acres. The population in 1890 was 84,385; that of 1880, 32,610, the gain being 51,775, or more than 158 per cent. The increase during the preceding ten years was in excess of 117 per cent, the population in 1870 being only 14,999. In 1890 the number of whites was 82,018; negroes, 201; Chinese, 2,007; civilized Indians, 159. The population by the Twelfth (1900) Census was 161,771.

Idaho was created a territory by act of Congress, March 3, 1863. A constitutional convention assembled at Boise City, and, July 4, 1889, drafted a constitution, which was ratified by the people and submitted to Congress, July 3, 1890. The territory was proclaimed a state, being the forty-fourth in order of admission to the Union, and the thirty-first under the Federal constitution. The constitution adopted provided that the senate should consist of 18, and the house of 36, members, and should never exceed 24 and 60 respectively. The executive department consists of a governor, lieutenant-governor, secretary of state, auditor, treasurer, attorney-general and superintendent of public instruction, each to hold office two years. The governor has the right to veto separate items of any appropriation bill. The supreme court consists of three judges, to be elected at large. Women resident six months in the state may hold school offices and vote at school elections. Almost the entire vote of the territory was registered on the question of statehood, and out of a total of 14,184 votes, 12,398 were cast in favor of and 1,773 against it.

STATE SEAL OF IDAHO.

Idaho is an Indian word meaning "Gem of the Mountains." The first white man to enter the territory now comprising the state was Captain

Clark, with a detachment of the Lewis and Clark exploring expedition, about Aug. 12, 1805. In 1810 a trading-post was established on Snake River, but soon was abandoned. In 1834 Fort Hall was established as a trading-post on the Fort Hall Indian reservation, near Snake River. In 1860 gold was discovered on Oro Fino Creek, a tributary of the Clearwater, followed by other valuable finds in rapid succession. The first permanent settlement was made at Mount Idaho, the present county seat of Idaho County, in May, 1861.

Idaho is in the same latitude as France, Switzerland and portions of Italy, Spain and Portugal. The average or mean temperature at Lewiston, in northern Idaho, is 56°, a milder snowing by 5° than is made by Ohio, milder by 10° than Iowa, and milder by 12° than Maine and New Hampshire. Boise City, in western central Idaho, has a much greater altitude than Lewiston, and has an average temperature of 51°, the same as Ohio, and 4° warmer than Connecticut.

The forest area of the state is estimated at 7,000,000 acres, the greatest timber regions being in the extreme north. Bull-pine, white pine, tamarack and fir predominate here, while cedar attains great height and thickness. There are, in other sections of the state, various varieties of fir, white, red and black spruce, yellow and white pine, mountain mahogany, juniper, birch, cottonwood, alder and willow. Idaho is a vast lumber-preserve for future generations.

The soil of Idaho is well adapted to agriculture, but in almost all sections of the state irrigation is necessary, on account of the limited rainfall, though in the extreme north there is sufficient rain to insure good crops, as is also the case in the mountain valleys of the southern and central sections. Estimates as to the amount of agricultural lands within the state vary from 13,000,000 to 16,000,000. The elevation of the land governs, to a great extent, the character of its productions. The valleys of Bear Lake, Lemhi and Custer counties are cultivated profitably at an elevation of 6,000 feet above tide-water; and at 5,000 feet, oats, wheat, potatoes, turnips, etc., are raised abundantly. Timothy and a few hardy grasses flourish at these altitudes. At 4,000 to 4,500 feet all kinds of grain and vegetables are profitable, except a few tender garden products. In some localities fruit is grown successfully at 4,000 to 4,300 feet, and berries are abundant at 4,500. The Boise valley, so prolific of all kinds of fruit, is 2,800 feet above the ocean, while the valleys of the Clearwater and Snake rivers, near Lewiston, in the northwest, with an altitude of but 680 feet, revel in tropical vegetation. Thus Idaho, in addition to its invaluable mineral wealth, possesses a share of the best climatic influences of every portion of the Union. The soil in the valleys and on the plateaus in the eastern and southern parts of the state is composed of vegetable matter mixed with mineral, and in some localities, with sand and clay. On this class of soil sage-brush

grows extensively. In the northwestern counties, dark loam of great depth prevails. In the gulches and near the mountains the soil is mixed with decayed rock. Alkali soil is limited to narrow strips, in widely separated localities, and rarely interferes with agriculture. The yield of all kinds of cereals, when the land is irrigated, is most gratifying, and is not surpassed by any state or territory. The same can be said of all kinds of vegetables, while in many parts of the state tender vines produce abundantly. Fruits are excellent in quality and flavor. Apples, plums, pears, peaches, prunes, apricots, grapes and all small fruits and berries are raised in great abundance. Huckleberries, gooseberries and cherries grow wild, in profusion, on the mountain sides and foothills. Among the mountain ranges are many valleys, large and small, affording, in the aggregate, a vast area of agricultural lands not exceeded in fertility by any in the world. The arable portions of the valleys lie from 600 to 6,000 feet above the sea, and they range in size from one to twenty miles in width, and from twenty to one hundred miles in length.

Mining is the principal industry of the state. The total metal-production for 1897 was \$13,110,000, of which \$2,500,000 was gold, \$7,100,000 was silver, \$3,500,000 was lead. Both gold and silver are found along the rivers and in every county in the state. The census of 1890 shows Idaho third among the states of the Union in the production of lead. At different points in the state are deposits of coal and iron, and in the southeast is found sulphur, soda, magnesia, carbonates, sulphate of lime, almost pure salt, and other minerals and alkalis.

Notwithstanding the great amount of arable land and the fertility of the soil, agriculture is not carried on to any great extent, though the showing made by the state at the World's Fair, of the products of the state, was very creditable, including wheat, corn, oats, rye, clover, flax, hemp, cotton, tobacco, figs, almonds, walnuts, apples, quinces, peaches, pears, plums, cherries, apricots, nectarines, prunes, berries, and many varieties of the finest grapes. The total production of the cereals—corn, wheat, oats and barley—together with potatoes and hay, for the year 1893, amounted to almost \$5,000,000.

The total assessed value of all property on Jan. 1, 1899, was \$30,423,671. On Jan. 1, 1898, the net debt was \$597,469. For 1898 the ordinary revenue was \$359,496; and the ordinary expenditure \$223,882. In 1897 the bullion receipts at the U. S. assay office at Boise were \$1,497,146.

The wool-clip for 1897 amounted to 9,189,719 pounds, coming from 1,312,817 sheep, which was valued at about \$3,500,000.

Large appropriations have been made for the purpose of constructing irrigation canals and ditches, the Snake River and its tributaries furnishing an abundant water-supply. Up to 1894 about \$2,000,000 had been expended for the purposes of encouraging irrigation. The fertile bottom-lands of the Snake River and of some of the

other streams yield the most abundant crops when under irrigation.

The state has had grants from the general government of over 4,000,000 acres of land, much of which has been apportioned to specific institutions and a large revenue thereby obtained. Of the 90,000 acres granted to the Agricultural College, 75,703 acres have been selected; of the 150,000 acres granted to charitable and other institutions, 96,617 acres have been selected; of the 50,000 acres granted to the insane asylum, 42,670 acres have been selected; and out of the grant of 100,000 acres granted to normal schools, 46,824 acres have been selected.

STATE CAPITOL, BOISE CITY.

The school census of 1898 gives the number of children within the school age as 38,810, the amount of the school fund for the same year being forty thousand dollars. The school system has been improved very materially within recent years; the Mormons, formerly opposed to the public schools, now give them their hearty support, and Mormon children attend the district schools throughout the entire state. Higher education is provided abundantly, the University of the State of Idaho being the principal institution. It is located at the city of Moscow, and, in addition to state support, receives the government appropriation to which agricultural colleges are entitled. Three experiment stations are attached to the university, one located at Nampa, one at Grangeville and one at Idaho Falls. State normal schools are established at Albion and Lewiston, bonds having been issued for their support and maintenance.

The state institutions comprise the insane asylum and the penitentiary, for each of which an appropriation of sixty-five thousand dollars was made in 1895. The former is located at Blackfoot, Bingham County, and in 1898 had 187 patients, with a total expenditure of \$37,731. The rate of insanity among the people of Idaho is less than one-half that of the average rate of the other states of the Union. The penitentiary is located two miles east of Boise City. On July 1, 1897, the inmates numbered 210, which is about the average number confined. The deaf, dumb, and blind are cared for at the Colorado Springs (Colorado)

Deaf, Dumb and Blind Asylum, an annual charge of \$250 for each person being made, which is paid by legislative appropriation. It was estimated that at the close of 1895 not more than fifty persons in the entire state were entitled to the provisions of the act, while not more than ten at any one time have availed themselves of its provisions. In 1895, twenty-eight thousand dollars was appropriated for the support of the Soldiers' Home, which institution, at that time, contained 27 inmates and 11 officers and employees.

The state constitution makes no provision for state or savings banks, and the banks of the state are all national institutions. In 1895 there were 12 national banks, carrying in excess of three million dollars of individual deposits and having a capital of \$750,000.

At the beginning of 1899 there were 80 newspapers published in Idaho. Papers are published in all of the 21 counties and in 49 cities, towns, and villages. Of the total number of papers published, 5 are daily, 4 semiweekly, 66 weekly, 1 semimonthly, and 4 monthly.

The state is well supplied with railroads, the Northern Pacific and the Great Northern lines extending across the northern part, and the Union Pacific across the southern. The total number of miles of track in 1898 was 1,085.

According to the census of 1890 there were 184 church organizations in the state, with about the same number of churches and halls. The membership approximated 22,000, and the value of the church property was nearly \$300,000.

The census of 1900 showed the population of the principal towns in Idaho as follows: Boise City, 5,957; Montpelier, 1,444; Weiser, 1,364; Paris, 906; Genesee, 731; Wallace, 2,265; Lewiston, 2,425; Caldwell, 997; Grangeville, 1,132; Pocatello, 4,056; Malade, 1,050; Rexburg, 1,081.

The following is a list of the governors of Idaho, with their terms of office: Territorial—William H. Wallace, 1863-64; Caleb Lyon, 1864-66; David W. Ballard, 1866-67; Isaac L. Gibbs, 1867-68; David W. Ballard, 1868-70; Gilman Marston, 1870-71; Thomas W. Bennett, 1871-75; Mason Brayman, 1877-78; John P. Hoyt, 1879; Mason Brayman, 1880; John P. Neil, 1880-83; John N. Irwin, 1883; William N. Bunn, 1884-85; Edward A. Stevenson, 1885-89; George L. Shoup, 1889-90. State—G. L. Shoup, 1890; N. B. Willey, 1891-92; W. J. McConnell, 1893-97; F. Steunenberg, 1897. See also IDAHO, Vol. XII, pp. 697, 698.

IDAHO SPRINGS, a post town of Clear Creek County, northern central Colorado, on the Union Pacific railroad, at the junction of Chicago and Clear creeks, 34 miles W. of Denver. It is surrounded by beautiful scenery, and is well known for its hot and cold mineral springs, which attract a large number of visitors in summer. The springs contain, as principal ingredients, carbonates and sulphates of soda and magnesia. There are swimming and vapor baths here. Gold, silver, copper and lead are mined in the vicinity. Population 1890, 1,338; 1900, 2,502.

IDANTS. See HEREDITY, in these Supplements.

IDAS, in Greek mythology, one of the Apharetidæ, or sons of Aphareus and Arene; the husband of Marpessa, whom he took away on a winged chariot from Apollo, another of her suitors; the brother of Lynceus and the father of Cleopatra and Alcyone. He and his brother had a pitched battle with the Diocuri, Castor and Pollux, the sons of Jupiter, caused by an unfair division of cattle stolen by the four warriors. It is said to have taken place in Mecene or Laconia, and to have ended by the death of both Apharetidæ, the twin sons of Jupiter being saved from destruction by a bolt of lightning striking Idas.

IDDA OR IDDAH. See NIGER, Vol. XVII, p. 497.

IDDESLEIGH, LORD, better known as Sir Stafford Northcote, an English statesman; born in London, Oct. 27, 1818, and educated at Eton and Balliol College, Oxford, graduating with distinction in 1839. In 1843 he became private secretary to Mr. Gladstone, then president of the Board of Trade. He was called to the bar at the Middle Temple in 1847. In 1851 he succeeded to the baronetcy of his father, and in this year was made secretary to the commissioners of the Universal Exhibition, and was knighted for his services in connection therewith. In 1855 he entered Parliament, as a Conservative, for Dudley, and sat for various constituencies until his elevation to the peerage. In 1889 he was appointed Financial Secretary in Lord Derby's Cabinet, and in 1866 was appointed by the same minister president of the Board of Trade. In 1868, while Secretary for India, he had charge of the Abyssinian expedition, which was conducted with success. In 1871 Mr. Gladstone appointed him British commissioner to the United States to aid in the adjustment of the *Alabama* claims. In 1874 he was Chancellor of the Exchequer in the Cabinet of Mr. Disraeli, and on the latter going to the Upper House, Sir Stafford became leader of the House of Commons. In 1885, on the accession of Lord Salisbury to power, the latter bestowed a peerage on Sir Stafford, who went to the Upper House as the Earl of Iddesleigh and Viscount St. Cycles and was also appointed First Lord of the Treasury. He was Foreign Secretary in Lord Salisbury's second administration. He resigned early in January, 1887, and on the 12th of the same month he died very suddenly at the official residence of the Premier, in Downing Street. In 1883 he was elected, by the students, lord rector of the University of Edinburgh. He was noted for his literary taste, and his works are *Twenty Years of Financial Policy, 1842-61* (1862); *The Pleasures, the Dangers and the Uses of Desultory Reading* (1885); and *Lectures and Essays* (1887).

IDE OR ID, a small fresh-water cyprinoid fish, *Leuciscus idus* or *Idus melanotus* of Europe, closely allied to the American *Cyprinidæ*. Its flesh is esteemed. A domesticated variety, colored like the goldfish, is known in northern Europe as the orfe.

IDEALISM, a term which, besides its ordinary sense of seeking to expound or realize an ideal condition or standard, is applied to a method in art and a school of philosophy.

Art. There can be no art without the expression

of that personal quality of the artist which is the root of idealism. Representations which are without a human element of choice, taste or feeling are mechanical, and not artistic, productions. Even the extreme realist cannot escape registering something of his personality in his work; for the painter cannot put on his canvas all the details that actually confront him. He must distinctly recognize something that appeals to his sentiment, and then produce what *his eyes see*, and it is in reproducing his own moods and visions that the art lies. Yet there is a wide range from Meissonier, with his Dutch fidelity to details, and Cimabue and the Byzantine painters. The antipodes are a Sistine Madonna and a Bacchanalian scene by Ccuture. There is no complete antithesis between idealism and realism in art; it is a question, simply, of the predominance of the artist's individual moods and exaltations over his fidelity in depicting the object to be represented as it is in itself and must seem to others. For a discussion of this subject from a philosophical point of view, see *ÆSTHETICS*, Vol. I, p. 213; and for a critical consideration of it, see *FINE ARTS*, Vol. IX, pp. 210, 211.

Philosophy. Idealism is a scheme of philosophy that finds the ground and reality of things in thought. In its largest sense, it is one, and the elder and more Protean one, of the two possible methods of philosophy. In calling it the elder, the Greek physicists are neglected, because of their inability, Democritus perhaps excepted, to find the fruitful germ of a persistent development. Philosophy sets for itself the task of bringing all the individual particulars of a complex universe into a unity that relates these particulars to each other. Yet this eternal problem is worked under the limitation that all the material of philosophy is that small portion of nature which has become a part of human experience and the object of conscious reflection. The naturalist or experimentalist begins from without, and endeavors, by gathering the data of observation to produce a system, the unity of which is found in force, or will, or pure being. Empiricism begins with experience and works upward. The idealist reverses the process, and, starting with pure being, or the absolute, works downward to the explanation of the phenomenal. Both methods have the same goal to reach—the one ground of being. In history, idealism has been the chief support of religious systems, and experimentalism of skepticism, hence the passion of philosophy.

The first step in philosophy is taken when a man reflects upon his own identity, or becomes conscious of self. By this, something more is meant than that vague sense of a continuous memory which the savage, and probably beasts, have in common with the thinker. It is self as perceived, self as object, self as the principle that brings all the facts of consciousness into relation.

All mental perceptions are mere unrelated and distinct entities, passing in meaningless sequence, through consciousness, until they are seen to be united by a persisting principle, which is the perceiving *ego*. But why should this principle of personal identity bring perceptions into relation? Because of thought and the laws of thought. Now, thought does not deal with objects, but only with

the ideas or presentations of objects in the mind. Ideas are the subject-matter of thought; or, rather, a perception of their relations is thinking. What, then, are the real things of knowledge? Psychologically, they are ideas, or thought, and the treatment of them as such constitutes idealism. Hence the force of the injunction of Thales in its Socratic and even in its Buddhistic sense, "Know thyself."

As the individual *ego* finds in thought the grounds of its own knowledge, and systematic grasp upon it, and is able to contemplate itself as an object of reflection and even of investigation, so it comes to conceive of being outside of itself, which is the substance of unity for all other individual life, giving certitude and correspondence to the knowledge of all men. Thus the supreme principle is reached, absolute being, the ground and essence of all other being. Primordial being is the "pleroma" of all individual beings—the principle giving validity to all thought.

Because the idea of identity, or the consciousness of self, works this unity in the perceptions of consciousness, so it teaches men to apply the same method of thought to nature or all external verities. They are the phenomena of thought, the embodiment of the idea. The same rational principle that exists in the human mind is conceived to give unity to the particular entities of external nature. To use a metaphor of Goethe, "The roaring loom of time weaves the vesture God puts on."

Out of the postulates now broadly stated have grown innumerable schools of philosophy, of which some historical notice will be found under *EVOLUTION*, Vol. VIII, pp. 751-772. If God be viewed quite anthropomorphically, a doctrine of creation will be developed. As the human attribute of personality is withdrawn from Him, theories of emanation ensue, and no people have carried them further than the Hindus. The complete denial of personality to the absolute results in pantheism. Pantheism, in turn, has manifold forms. We may have from it a refusal to recognize the objective world at all; or that world may be reduced to mere phenomena without material substance; or object and subject may be identified as opposite poles of one thing; or sentient nature may be regarded as the agency by which primordial being becomes self-conscious. From a religious point of view, idealism, when held in a rigid dialectic, gives rise to dogmatism; when intuitional, to mysticism. The idealistic school, therefore, separates into two great divisions the theistic, or spiritualistic, and the pantheistic. Opposed to it was the nominalism of the schoolmen, which held that real existence was predicable only of individual things, and that the ideas represented by class names were only convenient generalizations. This school had for its logical sequence the doctrine of the sensationists, that ideas are reproduced sensations. The Scotch school assumes the reality of the natural world, relying on the validity of the mental affirmation that our perceptions represent the things that caused them. The experimental philosopher also holds a realism, affirming that cognitions of external things correspond to exterior and real phenomena, and

furnish real and assured knowledge. Another name for this doctrine is "perceptionalism," and it is the ground taken by physical scientists. This form of realism must not be confounded with that of the mediæval schoolmen, for whom universal terms, type concepts and class words stood for persisting actualities, independently of sensible phenomena, although the phenomenal must conform to and embody the universal or type idea. Their doctrine admitted the Platonic theory of all nature existing forever in the divine omniscience, in the form of ideas or thought, and taught that these archetypal ideas are the essence of phenomena, while perceptions of phenomena furnish the material of knowledge. Thus the idea exists *ante rem*, *in re* and *post rem*.

Idealism emerges into the history of philosophy with the Eleatic school, of which Parmenides was the chief expounder. With him, pure primordial being, uncreated, indivisible, imperishable, changeless, is the sole object of thought, and all else is illusory and phantasmal. With Anaxagoras this illimitable being is Mind or Reason, and the origin of all form and life. But it was Plato who gave persistent development to idealism, with his doctrine that all the forms of the universe lay as ideas or thought in the omniscient Mind, where they were immaterial and eternal essences, and that the finite universe was the result of a movement to realize these archetypes in phenomena. Aristotle is not clear upon the subject, but, while rejecting Plato's archetypal ideas, declares that "universals and the truths apprehensible by the highest reason are 'by nature more known' than individual concrete phenomena and the facts apprehended by sense." This idealism of Greek philosophy became the possession of the Neo-Platonists of Alexandria, and subsequently it passed into Europe through the Arabian commentators of Aristotle. Its influence on scholasticism has already been pointed out.

It belongs to Descartes to have called attention away from the multiform essences and quidities of the schoolmen, in the consideration of which they seem to have forgotten philosophic unity and to have left small place for natural science. He addressed himself to the work of finding the ground of all knowledge, whether of ourselves or of external nature, and for the latter he finds support in mathematical conceptions of extension and motion. Yet he was an idealist; for he finds the unity and cohesion of things in thought. "The formal fact of thinking is what constitutes our being; but this thought of which we are certain leads us back, when we consider its concrete contents, to the necessary presupposition on which our ideas depend, the ultimate totality in which they are all reconciled, the permanent cause on which they and we, as conscious beings, depend"—an infinite, perfect and omnipotent intelligence, or pure Mind. Thus he opened the way for Locke, Berkeley, Hume, Kant, and the whole succession of German metaphysicians to Hartmann.

Locke tried, by an inductive method, or a critical scrutiny of the facts of consciousness, to determine how far the operations of the human mind were

valid sources of knowledge. Yet the facts that he dealt with were mental concepts and percepts; for he says, concerning physical sciences, "our knowledge is very short, if indeed we have any at all." Even while objecting to "innate ideas," it was chiefly an objection to treating them as beyond investigation; for he confessed there were ideas, as of substance or cause, not presentable to the mind, but which he could not do without.

Although George Berkeley has been accounted the apostle of "subjective idealism," because he held, as a metaphysician, that matter and external things are inconceivable as existences outside of the circle of consciousness, yet he taught a fundamental distinction between the ideas that arise from sense-experience and those that come from the activity of the mind acting on itself. Sense-experience is the realization, in the finite mind, of the archetypal ideas of the divine mind. In God, who is free, and not fate, and who is not the human *ego*, the external world becomes objective to the thinker. Because of our belief that the universe is caused and regulated by intelligence, we are assured that there must be a correspondence in nature between phenomena and our sense-perceptions.

Hume was not less an idealist than Berkeley, but he was the chief of modern skeptical philosophers, because to him ideas were discrete entities. He says: "There are two principles which I cannot render consistent, nor is it in my power to renounce either of them; viz., that all our distinct perceptions are distinct existences, and that the mind never perceives any real connection among distinct existences." He could not find a metaphysical ground of unit satisfactory to his dialectic, and perceived that his philosophy was "a rope of sand."

At this point systematic metaphysics passed to the Germans. Kant, who was of Scotch ancestry, and familiar with Hume's writings, set to himself the task of finding a way out of the subjectivity of Locke and Hume. It is the fault of Hume's position that he did not see that his thinking at all involved his self, and in his identity or being lay the solvent of his problem. Kant's solvent lay in certain "necessary conceptions, of the reason for which no corresponding real objects can be given in the sphere of the senses." These ideas, although suggested by and necessary to experience, transcend experience; hence the phrase "transcendental idealism" applied to his philosophy. The views of the various German metaphysicians will be found best described under their own names in this *ENCYCLOPÆDIA*. It may here be noted, that their systems are various, characterized with none too great accuracy, but with epithets intended to indicate the leading principle of their teaching. Thus Spinoza, for whom the divine mind dominated, and was the essence of all being, is called a substantial idealist; Fichte, who found in the primordial being the object of all thought, the source of all cosmic things, is termed a subjective idealist; Schelling, who affirmed the identity of subject and object as poles of one reality, receives the name of objective idealist; Hegel, who reduced the universe to phenomena, having substance only in the eternal thought, is the

absolute idealist. Schopenhauer found the root of all things in a principle he called will, or the self-determination of things to exist, and Hartmann lodged the origin and essence of things in unconscious being striving to come to self-consciousness in nature. Sir William Hamilton offered the phrase "cosmothetic idealism" to cover the doctrine that the external universe has actuality, but cannot be immediately known, or virtually the doctrine of the common-sense, or Scotch, philosophers.

D. O. KELLOGG.

IDEALISM IN FINE ARTS. See FINE ARTS, Vol. IX, pp. 209, 210.

IDEAS, mental conceptions made objects of knowledge or reflection. In philosophy, ideas are the subject-matter of metaphysical reasoning. See METAPHYSIC, Vol. XVI, pp. 79-102.

IDEATION. See PSYCHOLOGY, Vol. XX, pp. 57-60.

IDELER, CHRISTIAN LUDWIG, a German astronomer and chronologist; born near Perleberg, in Prussia, Sept. 21, 1766. After holding various offices, he was appointed professor of astronomy and chronology at the Berlin University in 1821. He wrote *Historische Untersuchungen über die Astronomischen Beobachtungen der Alten* (1806); *Handbuch der Mathematischen und Technischen Chronologie* (1825-26); and *Handbuch der Französischen Sprache und Litteratur* (1852). He died Aug. 10, 1846.

IDES. See CALENDAR, Vol. IV, p. 665.

IDIOCY. See INSANITY, Vol. XIII, pp. 95-113.

IDIOPLASM. See EMBRYOLOGY and HEREDITIV, in these Supplements.

IDOCRASE. See MINERALOGY, Vol. XVI, p. 410.

IDOMENCUS, in Greek mythology and Homeric legend, a king of Crete, son of Deucalion, who took part in the Trojan war, with ninety ships, on the Greek side, and was famous for his valor. On his return, and during a dangerous storm, he rashly vowed to give to Neptune, in case he were saved from drowning, the first object he should see on reaching the Cretan shore. This was his son, whom he mercilessly sacrificed to fulfill his vow. Having thus become odious to his subjects, he soon was exiled from his own kingdom. Having landed on the Italian coast, he founded the city of Salentium, in Calabria, where he spent the rest of his life.

IDUN OR IDUNA, the name of a goddess of Norse mythology. See ÆSIR, Vol. I, p. 211.

IESI OR JESI. See JESI, Vol. XIII, p. 644.

IGLESIAS, MIGUEL, a Peruvian soldier and statesman; born in Cajamarca, Peru, Aug. 18, 1822. Wealthy by inheritance, he received a careful education and studied law; was several times elected a Deputy, 1861-76; he became Senator in 1879; was appointed Minister of War by Dictator Pierola in December, 1879; he defended Lima valiantly, but unsuccessfully, against the Chileans. After the complete defeat of the Peruvians, he was placed at the head of the peace party that overthrew Pierola; having assumed the Presidency, he signed the treaty

of peace with Chile, Oct. 20, 1883. The Chambers ratified the treaty, although it gave up everything to the conquerors. Caceres raised the standard of revolt, and, having captured Lima, Dec. 1, 1885, after a long period of alternate successes and defeats, forced Iglesias to resign pending a Presidential election. It was held in June, 1886, and resulted in favor of Caceres; his rival left the country and settled in Europe.

IGNATIEFF, NICHOLAS PAVLOVITCH, a Russian soldier and diplomatist; born in St. Petersburg, Jan. 29, 1832; a godson of Emperor Alexander II. He was the son of Count Paul Ignatieff, a captain of infantry who, at the time of the military insurrection that occurred at St. Petersburg in consequence of the accession of the Grand Duke Nicholas to the throne of Russia in 1825, was the first to pass over, with his company, to the side of the new czar, thus insuring the triumph of the former and gaining for Captain Ignatieff and his family the powerful protection of Nicholas I. His son was educated at home and in the Corps des Pages; entered the Chevaliers-Gardes (1849), and after three years' study appointed staff-officer (1852). At the beginning of the Crimean War he was placed on the staff of General Berg; was appointed quartermaster-general of the Baltic Corps at Riga; and left the military for the diplomatic service, first as military attaché to the embassy at London. One of his reports on England's military position in India so pleased the Emperor that he summoned Captain Ignatieff to Warsaw for a personal interview. Appointed colonel and aide-de-camp to the Emperor in 1858, he was sent on a special mission to Khiva and Bokhara. Created a major-general in the imperial suite in 1860, he was sent as plenipotentiary to Peking, where he concluded a treaty by which the province of Ussuri was ceded by China to Russia. On his return to Russia, he was made director of the Asiatic department in the Ministry of Foreign Affairs. Appointed minister at Constantinople in 1864, his legation was raised to the rank of an embassy in 1867. The object which General Ignatieff steadily pursued at Constantinople was to secure for Russia a powerful influence over Turkey. He completely reassured the late Sultan Abdul Aziz as to the intentions of the government of St. Petersburg, while, on the other hand, he gained the good will of the Christian subjects of the Porte by his kindly behavior and his anxiety to protect them. He was recalled from the embassy at Constantinople, May 2, 1878, Prince Lobanoff being sent there in his place. Afterward he was appointed Minister of the Interior, from which post he was dismissed in June, 1882, on account of his Pan Slavist intrigues, and for shutting his eyes to the persecution of the Jews. He remained, however, a member of the Council of the Empire.

IGNATIUS, FATHER. See LYNE, in these Supplements.

IGNATIUS, SAINT. See APOSTOLIC FATHERS, Vol. II, pp. 196, 197.

IGNATIUS BEAN, a name given to the seed of *Strychnos Ignatii*, of the family *Loganiaceæ*. The fruit is a spherical berry, containing compressed

bean-like seeds. It is an article of commerce, yielding the well-known alkaloid strychnia.

IGNIS FATUUS. See PHOSPHORESCENCE, Vol. XVIII, p. 813

IGNORANTIA FACTI, the want of knowledge as to some fact in question. It is a general rule of law that when a contract is entered into through ignorance of some material fact on the part of one of the parties thereto, such party may avoid the contract. The same rule will generally apply when money is paid under a mistake of fact, and the money so paid may be recovered. The contrary is generally true when the mistake was one of law. See IGNORANTIA JURIS, in these Supplements.

IGNORANTIA JURIS, the want of knowledge of the law. It is a legal maxim that ignorance of the law excuses no man. This maxim is founded upon public policy, and the law presumes every one to know the law. It is, therefore, the rule that an act done or contract entered into through ignorance of one's legal rights will be enforced. Through the great injustice which may at times result from the absolute enforcement of this rule, exceptions have frequently been allowed, where the mistake is clearly made out and manifest injustice will be done by strictly enforcing the rule. Where the mistake is mutual to both parties to a contract, the general rule is that it may be set aside. The rule, however, that money voluntarily paid under a mistake of legal rights cannot be recovered is practically absolute.

IGOR, TALE OF THE TROOP OF THE. See RUSSIA, Vol. XXI, pp. 87, 104.

IHLANG—IHLANG, the Malayian name of the perfume of *Unona odoratissima*, a forest tree of the Malay Islands. This rich perfume is much used in making various fine perfumes of commerce.

IHRE, JOHAN. See *Literature*, under SWEDEN, Vol. XXII, p. 756.

ILBERT, SIR CHARLES P., an English lawyer and politician; born at Kingsbridge, Devon, June 12, 1841; graduated at Balliol College, Oxford, where he was awarded several important scholarships and first class honors; elected a fellow of Balliol (1864); called to the bar (1867); practiced as a parliamentary and equity draftsman and conveyancer; counsel to the Education Department (1879-82); legal member of the Indian Viceregal Council (1882-86); acting governor-general (1886); author of the Bengal Tenancy Bill, a measure which affected favorably the interests of sixty millions of the Empress' subjects; permanent assistant Parliamentary counsel of the Treasury (1886); knighted in 1895. He drafted the Ilbert Bill, conferring jurisdiction over Europeans on the native judiciary, which caused much indignation in India. It was withdrawn in deference to popular opinion.

ILLEGITIMACY. See BASTARD, Vol. III, 426-28.

ILLIMANI, a mountain. See PERU, Vol. XVIII, p. 672. The first ascent was made on Sept. 9, 1898, by Sir Martin Conway, who calculated the height to be from 22,200 to 22,500 feet.

ILLINOIS, called the "Prairie State," from the level character of its surface, has an area of 56,650

STATE SEAL OF ILLINOIS.

square miles, or 36,256,000 acres. In 1880 the population was 3,077,871 and the relative rank fourth. The population in 1890 was 3,826,351, giving it the rank of third in population among the states of the Union. The density of population was 68.33 to the square mile; the 24 cities of the state contained 1,485,955 inhabitants, constituting 38.83 per cent of the total population; the relative proportion of males to females was 1,972,308 of the former, 1,854,043 of the latter; the percentage of native-born citizens was 77.99, of foreign-born 22.01. The population of the state in 1900 (12th census) was 4,821,550, an increase over that of 1890 of 26 per cent.

The total amount of property in the state upon which taxes were levied for the year 1899 was \$778,474,910, of which almost \$80,000,000 was railroad property, and nearly \$208,000,000 consisted of property within Cook County (Chicago) alone. The total receipts from all sources for the year 1898 were \$15,181,030, and the disbursements were \$13,017,652. The tax rate for 1898 was 56 cents on the \$100 valuation, of which 13 cents belonged to the school fund, and the remainder to the general revenue fund. On Oct. 1, 1898, the total outstanding bonded debt was \$18,500, which draws no interest, the bonds having long since become due, but never having been presented for payment.

The state is eminently an agricultural region, the climate and soil being well adapted for the cultivation of the principal cereals. The reports of 1898 showed the following facts in relation to the leading crops: Corn, 7,051,500 acres, yielding 239,360,000 bushels, of the value of \$51,510,000; wheat, 1,911,-

852 acres, yielding 18,383,943 bushels, of the value of \$11,473,216; oats, 3,747,938 acres, yielding 108,720,511 bushels, of the value of \$21,218,742; rye, 115,822 acres, yielding 1,500,000 bushels, of the value of \$657,414; hay, 2,058,647 acres, yielding 2,840,933 tons, of the value of \$18,153,562; potatoes, 173,204 acres, yielding 16,800,788 bushels, of the value of \$4,368,205. In addition to these products, immense quantities of other crops were raised, such as barley, tobacco, buckwheat, sweet potatoes, and vegetables. The proximity to the great markets of Chicago makes small farming very profitable, and many thousands of acres within easy reach of that city are devoted to the raising of beans, cabbage, onions, melons, berries and other fruits and vegetables of many kinds. In 1890 in the acreage devoted to the cultivation of the cereals the standing of the state was that of first, the area being 14,191,410 acres, which constituted 10.12 per cent of the entire acreage of the United States. In the production of the cereals the rank was that of second, the total number of bushels being 468,643,860—13.32 per cent of the whole crop of the country. In corn the standing was first in acreage, and second in production. The first mentioned was 10.91 per cent of the entire amount of land under corn and the crop was 13.68 per cent of the total production. In wheat the state had the rank of seventh and third position in the matter of production. The rank of first was maintained in the area under oats, and second in production, the former being 13.67 per cent of the total acreage and the latter 17.01 per cent of the whole crop. In barley the position was eleventh in area and tenth in production; in rye, fifth in both area and production, and in buckwheat thirteenth in both the acreage and amount of the crop. Illinois had an average of 54.70 neat cattle to the square mile, giving it the rank of second in this connection. The total number and values of farm-animals in 1894 were as follows: Horses 1,308,771, value \$56,799,353; mules 104,720, value \$5,367,573; milch cows, 1,039,121, value \$26,102,720; cattle 1,553,383, value \$28,984,266; sheep 1,032,976, value \$2,450,632; swine 3,422,454, value \$23,988,664; the total number being 8,461,425 animals, of the value of \$143,693,208. The assessment of 1895 showed the number of acres of improved lands listed with the assessors amounted to 28,452,172, of the average value of \$10.82 per acre, a total valuation of \$307,863,735. There were 6,080,819 acres of unimproved lands, valued at \$4.04 per acre, or a total of \$24,545,750. The improved town and city lots assessed numbered 639,760, of an average value of \$376.74, a total of \$241,022,950. There were 837,454 unimproved lots, the average value of which was \$46.63, making the total \$39,051,394. The personal property in the state was assessed at \$129,254,545. The railroads of Illinois had an equalized assessment made against them on a basis of a valuation of \$81,565,298. The state board of equalization adjusted valuations and reported the total assessable value of all property subject to taxation at \$833,188,467. The shrinkage in value occasioned by the financial depression is best illustrated by the fact that notwithstanding the great increase in real value of

property in the state within the last two decades of the century the valuation of 1895 was more than \$500,000,000 less than that of 1873.

Coal has been mined in 56 of the 102 counties into which the state is divided, and the industry of coal-mining is one of the first importance. Statistics for 1894 show the total output for the year to have been 17,113,576 tons, and the average home value of the product \$15,282,111. The number of mines and openings was given as 836, and the number of employees 38,477, of whom 32,046 worked underground. St. Clair County stood first in production, with 1,623,684 tons; Macoupin stood second, with 1,575,045 tons, and Sangamon third, with 1,142,299 tons. Mining machinery is coming more rapidly into use than elsewhere, and in 1896 there were more than three hundred of these machines in operation.

By reason of the great amount of manufacturing carried on in the city of Chicago, Illinois stands very high in rank among the states in this industry. The census reports of 1890 give the total number of manufacturing establishments in the state as 20,482, the number in Chicago being 10,097. The total amount of capital invested is stated at \$502,004,512; the aggregate number of employees 312,198, whose wages were \$171,523,579, and the value of the products \$908,640,280. In the matter of capital invested, number of employees and the value of products, the ratio is about 66 per cent for Chicago and 34 per cent for the remainder of the state.

In 1897 the railroads of the state numbered 117 different lines, operating 10,775 miles of main track within Illinois. They had, in addition, 1,370 miles of second, third, and fourth tracks, and 3,806 miles of yard-tracks, sidings, and spurs, making the total mileage 15,951. The total railway capital represented by the lines in operation was \$2,725,415,138. The lines had outstanding stocks to the amount of \$978,563,848, and their bonds and other obligations amounted to \$1,189,418,515. The gross earnings from operation amounted to the sum of \$268,059,980, and the total net income from all sources was \$102,517,311. The total fixed charges were \$86,300,942, leaving the total net income \$16,216,369. Some of the lines had a deficit after the net income had been applied to the payment of the fixed charges, the total net deficit of all the lines operated at a loss being \$7,803,544. The total number of persons employed was 61,200, their pay amounting to \$46,848,608. The total number of passengers carried was 83,281,655, and total tons of freight 56,736,687.

In June, 1898, there were 139 state banks in Illinois, whose total capital stock amounted to \$17,148,000, their total resources \$159,956,854, and their total individual deposits subject to check \$51,216,941. The national banks number 212, with a combined capital of more than \$40,000,000, surplus and profits of almost \$24,000,000, and individual deposits in excess of \$126,000,000.

At the beginning of 1896 there were 726 building and loan associations doing business in the state. Their total receipts for the fiscal year were \$46,306,969; their assets were \$82,639,258, of which amount \$72,422,035 were loaned to stockholders.

The statistics relative to the National Guard for 1895 showed that body to consist of 5,567 officers and enlisted men, and the naval militia had a total of 359. The appropriation for the year was \$120,000, which is about the average annual expenditure for the maintenance of the Guard in ordinary times, but during the great strike of 1894 the cost to the state for the services and expenses of the Guard was but little less than a quarter of a million dollars.

The reports of the state superintendent of public instruction for the school year ending June 30, 1897, give the following facts: There were about 1,400,000 children within the school age of 6 to 21 years, of whom 920,425 were enrolled in the public schools. The average daily attendance was 705,481, the number of school districts was 11,612, the average school year 7.5 months. The report shows 138,542 children in private schools, attended by 4,615 teachers. The total cost of the public schools for the year was \$14,442,288, of which sum teachers received \$8,420,330. Of the denominational institutions of learning in Illinois, Hedding College, at Abingdon; Illinois Wesleyan University, at Bloomington; the Northwestern University, at Evanston; McKendree College, at Lebanon; Chaddock College, at Quincy, are all conducted under the auspices of the Methodist Episcopal Church. The Baptist Church controls the University of Chicago; Ewing College, at Ewing, and Shurtleff College, at Upper Alton. The Presbyterian Church manages Blackburn University, at Carlinville, and Lake Forest University, at Lake Forest. The Cumberland Presbyterian Church has Lincoln University, at Lincoln. The United Presbyterian Church controls Monmouth College, at Monmouth. The Lutheran Church manages Carthage College, at Carthage, and Augustana College, at Rock Island. Those under Roman Catholic control are St. Viateur's College, at Bourbonnais; St. Ignatius College, at Chicago; St. Francis Solanus College, at Quincy, and St. Joseph's Diocesan College, at Teutopolis. The Evangelical Association has the Northwestern College, at Naperville. The United Brethren have Westfield College, at Westfield. The Congregationalists have Wheaton College, at Wheaton. The Universalists have Lombard University, at Galesburg; and the Christians have Eureka College, at Eureka. The non-sectarian institutions are the University of Illinois, at Champaign; Austin College, at Effingham; Northern Illinois College, at Fulton; Knox College, at Galesburg; Greer College, at Hoopston; and Illinois College, at Jacksonville.

Illinois has a great number of charitable, reformatory and penal institutions, costing immense sums for original construction, and entailing large annual appropriations for their maintenance. The Illinois Institution for the Education of the Blind cost \$200,264, has been established for almost 50 years, has an average attendance of about 250 pupils, and costs, on an average, \$40,000 annually; the Illinois Institution for the Education of the Deaf and Dumb cost \$495,500, was established in 1841, has an average of 600 pupils in attendance, and costs the state about \$100,000 annually; the Illinois Central Hospital for the Insane cost the state \$927,000, has, on an average, from 1,400 to 1,500 patients, and requires

about \$186,000 annually. These three institutions are all located at Jacksonville, a city in the west-central portion of the state, about 50 miles from the Mississippi river. The Illinois Asylum for Feeble-minded Children, located at Lincoln, Logan County, was established in 1865, cost \$210,600, cares for about 700 unfortunate children between the ages of 6 and 18 years, and requires state aid to the amount of about \$120,000 annually. The Illinois Soldiers' and Sailors' Home, located at Quincy, in the west-central part of the state, on the Mississippi River, cost almost \$300,000, has a varying population, ranging from 900 to 1,000, and requires about \$140,000 per annum from the state, in addition to \$100 per annum, which is paid by the general gov-

STATE CAPITOL, SPRINGFIELD.

ernment for each inmate. The Illinois Soldiers' Orphans' Home, established soon after the close of the Civil War, located at Normal, in McLean County, in the north-central part of the state, cost about \$175,000, assumes the care of from 500 to 600 children, necessitating an annual outlay on the part of the state of about \$50,000. The Illinois Eastern Hospital for the Insane, at Kankakee, a town in the northeastern part of the state, near the Indiana border, and about 50 miles south of Chicago, cost for construction about \$1,340,000, has on an average 2,000 patients under treatment, costing the state about \$360,000 for its yearly running expenses. The Illinois Northern Hospital for the Insane, at Elgin, a city about 35 miles west-northwest of Chicago, cost near \$650,000, has an average attendance of about 1,100 patients, and calls for about \$145,000 annually. The Southern Hospital for the Insane, at Anna, in Union County, the extreme southern part of the state, has been destroyed by fire and rebuilt, the two constructions costing about \$750,000. The average attendance of patients is between 900 and 1,000, whose maintenance demands from the state about \$180,000 annually. The Illinois Asylum for Insane Criminals, located at Chester, on the Mississippi River, in the extreme southwestern portion of the state, has been in operation only since 1890, but within that time has reached an average of consider-

ably over 100 patients, requiring the expenditure of about \$30,000 annually by the state. The Illinois Charitable Eye and Ear Infirmary, on the corner of Adams and Peoria streets, Chicago, cost nearly \$300,000, treats annually from 7,000 to 8,000 patients, and receives from the state about \$25,000 per year. In the 22 years of its existence the infirmary has treated over 100,000 patients and gives free attention to those unable to pay for the same.

The 11 charitable institutions above named cost for maintenance, during the year 1895, the sum of \$1,255,089, received from sources other than the state the sum of \$111,267, leaving for payment by legislative appropriation \$1,143,821. The site for a new hospital for the insane, to be called the Western, has been chosen at Watertown, near Rock Island. Other charitable institutions are the Illinois Industrial Home for the Blind in Chicago and the Industrial Home for Girls. The legislature made an appropriation of \$100,000 for its construction in 1893, and the institution, opened in 1897, furnishes employment for the blind who are able to engage in some mechanical pursuit. The home for girls is located at Evanston, a suburb of Chicago, and accommodates about 100.

The Illinois State Penitentiary at Joliet has on an average about 1,400 inmates, the Southern Illinois Penitentiary at Chester has about 650, and the Illinois State Reformatory at Pontiac, in Livingston County, about 75 miles southwest of Chicago, has from 750 to 800 convicts, ranging in age from 10 to 21 years.

The church statistics for the year 1890, as furnished by the Federal census, show Illinois fourth among the states, with 8,296 organizations; fourth in edifices, with 7,352 church buildings; fifth in the value of church property, the sum, total being \$39,715,245, and fourth in communicants, having 1,202,588 members. The 8,296 organizations are made up from 68 different denominations and 8 independent congregations. The Methodist Episcopal leads in the number of organizations, having 1,903; the Baptists come next, with 966; the Roman Catholics next, with 688. Other organizations are the Disciples of Christ, 641; Presbyterians in the United States of America, 472; United Brethren, 320; Congregational, 302; Lutheran, Synodical Conference, 250; Cumberland Presbyterians, 198; Protestant Episcopal, 186; German Evangelical Synod of North America, 164; and Lutheran, General Council, 141.

At the beginning of 1899 there were 1,728 newspapers published in Illinois; 612 of the cities, towns, and villages of the state had newspapers, every county and every county capital having periodicals. Of the entire number of papers 183 were daily, 1 triweekly, 40 semiweekly, 1,213 weekly, 10 fortnightly, 24 semimonthly, 241 monthly, 1 eight times a year, 4 bimonthly, and 11 quarterly.

There were 2,577 post offices in the state, June 30, 1898, of which 10 were first-class, 46 second-class, 204 third-class, 2,317 fourth-class, and 1,477 were money-order offices.

The principal cities of the state are Chicago

city (1900), 1,698,575; Peoria, 56,100; Quincy, 36,252; Springfield, the capital, 34,159; Rockford, 31,051; Joliet, 29,353; Bloomington, 23,286; Aurora, 24,147; Elgin, 22,433; Decatur, 20,754; Belleville, 17,484; Galesburg, 18,607; East St. Louis, 29,655; Rock Island, 19,493; Jacksonvillle, 15,078; Moline, 17,248; Danville, 16,354; Streator, 14,079; Cairo, 12,566; Alton, 14,210; Freeport, 13,258; Ottawa, 10,588; Lasalle, 10,446; Kankakee, 13,595; Mattoon, 9,662; and Evanston, 19,259.

The following is a list of the governors of Illinois since its admission into the Union in 1818, with their terms of office: Shadrach Bond, 1818-22; Edward Coles, 1822-26; Ninian Edwards, 1826-30; John Reynolds, 1830-34; William L. D. Ewing, 1834; Joseph Duncan, 1834-38; Thomas Carlin, 1838-42; Thomas Ford, 1842-46; Augustus C. French, 1846-53; Joel A. Matteson, 1853-57; William H. Bissell, 1857-60; John Wood, 1860-61; Richard Yates, 1861-65; Richard J. Oglesby, 1865-69; John M. Palmer, 1869-73; Richard J. Oglesby, 1873; John L. Beveridge, 1873-77; Shelby M. Cullom, 1877-83; John M. Hamilton, 1883-85; Richard J. Oglesby, 1885-89; Joseph W. Fifer, 1889-93; John P. Altgeld, 1893-97; John R. Tanner, 1897. See also ILLINOIS, Vol. XII, pp. 703-706.

ILLINOIS, UNIVERSITY OF (ILLINOIS INDUSTRIAL UNIVERSITY until July 1, 1885), at Urbana, 128 miles from Chicago; was established under acts of Congress of July, 1862, and July, 1866, and under acts of the legislature of Illinois, Jan. 25, Feb. 28, and March 8, 1867, to "teach in the most thorough manner such branches of learning

UNIVERSITY OF ILLINOIS.

as are related to agriculture and the mechanic arts, including military tactics, and not excluding other scientific or literary studies." The state received scrip for 480,000 acres of land. The county and the Illinois Central railroad made large appropriations; the State gave \$879,000. The University was incorporated in 1867, and opened in 1868, and three years later women were admitted as students. It includes the following colleges and schools: College of agriculture and horticulture; college of civil, mechanical and mining engineering, and architecture; college of natural sciences, chemistry, and natural history; college of literature and art; school of military science; and school of industrial art. The assets of the University are about \$1,372,000,

with a total income in 1898 of \$354,982. Its students now (1899) number 1,750; it has 214 instructors, and a library of 50,000 volumes.

ILLINOIS AND MICHIGAN CANAL. See CANAL, in these Supplements.

ILLINOIS RIVER, the largest stream in Illinois, formed by the Desplaines and Kankakee rivers, which unite in Grundy Co.; flows southwest to the Mississippi 16 miles above Alton; about 350 miles long; navigable in favorable seasons as far as Peru, 250 miles; connected by a canal, 96 miles long, with Lake Michigan at Chicago. See also CANAL, in these Supplements.

ILLUMINATED MANUSCRIPTS. See ILLUMINATION, Vol. XII, pp. 707-09.

ILLUMINATING APPARATUS, SURGEONS'. An illuminator, attachable to a student's lamp, gas-jet, or other source of light, is made with a bracket-stand, supporting a bull's-eye condenser, adjusted on a line with the light, and bearing a mirror adjustable on a rod, so that it may reflect the light into a patient's mouth, ear, etc. These are used extensively in laryngeal operations. For more difficult explorations a photophore bearing a small incandescent electric light is used to examine all the openings of the body. The laryngeal electric photophore is a simple rod bearing the light on the tip, and a small adjustable mirror beside or in advance of the light. A tongue-depressor is also made with a similar light.

ILLUSIONS. See PSYCHOLOGY, Vol. XX, p. 63.

ILLUSTRATION. See ENGRAVING, in these Supplements.

ILMEN. See NOVGOROD, Vol. XVII, pp. 606-07.

ILMENITE. See MINERALOGY, Vol. XVI, p. 386.

ILOILO, a seaport town, the capital of the populous province of Iloilo, on the southeast coast of the island of Panay, Philippine Islands, on the strait separating Panay from the small island of Guimaras. It is one of the only three ports in the islands (Manila and Cebu being the other two) at which foreign vessels have hitherto loaded. The port is a safe one, and the inner harbor has a depth of 14 feet at average high tide. Vessels load and discharge by means of lighters. The chief exports are sugar, hemp, canes, sapan-wood, and tobacco. After the signature of the treaty of peace between Spain and the United States, Dec. 10, 1898, by which the Philippines were ceded to the latter Power, the Spaniards, on Dec. 23, surrendered Iloilo to the Filipino insurgents, who had been besieging the town, and who ignored the treaty, and declined to deliver up the place to the American troops sent to occupy it, and even refused to allow them to land. On Feb. 11, 1899, however, the American forces under General Marcus P. Miller captured the town without loss. Pop. from 12,000 to 24,000.

ILOPANGO. See SAN SALVADOR, Vol. XXI.

IMAGO. See BUTTERFLIES, Vol. IV, p. 592.

IMBABURA. See ECUADOR, Vol. VII, p. 646.

IMBECILITY. See INSANITY, Vol. XIII, 97-98.

IMBRIANO, Italian patriot and litterateur; born in Naples, Oct. 24, 1840; abandoned his college course to follow Garibaldi in the campaign of 1860. His criticisms of modern writers were pungent and combative. They have been collected under the

titles of *Fame Usurpate* (1877), and *Appunti Critici* (1878); some powerful verse of his is included in *Esercizi di Prosodia*; his best work, however, is his collection of popular poetry under the title of *Canti Popolari delle Provincie Meridionali* (2 vols., 1871-72); *Dodici Canti Pomiglianesi* (1877); *La Novellaja Milanese* (1872); *La Novellaja Fiorentina* (1877). He died Jan. 1, 1886.

IMITATION, IN ART. See FINE ARTS, Vol. XI, pp. 202-211.

IMMIGRATION INTO THE UNITED STATES OF AMERICA. (For general article on this subject, see EMIGRATION, Vol. VIII, pp. 173-177; and UNITED STATES, Vol. XXIII, pp. 821, 822.) The laws of Congress governing immigration are summarized as follows:

1. There shall be collected a duty of one dollar from each passenger not a citizen of the United States who shall come by steam or sail vessel from a foreign port to any port within the United States, the money thus collected to constitute an immigration fund, for the care and relief of immigrants in distress and for the expense of regulating immigration under the immigration laws.

2. The following classes are excluded from admission to the United States: All idiots, insane persons, paupers or persons likely to become a public charge; persons suffering from a loathsome or dangerous contagious disease; persons who have been convicted of a felony or other infamous crime or misdemeanor involving moral turpitude; and polygamists; also, under the Lodge act of 1898, all persons unable to read or write. But persons convicted of a political offense shall not be excluded, whatever be the name of the offense by the laws of the land whence they come.

3. It shall be unlawful for any person, company, partnership or corporation to assist in any way any foreigner into the United States under contract or agreement made previous to the importation of such alien to perform labor or service of any kind in the United States. The penalty is one thousand dollars for each offense. Masters of vessels who shall knowingly bring to the United States such excluded persons may be fined for each offense five hundred dollars, and may also be imprisoned for a term not exceeding six months. But skilled workmen from foreign countries may be imported for the purpose of labor in any new industry to be established, provided such labor cannot be otherwise obtained. This provision of the law does not apply to actors, artists, clergymen, lecturers, singers or domestic servants.

4. The importation into the United States of women for the purpose of prostitution is forbidden. The penalty for the offense is imprisonment not exceeding five years and a fine not exceeding five thousand dollars.

5. All persons excluded by law shall, upon arrival, be sent back to the countries to which they belong or whence they came. The expense of such return shall be borne by the owners of the vessels in which they came. In case an immigrant has been allowed to land contrary to law,

such immigrant may, within one year after landing, be taken into custody and returned to the country whence he came, at the expense of the importing vessel. Any alien who becomes a public charge within one year after his arrival in the United States, from causes existing prior to his landing, may be returned to the country whence he came.

6. The Secretary of the Treasury is charged with the duty of executing the laws relating to immigration, and he has the power to enter into contracts with such state commissions, boards or officers as may be designated by the governor of any state, under the rules and regulations prescribed by the Secretary. The Secretary may designate the state board of charities of any state, or any person or persons in any state, whose duty it shall be to execute the provisions of the immigration laws; and the Secretary may prescribe regulations for carrying into effect the provisions of the law.

With regard to insane persons, idiots, paupers and convicts there is evidence that hundreds have gained admission to the United States who should have been excluded. They were shipped from Europe by the authorities of cities and towns, or by so-called benevolent societies. By the same agencies convicts have also been sent to the United States. In 1891 there was shipped to America by the authorities of a town in Germany a convicted murderer, who had been in prison one year and in an insane asylum twenty-four years. In Austria, many persons convicted of crime have been given the alternative of going to prison or emigrating to America. Since 1884 the Board of Charities of the state of New York has returned to Europe more than six hundred lunatics, imbeciles and feeble-minded persons who had been shipped to the United States, in many cases with through tickets to interior towns. The number of insane in the state of New York in 1880 was 9,537 and in 1890, 16,022, an increase in 10 years of 68 per cent. During the same time the increase in population was only 18 per cent. It was therefore the belief of the Board of Charities that the greater part of this increase was due to the shipment of insane persons from the countries of Europe. Since the passage of the act of 1893 concerning the return of paupers, convicts, etc., to the countries whence they came, the German, Italian and some other European governments have established stations along their frontiers for the examination by the police of those about to emigrate. If found liable to be refused by the American authorities, permission to proceed to the seaports is refused. These governments have also decreed that transportation lines shall at their own expense return immigrants rejected by the United States.

After the passage of the immigration act of 1893 it was represented to the bureau of immigration that undesirable immigration would seek Canadian routes and enter the United States across the frontier. To protect the United States from such possible invasion and to prevent the importation of

laborers under contract, the superintendent of immigration made an agreement with the steamship lines plying between European and Canadian ports, and the railway lines in Canada, that all immigrants destined to the United States shall be landed at certain Canadian ports; that United States officers may inspect such immigrants at the ports of entry and furnish a certificate or passport entitling them to cross the frontier and enter the United States; that the railway companies shall not transport immigrants to the frontier without such passport; and that to defray the expenses of such inspection there shall be paid by the transportation lines to the inspectors 50 cents for each immigrant admitted to the United States; and this fee shall be the only charge for entering the United States. To carry out this agreement, inspectors have been located at Quebec in summer and Halifax in winter, at Vancouver and Victoria, British Columbia, and at the several ports of entry along the Canadian border. This agreement may be terminated by either party at the expiration of 60 days' notice. Statistics of immigrants entering the United States from Canada had not been kept prior to October, 1893, but from Canadian sources it is ascertained that from 40,000 to 50,000 Europeans entered the United States who landed at Quebec and Halifax during the twelve months preceding that date. From October, 1893, to June 30, 1894, only 7,771 landed in Canada destined to the United States, and for the year ending June 30, 1895, only 5,988.

The following table shows the official summaries by decades from 1820 to 1889 inclusive, and by years from 1890 to 1897 inclusive. Immigrants from British North America and Mexico are not included since 1885, except for the years 1896-97:

YEARS.	NUMBER OF IMMIGRANTS.	PER CENT INCREASE.	PER CENT DECREASE.
1789-1820 (estimated) ..	250,000
1820-29	128,502
1830-39	538,381	411	..
1840-49	1,427,337	265	..
1850-59	2,799,329	198	..
1860-69	2,041,459	..	28
1870-79	2,742,137	134	..
1880-89	5,248,568	191	..
1890	455,302
1891	560,319	123	..
1892	579,663	103	..
1893	439,730	..	24
1894	285,631	..	35
1895	258,536	..	10
1896	343,267	132	..
1897	230,832	..	33
Grand total	18,328,993		

A number of causes have operated to vary the immigration from year to year. For example, in the years 1845-47 the famine in Ireland compelled thousands to emigrate to America—as many as 105,955 in 1846 and 215,444 in 1847. In 1861-62 the number of immigrants diminished nearly one-half from that of 1860, owing to the

Civil War. The greatest number for any one year was in 1882, being 788,992. From that year to 1892 the number gradually decreased from year to year, owing largely to the enactment by Congress of more stringent immigration laws. In 1893 United States inspectors at Canadian ports still further decreased the number, as stated above; and the quarantine and detention of passengers from cholera-infected European countries resulted in the refusal of steamship companies to embark immigrants. The chief cause operating constantly to produce fluctuations in the stream of immigration is the comparative industrial conditions in the United States and foreign countries. The decrease of immigration in 1894 is largely to be attributed to the stagnant condition of business enterprises, owing to financial causes and the consequent absence of demand for both skilled and unskilled labor in the United States.

The following table, showing the immigration from those European countries which of late years have contributed the greatest numbers, will be of interest, as exhibiting the extent and the direction of the fluctuations for the years 1892-96.

COUNTRIES.	1893.	1894.	1895.	1896.	1897.
Poland and Russia-----	57,492	39,646	35,510	52,536	29,981

The following is a summary of the official report of the Commissioner-General of Immigration for the ports of the United States and Canada for the year ending June 30, 1896. It is very suggestive, as showing the nationality of the immigrants, their illiteracy, the amount of money they brought over, their destination in the states and territories, and their occupations:

Of the total number of immigrants, as above reported, 38 per cent. were females; a little more than 10 per cent. were over 40 years of age; about 51 per cent., over 20 years of age, brought less than \$30 each; nearly 20 per cent. were from Italy, which sent more than any other foreign country; over 37 per cent settled in the state of New York, which absorbed a greater number than any other state. One was an idiot; 10 were insane; 2,010 were paupers or likely to become a public charge; 776 were contract laborers; and 238 were returned within one year after landing. Nearly 23 per cent. could neither read nor write.

IMMORTALITY. See BUTLER, Vol. IV, pp. 584, 585; ESCHATOLOGY, Vol. VIII, pp. 537, 538; PLATO, Vol. XIX, pp. 199, 200, 209, 210; Brahman idea of, VEDANTA, Vol. XXIV, pp. 118, 119.

IMPATIENS, a genus of the family *Geraniaceae*, or geraniums, although some botanists separate it as a distinct family, *I. balsamina*, or garden balsam, from India, is well known in cultivation. The two species indigenous in the United States are *I. pallida* and *I. fulva*, common in wet ground and moist, shady places. The genus is known by its delicate, tender foliage and irregular flowers, but most by the fact that its pods suddenly burst when touched, giving rise to the common name "touch-me-not." The species are also known as "jewel-weeds."

IMPENETRABILITY. See ATOM, Vol. III, p. 38.

IMPENNES. See ORNITHOLOGY, Vol. XVIII, p. 45.

IMPERATOR. See EMPEROR, Vol. VIII, pp. 179, 180.

IMPERIALINE, an alkaloid obtained from the bulb of the poisonous plant Crown Imperial (*Fritillaria imperialis*). It is, when first obtained, in the form of a yellow precipitate, but from the alcoholic solution crystallizes in short, colorless needles with a composition of C³⁵H⁶⁰NO⁴. The crystals are not readily soluble in water, but yield to ether, chloroform, and alcohol. A chloride has been obtained, which makes bitter solutions with alcohol and water, and forms salts with platinum and gold. The discoverer was Dr. Fragner, of Prague.

IMPERIAL INSTITUTE, a London organization of some importance, started in 1887, as a memorial of Queen Victoria's Jubilee. Its aims consist of the formation of a complete collection of the natural products of the British Empire, the establishment of a system of commercial intelligence to work with and supplement the display of the specimens, and the practical adaptation of both the purposes and advancement of trade. To facilitate the work of the organization, a superb building was erected in London by public subscription, and formally inaugurated by the Queen, May 11, 1893. The institution is governed by 125 trustees, called *governors*, and appointed by the crown, by the colonial governor, by county and municipal authorities in the United Kingdom and by learned societies. There are 8,000 Fellows—of either sex—who acquire the title by

vote of the governors and the payment of £2 a year; ladies and colonial Fellows £1 only. The collections have quickly grown to huge proportions, and are being increased constantly. There are lectures by the best speakers in various branches; also indoor and outdoor concerts by famous orchestras. *The Imperial Institute Annual* is a valuable yearly compilation of information and statistics concerning British colonies; *The Imperial Institute Journal* is a monthly, ably edited, and a record-keeper of the trade, commerce, finance and agriculture of the British Empire. Frequent expositions are held in the halls and grounds of the Institute, and attract large crowds. At certain hours every day the Institute is free to all comers; the rest of the time a fee of one shilling is exacted; and on Thursdays, Fellows and their friends only are admitted. In many respects it has the conveniences of a high-class club-house for both sexes.

IMPETIGO. See **SKIN DISEASES**, Vol. XXII, p. 123.

IMPEY, SIR ELIJAH. See **HASTINGS, WARREN**, Vol. XI, pp. 512-518.

IMPEYAN PHEASANT, a beautifully colored pheasant (*Lophophorus impeyanus*), native of the elevated regions of northern India and the Himalayas. The natives call it the monaul, which means bird-of-gold. It was named from Sir Elijah Impey, who first attempted transporting living birds to Europe. The bird is sometimes domesticated.

IMPRESSIONISM, a theory in art which has been adopted as a creed by a school of French painters, among whom Courbet and Manet (q.v.) attained a high reputation. The original exponents of this doctrine affirmed that the too close observation of nature causes a weakening in one's power of realization, and that even colors change when gazed at for too long a time. They claimed that a properly trained eye, or rather an unsophisticated eye, will see things, both in shape and coloring, under an aspect radically different from that commonly observed and rendered by pencil or brush. It is certain that the efforts of many artists of the new school to realize their impressions have produced results that have astounded and oftentimes greatly amused the on-lookers. But it is just as true that the persistent efforts of the young school of impressionism have brought about a partial revolution in the teaching of the plastic arts, and have made away, to a great extent, with that minute copying of details, at the expense of a broad and far-reaching grasp of the whole, that characterized for centuries the average painter and sculptor. That a clever sketch is often, if not always, closer to nature than an ultra-finished painting, needs no demonstration; on the other hand, the Impressionists number among their growing cohorts many artists who make a habit and a boast of replacing hard work and long study of their art by a certain crude dash, the shallow brilliancy of which often deceives the unwary. The theory they proclaim is in itself logical and deserving of respect; but it

does not do away with arduous labor and persistent application in the search of the true, the harmonious and the beautiful.

IMPROVISATION. See **POETRY**, Vol. XIX, p. 272; and **MUSIC**, Vol. XVII, p. 90, note.

IMPULSE, IN MOTION. See **MECHANICS**, Vol. XV, pp. 735, 736.

IMPUTATION, a theological doctrine that is exalted or obscured as the mind of man works on formal or on vital lines. It is founded on the fourth chapter of Romans, in which the Douay version of the New Testament, with the exception of a quotation from the Psalms, uses the word "repute" where the authorized version says "impute." The change works no real alteration in the moral content of the apostolic argument. A new sense came to the word "impute," under the tremendous subjection of the mediæval mind to judicial forms, a subjection that gives appalling character to the thirteenth-century hymn of Celano, *Dies Ira*, and to the theology of that time. The doctrine of imputation conceives of God as a judge, acting with judicial forms and records. The guilt of Adam, incurred in his primal disobedience, and which is deserving of endless wrath, is imputed to or charged upon each of his descendants as if he himself had done the deed. In a like formal, but in a compensating manner, the Almighty Judge reckons the meritorious obedience of the Saviour to those who believe on him and are regenerated by the Holy Ghost. This imputation of Christ's righteousness constitutes the believer's title to grace and everlasting felicity. The doctrine would lead to antinomianism if it were left in this bare tribunitial form; but all theologians who teach it, associate it inextricably with the spiritual content of a depraved nature working a guiltiness of its own on the one side, and of a soul imbued with the spirit of Christ on the other. The most rigid and formal statement of imputation is to be found in Calvinistic authors, but they now seldom bring it forward in terms, although that for which it stands is the doctrine of all orthodox Christianity. A modified view of this tenet is known as "mediate imputation," in which not the guilt but the consequences of the first sin of the race attaches to every man. The distinction has no logical or real value. Eternal damnation on account of Adam's misconduct gains no alleviations from refinements of definition.

INACHUS, in Greek mythology, the first king and most ancient hero of Argos, whence the country is often called, in ancient poets, the Land of Inachus. He sometimes was supposed to have been the leader of an Egyptian or Lybian colony, which settled on the banks of the Inachus, a river rising from the Mt. Lyceus on the borders of Arcadia.

INAGUA, **GREAT** and **LITTLE**, two islands of the Bahama group, the former being the largest and most southerly of the chain. Great Inagua lies in lat. 21° 10' N., long. 73° 30' W., is 50

miles long and 25 wide. Little Inagua lies 12 miles N. of North East Point, and is about 6 by 8 miles. These islands are low and have salt marshes. Navigation about them is dangerous on account of the surrounding reefs. Area, 705 square miles. Population, 1,000.

IN COENA DOMINI, a collection of church censures or anathemas against heretics, schismatics, sacrilegious persons, pirates, forgers and highway robbers; called a bull, although the work of no particular pope, and even of uncertain date; takes its name from its first Latin words, "at the Lord's Supper"; until 1770 it was customary to have it read in every Roman Catholic church on Holy Thursday, the anniversary of the first eucharistic feast. Several European governments opposed it as an infringement on the secular power. Finally it was replaced by a less comprehensive document, which was ordered read in all churches on Easter Monday.

INCOME TAX, a tax imposed upon annual incomes or the yearly revenue derived from labor, business enterprises, investments and other sources of income. This method of taxation was resorted to in mediæval times with more or less frequency, but did not become of general use throughout the world until the early part of the nineteenth century. The first instance of this class of tax in America was probably that of Massachusetts Bay Colony, which established such a tax in 1646. The colony, afterward the state of Massachusetts, retained the tax upon incomes among its laws, with frequent modifications and alterations, during most of the time since, and is one of the few states in which this class of taxes is now imposed. The first income tax in Great Britain in modern times was that of 1799, which was levied upon all incomes of over £200 per annum, at the rate of 10 per cent upon the excess of that amount, with a less rate, gradually decreasing, on incomes ranging between £200 and £60. Below £60 no tax was imposed. In 1842 another income-tax law was enacted, which, with modifications, still exists.

At the present time in England, incomes in excess of £150 per annum are taxed, but those between £150 and £500 are subject to an abatement from the regular rate of taxation.

At the present time taxes are imposed in some form upon incomes in the following countries:

England, Holland, Switzerland and the various states of Germany and Austria. Some of the states of the United States impose income taxes, and in others they have constitutional provisions authorizing the legislature to impose such taxes. Massachusetts, Virginia and North Carolina are the states in which incomes are taxed, while there are constitutional provisions authorizing income taxes in Tennessee, Texas and California.

The first attempt by the Congress of the United States to impose an income tax was in 1861. The law which levied a direct tax for the support of the war contained a provision for a tax of 3 per cent on the excess of all incomes above \$800. This tax, however, was not collected. The following year, Congress imposed an income tax of 3 per cent upon the excess of all incomes above \$600 up to \$10,000, and 5 per cent above \$10,000. In 1864 the rate was increased upon incomes between \$600 and \$5,000 to 5 per cent; between \$5,000 and \$10,000, to 7½ per cent; and over \$10,000, to 10 per cent. In the fall of the same year a special income tax was imposed upon all incomes in excess of \$600, to apply to the incomes of the preceding year only. In 1865 the rate was again increased to 10 per cent on incomes in excess of \$5,000. In 1867 an income tax of 5 per cent was imposed only upon the excess of incomes above \$1,000 per annum, which was again reduced, in 1870, to 2½ per cent for that and the following year, at which time the law expired.

No attempt was made thereafter to impose an income tax until 1894, when by act of Congress of August 28th of that year, a tax of 2 per cent was imposed upon the excess of all incomes above \$4,000 per annum, and upon incomes of all corporations, companies and associations other than partnerships. On May 20, 1895, this law was declared to be unconstitutional and void by the Supreme Court of the United States in the case of *Pollock vs. Farmers' Loan and Trust Company*, reported in the 159th volume of the United States Supreme Court Reports.

The decision was: 1. That taxes on real estate being indisputably direct taxes, taxes on the rents or income of real estate were equally direct taxes.

2. That taxes on personal property or on the income of personal property were likewise direct taxes.

3. That the tax imposed by sections twenty-seven to thirty-seven, inclusive (all the income tax sections), of the act of 1894, so far as it fell on the income of real estate and of personal property, being a direct tax within the meaning of the constitution, and therefore unconstitutional and void, because not apportioned according to representation, all those sections, constituting one entire scheme of taxation, were necessarily invalid. Thus the whole act was declared unconstitutional and void, a decision which created much consternation among the government officials, as it cut off a vast source of revenue to the Federal government, and tended largely to

create a deficit in the funds of the nation. This effect was aided by the fact that the same Congress which imposed the income tax greatly reduced the tariff upon imported goods, relying upon the income tax to make up the deficiency which the tariff reduction would create. See also FINANCE, Vol. IX, pp. 187, 188; PEEL, ROBERT, Vol. XVIII, p. 456; PRUSSIA, Vol. XX, p. 19; and TAXATION, Vol. XXIII, pp. 85-89.

INCUNABULA. See BIBLIOGRAPHY, Vol. III, p. 653.

INDEPENDENCE, a city and the capital of Buchanan County, northeastern Iowa, on Wapsipincon River and the Burlington, Cedar Rapids and Northern and the Illinois Central railroads, 65 miles W. of Dubuque. It has the State Hospital for the Insane, erected at a cost of nearly \$1,000,000; three parks, expensive school-buildings, a public library and fair-grounds, and is known for its trotting-horse breeding-farms. Population 1890, 3,163; 1900, 3,656.

INDEPENDENCE, a city and railroad junction and the capital of Montgomery County, southeastern Kansas, located on the Verdigris River, 134 miles, by the Atchison, Topeka and Santa Fé railroad, S. of Lawrence. It is also on the Missouri Pacific railroad, and is the trading and shipping point of a rich corn and vegetable producing section. It has steam grist and planing mills, and has natural gas and a mineral well, valuable for the cure of cutaneous diseases. Population 1900, 4,851.

INDEPENDENCE, a city and the capital of Jackson County, central western Missouri, 10 miles E. of Kansas City and three miles from the Missouri, on the Missouri Pacific railroad. It contains Woodland College (Christian), and Kansas City Ladies' College and several other institutions of learning. It was formerly the headquarters and outfitting depot for the overland routes to New Mexico, Oregon and California. Fruit-growing, apiculture and blooded-horse and cattle breeding are leading industries of the surrounding country. The city has woolen, flour and cider mills, iron and brass foundries and a machine-shop. Pop. 1890, 6,380; 1900, 6,974.

INDEX, REFRACTION. See LIGHT, Vol. XIV., p. 590.

INDIA. For general article on this great British empire, giving *in extenso* its geography, history, government, productions, commerce and earlier statistics, see Vol. XII, pp. 731-812. The present area of the empire, without reckoning in Baluchistan (130,000 square miles), which is to some extent dependent on, or feudatory to, India, reaches from lat. 8° N. to lat. 35° N., and from long. 67° E. to long. 100° E. of Greenwich, Cal-

cutta itself lying in long. 88° E. The areas of Kashmir, Manipur, and also of some recently annexed territory, including various dependent Shan states, have never been surveyed. Kashmir, however, is estimated at 80,900 square miles, Manipur at 8,300, and the British Shan states at 90,000. Upper Burma has an area of 83,473 square miles. With these figures the total area of British India may be taken to be 1,559,603 square miles, of which 594,610 square miles are under native, and the remainder under British administration. The population of India, shown by the census in 1891, was 287,123,350. This included the figures for Kashmir, which is allowed a population of 2,543,952, but not Manipur with its population of 221,070, or the Shan states with their estimated population of 400,000, but it includes Upper Burma with its 2,946,933. Adding in these totals, and allowing for a yearly increment of one-half of one per cent to the census figures, the total population of British and feudatory India at the beginning of the year 1899 may be taken to be 308,000,000, of whom 242,000,000 are in British territory. From Peshawar, the northern frontier station, to Cape Comorin, the distance is 1,900 miles, and the same distance separates Karachi, the port of Sind, from Sadiya, the frontier post on the eastern border of Assam. The limit, yet undefined, of the states dependent on Upper Burma stretches even farther to the east than Sadiya, while British influence in Baluchistan goes farther west than Peshawar. The province of Burma, including the country formerly independent, and now called Upper Burma, which was annexed to the Asiatic dominion early in 1886, lies to the east of the Bay of Bengal and forms no part of the Indian Peninsula.

Queen Victoria assumed the government of all the territories of India on September 1, 1858. It was not, however, till Jan. 1, 1877, that she formally assumed the title of Empress of India. The home imperial government is intrusted to a Secretary of State for India, assisted by a council of not less than ten members, the majority of whom must be persons who have served or resided ten years in India, and who have not left India more than ten years previous to the date of their appointment on the council. The office is held for a term of ten years, and any vacancy is filled by the appointment of the Secretary of State for India.

British India proper embraces nine separate provinces, each under its own civil government, but subordinate to the general and supreme government. The resident chief executive, the viceroy and governor-general, whose administration extends over all the provinces, is appointed by the crown. His present annual salary is £20,000 (\$100,000), with additional allowance of about £12,000. His term of office is four years. He is supreme in his executive authority, but is assisted by an executive council of six members, including the commander-in-chief. Power is reserved to him of overruling his council; but all

acts of the government run in the name of the "Governor-General in Council." This body, forming the supreme government in India, passes in review the entire administration in six separate departments—Finance and Commerce, Foreign, Military, Public Works, Home, and the Department of Revenue and Agriculture. Each department is under the charge of a secretary, and is also the special care of a member of the supreme council, who has authority to deal with affairs of routine and minor importance, and to select what is worthy of the consideration of the governor-general and his collective council. The governor-general specially superintends the political business of the foreign office. The Department of Finance and Commerce looks to questions of finance, to stamps, excise, the postoffice, and anything involving a permanent charge on the state; also to questions bearing on the commerce of the country. The most important subjects coming under the attention of the Department of Revenue and Agriculture are the land revenue, forests, and the agricultural development of the country. The Home Department deals with the educational, medical, sanitary, ecclesiastical, judicial, municipal, local government, police and other matters, and has likewise charge of the penal settlements of Port Blair and Nicobar. The Foreign Department conducts relations with Afghanistan, Nepal and other conterminous countries, and corresponds with the political agents of the numerous semi-independent native states of Rajputana and Central India, and with the residents of Mysore, Cashmere, Baroda and Hyderabad. The marine service, as well as the army, is under the Military Department. The legal member takes charge of government bills in the legislative council, which consists of twelve members (besides the seven members of the executive council), of whom one half must be unconnected with the public service. As only Bengal, Madras, Bombay and the Northwest Provinces possess councils of their own, the legislative council of India legislates for those provinces which are unprovided with local councils, or on matters of exceptional importance affecting the empire.

Separate high courts have been established for the provinces of Madras and Bombay and for the lieutenant-governorship of Bengal (with jurisdiction also over Assam), and of the Northwest Provinces. The Punjab has a chief court; the Central Provinces, Oude and Mysore, have each a judicial commissioner, and Burmah has a judicial commissioner and a recorder.

The government of India is debited with the cost of the army for all India, with the interest on debt, and, generally, with all imperial as distinguished from provincial expenditure.

Since the close of the record in Vol. XII, the governors-general have been as follows, with date of appointment: Marquis of Ripon, 1880; Marquis of Dufferin and Ava, 1884; Marquis of Lansdowne, 1888; Earl of Elgin, 1894; Lord Curzon, 1898.

The following table gives the area, the population, and the density of the population per square

mile in the native states of India, according to the census returns of 1891:

NATIVE STATES.	SQUARE MILES.	POP. 1891.	DENSITY PER SQ. M.
Hyderabad	82,698	11,537,040	139
Baroda	8,569	2,415,396	294
Mysore	27,936	4,843,523	177
Kashmir	80,000	2,543,952	31
Rajputana.....	130,268	12,016,102	92
Central India.....	77,808	10,318,812	133
Bombay.....	69,045	8,059,298	117
Madras	9,609	3,700,622	385
Central.....	29,435	2,160,511	73
Bengal.....	35,834	3,296,379	93
Northwest Provinces..	5,109	792,491	155
Punjab.....	38,299	4,263,280	111
Shan.....	2,992	...
Total	594,610	65,950,398	111

The names of the principal provinces, with their population, as reported at latest dates, are as follows:

POPULATION OF PROVINCES AND CHIEF CITIES.

PROVINCES.	POPULATION IN 1891.	CHIEF CITY.	POP. IN 1891.
Bengal.	71,346,987	Calcutta	861,764
Northwest Provinces and Oudh..	46,905,085	Allahabad ..	175,246
		Lucknow ..	273,028
The Punjab.	20,866,847	Lahore	176,854
Central Provinces..	10,784,294	Nagpur.	117,014
Burma (Upper and Lower).....	7,605,560	Mandalay... ..	188,815
		Rangoon ...	180,324
Assam.....	5,476,833	Gauhati	10,817
		Sylhet	14,027
Madras.....	35,630,440	Madras.....	452,518
Bombay.....	18,901,123	Bombay.....	821,764
Berar	2,897,491	Ellichpur....	36,240

The present Nizam of Hyderabad was installed in 1884. Kashmir was granted to Gholab Sing by Lord Hardinge, after the first Punjab war. His son and successor, Rumbir Sing, died on Sept. 12, 1885, and was succeeded by the present Maharaja, Pertab Sing, when also a British resident was appointed, and stronger pressure was brought to bear in favor of much-needed reforms in the government. In 1889, in consequence of continued misgovernment, the Maharaja was deprived of his powers, which were intrusted to a native council, assisted by the advice of the resident.

The most important recent act of the Indian legislation was a comprehensive act, passed in 1890, dealing with railways in that empire. Other acts dealt with probate and administration in India; with the charge of charitable endowments; with the law relating to guardians and wards; with Indian cantonments; with the forests of Burma; and with tenant-right, land revenue, sanitation and local self-government in the central provinces. All imports are free, excepting arms and ammunition, opium, liquors, petroleum oil and salt.

INDIA, FAMINE IN (1900). To add to the horrors of the plague, which up to the close of 1899 was still virulent in Bombay, India was in 1900

confronted with a direful famine, owing to continuous drought and the failure of the crops. The area affected was of enormous extent, and included the Bengal Presidency and the greater part of the Central Provinces, and from northern Mysore to the Punjab. So calamitous was the scourge that 50 million people were destitute, and in a tract over 300,000 square miles in extent, there was no money to buy grain for the people, save what reached India by the doles of the charitable. In this vast parched area, where the population is in parts 1,000 to the square mile, millions actually died of starvation, while there was hardly a blade of grass or green herb to feed to the cattle. The government of India did what it could in the way of subsidies and in employing millions of the people on irrigation and other relief work. The benevolent among the peoples of the United States and England also did nobly in sending to India both money and food. America, it is stated, contributed a million dollars to the sufferers. Germany also contributed largely. British charity gave \$1,700,000, while the government of India spent \$65,000,000 in relief work. The Viceroy and other British officials also gave freely, while a few of the native princes gave large sums. The squalor, misery, and want were so great, however, that relief, in the mass of instances, was sadly inadequate, and until the rains came, with revived vegetation, the loss of life among the stricken myriads was appalling.

INDIA INK. See INK, Vol. XIII, p. 80.

INDIANA, popularly known as the "Hoosier State," has an area of 35,910 square miles, or 23,264,000 acres. The population, according to the census of 1900, was 2,516,462, giving the state the rank

STATE SEAL OF INDIANA.

of eighth. Within the borders of Indiana the center of population of the United States was located, being at a point a little southwest of Greensburg, the capital of Decatur County, and 20 miles E. of the city of Columbus. During the decade 1880 to 1890, the population of the state increased 10.82 per cent, the number of inhabitants, at the last mentioned date, being 2,192,404. The density of the population was 61.05 to the square mile; 400,566 of the people of the state resided in the 18 cities, constituting 18.27 per cent of the entire population; the relative proportion of males to females was 1,118,347 of the former and 1,074,057 of the latter; 93.33 per cent of the population was native-born, 6.67 per cent only being of foreign birth; there were 45,215 negroes in the state, a gain of 5,987 since 1880.

The surface of Indiana is an undulating plain, sloping toward the southwest; the average annual temperature is about 52° F., and the rainfall is

abundant, being about 42 inches. These conditions are all favorable to agriculture, and the principal products raised in the north central group of states all flourish. The census reports for 1890 gave Indiana the position of fifth in the area of the cereals under cultivation, the amount being 7,341,404 acres, which gave a yield of 178,881,244 bushels, the relative position in production being seventh. The state stood sixth in the area devoted to Indian corn and seventh in the amount produced, the former being 3,586,190 acres and the latter 108,843,094 bushels. In wheat the position occupied was fourth in area, 2,570,017 acres, and fourth in production, 37,318,798 bushels. A good showing was also made in the acreage and production of oats, rye, barley, buckwheat and tobacco, the yield of the last named for the census year being but little short of 8,000,000 pounds. The total number of farms was 198,167, their acreage 20,362,516, their valuation \$754,789,110, the value of implements and machinery \$21,172,255, the live-stock on hand \$93,361,422. The estimated value of the farm products for the year was \$94,759,262. Statistics for 1894 show the total value of the wheat crop to have been \$25,396,310; that of the corn crop, \$38,082,053; and of the crop of oats, \$11,470,806. In addition to the above, about 90,000 acres were devoted to the cultivation of rye, barley, buckwheat and flaxseed, bringing to the producers almost \$1,000,000. The clover hay of the year brought \$8,362,765; the timothy hay, \$11,511,563; Irish potatoes, \$3,539,805; sweet potatoes, \$106,513; and tobacco, \$536,121. The same report shows the number of horses to have been 761,594, of the value of \$38,331,935; mules 57,688, valued at \$3,241,815; milch cows 656,982, valued at \$15,872,685; and other cattle 904,001, of a value of \$18,178,747.

In 1894 the value of all land in the state was \$454,131,203; improvements on these lands, \$86,544,952; city lots, \$149,263,802; improvements thereon, \$153,441,643; personal property, \$291,085,845; telephone and railroad property, \$160,638,070, making the total value of all property subject to taxation, \$1,295,106,515. In 1895 the total receipts of the state from all sources were \$8,525,219.33; the total expenditures aggregated \$8,342,004.20. The state debt, exclusive of the bonds held by state institutions, on January 1, 1898, amounted to \$5,700,615, a reduction of \$1,200,000 having been made during the year preceding. The expenditures for the maintenance of benevolent institutions amounted to \$959,525; for the penal institutions, \$190,484; and for reformatories, \$110,000.

Indiana has made bountiful provision for her dependent and unfortunate citizens, and the institutions for their maintenance and betterment are many and well sustained by ample appropriations. The Central Hospital for the Insane, at Indianapolis, required \$287,000 for the expenses of 1895. The Northern Hospital for the Insane, at Logansport, disbursed the sum of \$105,000 during the same period. The Eastern Hospital for the Insane, at Richmond, which has an average of about 450 patients, expended \$119,973, and the Southern Hospital for the Insane, at Evansville, \$99,984. The

institutions above named all received a portion of the sum required for their maintenance from earnings and contributions levied on counties having citizens among the patients, the aggregate amount of such fund being about \$20,000. The aggregate number of inmates of the four hospitals named ranges from 3,000 to 3,300. The expenses of the Institute for the Deaf and Dumb, located at Indianapolis, were \$70,337; those of the Institute for the Blind, in the same city, \$33,738; for the School for Feeble-minded Youth, at Fort Wayne, \$99,648. A portion of this last-named sum was for the purchase of farm and buildings. The Soldiers' and Sailors' Orphans' Home, at Knightstown, having an enrollment of from 625 to 650 children, required \$107,200. The Reform School for Girls and Women's Prison, at Indianapolis, disbursed \$45,000. The school was opened in 1873, since which time 988 girls had been received up to the close of 1894. The number of girls in attendance for 1895 was about 150, the inmates of the Women's Prison numbering 46. The Reform School for Boys, at Plainfield, with an average of 550 inmates, required \$65,000 for the running expenses of 1895; the State Prison North, at Michigan City, \$105,484; the State Prison South, at Jeffersonville, \$84,999. The two penitentiaries have an average of about 1,500 convicts. In addition to the total number of inmates of the state charitable institutions, there were 2,982 persons at the opening of 1895, who were inmates of county asylums or poorhouses. The causes of their having become dependent on public charity were given as follows: Blind, 131; deaf and dumb, 55; idiotic, 358; insane, 347; old age, 734. The number of inmates of the charitable and penal institutions of the state increased more than 15 per cent from 1890 to 1895,

CAPITOL BUILDING, INDIANAPOLIS.

but the cost of maintenance has been decreased greatly, the per-capita expense in 1890 being \$190.68, and \$171.64 in 1895.

During 1895 the amount of money going to the support of the public school was \$1,436,852; the number of children of school age, 808,261. Much state aid is given to institutions of higher education. The Indiana University, at Bloomington, received, in 1895, \$72,200, only \$40,000 of which was required for annual expenses, the remainder going to the purchase of new buildings and interest on bonds. The expenses of the State Normal School were \$20,222, \$10,000 of which went for the pur-

chase of new buildings. This institution had an attendance at the spring term of 1,224, and the graduating class numbered 101, the largest in its history. The Northern Indiana Normal School, at which over 100,000 students have received their education within the 23 years of its existence, had a total attendance of 6,000 in 1895, and the graduating class was the largest ever had, numbering 1,307. The State University had a graduating class of 87, and Wabash College, 28. De Pauw University graduated 65; Butler University, 19; and Purdue University, 76. This latter institution is located at Lafayette, is in its twenty-second year, and disbursed for its annual expenses in 1895 \$128,500, \$21,000 of which came from the government as the annual appropriation for the agricultural college, which is connected. Of the denominational institutions of learning in Indiana, De Pauw University, at Greencastle; Taylor University, at Upland; and Moore's Hill College, at Moore's Hill, are all under the control of the Methodist Episcopal Church. The Lutheran Church controls Concordia College, at Fort Wayne; the Baptist Church, Franklin College, at Franklin; the Presbyterian Church, Hanover College, at Hanover; and the United Brethren, Hartsville College, at Hartsville. The Christian Church has two institutions, one at Irvington, known as Butler College, and one at Merom, known as Union Christian College. The Friends' Church has Earlham College, at Richmond; the Congregationalists, Ridgeville College, at the town of the same name; and the Roman Catholics, St. Meinard's College, at St. Meinard, and the University of Notre Dame, at Notre Dame. The non-sectarian institutions are Indiana University, at Bloomington, and Wabash College, at Crawfordsville.

The census reports of 1890 give the number of manufacturing establishments in the state as 12,354. The leading lines of manufacture were flouring and grist-mill products, \$31,239,627; wholesale slaughtering, \$20,989,039; lumber and other saw-mill products, \$19,964,293; foundry and machine shop products, \$9,542,499; car building, \$14,362,711; carriages and wagons, \$8,248,873. The total amount invested in manufacturing was \$131,605,366; the total number of employees, 124,349; the wages paid, \$51,749,976; and the value of all products, \$226,825,082. Since the date of the compilation of the census figures, large amounts have been invested in manufacturing industries in the gas region. From the time of the discovery of natural gas in 1888 there has been a steady growth of all manufacturing enterprises, requiring large amounts of fuel; and the "gas belt," extending through some twenty-two counties, and covering about six thousand square miles, has attracted capital from all sections of the United States. Reports made at the beginning of 1895 showed that \$300,000,000 had been invested in the various manufactories that had sprung up within the past seven years.

Thirty-one railroads reported to the state officials in 1893, whose total mileage was about 6,000, the earnings \$190,000,000, and the expenses of operation and taxes \$110,000,000.

In 1895 the national banks within the state num-

bered 109, their combined capital \$13,722,000, surplus and profits almost \$7,000,000, and individual deposits of \$38,362,861. There were also 85 state banks and five savings banks, whose combined deposits amounted to about \$13,800,000. The capital of the first-named was \$4,220,000, and the savings banks had 16,127 depositors.

The coal-field of the state is a continuation eastward of the Illinois field, and is known to extend over an area of about 7,000 square miles. It is confined to the western and southwestern portions of the state, and is of the bituminous variety, good for fuel, but worthless for coke or gas. The following report was made of the industry for 1895: Capital invested in the 71 mines reporting, \$1,374,440; amount paid in wages during the year, \$2,473,806; number of tons of coal mined during the year, 3,065,394; total number of employees, 6,663; the average number of days worked, 193.

The gas-fields of Indiana exceed in area those of both Pennsylvania and Ohio, and the oil territory is both extensive and rich. In 1895 and 1896 new wells were being developed almost daily.

Reports made in 1895 showed the building and loan associations of the state to have loaned more than \$12,500,000. The amount of installment stock and credited dividends was \$9,513,487; the paid-up stock and credited dividends, \$3,245,125; the total number of shares of installment stock issued by all associations was 321,831, and of paid-up stock 45,907. The aggregate authorized capital of all was \$94,620,000, of which the sum of \$38,821,220 had been subscribed. The number of shareholders that had borrowed money were 19,176, and the number that had not borrowed were 50,205.

At the beginning of 1899 there were 856 newspapers published in the state, of which number 150 were daily, 2 triweekly, 31 semiweekly, 599 weekly, 1 fortnightly, 9 semimonthly, 62 monthly, and 1 bimonthly. Papers were published in every county and in every county capital of the state.

The following are the chief towns, with official population in 1900: Indianapolis, 169,164; Evansville, 59,007; Fort Wayne, 45,115; Terre Haute, 36,673; New Albany, 20,628; Lafayette, 18,116; South Bend, 35,999; Richmond, 18,226; Logansport, 16,204; Muncie, 20,942; Jeffersonville, 10,774.

The following is a complete list of the governors of the state, with their respective terms of office: Jonathan Jennings, 1816-22; William Hendricks, 1822-25; James B. Ray, 1825-31; Noah Noble, 1831-37; David Wallace, 1837-40; Samuel Bigger, 1840-43; James Whitcomb, 1843-49; Joseph A. Wright, 1849-57; Ashbel P. Willard, 1857-60; Abraham A. Hammond, 1860-61; Oliver P. Morton, 1861-67; Conrad Baker, 1867-73; Thomas A. Hendricks, 1873-77; James D. Williams, 1877-81; Albert G. Porter, 1881-85; Isaac P. Gray, 1885-89; Alvin P. Hovey, 1889-91; Ira J. Chase, 1891-93; Claude Matthews, 1893-97; James A. Mount, 1897. See INDIANA, Vol. XII, pp. 813, 814.

INDIANA, a borough and the capital of Indiana County, western Pennsylvania, 72 miles E.N.E. of Pittsburg, on a branch of the Pennsylvania railroad. It contains a state normal school, planing-mills,

foundries, glass-works, machine-shops, tanneries and a farming-tool factory, and has a large lumber trade. Population 1890, 1,963.

*INDIAN AFFAIRS IN THE UNITED STATES. (See INDIANS, AMERICAN, Vol. XII, pp. 822-833.) The Indian administration of the United States government is centered in the Department of the Interior. As chief executive of the department, the Secretary of the Interior is *ex officio* at the head of the entire Indian administration. One of the divisions of his office is known as the Division of Indian Affairs, and here a force of clerks is employed in keeping records and in digesting and preparing for consideration those subjects which are referred to the Secretary either directly or through the Commissioner of Indian Affairs, the titular head of the Indian service.

The Commissioner of Indian Affairs is an officer appointed by the President, by and with the advice and consent of the Senate. Although the statutes give him only a general authority over Indian affairs "under the direction of the Secretary of the Interior, and agreeably to such regulations as the President may prescribe," the custom is for the Secretary to consult him on all important questions of policy in his own domain. His immediate jurisdiction is over the Office of Indian Affairs, which is composed of several divisions, such as the division of finance, the division of accounts, the division of lands, etc., each with its force of clerks. He also has the oversight and general control of the Indian field-service, including both agencies and schools; recommends appointments and removals of employees, and himself appoints and removes physicians and licensed traders; he buys and distributes all the food, clothing, farm, school and household utensils, medicines, etc., used for the support and education of the Indians; disburses and accounts for most of the appropriations made by Congress for the Indians and the Indian service, which range from \$8,000,000 to \$10,000,000 or more a year; passes upon the legal questions continually arising out of Indian relations; renders opinions on legislation in process of enactment; issues instructions and directs work pertaining to allotments; approves contracts between Indians and whites, and the like. His conclusions in all cases are subject to review by the Secretary of the Interior. An assistant commissioner, whose tenure of office is the same as the Commissioner's, relieves the Commissioner of a part of his tasks at all times, and exercises the functions of Commissioner in his absence.

Agents, to the number of about sixty, make their homes on the reservations, and represent the government in its ordinary dealings with the Indians under their care. They are of two classes—agents appointed from civil life, and officers of the army detailed by the Secretary of War, at the request of the Secretary of the Interior, for service as acting agents. Civilian agents are appointed by the President, with the consent of the Senate. They give bonds for the faithful performance of their duties, report to the Commissioner, and take orders from him in the ordinary routine of official business.

In cases where the conduct of affairs at any agency

calls for investigation, the Commissioner usually assigns the task of making the inquiry (unless the conditions seem very serious) to one of a staff of five special agents, appointees of the Secretary of the Interior. If the work is intricate, or if the offenses charged are particularly grave, the matter is referred to the Secretary, who has at command a force of five inspectors, appointees of the President, with the consent of the Senate.

The Board of Indian Commissioners consists of ten citizens "eminent for intelligence and philanthropy," chosen from civil life by the President without reference to the Senate, who receive no compensation and who co-operate with the Secretary of the Interior and the Commissioner of Indian Affairs in protecting the Indians from fraud and promoting their civilization. Besides visiting reservations, inquiring into causes of complaint, and supervising the work of the Office of Indian Affairs in letting contracts for supplies, the Board holds two meetings each year for conference with the representatives of missionary societies, Indian schools and the Indian Rights Association. One is held in Washington in the winter, the other in the early fall at Lake Mohonk, New York. At these gatherings reports are made, plans discussed, and memorials prepared for bringing to the attention of the government particular subjects which might otherwise be overlooked as being outside of the general administrative routine. Although the duties of the board are largely advisory, its share in the economy of the Indian administration is important; for on the one hand its recommendations have always had the ear of the President, and on the other hand its expressions of criticism or approval command the confidence of those citizens outside of the public service who are interested in the welfare of the Indians; so that it may be said to serve as a connecting link between the official trustees for the Indians and the public, to whom these trustees must make their ultimate accounting.

At the head of the educational system is a Superintendent of Indian Schools, an appointee of the President. He has nominal control of the whole system, though his authority is exercised subject to the approval of the Commissioner. He is expected to be not only a man of executive capacity, but a skilled educator as well. Under him are three supervisors, appointed by the Secretary of the Interior, who maintain the same relation to the Superintendent that the special agents do to the Commissioner of Indian Affairs. Their work is entirely in the field, where they visit schools, investigate charges of wrongdoing, and report upon the condition of the institutions and the qualifications of superintendents, teachers and lesser employees. The superintendents of the larger schools are bonded officers, and have the direct disbursing of funds. In some cases, where a school is the nucleus of a reservation, its superintendent exercises also the functions of an agent.

The routine work of the Indian service is performed by some 3,500 employees, ranging in rank from clerks and accountants of the highest class down to laborers and servants. In addition to these there is a group of appointees for special and tem-

porary purposes under various acts of Congress, such as commissioners to negotiate with certain tribes, and agents to allot lands, to remove Indians from one point to another, to make treaty payments, to compute damages, etc.

COST OF THE INDIAN SERVICE. A fair example of the way in which the money appropriated for the support of the Indian administration is apportioned may be found in the budget for the fiscal year 1896. Here we find devoted to—

Salaries in office of Indian Affairs, and Indian division of Secretary's office-----	\$127,180.00
Current and contingent expenses, including pay of agents and general officers in the field-----	736,190.68
Fulfilling treaty stipulations with Indian tribes-----	2,933,768.44
Gratuitous support of Indian tribes-----	696,759.97
General and miscellaneous expenses-----	287,164.35
Support of schools-----	2,058,507.07
Indian depredation claims-----	200,000.00
Carrying out new agreements-----	15,000.00
Payments from trust funds-----	1,856,909.42
Total-----	\$8,911,479.93

In this table the salaries of the lesser employees in the field are scattered among several items, according to the specific fund out of which each is paid.

STATISTICS OF INDIAN DISTRIBUTION. The distribution of the Indian population still under the control of the Federal government, with the number of reservations in each state and territory, the acreage of land occupied by Indians, the acreage cultivated by them, the number of Indians who have adopted citizen's dress and the number who have learned to read, and the number of Indian families who are actually living upon and cultivating lands allotted to them in severalty, are shown in the following table. From this table, and others which follow, the natives of Alaska are omitted. The Alaskans are not under control of the Indian administration, but are cared for by the Federal office of education.

In addition to the Indians shown by this table to have advanced in civilization so far as to discard their savage costumes entirely, about 32,000 have combined some important feature of civilized attire with it. The remainder, a considerable majority, are still in the "blanket" stage, so styled on account of the leading article of outer apparel common to all barbarous Indians.

Anthropologists differ as to whether the Indian race as a whole is decreasing in numbers or slowly dying out. Accurate statistics are difficult to obtain, both on account of the nomadic habits of the Indians and because the treaties and laws under which some of the tribes draw their substance from the government make it profitable for them to conceal deaths and exaggerate the increase of their families. The most trustworthy indications, however, point to an excess of births over deaths, adding perhaps one-fifth of one per cent each year to the Indian population. Most of this increase occurs in the Southwest, where the conditions of life are generally fairly favorable; and the northern tribes which have best held their own are those which

have not been subject to removal to a very pronounced change of climate.

THE RESERVATION SYSTEM. By far the larger part of the Indians in the United States are gathered on reservations. The reservation system had its origin in the difficulty of keeping the peace between the white settlers in the frontier territory and the bands of Indians who roamed about there. The policy was adopted of placing the Indians, in separate groups, on tracts of land from which white trespassers could be excluded, and beyond the limits of which they should not themselves pass except for necessary purposes, and then by special permission.

Reservations as they now exist are of two classes: those established by treaty or act of Congress, and those set apart merely by an executive order. One tribe, for instance, after proving its strength in war, has made a treaty of peace, binding itself to retire to a certain reservation, which shall be its own property thenceforward, and on which it shall live in amity with the government. Another tribe has consented to release a large area of land which it held by right of first possession, and Congress by statute has conferred upon it a smaller area for its home reservation and made up the balance of value in cash, or in interest-bearing Government securities. These are illustrations of the establishment of treaty or statute reservations. Again, where white pioneers have found a tribe of Indians in general possession of a tract of country which invited development, the President, in order to avoid possible friction, has drawn a boundary about that part which seemed to be in most constant use by the Indians, proclaimed it their reservation, and designated an

agent to take charge of it for them; or, the wandering remnants of some almost extinct band of Indians, reduced to a condition of pauperism, have been gathered and given a home upon a parcel of public land set apart by proclamation for the purpose, in the hope, that, by proper instruction and encouragement, they may in time be made self-supporting. These last examples show the origin of the executive-order reservations. Prior to 1887 an essential difference was recognized between such reservations and those created by treaty or statute; the theory being that a mere executive order could vest no title in the Indian occupants of a reservation, and hence that the government might open any part of it to white settlement at will, without paying the Indians for the land thus taken. In that year, however, an allotment law was enacted, which, as construed in a ruling by the Secretary of the Interior, placed an executive-order reservation on substantially the same footing as a reservation created by any other process.*

ALLOTMENTS IN SEVERALTY. Like other nomadic peoples, the Indians have under their own social order no idea of individual ownership of the soil; and to the communistic principle they have clung with great persistence through the four centuries of their contact with white civilization. The obvious necessity of giving the red man a permanent foothold somewhere before he could make any industrial growth, and of cultivating in him the notion of a settled home-life before the moral side of his nature could expand, gave rise to an agitation, some years ago, in favor of a system for allotting lands to

* The whole subject of Indian land titles, which is too extensive for consideration here, is presented ably in the Annual Report of the Commissioner of Indian Affairs for 1890.

Indians in severalty. The agitation culminated in the enactment, in 1887, of the law commonly known as the "Dawes Act" in compliment to its chief champion in Congress, Senator Dawes of Massachusetts. This law, in general terms, empowered the President, in his discretion, to cause any Indian reservation to be surveyed, and the land, or so much as might be necessary, to be divided into parcels of 40, 80 and 160 acres respectively; 160 acres to be allowed to each head of a family, 80 acres to each single person more than eighteen years old and to each orphan under that age, and 40 acres to each other child born before the issue of the President's order directing the allotment; every adult male Indian receiving an allotment of land to be thereby invested with citizenship; the lands thus allotted to be held in trust by the government for the sole use and benefit of the several allottees for twenty-five years, or for a longer period, in the President's discretion, and then conveyed in fee simple, and free of incumbrance, to the allottees or their heirs. The design of these last provisions was to protect an Indian land-owner from the possible bad results of his ignorance and business incapacity, by preventing him from selling or mortgaging his land or loading it with taxes while slowly learning the ways of civilization.

In 1891 the Dawes Act was modified so as to give to each Indian, of any age or sex, eighty acres, making no distinction in favor of heads of families. This amendment resulted from the discovery that under the original law there were frequent instances of injustice to married women. A male Indian who, as the head of a family, had received 160 acres, would divorce his wife after the summary fashion of his race; as the title to the 160 acres was lodged in him, he would retain all this land, or even extend his control to eighty acres more by marrying a single woman who had already an allotment in her own right; while the first wife, through whose union with him he had acquired half of his 160 acres, would become, perhaps by no fault of her own, a homeless pauper.

The land-in-severalty policy was fiercely resisted by two elements among white citizens: that small group of sentimentalists in the East who regard all attempts at the compulsory improvement of the Indian, whether philanthropic or selfish in purpose, as an invasion of his natural rights; and the more numerous class of white farmers in the West who had been able to drive thrifty bargains for grazing cattle and raising crops on the common tribal lands at a nominal yearly rental. The latter class, after the law had reached the statute-book in spite of their resistance, were obliged to lease the lands of the individual allottees; this cost more in rent, because it was necessary to deal with a large number of separate owners instead of making a private arrangement with a few chiefs and head-men. But there was still a rich profit in it till the government, discovering that the ignorant allottees were signing away for a trifle the use of their lands for several years in advance, interfered as trustee and swept aside all leases not officially authorized, declaring them illegal and void. This caused a great commotion among the parties interested. The business

had grown so profitable in some quarters that corporations had been formed to lease Indian lands for a few cents an acre and sub-let them to white farmers for \$1, \$2 or \$2.50 a year. The hardest struggle the government had in breaking up this nefarious traffic was on the lands of the Omahas and Winnebagos, in Nebraska, where test cases were tried in the courts involving all the questions at issue. The decisions were uniformly in favor of the government. An Indian's privilege to lease his land, if he cannot use it advantageously himself, is recognized by law, but this does not limit the discretion vested in the Commissioner of Indian Affairs and the Secretary of the Interior as to disapproving any contract executed by an Indian still under the tutelage of the government.

The policy of allotting lands in severalty has been explained as founded on a hope of making the Indian a fixture somewhere, and of encouraging him to build up a home. It also offers the best practicable means of throwing Indians and whites together in a peaceful relation as neighbors. The Dawes Act confers upon the Secretary of the Interior authority, where an allotment of lands on any reservation is ordered by the President, to negotiate with the Indians for the sale or release of whatever lands may still remain after all the members of the tribe have been provided for. The purpose of this feature of the law is twofold: the money thus acquired, if wisely spent, may be used for improving their farms, supplying needed stock and implements, and otherwise aiding their efforts at self-support; and in any event the opening of the unallotted lands to white settlement is bound to attract to the neighborhood experienced ranchers and herdsmen, from whom the Indians can learn much about practical farming, if they will. It is true that the civilization which these immigrants bring with them is crude, but it is, on the whole, a stepping-stone to something better. Hemmed in on his reservation, the Indian is surrounded only by people of his own race, whose daily companionship is incapable of lifting him out of the condition in which he was born. The handful of Government employees of whom he sees something may be good men, or bad, or indifferent; they certainly are in no sense his permanent neighbors or competitors. On the edge of the reservation, while it remains inclosed, usually gather the worst class of whites, whose only purpose in clustering there is to debauch the Indian and rob him when the government pays money or issues goods to him. So it does not appear that, by having his reservation allotted and opened, and exchanging the environment of a closely watched and guarded ward for that of a free man among men, the Indian is necessarily a moral sufferer.

The whole matter of allotments is still, after nearly ten years of the operation of the Dawes Act, in the experimental stage. The advocates of that law had intended to have it applied at first to one or two tribes which seemed to be in the right condition for a test, and, if it proved successful with them, to extend its operation gradually and carefully through the Indian country. But at about the time of its enactment a land mania seemed to seize the

American people, and unremitting pressure was brought to bear upon the administration at Washington for the opening of new country to settlement. Before the next session of Congress began, seven reservations were in process of allotment. A check was then applied by the President; but the work of rapid allotment was resumed under his successor in office two years later, and has been going on more or less rapidly ever since, with varying results. In individual instances the system has worked well, without doubt, but there are still a number of vexatious problems to be solved in connection with it. One of these is the liquor question.

THE LIQUOR QUESTION. The law against introducing intoxicants into "the Indian country," and against selling or giving them to "any Indian under the charge of an Indian superintendent or agent," makes the offense punishable by imprisonment for not more than two years, and by a fine of not more than \$300. Any superintendent, agent, sub-agent or commander of a military post is authorized to search the property of a suspected person, who, if intoxicants are found in his possession, must suffer forfeiture of all his belongings; and if the offender be a licensed trader, his license must be revoked and his bond put to suit.

The interpretation of these statutes has never proved difficult, except as to some minor technical details; but with the transition of an Indian from the exclusive control of the Federal government on a reservation to citizenship, in the midst of a different social order, the question has arisen whether the laws against the liquor traffic in "the Indian country" are any longer applicable to his case, and, indeed, whether a person who sells liquor to him anywhere does not enjoy the same immunity as one who sells to a white citizen. The Commissioner of Indian Affairs has insisted steadily that the government's tenure of an Indian's allotted land, in trust for 25 years, involves also such control of the allottee that he is, for the purpose of the liquor law, still under charge of the resident agent. But the decisions of the courts on this point are so conflicting that the Commissioner has urged the enactment of new and unequivocal legislation, forbidding the sale or gift of intoxicants "to any Indian to whom allotment of land has been made while the title to the same shall be held in trust by the government, . . . or any Indian, including mixed bloods, over whom the government, through its departments, exercises guardianship."

JUDICIARY AND POLICE. The preservation of good order on a reservation several hundred square miles in area, containing some thousands of Indians and only a handful of white government employes, presents not a few difficulties. It is impracticable to treat the reservation Indian as amenable to all the laws of civilized white society, and to try him in the United States courts for such misdemeanors as theft, destruction of property, drunkenness, licentiousness, etc. On the other hand, to clothe the agent or superintendent with despotic powers as a magistrate fails to educate the Indian to that understanding of and respect for the machinery of organized justice which must be his first

lesson in citizenship. Accordingly, in 1883, the Office of Indian Affairs established in several of the more important reservations a Court of Indian Offenses. This tribunal consisted of three Indian judges, nominated by the agent, and appointed by the Commissioner for a term of one year, but subject to instant removal for misconduct. The aim of every good agent was to select for judges the wisest, cleverest and most generally esteemed chiefs who could be induced to serve, and their sittings were surrounded with as much solemnity and dignity as possible. For five years this system of courts was sustained without cost to the Government, the judges serving gratuitously or being remunerated from the fines collected. Then Congress recognized its existence by a small appropriation for its support, which later was increased and has since been repeated regularly in the annual budget. The judgeships, however, even with a small salary attached, have not been much sought, because of the unpopularity suffered by any Indian magistrate who did his full duty in punishing the wrong acts of his fellow-tribesmen. They fell into still further disfavor with the progress of the allotment system; for the cases involving citizen Indians began to be carried into the neighboring state and territorial courts, which regularly ignored or overturned the decrees of the Indian courts. The latter still are maintained where the local conditions are not too unfavorable, but as a whole they are on the decline.

The judgments of these courts are enforced, and the orders of the agents everywhere executed, by a body of Indian police. Each reservation has its separate troop, and the larger troops are officered by captains, lieutenants and sergeants. The number on each reservation varies, and is governed by the area to be patrolled, the size, character and occupations of the tribe concerned, and like considerations. The whole number of police, including officers, is 895. The largest single forces are found in Indian Territory and Oklahoma, and on the various Sioux reservations in North and South Dakota, where they range from 26 to 43. On some small and peaceable reservations one captain and four privates do all the work. A private is paid \$10 a month, and an officer \$15, and the places are usually in demand, so that an agent, who is both conscientious and tactful, is able, by a judicious use of his recommendations for appointment, promotion and dismissal, to command the services of some of the best Indians on his reservation to help him keep order and administer discipline.

The active service of a policeman, being mostly performed in the open air and on horseback, and in a uniform of blue cloth with brass buttons, offers more attractions to the Indian taste than that of a judge, which is somewhat confining and lacks variety. The Indian police help the agent hunt down violators of the liquor laws; arrest intruders on the reservation; suppress violence among members of the tribe; collect and report data about births and deaths; carry the summons when it is necessary to hold a council, and make themselves generally useful about the agency. They also, on several occa-

sions, have proved their loyalty by heroic service for the government when their own people were in revolt.

THE SCHOOL SYSTEM. The school system came into being when, after years of wasteful warfare, the government concluded that to educate the Indians would be more practical, as well as more humane, than to kill them. Religious and philanthropic corporations established schools for Indian children at various points on the frontier of civilization, and with these the government entered into contract for the care of a certain number of pupils each year at a uniform rate for each pupil. They are known technically as "contract schools," but "sectarian schools" has come to be their popular designation, owing to the fact that the religious instruction imparted in most of them is according to the tenets of some one denomination. The government also has established a number of schools of its own, in which the teaching is in the main secular, though a few of the elementary principles common to all phases of the Christian religion give tone to the instruction in morals and manners. About the year 1890, the government, in pursuance of a policy mapped out by Commissioner Morgan, began to strengthen its own school system with a view to the gradual substitution of government schools for contract schools till the whole educational establishment should be brought absolutely under government control. In this movement the religious organizations generally have co-operated. In some instances they have turned their schools over bodily to the government; in others they have arranged for the sale of certain buildings and apparatus. Many of the teachers have been transferred by mutual consent from the pay-rolls of the missionary societies to those of the government. In 1895 Congress sanctioned the change, by providing in the general appropriation bill for the gradual shrinkage of the contract system at the rate of twenty per cent yearly, with a view to its entire extinction with the close of the nineteenth century. The following table shows the amounts set apart for the education of Indians in schools under private control for the fiscal year 1890, which marks the point at which the Office of Indian Affairs entered upon its new policy, and for the fiscal year 1896, the first one in which this policy was recognized by Congress in appropriate legislation:

	1890.	1896.
Roman Catholic-----	\$356,957	\$308,471
Presbyterian-----	47,650	-----
Congregational-----	28,459	-----
Protestant Episcopal-----	24,876	2,160
Friends-----	23,383	-----
Mennonite-----	4,375	3,125
Unitarian-----	5,400	-----
Lutheran-----	7,560	-----
Methodist-----	9,940	600
Miss Grace Howard*-----	600	3,000
Lincoln Institute*-----	33,400	33,400
Hampton Institute*-----	20,040	20,040
Totals-----	\$562,640	\$370,796

*Unsectarian.

The difference between these totals is the joint product of the changes in the contract system made by the Office of Indian Affairs in its own discretion—which between 1890 and 1895 effected a reduction of nearly one hundred thousand dollars—and by the twenty-per-cent scale sanctioned by Congress for the fiscal year 1896. It will be observed that the distribution of the reduced appropriations followed no hard and fast lines, but was made according to the needs of the service. The general appropriation bill for the fiscal year 1897, as it passed the House of Representatives, contained no provision for the contract schools under sectarian control, the House voting to withdraw their government support at once instead of continuing the policy of gradual extinction. The omission gave rise to extended debate in the Senate, ending with the passage of a greatly reduced appropriation and a proviso that all contracts with sectarian schools should cease on or before July 1, 1898. This compromise was suggested by the fact that the managers of those schools, who had made their preparations with reference to the continuance of the sliding scale of reduction, would suffer injustice by a sudden change of programme, while the government schools, even if filled to their utmost capacity, would leave about one thousand pupils unaccommodated.

The government schools are divided into three classes: Day-schools, on or adjoining reservations, numbering 110, with a total capacity for 4,145 and an average attendance of 2,528 pupils; boarding-schools, on the reservations, numbering 75, with a total capacity for 7,845 and an average attendance of 6,477; and training-schools, not on the reservations, known briefly as "non-reservation" schools. Of this last class the following table shows the locations, dates of establishment, capacity and average attendance during the fiscal year 1895:

	OPENED.	CAPACITY.	ATTEND- ANCE.
Albuquerque, New Mexico----	1884	500	499
Carson, Nevada-----	1890	135	119
Charlisle, Pennsylvania-----	1879	800	668
Chemawa, Oregon-----	1880	300	214
Chillico, Oklahoma-----	1884	400	339
Flandreau, South Dakota-----	1893	175	112
Fort Lewis, Colorado-----	1892	300	151
Fort Mojave, Arizona-----	1890	150	151
Fort Shaw, Montana-----	1892	250	194
Genoa, Nebraska-----	1884	350	192
Grand Junction, Colorado----	1886	150	117
Lawrence, Kansas*-----	1884	500	499
Mount Pleasant, Michigan----	1893	160	135
Perris, California-----	1893	125	107
Phoenix, Arizona-----	1891	150	137
Pierre, South Dakota-----	1891	180	104
Pipestone, Minnesota-----	1893	90	58
Santa Fé, New Mexico-----	1890	150	133
Tomah, Wisconsin-----	1893	125	80
Totals-----	-----	4,990	3,779

The schools considered under this title do not include those of the Five Civilized Tribes in Indian Territory, which are under the jurisdiction of the tribal governments, or those in New York, for which the state has undertaken to provide.

*Haskell Institute.

The total average attendance at the government schools is, as we have seen, 1,976 short of their capacity, the greatest disparity showing itself in the day-schools, where the children are under home influences, which often interfere with their regularity of attendance. The contract schools had an average attendance, during the fiscal year 1895, of 4,998; and 192 Indian children, living near public day-schools supported by state and territorial taxation, attended those by special arrangement between the Federal government and the local authorities, while 194 attended mission schools not assisted by the government. This gives us a grand average of 18,188 Indian pupils actually attending school, or about one half of the school population under the jurisdiction of the Office of Indian Affairs.

Great diversity of opinion exists among Indian educators whether the reservation or the non-reservation school is the more fruitful of good. The truth is that each meets a need which the other could not. There are many Indian parents who will not permit their children to leave them for a considerable period, or make a long journey from home; but the children ought not, on that account, to be deprived of an education. The pupils at the reservation boarding-schools can be visited by their parents from time to time, and spend their vacations at home; and those at the day-schools are continually under the eyes of their parents. Although these conditions are not usually conducive to the best advancement of the pupils, they have their compensation in the fact that the children carry some of the moral atmosphere of the school home with them to the advantage of the elders. On the other hand, the young Indians who attend the non-reservation schools make more rapid progress, because they are wholly divorced for a while from the degrading influences of the camp and lodge, and learn from their surroundings to appreciate the higher civilization; but when, after an absence of some years and a course of careful training for mind and hand, they return to their home reservations, their situation is most trying. They are out of sympathy with the tribal life and institutions. The Indians who have remained in barbarism are jealous, suspicious and often vengeful in their attitude toward the returned students; and the latter, if once overcome by the old influences, relapse into a state much worse than that from which they first emerged. The duty of the government to these young people is plain. They should go back, if at all, clothed with some outward dignity which will compel the respect of the tribe. They should be commissioned as employees of the government, as teachers, farmers, blacksmiths, or the like. The spectacle of these young men and women returning from their schools with some insignia of authority, and with a monthly salary, however small, coming to them as the fruit of their labor, would impress the conservative element with more of a sense of the benefits of an education than any amount of abstract argument. The wisdom of such a policy is beginning to be understood at Washington. In selecting the minor employees at the agencies and in the schools, the preference now is given uniform-

ly to educated Indians over whites of like capacity.

An admirable feature of the course of instruction at the Carlisle School, which has been followed successfully at some other non-reservation schools, is the "outing system." This consists in finding employment in the neighborhood, as farm-hands, cooks, dairy-workers, etc., for those pupils of both sexes who can be trusted to fill them acceptably during the long vacations. The young Indians thus are enabled to apply practically the industrial lessons they have learned at school, while their introduction to civilized home-life among the white people of the denser communities of the East aids greatly in their moral development.

Three subjects have occupied largely the attention of the superintendent of Indian schools, Dr. W. N. Hailmann. One is the inner work of the schools; that is, the special adaptation of the methods of instruction to the minds of children who are acquiring the rudiments of an education in a civilization and a language utterly foreign to those of their ancestors. The second is the combination of industrial with scholastic work, so as to make each of the two elements promote the progress of the other. The third is the cultivation of a distinct *esprit de corps* among the superintendents, teachers and school employees, by the encouragement of frequent conferences and discussions, so that each member of the educational staff, from the highest to the humblest, shall feel not only that his own work is of practical importance in itself, but that its greatest usefulness will be assured by maintaining its proper relation to the work of all the others.

Dr. Hailmann is engaged now in an effort to supplement the changes which land-ownership and citizenship have wrought in the status of the Indians, by making gradual provision for the absorption of Indian children into the general school population of the several states and territories in which they live. Wherever it is impracticable to place these children in the common schools of their own neighborhoods, side by side with the white children, he is endeavoring to induce the state authorities to establish separate schools for the children of Indian allottees. The commonest objection raised by the local authorities is, that as long as the land of the Indians is absolved from taxation, the burden of educating both races falls unfairly upon the white taxpayers; this he meets with the proposal that the Federal government shall pay a proportional share of the expense out of the income of the funds which it holds in trust for the benefit of the various tribes. The idea which he is endeavoring to impress upon the state governments is, that since the Indians are being transformed rapidly from irresponsible wards into responsible citizens, any state whose population is absorbing them ministers directly to its own interest in aiding their rapid civilization and education. His efforts have already met a hearty response in Washington, Oregon, California, Nevada, Minnesota, Wisconsin and Iowa, and in others the matter has been taken under advisement.

FIELD MATRONS. A very important adjunct to the day-school on a reservation is the work of the

field matron. Her duty is to instruct Indian women in the arts of housekeeping and home-making. She visits them in their camps, tries to win their confidence and affection, and acts as their adviser and helper in all matters of domestic management. For such duties it is desirable to have a woman without close family ties that are liable to distract her attention; unmarried women of experience and judgment, or widows without living children, are oftenest chosen. The lessons of morality, neatness and method, which the children of a family learn at school, are carried home and doubtless form the subject of more or less discussion with the mother. If her attitude toward all this is indifferent or contemptuous, the influence of the teacher with the child receives a serious check. If, on the other hand, the field matron has succeeded in arousing the mother's interest, the teacher's work is not only supplemented as far as the child is concerned, but its general effectiveness is increased, and a whole camp feels its indirect effects. It is a striking illustration of the government's lack of a definite policy in dealing with Indian affairs, that Congress, while appropriating liberal sums for the instruction of adult male Indians in farming, has provided only a pittance, and that grudgingly, for the instruction of the women in their duties as wives and mothers. Hence, on many of the reservations the head of the family and his children of school age spend their working day in an atmosphere of modern civilization and thrift, only to return in the evening to the squalor and barbarism of a tepee kept by a woman still almost as savage as her ancestors four centuries ago.

CIVIL-SERVICE REFORM. Until the year 1891, the Indian service had suffered seriously from the lack of a consistent system governing appointments to any of its branches. With the exception of the clerical force in the Office of Indian Affairs in Washington, who were subject to the civil-service law of 1883 as part of the Departmental service, changes of officers and employees were made with each change of political control of the government at Washington, regardless of the fitness of the persons dismissed or appointed, but with a view simply to finding salaried positions for members of the dominant party and their dependent relatives and friends. In 1891 President Harrison issued an order extending the civil-service rules over 703 positions, including those of physicians at both agencies and schools, and of superintendents, assistant superintendents, teachers and matrons in the school service. In 1896 President Cleveland made a further extension of the rules, covering the places of clerk, assistant clerk, issue clerk, property clerk, storekeeper and all other clerical positions at Indian agencies and Indian schools, and of supervisor, day-school inspector, disciplinarian, industrial teacher, teacher of industries, kindergarten teacher, farmer, nurse, assistant matron and seamstress at the schools. Soon afterward the same President ordered a complete revision of the civil-service rules, which added all the other minor places to this list, as far as practicable.

Secretary of the Interior, Hoke Smith, became so impressed, during the first two years of his

administration, with the evil effects of allowing the Indian service to be made the sport of politics, that, in his annual report for 1895, he outlined a policy which attracted wide attention, and which the friends of the service now are using their best endeavors to have embodied in legislation. Besides the extension of the civil-service rules to all the subordinate places to which they could properly be applied, he recommended:

1. That instead of a single commissioner of Indian affairs, there be a board of three commissioners, two of them to be civilians, appointed from different political parties, and the third a detailed army officer.

2. That the tenure of office of an Indian agent be conditioned alone upon the faithful discharge of his duties, and that appointments and removals be made by the President on the recommendation of the three commissioners.

Up to the present time Congress has taken no steps looking to the execution of this programme.

FRANCIS E. LEUPP.

INDIAN ANTIQUITIES. See AMERICA, Vol. I, pp. 692-694.

INDIANAPOLIS, a city of central Indiana and the state capital. (See INDIANAPOLIS, Vol. XII, pp. 814, 815.) It is in the great corn belt of the West, near its center, and in the natural-gas region of Indiana. It has many grain-elevators, flouring-mills and pork-packing establishments, extensive rolling-mills, malleable-iron works, carriage-shops, foundries and machine-shops, manufactories of agricultural implements, glass, organs, railroad cars, sewing-machines, pianos, cotton goods, woolen goods, sashes, blinds and furniture. The manufacturing establishments of the city have an aggregate capital of \$15,000,000, and produce \$32,000,000 worth of merchandise annually. They employ on the average 16,000 hands. The stock-yards cover an area of over 100 acres, and receive annually over 1,000,000 head of stock. Indianapolis has numerous public schools and many medical and other professional colleges. The clearing-house does an annual business of \$215,000,000. The city has an excellent fire department, the Holly system of water-works, electric and gas lights, and a system of electric street-railways. In 1890 the assessed valuation was \$99,125,695; tax rate, \$15 per \$1,000; municipal debt, \$1,384,500. Population 1890, 105,436; 1900, 169,164.

INDIANA UNIVERSITY, a state institution for collegiate education, founded in 1820, and

INDIANA UNIVERSITY.

non-sectarian. It occupies a fine set of buildings in Bloomington, the county-seat of Monroe County, Indiana; it is opened to both sexes, and counts (1898) 60 professors and instructors, 1,049 students, and a library of 30,000 volumes. Since

its organization 2,022 students were graduated from this university.

INDIAN CALENDAR. See AMERICA, Vol. I, p. 695.

INDIAN CORN OR MAIZE. See MAIZE, Vol. XV, pp. 309, 310; and AGRICULTURE, in these Supplements.

INDIAN HEMP OR CANNABIS. See BHANG, Vol. III, p. 627.

INDIAN LANGUAGES. See AMERICA, Vol. I, pp. 688, 689; and INDIANS, Vol. XII, pp. 823, 824.

INDIANOLA, a city and the capital of Warren County, Iowa; located 20 miles S. of Des Moines, on the Chicago, Burlington and Quincy and the Chicago, Rock Island and Pacific railroads. It manufactures farm implements, bricks, tiles and earthenware; and ships corn, wheat, oats, butter and other farm produce. It is the seat of Simpson (Methodist) College, which has 14 instructors and 451 students. Population 1890, 2,254; 1900, 3,261.

INDIAN RIVER, a narrow tidal channel parallel with the Atlantic coast, and lying in Brevard and Volusia Counties, Florida. It is 82 miles long, and finds an outlet to the ocean at Indian Inlet. It is navigable for boats drawing not more than five feet, and as the climate of the locality is healthful, and fish abound in the river, it is a resort for invalids and sportsmen.

INDIAN SHOT. See CANNA, in these Supplements.

INDIAN SUMMER, in the United States a period of late autumn characterized by calm, dry, and hazy weather, particularly noticeable in the upper Mississippi Valley, although extending east to the Atlantic States. The haze is due to very fine dust and thin smoke which float close to the surface of the earth in the still atmosphere. The name is due to the fact that this condition was first observed in the central region chiefly occupied by Indians at the time the term was introduced.

INDIAN TERRITORY now comprises the only unorganized territory of the United States. It was originally set aside as a permanent home for the Indian tribes who had occupied reservations east of the Mississippi River, and upon their removal the government of the inhabitants was placed in the hands of the different tribes, who selected legislatures, followed old tribal customs and had their chiefs, mingling the usages of civilized countries with their own ideas of government. The territory was placed under the supervision of the Bureau of Indian Affairs, of the Department of the Interior, and remains under the direct management of that bureau.

By the act of Congress, approved by the President May 2, 1890, creating Oklahoma Territory, the boundaries of the former Indian Territory were changed, and the new Indian territory was defined to comprise "all that part of the United States which is bounded on the north by the state

of Kansas, on the east by the states of Arkansas and Missouri, on the south by the state of Texas, and on the west and north by the territory of Oklahoma.”

CHEROKEE NATION SEAL.

On September 16, 1893, the Cherokee Strip, comprising 6,000,000 acres of the north part of the territory, was opened for settlement. The eastern part of the strip was fertile, and was traversed by a railway, in addition to being well

watered. Ninety thousand people gathered at the boundary-line to compete for claims when the signal-gun should be fired at noon of the day set for the opening. Every available claim was taken the first day, and thousands were disappointed in securing any land. The middle section of the tract was arid and not at all desirable. In 1892 the reservations assigned to the Cheyennes and Arapahoes, containing 6,500 square miles, were acquired by the government and thrown open for settlement. The tribes now remaining in the territory and holding lands are as follow:

NATIONS.	AREA.	POPULATION.
Choctaw -----	10,450	42,645
Cherokee -----	7,861	56,775
Chickasaw -----	7,267	57,793
Creek -----	5,024	17,912
Seminole -----	312½	2,657

Attempts were made in 1892-93 to secure the passage of a law in Congress looking to the admission of Indian Territory as a state of the Union. The act failed of passage, and in 1894 again was defeated.

CAPITOL BUILDING, TAHLEQUAH.

The population is a mixed one. The laws of all the five nations allow negroes to become citizens, and white men marrying Indian women are counted as citizens and may hold property. By the census of 1900 the following were shown to be the constituents of the population: Indians, chiefly Cherokees, Chickasaws, Choctaws, and Creeks, making, with some whites, a total of 391,960.

In the eastern part of the territory agriculture is carried on to a large extent, the principal crops and their yields for 1890 being as follows: Corn, 3,724,000 bushels; wheat, 148,980 bushels; oats, 204,684 bushels; potatoes, 54,600 bushels; sweet potatoes, 47,900 bushels. Cotton thrives well, and the yield is estimated at about 24,000 bales annually. The live-stock numbered more than 1,000,000 head at the time of the taking of the decennial census, comprising some 75,000 horses, 35,000 sheep, 300,000 head of hogs and more than 500,000 head of other cattle.

The census reports of 1890 show 20 specified manufacturing industries, in which \$204,429 was invested; 175 employees, who received \$79,830 in wages; materials used were valued at \$127,864, and the finished products yielded a return of \$248,932. The principal industry was that of lumber and other mill products from logs or bolts. Other enterprises were flour and grist mills, cotton-ginning, manufacture of brick and tile, and the printing and publishing of newspapers and periodicals.

The principal towns all have banks, there being six national and three private banks in the territory. The principal business of the Indian population is agriculture, stock-raising and wool-growing, the small amount of mining that is carried on being done principally by the whites who have become members of the tribes.

The government holds a little in excess of \$8,000,000 for the five nations, on which almost \$500,000 is annually paid as interest. This interest fund is expended under the direction of the different nations and their councils.

There are more than 600 church organizations in the Territory, with almost an equal number of houses of worship. The Methodist Episcopal South is the strongest organization, having 275 congregations, about 10,000 members, and property valued at \$60,000. The Baptist South is the next in importance, having about the same number of members, but lacking about one hundred of the number of congregations and having but \$35,000 worth of church property. Other denominations represented are the Disciples, Presbyterians in the United States of America, Roman Catholic, Cumberland Presbyterians, Methodist Episcopal and the Church of God.

The tribes all support schools abundantly. The entire number of primary and high-schools, seminaries and academies number about three hundred and fifty, in addition to which there are several denominational institutions supported by the churches, and three orphan asylums.

The Postmaster-General reported 498 post offices, June 30, 1898, at which time there were 6 daily papers, 77 weekly, 1 semimonthly, and 1 monthly; total, 85.

Muscogee is the chief commercial center of the territory, and is the seat of the United States court. McAlester and South McAlester, in the Cherokee Nation, have a combined population of about 15,000 (1896). The main supply of coal for the territory is obtained here, and the industry

is one of large dimensions and annually increasing. Okmulgee, capital of the Creek Nation; Tahlequah, capital of the Cherokee Nation; Atoka, capital of the Choctaw Nation; Tishomingo, capital of the Chickasaw Nation; We-woka, capital of the Seminole Nation, are all considerable places and constantly growing. See also **INDIAN TERRITORY**, Vol. XII, pp. 833-35.

INDIAN TOBACCO. See **LOBELIA**, Vol. XIV, p. 743.

INDIAN UNIVERSITY, an institution for the training of Indians as teachers and evangelists among their own people; near Muscogee, Indian Territory; was founded in 1880 by Professor A. C. Bacone, its first president; under control of the American Home Baptist Missionary Society; established since 1885 in its own commodious quarters, at a cost of thirty thousand dollars.

INDICAN. See **INDIGO**, Vol. XII, p. 843.

INDIGIRKA, a river of eastern Siberia, in the government of Jakutsk. It rises in the Yablonoi Mountains, flows north for about 750 miles, through deserts and frozen marshes, falling into the Arctic Ocean in lat. 71° N. and long. 150° E. The surrounding region is very thinly populated, and the few inhabitants live entirely by hunting.

INDUSIAL LIMESTONE, a variety of freshwater limestone, found in Auvergne, France, and some other localities, formed of the cases (indusæ) of caddice-worms—the larvæ of *Phryganea*—great heaps of which have been incrustated with

carbonate of lime, and formed into a hard travertine.

***INDUSTRIAL CONDITION OF WOMEN**. Mrs. Fanny Purdy Palmer, of Providence, Rhode Island, one of the factory inspectors of that state, delivered an address before the ninth annual convention of the International Association of Factory Inspectors, in September of 1895, in which she said: "At a low estimate there are at present about four million women engaged in paid industries in the United States, about 18 per cent of the entire female population of 10 years of age and upward. In 1870 there were 1,836,288 women in gainful occupations; in 1890 there were 3,914,711, the number having more than doubled in twenty years." Mr. Carroll D. Wright, in his study of working-women in the large cities, made in 1888, instances 340 occupations in which women are employed. The United States census of 1890 shows that out of 219 specified occupations, women are employed in 217. It is estimated that there are 400,000 women typewriters, bookkeepers and accountants in 1890, against 8,000 in 1870; one third the number of school-teachers in 1870 that were found in 1890; and the census of 1890 records for the first time women architects, surveyors, assayers, engineers, and even two veterinary surgeons. The average age of the four million women who have been tabulated as engaged in occupations is twenty-four years. Observation indicates that the majority of women employed in mills, stores and offices are from 15 to 25 years of age. The larger number of women thus employed do not, therefore, work beyond the marriageable age. The wives of workingmen and mechanics are shown from recent statistics to have usually been working-girls before their marriage, and the fact that a girl's earning capacity is established seems to settle in a certain way her value as a home-maker. The effect of the entrance of woman into industrial life is very great; the transition of one third the working population from no pay even to low pay has a great effect. The average wage of the four million women is \$5.24 per week. This seems very low, but it can be explained from the fact that the work in which women now are competing with men was, under different conditions, exclusively women's work. At the beginning of this century all the trades and professions which underlie the home were in the hands of women: spinning, weaving, sewing, cutting, cooking, nursing, baking—all these trades were performed exclusively by women, mostly in their own homes, for which they received no pay beyond board and clothes. With the invention of machinery and the capitalization of great industries, women's trades were taken from the home, and now the great industries of men are founded largely on the simple home trades. Women naturally followed their trades into the factory; and, not having capital or being inventors, they were obliged in most cases to become employees rather than employers. About the middle of the century they were in a very

unfortunate position, and threatened to become a class of unproductive consumers. For the last thirty years, however, they have been coming to the front rapidly, and we hear much of the competition of women in the labor market, which means that they are becoming sufficiently well educated and thoughtful to reassert their right to take part in the world's work.

Mrs. Palmer says that "the two fundamental characteristics of woman's industrial life in our times are, first, freedom of choice as to occupation; and second, a receipt of a fixed wage instead of an indefinite reward for service." Mr. William P. Letchworth recently completed a most important inspection of the poorhouses in New York state, and he reports as the result of these investigations, that it is a most curious and suggestive fact that the number of men as inmates of poorhouses has increased gradually, and the number of women decreased. In the eighth judicial district in New York state there were 1,288 inmates. Of this number 801 were men, and only 375 were women. Mr. Letchworth is of the opinion that this decrease may be attributed to the increased avenues open to women for profitable employment, and the larger use of liquor among men. In Brooklyn, New York, this statement is not carried out by the facts, as the large immigration leaves on the seaboard those verging upon dependence, of whom there are as many men as women. The report of the Illinois Bureau of Labor Statistics for 1882, according to Mr. Ethelberth Stewart, of the Bureau of Labor, states that "fifty per cent of the workingmen of Illinois are unable to support their families without the assistance of their wives, and often of the children. In the cotton-mills towns of New England and the South, house after house is locked up, and little faces peer out of the window; the mother usually has gone to work in the mill." In the cotton-mills of the United States, in 1880, the whole number of employees was 172,540. Of this number 112,859 were women and children, while only 59,685 were men. The twentieth report of the Massachusetts Bureau of Statistics of Labor shows that the employment of women in industries increases three times as fast as the female population. It is claimed by some that the employment of women and children is not greatly on the increase, and this would be true if only one or two states were selected. The stringent child-labor laws of some states, and the lax laws of others, militate against enforcing adequate labor laws. Many of the cotton-mill proprietors are erecting works in the South, where they are not troubled by laws regulating the labor of children. The sweat-shops are an important factor in the labor market; and Mr. Stewart writes: "I have no doubt 15,000 families in New York, 10,000 in Chicago and 1,500 in Boston have no home apart from the rooms in which they make cigars or cheap clothing all day long. In the difference between the 15,000 families in New York and the 1,500 in Boston can be seen the good effect of stringent laws against

child-labor." Very little has been accomplished in the United States in the line of legislating for labor reform for women, far less than in Europe. The percentage of married women engaged in trade has been very small in this country, hence there has been less need for legislative interference; but during the last ten years the number of married women engaged in occupations outside their own home is increasing materially. In Massachusetts, Connecticut, New York and Rhode Island an eight or ten hour law is enforced. In all states in which there are factory inspectors the requirements for sanitary improvement are enforced fairly well. The effect of this legislation has been that thousands of women were discharged, and men employed in their place. Naturally, the great question which presents itself to the thoughtful economist is that of the disintegration of the home. As long as married women can remain in their own homes, the entrance of women into the labor market helps rather than hinders economic conditions, but when the wage of the father falls below the point of living wage and the mother must leave the children either to care for themselves or under the care of strangers, the moral effect is extremely dangerous, and the most thoughtful philanthropists and students of social economics are giving their attention to this important feature of present industrial conditions.

Women have a far larger stake in the finances of the country than is generally known. In real estate alone they control hundreds of millions of property, and in most cases income-paying property, as women rarely buy land for speculation, and where they inherit land it usually is improved in order to secure an income. In railroad bonds they are large holders. It would be impossible to ascertain the exact amount of money controlled by women in such investments. The department of labor at Washington will soon institute such an investigation. The relative numerical position of men and women as investors in building and loan associations is four to one. That is to say, 25 per cent of the shares of stock in such associations are owned by women. In New Jersey every fourth shareholder is a woman, and the present value of the shares held by women in New Jersey is \$6,401,593; by present value is meant dues paid in, together with accrued profits. In New York state women own shares with the present value of \$5,935,554, and a maturity value approximating \$25,000,000. In the city of Philadelphia 34,000 women hold stock valued at \$10,059,861, while the stock matured and withdrawn either in money or in canceled mortgages equals \$15,000,000 more within the maturing period of eight years. By the law of Illinois, New Jersey, New York and Pennsylvania, building and loan stock taken out by women, on which they pay the premium, is theirs in every particular, and not subject to attachment or execution for household debts. In a teachers' building and loan association in New York City, 90 per cent are women earning their own money, many of whom have built several houses for rent through the associa-

tion. Mr. Eckels, comptroller of the currency, sent out to the national banks a request to furnish him with the list of women holding bank stock April 15, 1893. The following is the result: The number of shares owned by women in the United States in national bank stock was 1,703,759. The par value of the shares was \$130,681,485. In state and county banks the par value of shares owned by women was \$145,000,000. Women also control large sums of money in insurance companies, and it is more and more becoming the custom for women to insure their lives for the benefit of husband and children. Ten years ago few insurance companies had agents to canvass among women to secure life insurance; now, hundreds of the best companies have special departments for women.

From this brief statement it will be seen that woman is rapidly becoming an important financial factor in the country, and more and more is she giving to financial interests her time and attention. (See also CLUBS, WOMEN'S, in these Supplements.)

INFALLIBILITY OF THE POPE. See VATICAN COUNCIL, Vol. XXIV, pp. 112, 113; and POPedom, Vol. XIX, p. 492.

INFAMY AND INFAMOUS CRIMES. Infamy is the condition or state which the law imposes upon one who is convicted of certain crimes. These crimes are termed infamous crimes, and consist of such offenses as are inconsistent with the common principles of honesty and humanity. The law considers one who has been convicted of an infamous crime to be too much depraved to be permitted to give testimony tending to deprive another of life, liberty or property. The crimes which were considered infamous at common law are treason and felony. In most of the states of the United States the disability of one convicted of an infamous crime to testify as a witness has been removed by statute, but evidence of such conviction may be given as affecting the credit to be allowed to the testimony of such witness. The principal disability which now exists against one convicted of infamous crime is that of disfranchisement at public elections. In most states, however, this disability may be removed by act of the legislature on pardon of the governor. It is provided in the constitution of the United States that no one shall be held to answer for an infamous crime unless upon indictment by a grand jury, except in cases arising in the land or naval forces, or in the militia when in actual service in time of war or public danger. Under this provision of the constitution the United States supreme court has held the term "*infamous crime*" to include any crime which is punishable under the laws of the United States by imprisonment for one year or more at hard labor, and crimes against the United States punishable by imprisonment in a state

prison or penitentiary, whether with or without hard labor.

INFANTE, the title given in Spain and Portugal to the princes of the royal family, the corresponding title of *infanta* being given to the princesses. The personal domain of an infante or infanta is called the *infantado*. The term was formerly applied to any children of noble birth.

INFANTE, JOSÉ MIGUEL, a Chilean statesman; born at Santiago in 1777. He was a leader of the movement for independence, 1811; and was regent while the President was in the field against the Spaniards. He led the movement which drove O'Higgins from the Presidency; was at the head of affairs in the temporary absence of President Freire in 1825, and with the aid of the Senate, which he had organized, abolished slavery and did much toward the adoption of a federal government copied after the United States. He died April 9, 1844.

INFANTRY. See WAR, Vol. XXIV, pp. 354-368; British, see ARMY, Vol. II, p. 580; German, see ARMY, Vol. II, p. 596; French, see ARMY, Vol. II, p. 603; Austrian, see ARMY, Vol. II, p. 605; and Russian, see ARMY, Vol. II, p. 609.

INFANT SCHOOLS. Pastor Oberlin may be regarded as the founder of infant schools. The education and training of young children were also matters of great interest and study to Pestalozzi. The most successful system of educating quite young children is the kindergarten. See KINDERGARTEN, Vol. XIV, p. 79; and OBERLIN, Vol. XVII, p. 704.

INFECTIOUS DISEASES. See PATHOLOGY, Vol. XVIII, pp. 401-407; and MEDICINE, Vol. XV, p. 796.

INFINITE, same as ABSOLUTE. See ABSOLUTE, Vol. I, pp. 57, 58; also CARTESIANISM, Vol. V, p. 144; and THEISM, Vol. XXIII, pp. 247-249.

INFLATION. See MONEY, Vol. XVI, pp. 726-728.

INFLEXION. See PHILOLOGY, Vol. XVIII, pp. 789, 790.

INFLEXION, POINT OF. See CURVE, Vol. VI, p. 721.

INFLORESCENCE. See BOTANY, Vol. IV, pp. 121-126.

INFORMATION, used in a technical legal sense, is an instrument which contains an accusation exhibited against a person, charging him with a criminal offense. It is the general rule in the United States that prosecutions for offenses punishable by imprisonment in the penitentiary or state prison cannot be maintained upon an information, but must be by indictment of a grand jury. Its principal use in the United States now is in civil prosecutions for penalties and forfeitures. Thus informations are resorted to on account of illegal importation of goods. This is the common method of forfeiting the charters of illegal corporations, in which case the attorney-general or other proper officer of the state files the information. Informations in the United

States must generally be under oath, and are presented by a competent public officer. See INFORMATION, Vol. XIII, p. 73.

INFORMER. One who makes an accusation against another, charging the violation of some penal law. Statutes are frequently enacted, which entitle the informer to a part of the penalty upon the conviction of the offender. Such statutes are frequently enacted as to those who inform the proper authorities of the violation of game laws and other similar laws against acts not of a criminal nature except as they are made such by statute. The informer may or may not be a competent witness against the accused, according to the provisions of the statute. He is frequently disqualified from testifying on account of the personal interest he may have in the success of the prosecution.

INFRINGEMENT, in the legal sense, is the act of trespassing upon some right secured by patent, copyright or trade-mark. Any one who shall make use of or sell any patented article or any literary or other production which is copyrighted, or who shall adopt or use any registered trade-mark without first obtaining the right so to do from the owner thereof or in some other lawful manner, is guilty of infringement and must pay the damage which the owner sustains thereby. Infringements may be prevented by means of a bill in equity for an injunction to restrain further infringements, and an accounting may be had as to the damages sustained by reason of previous infringements. Before any remedy can be had for an infringement it must appear that the patent, copyright or trade-mark which is claimed to be infringed is valid, so that the complaining party has a right to the protection demanded. The mere fact that a patent or copyright has been issued or a trade-mark registered is not sufficient to entitle the person to protection. Many times the article patented or copyrighted is not of such a character as to be a proper subject for such protection. Infringement is the most frequent method of testing the validity of a patent or trade-mark in which case the person claiming to be injured has his remedy by suit for damages or bill for injunction, which will be sustained only when his patent, copyright or trade-mark is valid and in proper form.

INFUSORIA, a term for all corticate protozoans except Sporozoa. See PROTOZOA, Vol. XIX, pp. 856-865.

INFUSORIAL EARTH or **KIESELGUHR**, a silicious deposit, composed of the frustules of diatoms, and found in certain local strata of the Tertiary age. It is made up of microscopic angular particles, and is used for scouring purposes and in the manufacture of dynamite. It is found in large deposits in a dozen states of the United States. The largest deposit in Europe is found at Bilin, Bohemia.

INGALLS, JOHN JAMES, an American statesman; born in Middleton, Essex County, Massachusetts, Dec. 29, 1833. He graduated at Williams College in 1855, was admitted to the Massachusetts bar in 1857, and the following year went to Kansas. In 1860 he was secretary of the territorial council; was secretary of state senate in 1861; and member of

the state senate in 1862. In 1873 he became a member of the United States Senate, as a Republican, and was re-elected in 1879 and 1885. During his last term, which expired March 3, 1891, he was president of the Senate *pro tem*. After that he devoted himself chiefly to lecturing and writing. Died at Las Vegas, New Mex., Aug. 16, 1900.

INGALLS, RUFUS, an American general; born at Denmark, Maine, Aug. 23, 1820. Graduated at the United States Military Academy, 1843; served through the Mexican War with distinction, and as quartermaster at various places in the Northwest. In 1861 he became quartermaster of the Army of the Potomac; in 1886 assistant quartermaster general, and in 1867 became chief quartermaster at New York. Finally, in 1882, he became quartermaster general of the United States army, and retired in 1883. He died in New York City, Jan. 16, 1893.

INGELOW, JEAN, an English poet and novelist, was born at Boston, Lincolnshire, in 1820.

With Christina Rossetti, Jean Ingelow has, since the death of Mrs. Browning, shared the laurel crown of the female poets in England. Both were idyllic lyrists, and the poetry of each is marked by an introspective religious cast, and by much melody of form. In her early writings, the influence is strong both of Mrs. Browning and Tennyson, and not a little of her best work shows originality and strength. She has written some popular ballads, such as *The High-Tide on the Coast of Lincolnshire*, with its quaint, Elizabethan dialect, and much minor verse of considerable beauty. A collected volume of her poetry first appeared in 1850, which has since been repeatedly reissued, with additions. In 1867 she published another volume of verse, entitled *A Story of Doom*, while a third volume, entitled *Poems by Jean Ingelow*, appeared in 1887. Of her novels the following may be specially mentioned: *Off the Skelligs* (1872); *Fated to be Free* (1875); *Don John* (1876); and *Sarah Berenger* (1880). Died July 20, 1897.

INGERSOLL, a town of Oxford County, central southern Ontario, Canada, on the Thames River and the Canadian Pacific and the Grand Trunk railroads, 75 miles W. of Hamilton. It contains fine public buildings, and manufactories of woolen goods, cheese and farm implements, and carries on a brisk trade in lumber and grain. Population 1891, 4,191.

INGERSOLL, CHARLES JARED, an American statesman; born in Philadelphia, Oct. 3, 1782. He was admitted to the Pennsylvania bar, and was attached to the United States embassy to France. From 1813 to 1815 he was in Congress, and then became United States District Attorney, which office he held till 1829. Shortly afterward he served in

JEAN INGELOW.

the legislature, and in 1837 became secretary of legation to Prussia. From 1841 to 1847 he was again in Congress, and distinguished himself as a Democratic leader. He wrote a *Historical Sketch of the Second War with Great Britain*, and some other works, poetical and historical. He died in Philadelphia, May 14, 1862.

INGERSOLL, ERNEST, an American naturalist; born at Monroe, Michigan, March 13, 1852. He was educated at Oberlin College and in the Harvard Museum of Comparative Zoölogy. After the death of Agassiz, he became naturalist for the Hayden survey (1873); became a member of the United States Fish Commission, and in 1880 he was special census agent for the investigation of the American oyster industries. Among his publications are *Nests and Eggs of American Birds* (1879); *Friends Worth Knowing* (1882); *Country Cousins* (1884); *The Crest of the Continent* (1885); and *The Strange Adventures of a Stowaway* (1886). Later he turned his attention to the compilation of guide-books and produced some excellent works descriptive of Canada, New York City and the Hudson River.

INGERSOLL, JOSEPH REED, an American lawyer; born in Philadelphia, June 14, 1786. He began the practice of law in Philadelphia, Pennsylvania, and from 1835 to 1837, and again from 1843 to 1849 was a member of Congress. In 1852 he was appointed minister to England, but the following year retired to private life and devoted himself to literature. He was a strong Unionist, and wrote, among various other things, *Secession a Folly and a Crime*. He died in Philadelphia, Feb. 20, 1868.

INGERSOLL, ROBERT GREEN, an American lawyer; born in Dresden, Yates County, New York, Aug.

ROBERT G. INGERSOLL.

11, 1833. He began the practice of law in Shawneetown, Illinois, but in 1857 removed to Peoria; in 1862 became colonel of the Eleventh Illinois Cavalry. In 1866 he was appointed attorney-general for Illinois, and in 1877 refused the post of minister to Germany. He first attracted notice by his eulogy of James G. Blaine, in the National Republican Convention in Cincinnati in 1876, and also by his Decoration-day oration in New York in 1882. But he is known principally on account of his lectures and books, which criticise the Bible and the Christian religion. He wrote *The Gods, and Other Lectures* (1878); *Some Mistakes of Moses* (1879); *What Shall I Do to be Saved? Prose Poems* (1884); and other works. He settled in New York city about 1880. Died at Dobbs Ferry, N. Y., July 21, 1899.

INGHAM, BENJAMIN. See METHODISM, Vol. XVI, p. 185, note.

INGRAHAM, DUNCAN NATHANIEL, an American naval officer; born in Charleston, South Carolina, Dec. 6, 1802; entered the United States navy as midshipman in 1812; became lieutenant in 1818, commander in 1838, captain in 1855, and chief of the Bureau of Ordnance and Hydrography of the

Navy Department in 1856. In 1861 he entered the Confederate naval service as chief of ordnance, construction and repair, and rose to the rank of commodore. He served in the War of 1812, the Mexican and Civil wars. He died in Charleston, Oct. 16, 1891.

INGRAHAM, JOSEPH HOLT, an American novelist and clergyman; born in Portland, Maine, in 1809. After being a sailor and engaging in mercantile pursuits he attended college, and afterward became an instructor in Washington College, Mississippi. Later, he took orders in the Episcopal Church and had a parish at Holly Springs, Mississippi. He wrote *The Southwest, by a Yankee* (1836); between 1836 and 1854 a number of wild romances, among them *Lafitte, or the Pirate of the Gulf*; *Captain Kyd*; and *The Dancing Feather*; also *The Prince of the House of David* (1855); *The Pillar of Fire* (1859); and other works. He died at Holly Springs, in December, 1866.

INGRAM, JOHN KELLS, a British educator; born in the county of Donegal, Ireland, in 1823; was educated at Trinity College, Dublin; became professor of oratory and English literature in the same institution in 1846; regius professor of Greek in 1866, and librarian in 1879. He was president of the statistical section of the British Association (1878); also been president of the Irish Statistical Society, the Royal Irish Academy, and a trustee of the National Library of Ireland. He wrote *Greek and Latin Etymology in England*; *The Opus Major of Roger Bacon*; and *The Weak Endings of Shakespeare*. He contributed the articles on *Slavery* and *Political Economy* in this ENCYCLOPÆDIA. The latter paper was republished separately and translated into all the European languages. In 1893 he received the honorary degree of doctor of laws from Glasgow University.

INGRAM PRINTING MACHINE. See PRINTING PRESSES, in these Supplements.

INHERITANCE TAX. The question of whether the estates of deceased persons should be subject to taxation by a special inheritance tax when coming into the hands of heirs, devisees, etc., has been a subject of general interest in the United States within the last decade. While this system of taxation has been in use in some states for over fifty years, yet the justice of such a tax has not been fully conceded, as is shown by the strong opposition which has been manifested against it in those states where this class of taxation has been introduced within the last few years. It would now seem, however, to be the general opinion that inasmuch as under the common law a man has not the inherent right of disposing of his estate after his death, but that such right has been accorded him as a mere concession from the public to whom his estate would naturally go, therefore the state has the full right to impose a tax of this class, even admitting that such a tax is a mere bonus, burden, or a double tax, as its opponents claim. It is by virtue of the laws of the state, and not through any natural right, that heirs, devisees, etc., are permitted to succeed to property of which they, as a rule, have had no part in accumulating, and the

state would have a perfect right to change the rules of inheritance in such manner as might be thought best. The chief advantages of this method of taxation are, that it is perhaps less burdensome than any other, because it takes a portion of property which, under the natural laws, belong to the public. It also tends to lessen the evil of vast accumulations of riches in a family line, and to work a distribution to the interest of all.

The system of taxing collateral and direct inheritances, legacies and successions was in use among the Romans, and perhaps at a still earlier period. In modern times this system of taxation is in use in many of the countries of Europe, among which are England, Germany, Austria, France, Switzerland, Holland, Russia, Italy, Spain, Portugal, Greece, Denmark and Sweden. It also exists in the colonies of Australia, the provinces of Canada, in Chile and Guatemala. The first inheritance tax was imposed in the United States in 1826, in the state of Pennsylvania. Since then many states have adopted laws modeled somewhat after that of Pennsylvania. In Louisiana a tax was imposed upon foreign heirs, which was declared constitutional in 1850. This law was repealed in 1877 and re-enacted in 1894. The following states have now laws imposing an inheritance tax: Virginia, 1844; Maryland, 1845; Delaware, 1869; New York, 1885; West Virginia, 1887; Connecticut, 1889; Massachusetts, 1891; Tennessee, 1891; New Jersey, 1892; Ohio, 1893; Maine, 1893; California, 1893; Louisiana, 1894; Illinois, 1895. Many of these earlier laws have been greatly modified by amendment since their adoption. In New Jersey and Ohio these laws have been declared unconstitutional in part, and similar laws have been declared wholly unconstitutional in New Hampshire and Minnesota. In Minnesota, however, a constitutional amendment was adopted in 1894, permitting inheritance taxes to be imposed. Similar taxes were established in North Carolina in 1847, but the law was repealed in 1883.

The success of the inheritance tax from a financial standpoint has been very great. In the state of New York, since the adoption of this system in 1885, about fifteen million dollars have been collected from this system alone. About one million dollars annually is collected in Pennsylvania, which state has only a collateral inheritance tax and does not impose a tax on property descending directly to lineal heirs. The tendency to establish a tax of this character in states where it has not been done is increasing, and at least some additional states may be added to the list in the near future. Except in the states above mentioned, these laws have been held to be constitutional whenever tested in the courts, and it may be recognized that the principle of taxing inheritances is generally constitutional, and wherever the laws have been held otherwise, it is the fault of the lawmakers in framing them and not the principle itself. But in New Hampshire the principle was said to be contrary to the constitution.

The inheritance tax in England, there commonly called "death duties," was entirely remodeled in 1894. Instead of the five taxes known as probate, account, estate, legacy and succession duties, they

are reduced to three—estate, legacy and succession duties, which three include what was formerly included in probate and account duties. The great change is in estate duties, which are now levied upon the entire estate, real and personal, according to a graduated scale, and based upon the actual market value of the estate. Legacy duties are levied against personal property, and succession duties against real estate, somewhat similar to the old law. See SUCCESSION DUTIES, Vol. XXII, p. 616.

INHIBITION. See PHYSIOLOGY, Vol. XIX, p. 22.

INITIAL HEREDITY. See HEREDITY, in these Supplements.

INITIAL UNITS OF HEREDITY OR BIOPHORS. See HEREDITY, in these Supplements.

INJUNCTION. The rules under which injunctions may be obtained vary quite extensively in the different states of the United States, but it may be stated as a general rule, that a perpetual injunction will not be granted except after notice to the parties who will be affected thereby. In most of the states, however, an injunction will be granted temporarily when it appears to the court before which the application for an injunction is made that great injury or injustice will result by requiring notice to be given. This method of granting injunctions is not usually favored by the courts, and it is generally necessary that the facts warranting the issuance of an injunction without notice shall be fully set forth under oath.

The primary ground upon which injunctions are granted is to prevent irreparable injury. There are a great variety of cases in which the remedy of injunction is applicable, and its use throughout the United States has become very extensive by reason of the prompt and effective results which it affords. The remedy for any violation of an injunction is by an application to the court to punish the party disobeying the injunction for contempt of court in disobeying the mandate of legal process. The punishment will vary according to the gravity of the offense.

In recent years much complaint has been made because of the sweeping effect of some injunctions which have been granted for the purpose of assisting in quelling public disturbances. The practice of granting injunctions against rioters and the leaders of disturbances in cases of great industrial strikes has grown into extensive use, especially by the Federal courts, and has naturally met with much adverse criticism. The granting of injunctions under such circumstances to protect the United States mails and for other similar purposes has frequently been sustained by the supreme court of the United States. This practice of using an injunction to suppress public disturbances has been termed "government by injunction" by some opponents of the practice, and has been harshly criticized. See also INJUNCTION, Vol. XIII, p. 78.

INK-BERRY. See HOLLY, Vol. XII, pp. 101, 102.

INKERMANN. See CRIMEA, Vol. VI, p. 587.

INMAN, HENRY, an American painter; born in Utica, New York, Oct. 28, 1801. He studied with John Wesley Jarvis in New York, and in 1822

opened a studio as a portrait-painter and made quite a reputation for himself. He went to Philadelphia (1832), but in a few years returned to New York. In 1838 he had become famous in this country, but his health began to fail and other troubles came upon him. In 1844 he went to England with commissions from friends to paint for them portraits of Chalmers, Macaulay and Wordsworth. He partially regained his health, and acquired fresh laurels in England. Among his paintings are portraits of Van Buren, De Witt Clinton, Chief-Justice Nelson, Audubon, W. A. Duer, and William H. Seward. Some of his other paintings are *Lake of the Dismal Swamp*; *Newsboy*; *Rip Van Winkle Awakening*; and *An October Afternoon*. He returned to the United States in 1845, and died in New York city, Jan. 17, 1846.

INNATE OR INTUITIVE IDEAS. See LOCKE, Vol. XIV, p. 758; PSYCHOLOGY, Vol. XX, pp. 55-57.

INNERVATION. See RESPIRATION, Vol. XX, p. 480.

INNES, THOMAS, a Scottish historian; born at Drumgask, Aberdeenshire, in 1662. At fifteen he was sent to Paris, where he studied at the College of Navarre and the Scots College. In 1692 he received priest's orders, and after three years of mission work in Banffshire, returned to Paris and became prefect of studies in the Scots College. His *Critical Essay on the Ancient Inhabitants of Scotland* (1729) is much the earliest of all scientific histories. It was meant for an introduction to a *Civil and Ecclesiastical History of Scotland*, one volume of which, coming down to Columba's death, he prepared for the press, while another, bringing down the narrative to 831, was left incomplete. The work retains a permanent value. He died in Paris, Jan. 28, 1744.

INNESS, GEORGE, an American landscape-painter; born at Newburg, New York, May 1, 1825. At the

GEORGE INNESS.

age of twenty-one he began landscape-painting in New York City. He then made visits to Europe, and resided in Florence and Rome for some time. He returned to New York about 1868, and from 1871 to 1875 again lived in Italy. In 1868 he became a National Academician, and in 1889 received a third-class medal at the Paris Exposition. After his death a memorial exhibition of 240 pictures left by him was opened, and sold at auction for \$108,670. This exhibition called renewed attention to the fact that there was an ideality about the best landscapes of Mr. Inness which appealed to the best emotions and sentiments of a cultivated nature. He has taken rank already as one of the best of American landscape-painters. Among his best paintings are *The Sign of Promise*; *Peace and Plenty*; *Going Out of the Woods*; *The Valley of the Shadow of Death*; *Summer Sunshine and Shadow*; *Pine Grove*; *American Sunset*; *St. Peter's*; *Rome, from the Tiber*. He

died at Bridge of Allan, Scotland, Aug. 3, 1894; but was buried in America.

INN-KEEPER, one who keeps a public house for the lodging and entertaining of guests who conduct themselves properly and who are able and ready to pay for their entertainment. Such a house in the United States is usually called a hotel. Restaurants, boarding-houses, lodging-houses and other similar public houses are not inns within the meaning of the law, but in some respects such houses are governed by the same or similar rules. The common-law liability of inn-keepers for the protection of the property and personal effects of their guests is quite extreme, and the greatest care and caution are necessary, but by statute in many states of the United States it is provided that inn-keepers may provide iron safes for the purpose of depositing the valuables belonging to their guests for safe-keeping, and, upon posting notices in public places about the hotel to the effect that the proprietor will not be responsible for the loss of valuables unless given to him for deposit in such safe, the inn-keeper will be relieved from liability because of the loss of valuable articles, unless such loss was caused through the neglect or misconduct of the inn-keeper or some of his servants. Other statutory provisions are made in most states for the protection of inn-keepers. In most states it is made a criminal offense to obtain entertainment at a public house with the intention not to pay therefor, and the penalty for a violation is quite severe. As to the common-law rules concerning the liabilities and rights of inn-keepers, see INN-KEEPERS, Vol. XIII, p. 81.

INNOCENTS' DAY, a festival, in commemoration of the massacre of children ordered by Herod with a view of destroying the Saviour, and one of the anniversaries retained by the English Church at the Reformation. It falls on December 28, and in the Middle Ages it was one of the chief festivals. On that day children were dressed in the clothes of their elders and allowed to exercise mock authority; but in some places they were given a whipping to remind them of the original cruelty which gave rise to the day, and everywhere it was considered an unlucky day. At the present time, in some of the Roman Catholic countries, the day corresponds to our All Fools Day, and the remark after a practical joke is, "May your innocence protect you!"

INNUIT INDIANS. See ESKIMO, Vol. VIII, pp. 543-547.

INO, in Greek mythology daughter of Cadmus and Harmonia. Athamas, King of Orchomenos, by order of Juno had married Nephele, by whom he had two sons, Phrixus and Helle. But he put away Nephele and married Ino, with whom he had been in love. His first wife disappeared, and he was seized with madness and murdered his own son Learchus; and Ino, fleeing in terror with the other son, Melicurtis, threw herself into the sea, where she was transformed into the marine deity Leucothea, and Melicurtis into Palæmon. Athamas was compelled, on account of his crime, to flee from Boeotia into Thessaly.

INOCARPUS EDULIS, a plant of the Pacific islands, belonging to the family *Thymelæaceæ*, and

remarkable for its peculiarly modified branches, which are flat and board-like, and are used without modification by the natives in the erection of their huts. The nut-like fruit of the tree is edible.

INOCULATION, IN MEDICINE, the transference of a disease from one individual to another by insertion of the virus of the disease into the tissues of the body. See **SMALLPOX**, Vol. XXII, p. 162; also **VACCINATION**, Vol. XXIV, p. 23.

INOCULATION OF PLANTS OR BUDDING. See **HORTICULTURE**, Vol. XII, p. 237.

INOSITE OR MUSCLE-SUGAR, a sweet substance found in various portions of the body of many animals and plants. Though it has the same composition as grape-sugar, it is not a true sugar, but a hexaoxyhexahydrobenzene. It cannot be converted into alcohol by fermentation, but will undergo the lactic-acid fermentation.

INOUE, KAORU, COUNT, a Japanese statesman; born in Choshin, in western Japan, 1839. He was convinced, through a secret journey to Europe, that Japan should adopt the methods of Western civilization, and spent the rest of his life advocating this policy. He was appointed Minister of Finance in 1868, and was special ambassador to negotiate a treaty with Corea (1876), after which he was commissioner to the Centennial Exhibition at Philadelphia. On his return was made Minister of Foreign Affairs, an office he held till 1884. In 1885 a peerage was conferred upon him, and in 1887 he retired from public service, but was recalled, in 1892, to the office of Minister of the Interior, the second highest office in the cabinet.

IN REM, a technical legal term which is used to designate proceedings against the thing as distinguished from personal actions. Actions to declare a forfeiture against property are actions *in rem*. In actions of this class the property only is liable, and no right of action exists against the owner thereof. Personal actions are said to be actions *in personam*. Frequently actions may be maintained either *in rem* or *in personam*, and sometimes both together. Thus seamen may proceed against the ship for their wages, or against the master or owner thereof.

INSECT FERTILIZATION. See **INSECTS**, Vol. XIII, p. 142.

INSECTICIDE OR INSECT-DESTROYER. The development during the last few years, especially in horticulture, has necessitated the employment of means to do away with injurious insects. One means adopted has been to introduce birds which prey upon insects; but the commonest process of destruction has been through the use of poisons, fumigation, etc. These latter methods are especially effective after the insect has developed; but about the only way to prevent the egg from hatching is through washings, or, when the egg has been laid on a leaf of the previous year, by digging around the foot of the plant and so turning up the leaves. The various insecticides may be classified loosely under four heads:

(1) **MINERAL Arsenicals**—*Paris Green and London Purple*. Paris green is a fine crystalline powder, containing about 50 per cent arsenic, 30 per cent copper oxide and a small percentage of acid.

London purple is a by-product in the manufacture of aniline dyes, and contains a number of substances, but chiefly arsenic and lime. It is a finer powder than Paris green, but not so effective, and is likely to scald the foliage. Both are used almost exclusively for biting and gnawing insects on the exterior of plants, and may be applied in various ways, the commonest methods being to dissolve in large quantities of water and use as a spray, or by applying as a powder, mixed with lime, flour or some other dust.

Arsenate of Lead. Made by mixing three parts arsenate of soda with seven parts acetate of lead and adding a little glucose to make it stick. Its advantage over Paris green is that it can be more easily seen and will not injure delicate foliage; but its destructive powers are no greater.

Bisulphide of Lime. This is even better than sulphur, and is diluted easily. It is made by boiling sulphur and lime in a small quantity of water.

Carbon Bisulphide. This substance is useful in doing away with root-lice, ants, and insects which infest stored grain. It is exceedingly volatile, and the least spark is liable to explode it. The usual method of application is to pour it into holes near the affected root and cover up quickly; or, in the case of grain, by setting dishes in closed bins and leaving for 24 hours.

Sulphur. May be used in water or mixed with some other insecticide for plant-mites; in some cases it may be scattered around alone, or, for animal lice, etc., it may be fed to the animal.

Tur. Dissolved in water and sprinkled on the plant, it acts as a repellent, or, smeared on bands and wound about the bases of fruit-trees, it will prevent some insects from ascending and depositing their eggs. It is sometimes used about the nostrils of sheep as a preventive in the same way against the bot-fly.

(2) **VEGETABLE**. *Hellebore*. White hellebore is used as a substitute for the arsenicals, being less injurious to man and the higher animals. It is costlier than the arsenicals, and only serves the same purposes; may be applied either as a powder or diluted with water.

Pyrethrum, also sold under the name *Buhach* and *Persian Insect Powder*. It is used as a powder, and is dusted about rooms or wherever the insects are found; acts on insects externally through their breathing-apparatus; and may be used against mosquitoes by fumigation.

(3) **OILS AND EMULSIONS**. *Kerosene*. This is used sometimes as a spray directly against insects, but is liable to injure or kill the plant; if mixed with water it breaks into fine spray and is less likely to damage vegetable tissue. It is used also to kill many insects after they have been shaken or picked from the plant. If a small amount of kerosene is poured on the surface of a pond or stagnant pool it will destroy all forms of water-insects, including the larvæ, and prevent mosquitoes from depositing eggs. However, the oil is used more in emulsions for prevention of all sucking insects and all biting insects when they cannot safely be poisoned.

Kerosene and soap emulsion. Boil half a pound of soap in a gallon of water, and add it, while hot, to two gallons of kerosene and mix it thoroughly by force-pump until it attains the consistency of cream. An emulsion of this kind should keep for an indefinite period. The water should be soft or treated with lye before using, either in making or diluting the emulsion. The emulsions are used to spray the plant.

Kerosene and milk emulsion. Use a gallon of sour milk and a couple of gallons of kerosene; churn as in the other emulsion until it assumes the consistency of butter.

Naphthalene sometimes is used in place of carbon-bisulphide. In the form of crystals it is used to drive away moths and insects from stored grain, and to protect natural-history specimens from the ravages of museum pests.

Fish oil, train oil and cotton-seed oil. All these are used to get rid of vermin on domestic animals, and when smeared on points of attack will repel such insects as the horn-fly, the bot-fly, etc. They or any strong-smelling oil may be used against lice, but care must be taken or they may cause the hair to fall off.

(4) **MIXED**. *Corrosive sublimate*. It is a repellent, sometimes used on account of its strong smell.

Hydrocyanic acid gas. Generated by placing three ounces of water, an ounce of commercial sulphuric acid and an ounce of fused potassium cyanide in a glazed vessel. The plant or tree is covered with a tent and the generator left inside for about half an hour. The gas is used mostly against scale insects.

Resin wash. This is made by boiling thoroughly, and until there is no sediment, 20 pounds resin, 5 pounds of caustic soda, 2½ pints of fish-oil with water, gradually added and before using, amounting to 100 gallons. It is used in countries where long dry seasons assure its continuance on the trees; also as a winter wash in mild climates when the multiplication of insects continues throughout the year. It should be sprayed on plants.

Soaps. Any good soap is effective in destroying soft-bodied insects, such as plant-lice or young larvæ. The soap wash is made by dissolving half a pound of soap in a gallon of water; but fish-oil soaps are especially valuable.

Sulphide of soda wash. Made by dissolving 30 pounds of whale-oil soap in 60 gallons of water; then boil 3 pounds of concentrated lye with 6 pounds of sulphur and 2 gallons of water; mix both the soap and sulphide, and boil for half an hour. It is used for scale insects, and should be sprayed on while warm.

Tobacco and whale-oil soap. These are used as a wash, and tobacco is used alone as a dust, steeped in water, and as a fumigator.

Beside these, there are various processes which cannot be mentioned here; for instance, various methods of getting rid of bed-bugs and house-flies.

INSECTIVORA. See **MAMMALIA**, Vol. XV, pp. 400-405.

INSESSORES OR **PERCHING BIRDS**, an order of birds, including the perching birds exclusive of the birds of prey. The leading characteristic of birds of this group was the presence of three toes in front and one behind. The group was very artificial, including passerine and many other birds, and is now obsolete in this sense. The term is now often used as a synonym for *Passeres*.

INSOLVENCY, see **BANKRUPTCY**, Vol. III, pp. 341-345, and in these Supplements.

INSPIRATOR, a form of injector for supplying steam-boilers. It has two chambers, and employs two separate jets of steam, one to raise the water from its source, and the other to force it into the boiler against the pressure of the steam within. The steam acts by suction, on the principle familiarly observed in sprayers for cologne-bottles. The two jets work in combination, the second jet being equivalent to an ordinary boiler-injector.

INSULATION. See **ELECTRICITY**, Vol. VIII, pp. 36-40.

INSULATORS AND CONDUCTORS. See **ELECTRICITY**, § 6, in these Supplements.

INSURANCE. See Vol. XIII, pp. 161-187; also **ACCIDENT, FIRE, LIFE and MARINE INSURANCE**, in these Supplements.

INSURRECTION, an uprising of citizens of a country against the government or laws of the country. By the constitution of the United States, Congress is given power to provide for the calling out of the militia to execute the laws of the Union and suppress insurrections. By act of Congress of Feb. 28, 1795, it is provided that whenever the laws of the United States shall be opposed, or the execution thereof obstructed, in any state, by combinations too powerful to be suppressed by the ordinary course of judicial proceedings or by the powers

vested in the marshals by this act, it shall be lawful for the President of the United States to call forth the militia of such state or of any other state or states as may be necessary to suppress such combinations and to cause the laws to be duly executed; and the use of militia so to be called forth may be continued if necessary until the expiration of thirty days after the commencement of the next session of Congress.

INTEGRAL CALCULUS. See **INFINITESIMAL CALCULUS**, Vol. XIII, pp. 33-72.

INTELLECTION. See **PSYCHOLOGY**, Vol. XX, pp. 75-83.

INTENSITY. See **ELECTRICITY**, §§ 16, 20, 21, in these Supplements.

INTENT, the design or determination fixed in the mind. The law requires that one cannot be convicted of a criminal offense unless the act was done through a wrongful intent. The wrongful intent must also be combined with a wrongful act. Generally, when a wrongful act has been committed the law will conclusively imply a wrongful intent, in the absence of satisfactory proof to the contrary. Intent must generally be proved by attending circumstances, from which the intent may be inferred. In contracts it is essential to the validity of the document that the intent of the parties was to enter into the contract. In construing wills, deeds, contracts and other instruments the intent of the parties will govern, and such intent must usually be determined by reference entirely to the document, and to every part of it. Statutes are also to be construed according to the intent of the law-makers, which intent must be gathered from the statutes themselves and the attending circumstances. See also **NEGLIGENCE**, Vol. XVII, pp. 315, 316.

INTERCALARY. See **CALENDAR**, Vol. IV, pp. 666, 667.

INTERCOLUMNIATION, the spacing between columns. See **ARCHITECTURE**, Vol. II, pp. 409, 410.

INTEREST, the compensation which the debtor pays to his creditor for the use of money or the detention of the debt. Legal interest is the rate of interest which is established by law, and which will prevail in the absence of an express agreement as to the rate. Usury or usurious interest is a rate of interest in excess of that which the law permits to be charged under express contract. The rate of interest in the United States is governed by the statutes of the various states, which generally fix a legal rate of interest, but provide that by special contract a different rate may be charged, but not in any event to exceed a certain fixed maximum rate. Any rate higher than the maximum rate is made usury, and generally precludes the lender from the right to collect any interest, and in some states the lender at usurious interest forfeits the right to collect either principal or interest. When a contract is sought to be enforced in another state the laws of the state wherein the contract was made will govern, and the rate of interest permitted in such state will be followed. The laws of the various states as to the legal rate of interest are frequently changed. In some states, in addition to the forfeitures shown below, usurious

interest may be recovered, even when paid, if suit for that purpose is brought within time specified. In a few states, when such interest has been collected, double or even triple the amount of such usury may be recovered by the party paying it. In some states the laws are complicated, and many exceptions are allowed as to usury forfeitures.

As a general rule, the legal and maximum rates increase from the eastern to the western part of the United States. The legal rate in the majority of the states is 6 per cent. In Alabama, Colorado, Florida, Oregon and Utah the rate is 8 per cent; in Arizona, California, Georgia, Minnesota, Nebraska, Nevada, North Dakota, Oklahoma, South Carolina, South Dakota and Washington, 7 per cent; in Illinois and Louisiana, 5 per cent; in Idaho and Montana, 10 per cent; and in Wyoming, 12 per cent. The maximum rate does not exceed 10 per cent in the majority of states. In Idaho, however, it is 18 per cent; and in New Mexico, North Dakota, South Dakota and Washington, 12 per cent. Arizona, California, Colorado, Maine, Montana, Nevada, Oklahoma, Rhode Island, Utah and Wyoming either have no usury laws, or provide that any rate contracted for may be collected. Massachusetts provides that not more than 18 per cent can be collected on loans less than \$1,000. Of those states which have usury laws, 15 provide that in case illegal rates are charged the whole interest is forfeited. In Connecticut, Georgia, Indiana, Kentucky, Louisiana, Maryland, Missouri, New Mexico, Ohio, Vermont and West Virginia, all interest above the maximum rate is forfeited. The forfeiture for usury is, in Arkansas, both principal and interest; in Delaware, an amount equal to the money lent; in Idaho, 10 per cent of the debt; in Indian Territory, both principal and interest; in Iowa, all of the interest and 10 per cent of the principal, the latter forfeiture going to the school fund; in Kansas, double the excess above 10 per cent; in New Hampshire, three times the excess above legal rate; in Oregon, the principal is forfeited to the school fund; in South Carolina, double the interest charged; in Tennessee, only the actual debt is recoverable; in Washington, double the rate charged; in New York, usurious contracts are void; in South Dakota and Tennessee, taking of usury is a misdemeanor punishable by fine or imprisonment.

See also INTEREST, Vol. XIII, p. 188; and USURY, Vol. XXIV, pp. 17-19.

INTERFERENCE FRINGES. See WAVE THEORY, Vol. XXIV, pp. 425, 426.

INTERFERENCE OF POLARIZED LIGHT. See WAVE THEORY, Vol. XXIV, pp. 446-448. OF SOUND, see ACOUSTICS, Vol. I, pp. 116-119; and WAVE, Vol. XXIV, p. 421.

INTERIM. See TRUST, Vol. XXIII, p. 596.

INTERIOR DEPARTMENT OF THE, an executive department of the United States government, presided over by the *Secretary of the Interior*, who is a member of the President's Cabinet, and whose general duties are the supervision of patents and inventions; pensions and bounty lands; public lands and surveys; the Indians; education; railroads; the geological surveys; the census, and the reservations and national parks. He also exercises certain powers and duties relating to the territories of the United States. He is assisted by the *First Assistant Secretary of the Interior*, who examines charges against officers and employees; instructs Indian and mine inspectors; supervises matters pertaining to the Indians, to the distribution of certain public documents, to government schools, etc.; and acts as secretary in the absence of that

officer. The *Assistant Secretary of the Interior* considers appeals from the Commissioner of Pensions, on matters relating to violations of the pension laws, and from the Commissioner of Patents; countersigns letters-patent; admits and disbars attorneys and agents practicing in the department; and acts as secretary in the absence of both that officer and the first assistant secretary. The *Chief Clerk* has general supervision of the clerks and employees of the department; the order of business and records; correspondence of the secretary's office; stationery, printing, etc., for the department and its bureaus; and the buildings occupied by the department.

The work of this department is distributed among eight bureaus, as follows:

The *Commissioner of Patents* has charge of all matters relating to the issue of letters-patent for new and useful discoveries, inventions and improvements, and to the registration of trademarks and labels.

The *Commissioner of Pensions* supervises the examination and adjudication of all claims for pensions or bounty lands on account of service in the army or navy during the Revolutionary War and subsequent wars in which the United States has been engaged.

The *Commissioner of the General Land Office* is charged with the survey and sale of the public domain and the issuing of titles therefor.

The *Commissioner of Indian Affairs* has charge of the several tribes of Indians in the states and territories; of their agents and school superintendents; and superintends the purchase and distribution of presents and annuities to the Indian tribes.

The *Commissioner of Education* collects statistics and facts concerning education in the United States; in his reports gives information and suggestions respecting the organization and management of schools, of school systems and methods of teaching; and otherwise labors to promote education throughout the country.

The *Commissioner of Railroads* is charged with the duty of requiring such railroads to report to him as have had granted them by the United States any loan or credit, or subsidy bond or lands. He is required to examine the books and accounts of said railroad companies; to see that the laws relating to them are enforced; to furnish to the departments of the government such information as to tariffs for freight and passengers as may be required or which may be for the interest of the government; and to report annually to the Secretary of the Interior.

The *Director of the Geological Survey* has charge of the classification of public lands and of the government investigations of the geological structure, mineral resources and products of the national domain.

The *Superintendent of the Census* supervises the taking of the census in the United States every tenth year, and the subsequent publication of the statistics collected. The statistics relate to population, to the products of manufactories, mining

and agriculture, to mortality and vital statistics, to public indebtedness, to recorded public indebtedness, to statistics relating to corporations, etc.

SECRETARIES OF THE INTERIOR. The following is a complete list of the Secretaries of the Interior from the organization of the Department, with dates severally of their appointment: Thomas Ewing, 1849; James A. Pearce, 1850; Thomas M. T. McKernon, 1850; Alexander H. H. Stuart, 1850; Robert McClelland, 1853; Jacob Thompson, 1857; Caleb B. Smith, 1861; John P. Usher, 1863, 1865; James Harlan, 1865; Orville H. Browning, 1866; Jacob D. Cox, 1869; Columbus Delano, 1870; Zachariah Chandler, 1875; Carl Schurz, 1877; Samuel J. Kirkwood, 1881; Henry M. Teller, 1882; Lucius Q. C. Lamar, 1885; William F. Vilas, 1888; John W. Noble, 1889; Hoke Smith, 1893; David R. Francis, 1896; Cornelius N. Bliss, 1897; Ethan Allen Hitchcock, 1899.

INTERMITTENT FEVER. See *Malarial Fever*, under **PATHOLOGY**, Vol. XVIII, pp. 394-396.

INTERNATIONAL ARBITRATION LEAGUE, formerly known as the Workmen's Peace Association; was established in 1870 to promote a policy of peace and international arbitration, and for many years has carried on an active peace propaganda in Europe and America. It organized the inter-parliamentary conferences of members of parliaments in favor of international arbitration, which have met for the last six years in various cities of Europe. The society publishes a monthly organ, *The Arbitrator*.

INTERNATIONAL COPYRIGHT. See **COPYRIGHT**, in these Supplements.

INTERNATIONAL EXHIBITIONS. See **WORLD'S FAIRS**, in these Supplements.

INTERNATIONAL LAW, PRIVATE, is a branch of jurisprudence defining the rights and obligations of a subject or citizen of one state residing or making contracts in another state. Referring, as its principles do in the main, to real and personal estate, contracts and obligations, and to domestic relations, one general principle pervades the whole, viz., that in relation to property the *lex loci situs* (law of the place where situate) applies in general, and as regards contracts the *lex loci contractus* (law of the place of contract). Reference may also be made to the titles **DIVORCE**, Vol. VII, pp. 300-305; **DOMICILE**, Vol. VII, pp. 331-353; **INTERNATIONAL LAW**, Vol. XIII, pp. 190-197; **TESTACY**, Vol. XIII, pp. 197, 198; **MARRIAGE**, Vol. XV, pp. 565-569; **WILL**, Vol. XXIV, pp. 570-574; and to the same titles in these Supplements, as well as to **BELLIGERENCY** and **EXTRADITION**.

INTERPOLATION. See **TABLES**, Vol. XXIII, p. 13.

INTERPRETATION. See **HERMENEUTICS**, Vol. XI, p. 741.

INTERPRETATION, IN LAW. See **STATUTE**, Vol. XXII, pp. 469, 470.

***INTERSTATE COMMERCE LAWS.** The main cause leading to the Interstate Commerce Act was the almost universal dissatisfaction of the people with the methods of the railroad companies,

particularly as regarded the discriminations practiced between persons and places, and the policy of pooling earnings for the purpose of destroying competition. The multiplication of railroads caused wars of rates between the rival companies, resulting invariably in the defeat of the weaker company and its absorption by the stronger, and, finally, in the public being made to pay the whole cost of the war, by rates increased to the limit of all that the traffic would bear. Complaints of extortion, unfair dealing and worse practices were made against the railroads, so that the authorities were constrained to take cognizance of them.

Legislation which indicated the reserve power of the state to supervise the workings of the railroads had been enacted almost from the beginning. As early as 1845 New Hampshire provided for an official charged with the collection of information respecting railroads and the study of their relations to the state. In 1855, New York, Connecticut and Vermont took similar action. In 1858, Maine established an experimental railroad commission; Ohio established one in 1867, and Massachusetts in 1869. Even the regulation of rates had been the subject of legislation in various states, in one so early as 1850.

It was the Granger agitation, however, that brought railroad regulation prominently to attention as a subject for state legislation. This movement was the outcome of a spirit of discontent among the farmers of the states of Illinois, Wisconsin, Iowa and Minnesota, acting in unison as members of an organization called the National Grange. (See **FARMERS' ORGANIZATIONS**, in these Supplements.) The panacea for grievances was the reduction in transportation charges, which the Grangers sought—first, by the passage of state laws fixing rates, either through commissions or by statutes, at figures satisfactory to farming interests; and second, by obtaining Congressional aid in cheapening through movements, either by the improvement of waterways, regulation of charges of trunk lines, or the construction of a cheap national freight railway. All of these methods found earnest advocates.

The contention, by the railroad companies, that the states had no power to fix rates was disposed of by the supreme court of Minnesota, which decided, in a case against the Winona and St. Peter railroad, that the railroads are simply improved public highways, and that, as such, the right to prescribe a rate of tolls and charges is an attribute of the sovereignty of the people, of which no legislature can divest them. Furthermore, the United States supreme court established the precedent, that while Congress has the power to treat the subject of interstate commerce as a whole, any state, in the absence of national legislation, has the power to regulate such interstate commerce as affects its citizens, whether the transportation extends beyond the state or not.

As early as 1870, Ohio, Illinois, Iowa, Wisconsin and Minnesota began to respond to the demands of the Grangers with legislation aiming at the curtailment of railroad earnings, the regulation of charges and the obviating of causes of grievance and complaint.

The culminating point in this restrictive legisla-

tion was reached in 1874, when the so-called Potter Law was enacted in Wisconsin, and a state railroad commission established to carry out its provisions. The Potter Law divided the railroads of the state into three classes, and fixed rates of fare and freight for each class. Class A included all lines whose gross earnings per mile were \$4,000 or more; Class B, \$3,000, or any sum less than \$4,000; Class C, less than \$3,000. Class A was limited to a charge of 3 cents per mile for passengers; Class B, to 3½ cents per mile; and Class C, to 4 cents per mile. The law also divided freights into four general classes and seven special ones, the latter being confined to car-load freights. Railroads of Classes A and B were limited, for freight of Class D, which included grain in bulk, to a charge of 6 cents per hundred pounds for the first 25 miles, 4 cents for the second 25 miles, and 2 cents for each additional 25 miles. Class B railroads were forbidden to charge more than the rates which they charged on June 1, 1873. At the same time, the Maximum Rate Law, identical in its provisions and prohibitions with the Potter Law, except that no commission was established under it, was enacted in Iowa. The railroads refused to obey these laws, on the ground of their unconstitutionality, and applied for injunctions restraining the state officers from enforcing them; but the state courts, and finally the United States Supreme Court, declared them valid.

Other states followed those named with similar legislation, and state railway commissions began to be established and to become regular institutions in most of the states, some of the Southern states, as well as Western and Northwestern states, having substantially adopted the entire Granger system of railway regulation.

The Grangers demanded national as well as state action for their relief, and accordingly a committee was appointed by the United States Senate, in December, 1872, of which Senator Windom of Minnesota was chairman, to investigate and report upon the subject of transportation between the interior and the seaboard. After the most searching inquiry that had ever been made in all matters affecting through rail and water movements, the committee made a lengthy report in April, 1874, recommending that laws should be passed, providing, among other things, for the establishment of a national bureau of information, charged with the duty of obtaining and publishing annually such facts in relation to interstate commerce as would enable Congress to legislate intelligently on the subject. The committee announced, however, that it was of the opinion that the problem of cheap transportation might be better and more quickly solved, not by direct Congressional regulation of existing lines, but through competition furnished by one or more double-track freight railways, honestly and thoroughly constructed, owned or controlled by the government, and operated at a low rate of speed, and by waterways improved and extended at the national expense or by appropriations of Congress.

The recommendations of the Windom committee with regard to the government furnishing the competition thought necessary to the solution of the

railway problem, brought about no immediate action beyond the canvassing of several more or less visionary schemes, but the discussion which followed resulted in the introduction of various measures for the regulation of the railways, and finally in the passage of the Reagan Bill on Jan. 8, 1885. This bill had been advocated through four sessions of Congress, and made its nearest approach to success in its passage by the House. In the Senate it was opposed by the Cullom Bill. The Senate (Cullom) bill, when passed, went to the House of Representatives, and was referred to the committee on commerce, of which Mr. Reagan was chairman.

The House and Senate bills had much in common. Both bills attempted to define and prohibit discrimination and unreasonable rates, declared such offenses misdemeanors, and provided civil remedies and criminal penalties for them. The Cullom Bill prohibited rebates and drawbacks only where they inflict unjust discriminations, while these practices were altogether forbidden by the Reagan Bill; pooling was forbidden by the Reagan Bill, while the Cullom Bill would refer the subject to the commission, the creation of which was one of its distinctive features; the Reagan Bill forbade the charging of a greater rate for a short than for a long haul which included the shorter. But the most important difference was in the legal remedies provided against offenses prohibited. While the Cullom Bill provided for the establishment of a board of nine railway commissioners with power to hear complaints, assess damages, and certify cases to the district courts of the United States if companies refused to pay such damages, the Reagan Bill left its provisions to be enforced by the existing courts, only seeking to make the remedy more direct and easy.

After another session, in which each branch of Congress insisted upon its own measure, a bill uniting the commission feature of the Cullom Bill with most of the prohibitions and civil remedies of the Reagan Bill, was agreed upon in the House, and passed that body on July 30, 1886. A conference committee was appointed, and at the second session of the Congress, that committee agreed upon a report, which was presented to the Senate Dec. 16, 1886. It received the approval of the President of the United States on Feb. 4, 1887. The commission was organized March 31, 1887, and entered at once upon its duties. The other provisions of the act took effect April 5, 1887.

This act to regulate commerce was passed under the authority conferred upon Congress by the Federal constitution, "to regulate commerce with foreign nations, among the several states and with the Indian tribes."

As early in its existence as 1889 it was decided that the Interstate Commerce Commission was not a judicial tribunal within the meaning of the constitution.

By section 12 of the act the commissioners were empowered to subpoena witnesses and require them to produce books, papers, records, etc. In case of disobedience to a subpoena or refusal of a witness to appear before the commission and give testimony or produce books, papers and documents,

the commission was directed to appeal to the courts.

In November, 1890, one Charles Counselman was subpoenaed to testify before the United States grand jury in the northern district of Illinois touching alleged violations of the penal provisions of the act. The witness refusing to testify, and being held in contempt, appealed to the United States supreme court, and on Jan. 11, 1892, that court held said section to be unconstitutional. On Feb. 11, 1893, Congress enacted that the Interstate Commerce Commission was empowered to compel the attendance of witnesses and their testimony, including the producing of books, papers and documents, but provided that no such testimony should be used against the witness in any subsequent proceedings. This act was declared unconstitutional on Feb. 11, 1894, in that it required testimony which would incriminate witnesses. In March, 1896, the supreme court of the United States reversed the decisions of the lower courts, and decided that the amendment does not conflict with the constitution, and must stand. For applications of this law, see RAILROADS, in these Supplements.

JOHN P. MEANY.

INTERVALS. See MUSIC, Vol. XVII, p. 78.

INTESTINES. See DIGESTIVE ORGANS, Vol. VII, pp. 225-229.

INTOXICATING-LIQUOR LAWS. See LIQUOR LAWS, in these Supplements.

INTOXICATION, IN LAW. As a general rule, when a party, enters into a contract while intoxicated to such an extent as to be deprived of the exercise of his understanding, he may avoid such contract upon recovering his mental faculties. This rule is generally true, even though the intoxication was voluntary, but not when the party became intoxicated for the purpose of making the contract voidable.

In criminal law it is the rule that intoxication will not, in any manner, excuse or justify the commission of a crime. This is true, even though the person was so intoxicated as to be practically insane at the time of committing the crime. But the fact of drunkenness may be shown in mitigation of the offense, for the purpose of determining the purpose, intent or motive which actuated the commission of the crime. Thus, intoxication may be shown in rebuttal of charges of malice, and, when taken in connection with other facts, may operate to lessen the degree of the offense. But when the accused determined upon the act while sober and became intoxicated for the purpose of fortifying himself to commit the act, he will not be relieved in any particular because of being intoxicated. See DRUNKENNESS, Vol. VII, pp. 481-483.

INTRENCHED CAMPS. See FORTIFICATIONS, Vol. IX, p. 466.

INTROIT, an anthem sung in the Catholic Church by the choir at the beginning of high mass, while the celebrant, assisted by the deacon and subdeacon, is engaged in saying the *Judica me, Deus* and *Confiteor* at the foot of the altar.

The words are generally, though not always, taken from the Scriptures.

INTUITIONAL SCHOOL. See ETHICS, Vol. VIII, pp. 603-605.

INTUSSUSCEPTION, a term applied in physiological botany to a theory as to the mechanics of growth of the cell-wall, according to which this growth is due to the intercalation of new particles between those already existing. This theory is opposed to that of *apposition*, according to which the new material is deposited upon the internal surface of the cell-wall.

INULIN. See BOTANY, Vol. IV, p. 88.

INUNDATIONS. See RIVER ENGINEERING, Vol. XX, pp. 571, 572.

INVARIANT. See CURVE, Vol. VI, p. 722.

INVERSION, CHEMICAL. See SUGAR, Vol. XXII, p. 623.

INVERSION, ELECTRIC. See ELECTRICITY, Vol. VIII, p. 33.

INVERSION, IN MUSIC, a term denoting certain changes in melodies, chords or harmonies, bearing five different significations.

(1) In counterpoint it signifies the repetition of a phrase or passage with reversed intervals, or by contrary motion, and is a device very frequently used in the construction of fugues in order to secure variety.

(2) Double counterpoint is said to be inverted when the upper part is placed beneath the lower, or *vice versa*. The inversion may take place in any interval, thus giving rise to 14 different species of double counterpoint.

(3) When the lowest notes of an interval are raised an octave higher, and thus placed above the highest, or *vice versa*, the interval is said to be inverted. The process of inversion changes the name of an interval, and, to a certain extent, changes its nature in some cases. However, the essential character survives the operation unchanged, and appears with equal force in the inversion. No matter how they are taken, consonant intervals remain consonant, dissonant remain dissonant and perfect remain perfect.

(4) A note is said to be inverted when any note, other than the root, is taken in the lowest part.

(5) A pedal point is inverted when the sustained note, in place of being in the bass, is transferred to an upper or middle part.

INVERTEBRATA. See SKELETON, Vol. XXII, p. 106.

INVINCIBLES. See HOME RULE, in these Supplements.

INVOLUCRE. See BOTANY, Vol. IV, p. 120.

INVOLUTE. See MECHANICS, Vol. XV, pp. 679, 680.

IODIFORM, a compound of carbon, hydrogen and iodine, made by treating alcohol or acetone with iodine and caustic alkali. Hexagonal yellow crystals, having a peculiar, persistent odor, soluble in alcohol and ether, insoluble in water. Used in medicine as an antiseptic and in small doses, and sometimes, though rarely, given internally.

IOLA, a city and railroad junction and the

capital of Allen County, southeastern Kansas, situated on Neosho River and on the Atchison, Topeka and Santa Fé and the Missouri Pacific railroads, 38 miles W. of Fort Scott. The region is a fine agricultural locality and the city manufactures furniture and other goods, and quarries building and paving marble. An artesian well, 736 feet deep, supplies mineral water, and natural gas heats and lights the town. Population 1895, 1,565.

IOLAUS, in Greek mythology, son of Iphicles and Antomedusa, also friend and charioteer of Hercules. He assisted Hercules in the fight against the Lernæan Hydra, with Cynctus, with Geryones, and in the expedition against Troy. He was in the Argonautic expedition and the Calydonian boar hunt, and won the first Olympian chariot race with the horses of Hercules. He, with the children of Hercules, introduced civilization into the Island of Sardinia, and was worshipped by the inhabitants; was the first to worship Hercules after his death. After his own death he returned from the shades to assist the children of Hercules. He slew Eurystheus, and then went again to the shades.

IOLCUS. See THESSALY, Vol. XXIII, p. 299.

IOLITE. See MINERALOGY, Vol. XVI, p. 418.

ION, in Greek mythology, a son of Apollo and Creusa. He was taken to his father's temple at Delphi and educated. When Creusa and her husband, Xuthos, came to consult the oracle as to the means of obtaining an heir, Xuthos was prevailed upon by a false oracle to take Ion for his son. Creusa tried to poison the youth, and, when she failed, fled to Delphi, where she learned from a priestess that Ion was her son. The Ionians had a tradition to the effect that it was from him they received their name. Others represent him as helping the Athenians against the Eleusians, and later becoming their king.

IONIA, a city and the capital of Ionia County, central south Michigan, situated on Grand River and the Detroit, Grand Haven and Milwaukee and the Detroit, Northern and Lansing railroads, 32 miles E. of Grand Rapids. Agriculture and the lumber business are the leading industries. It contains the state asylum for insane criminals, and the state house of correction and reformatory. The place contains the railroad repair-shops of the Detroit, Lansing and Northern railroad, and various mills and factories. Population 1890, 4,482; 1900, 5,209.

IONIAN SEA, that part of the Mediterranean which lies between Greece and European Turkey on the east, and Italy and Sicily on the west. It forms the gulfs of Taranto and Patras, and communicates with the Adriatic Sea by the Strait of Otranto. It contains all the Ionian Islands, except Cerigo.

IONIC DIALECT. See GREECE, Vol. XI, p. 134.

IONIC ORDER. See ARCHITECTURE, Vol. II, pp. 405-407.

IOS, a small island in the Ægean, said to have contained the tomb of Homer, and claiming to be

his birthplace. Its modern name is Nio. It has a fine harbor and about 4,000 inhabitants.

IOWA. The population of Iowa in 1900 was 2,231,853. The number of inhabitants in 1890

STATE SEAL OF IOWA.

was 1,911,896, the gain for the ten years being 16.07 per cent. In 1890 the native-born citizens constituted 83.05 per cent of the entire population, the foreign-born 16.95 per cent. The negroes numbered 10,685, an increase for the decade of 1,169. The males numbered 994,453, the females 917,443. The number of persons to each square mile of territory was 34.46. In no state of as many inhabitants, except Texas, does the urban population constitute so small a percentage of the total number, the 12 cities of the state having 269,230 inhabitants, which is only 14.08 per cent of the whole. A state census was taken in 1895, which showed a total of 2,058,069, a gain since 1890 of 146,173.

The following table shows the area devoted to the cereals in 1889, the product in bushels of each, the relative standing of the state, and the percentage of the entire area and yield of the United States:

PRODUCT.	ACRES.	PER CENT.	RANK	BUSHEL.	PER CENT.	RANK
All cereals---	12,560,890	8.96	2d	483,198,008	13.73	1st
Corn-----	7,585,522	10.52	2d	313,130,782	14.75	1st
Oats-----	3,752,141	13.25	2d	146,679,289	18.13	1st
Barley-----	518,720	16.11	2d	13,406,122	17.11	3d
Rye-----	93,707	4.31	7th	1,445,283	5.09	7th
Buckwheat---	25,243	3.02	5th	286,746	3.85	6th
Wheat-----	585,548	1.74	18th	8,249,786	1.76	19th

Although Illinois had the largest cereal acreage, Iowa exceeded it in total production by 14,554,148 bushels. Of the total cereal production of the United States, more than one half was contributed by the five states of Iowa, Illinois, Kansas, Nebraska and Missouri; 35.38 per cent of the total land surface of Iowa was devoted to the cultivation of the cereals. During the ten years (1880-90) there were added to the meadow lands of the state, to be mown for hay, 2,748,891 acres, a greater gain in this connection than was made by any other state. The amount of land devoted to the cultivation of corn was increased during the same period by 969,378 acres, the number of swine by 2,000,000, the number of horses by 519,757, and the number of milch cows by 644,231. The county of Delaware was at the head of all counties of the country, with 1,630 cows to each 1,000 of the population. In 1889 there were more horses foaled in Iowa than in any other of the states of the north-central division, the number being 188,932. The largest number of neat cattle

to each square mile of surface was found in Iowa, the average being 88.25.

In the census year the state had 201,903 farms, an increase of 16,552 during the ten years preceding. The average acreage was 151, the total 30,491,541, about eighty-three per cent of which was improved. The total value of the land, fences, buildings, farm machinery and implements and the live-stock was estimated at \$1,100,682,579, and the estimated value of the farm products for the year \$159,347,844. The number of horses was 1,312,079; mules, 41,648; neat cattle, 4,895,550; swine, 8,266,779; and sheep, 547,394, the wool from which amounted to 2,649,652 pounds. The state reports for 1895 show an increase in all matters reported above, and give the total value of the farm products for the year as \$168,235,420. Much attention is given to dairying, and the production of butter and cheese is one of the foremost agricultural industries, there being in operation in 1895, 774 creameries and 81 cheese factories. The most intelligent attention is given to the work, there being dairy departments attached to all of the agricultural colleges, winter schools opened for instruction in the latest methods, and thousands of bulletins on the subject are annually distributed to the farmers of the state. The value of the butter shipped by railroads in 1895 was \$13,295,821. Stock-raising also receives much attention, the state having many herds of the finest breeds of cattle, horses, sheep and swine in the United States.

The census returns for 1890 show the following in regard to the manufactures of Iowa:

INDUSTRY.	NUM- BER.	CAPITAL.	WORK- ERS.	PRODUCT.
		Dollars.		Dollars.
All industries -----	7,440	77,513,097	59,174	125,049,183
Slaughtering and meat packing, wholesale.	25	4,105,020	2,128	19,615,386
Flouring and gristmill products -----	441	6,696,759	1,749	11,833,737
Lumber and other mill products from logs or bolts -----	137	17,487,825	7,011	11,829,065
Cheese, butter and condensed milk, factory product.---	497	2,074,177	2,545	10,545,182
Cars and railroad shop construction -----	41	2,204,648	3,893	4,473,089
Printing and publish- ing -----	643	3,501,710	3,576	3,818,623
Slaughtering, whole- sale -----	4	380,000	600	3,810,190
Lumber, planing-mill products -----	46	3,044,145	2,095	3,588,856

In addition to the above, the manufacture of carriages and wagons, foundry and machine products, printing and publishing and linseed oil were all industries of importance.

Although strictly an agricultural state, Iowa produced mineral products in 1889 of the value of \$10,267,068. Among these products were gypsum, lead, zinc, limestone and lime.

Coal is found in great quantities in the south, central and southeast portions of Iowa. The reports of the state mine inspectors for the fiscal period ending June 30, 1895, make a showing of

the following facts: During the fiscal year ending June 30, 1895, there were 342 mines in operation, producing 3,195,836 tons of coal; 10,992 persons were employed, who received in excess of \$3,300,000 for their services. The total value of the product at the mines was \$4,376,434.

The report of the state auditor for the biennial fiscal period ending June 30, 1895, makes the following showing; values for the years indicated in the table are also given for comparison:

EQUALIZED ASSESSMENT OF LANDS AND TOWN LOTS: 1895, 1890 AND 1885.

	1895.	1890.	1885.
Equalized assess- ment of lands and town lots..	\$413,970,588	\$374,753,112	\$353,614,837
Assessm't of rail- road property..	44,521,225	42,902,608	31,672,339
Telegraph and tel- ephone compa- nies -----	665,532	663,874	293,046
Total equalized assessment of state -----	\$559,650,824	\$523,862,858	\$488,953,127

The total amount of taxes received for the year 1894 was \$18,517,283, of which \$17,109,257 was apportioned to the county, district and city tax fund, the remainder to the state fund. The state treasurer reported for the same period covered by the report of the auditor that he had received from all sources the sum of \$3,704,888. The total disbursements for the two years were \$3,758,951. The amount of the permanent school fund held by the several counties was, on the 30th day of June, 1895, \$4,696,671.

The state census taken in 1895 shows the number of persons in the commonwealth liable to military duty to be 413,000. The report of the adjutant-general for the same year gives the strength of the national guard at 2,369 officers and enlisted men; appropriation for the years 1894 and 1895, \$90,000, of which \$85,104 was disbursed. The guard is in a high state of efficiency, and performed services of great value to the state during the riots occurring in the summer of 1894.

The report of the auditor of state shows the following to be the condition of the state and savings banks of Iowa on the 29th of June, 1895:

	No.	ASSETS AND LIABILITIES.	DEPOSITED.	CAPITAL STOCK
Savings banks	170	\$37,385,630	\$28,158,489	\$7,423,400
State banks---	194	26,659,427	15,668,647	8,737,900

Comparing the bank reports of 1893 with the above shows a gain of 22 savings banks and 17 state banks. At that time there were 154 national banks and 185 private banks, which had combined capital amounting to almost \$30,000,000, and aggregate deposits to almost \$60,000,000.

The report of the state commissioner of rail-

roads for 1895 shows that the mileage within the state was 8,486.36, the 38 roads doing business in Iowa having a total of 27,401.19 miles of track. The total earnings for the year of all the roads was \$137,168,249, the proportion for Iowa being \$35,823,879. The total operating expenses were \$94,201,681, the proportion for Iowa being \$24,726,072, which included state taxes amounting to \$1,388,226.

The superintendent of public instruction reported, under date of Nov. 1, 1895, the following facts relative to the public schools of Iowa: Number of persons of school age in the state (5 to 21 years), 712,941; number enrolled in the public schools, 533,824; total average attendance, 339,300; total number of school-houses, 13,613; number of volumes in school libraries, 151,561; total expenditures for school purposes for the year, \$8,317,875, of which \$5,075,492 were for teachers' salaries. Institutions of higher education are many. The University of Iowa (q.v., in these Supplements) is the leading college of the state. The Agricultural College is in a flourish-condition, and receives liberal appropriations

STATE CAPITOL BUILDING, DES MOINES.

from the state in addition to the large amount received from the general government. The State Normal School, at Cedar Falls, had, in 1895, 888 pupils; the amount paid for teachers' salaries was \$26,800, and the total expenditures for the two years ending June 30, 1895, \$97,794. In 1895 there were 17 denominational colleges and universities, with a total attendance of over five thousand, and the various academies and seminaries had an aggregate of about three thousand. There were many business colleges and normal schools.

Of the denominational institutions of learning in Iowa, the Methodist Episcopal Church controls the following: German-English College, at Charles City; Upper Iowa University, at Fayette; Simpson College, at Indianola; Cornell College, at Mt. Vernon; Iowa Wesleyan University and German College, both at Mount Pleasant, and the University of the Northwest, at Sioux City. The Presbyterian Church controls Coe College, at Cedar Rapids; Parsons College, at Fairfield; Lenox College, at Hopkinton, and Buena Vista College, at Storm Lake. The Baptist Church has Des Moines College, at Des Moines, and Central University of Iowa, at Pella. The Congregational Church has two institutions: one at Grinnell,

known as Iowa College, and Tabor College, at Tabor. The Lutheran Church has Luther College, at Decorah, and Wartburg College, formerly at Waverly, but in 1895 removed to Clinton. The Christian Church has Oskaloosa College, at Oskaloosa, and Drake University, at Des Moines. The Friends maintain Penn College, at Oskaloosa, and the United Brethren Western College, at Toledo. Two non-sectarian institutions are operated, one at College Springs, known as Amity College, and the other, the State University of Iowa, at Iowa City.

Among the state charitable institutions are three insane hospitals in operation and another under course of construction. The following is condensed from the reports for 1895:

	MOUNT PLEASANT HOSPITAL.	INDEPENDENCE HOSPITAL.	CLARINDA HOSPITAL.	TOTAL.
No. of patients July 1, 1895----	870	946	590	2,406
Amt. rec'd since July 1, 1893----	\$292,719	\$311,253	\$229,908	\$833,880
Amt. exp'd for same period. -	292,461	307,842	218,230	818,533

A hospital contracted for in 1894 is to be located at Cherokee, on a large tract of land eligibly situated, and to be of the most modern construction. The building of this additional hospital was made necessary by the reports of the officials of the several counties, which showed that 793 insane persons were confined in the county poor-houses, 265 in private hospitals at the expense of the state and 80 in the care of friends. The capacity of all of the three institutions being already exceeded, the new one became a necessity.

Other charitable institutions of the state made reports for the biennial period ending June 30, 1895, from which the following facts are taken, the number of inmates being that of the end of the period, and the amount of the operating expenses for the two years being given:

Institution for Feeble-Minded Children ..	574	\$226,435
College for the Blind	228	72,366
School for the Deaf	306	93,653
Industrial Home for the Blind.....	40	19,868
Industrial School.....	145	39,531
Soldiers' Orphans' Home and Home for Indigent Children	458	107,899
Benedict Home (for women).....	304	10,633
Soldiers' Home.....	466	107,156

The state has two penitentiaries, one located at Anamosa, the other at Fort Madison. The former reported 542 convicts June 30, 1895; the expenditures for the two years preceding, \$235,000. The latter reported 441 convicts; and expenditures for the same period, \$156,628. Both institutions were crowded to their full capacity at the date of the reports.

No church statistics of Iowa have been taken since the Federal census of 1890, at which time there were 5,539 organizations, 4,539 edifices, 556,817 members, which constituted 29.12 per cent. of the population. Of the denominations represented there were 500 Baptist bodies, 441

Roman Catholic, 285 Congregationalist, 403 Disciples, 1,342 Methodist Episcopal, 518 Presbyterian bodies, 236 United Brethren, and smaller bodies of almost all denominations.

Jan. 1, 1899, there were 1,109 newspapers published in Iowa. In each of the 99 counties of the state one or more papers were issued, and in all of the county capitals except one; 70 of the papers were daily, 6 triweekly, 45 semiweekly, 886 weekly, 2 fortnightly, 7 semimonthly, 92 monthly, and 1 quarterly. The increase in the number of publications since Jan. 1, 1894, had been 158.

The principal cities of the state, together with the population as given by the census of 1900 are as follows: Des Moines, the capital, 62,139; Dubuque, 36,297; Davenport, 35,254; Sioux City, 33,111; Burlington, 23,201; Cedar Rapids, 25,656; Council Bluffs, 25,802; Clinton, 22,698; Ottumwa, 18,197; Keokuk, 14,641; Muscatine, 14,073; Marshalltown, 11,544; and Fort Dodge, 12,162.

Following is a list of the governors of Iowa, and their respective terms of office: Ansel Briggs (1846-50), Stephen Hempstead (1850-54), James W. Grimes (1854-58), Ralph P. Lowe (1858-60), Samuel J. Kirkwood (1860-64), William M. Stone (1864-68), Samuel Merrill (1868-72), Cyrus C. Carpenter (1872-76), Samuel J. Kirkwood (1876), Joshua G. Newbold (1876-78), John H. Gear (1878-82), Buren R. Sherman (1882-86), William Larrabee (1886-90), Horace Boies (1890-94), Frank D. Jackson (1894-96), Francis M. Drake (1896-98), Leslie M. Shaw (1898-1900). See also IOWA, Vol. XIII, pp. 207-09.

IOWA AGRICULTURAL COLLEGE, a state institution established in 1858, and benefited by the land-grants made by Congress in 1862 to such states as had established or should establish colleges of agriculture and the mechanic arts. These land-grants formed the basis of the present endowment of the college—about \$650,000. The college is equipped with a farm of 900 acres, buildings costing about \$350,000, apparatus required by the courses of study valued at \$100,000, a library of 10,000 volumes, and a museum containing large collections. The income amounts to about \$70,000. There is a faculty of 44 teachers and a student body of about 600.

IOWA CITY, the capital of Johnson County, central eastern Iowa, and the capital of the state from 1839 to 1856, situated in Lucas township, on the east bank of the Iowa River, 120 miles E. of Des Moines, on the Burlington, Cedar Rapids and Northern and the Chicago, Rock Island and Pacific railroads. It is the seat of the Iowa State University, organized in 1860, and Iowa City Academy. It contains, besides many important public buildings, a large paper-mill, a foundry, manufactories of carriages, alcohol, flour, beer, linseed oil, pumps, plows, a flax-mill, glove factory and a pork-packing plant. Population 1880, 7,123; 1890, 7,016; 1900, 7,987.

IOWA COLLEGE, the oldest college in Iowa, situated at Grinnell. It was founded by Congregationalists at Davenport in 1847, but in 1860

was removed to Grinnell. The school, though strongly under Congregational influence, is non-sectarian. It admits women, and has a preparatory department. The value of the buildings, grounds, and equipments is about \$250,000, and its income amounts to \$48,000. In 1898 there were a library of 26,000 volumes, a faculty numbering 32, and a student body of 506.

IOWA FALLS, a railroad junction of Hardin County, Iowa, on the Iowa River, the falls of which at this point give the name to the town, and on the Burlington, Cedar Rapids and Northern, the Chicago, Iowa and Dakota and the Illinois Central railroads; 38 miles N.N.W. of Marshalltown. It manufactures flour, machinery, tiles, plows, ditchers, wire mattresses and butter-tubs. It ships farm produce and stone. Population 1900, 2,840.

IOWA, UNIVERSITY OF. See UNIVERSITY OF IOWA, in these Supplements.

IPIALES, a town of southeastern Colombia, on the San Miguel River; on a plateau between the Cordillera Central and the Cordillera Occidental, at an elevation of 11,108 feet. It has the only custom-house for the Equator trade, though this is very small. The roads are poor and the climate cold. Population, 13,000.

IPOMEEA. See JALAP, Vol. XIII, p. 547.

IPSAMBUL, same as ABOOSIMBEL. See ARCHITECTURE, Vol. II, p. 388.

IPSUS, BATTLE OF. See MACEDONIAN EMPIRE, Vol. XV, p. 142.

IPSWICH, a town of eastern Essex County, Massachusetts, on Ipswich River, 3 miles from the Atlantic and 27 miles northeast of Boston, on the Boston and Maine railroad. The town was settled in 1642, and was originally the county seat. It has manufactories of silk, hosiery, shoes, isinglass, soap and woolen fabrics, and extensive clam-digging industries. It contains the Manning High-School, the Heard Public Library, with 15,000 volumes, a house of correction and an insane asylum. Population 1900, 4,658.

IRANIAN LANGUAGE AND LITERATURE. See PERSIA, Vol. XVIII, pp. 653-655.

IRAPUATO, a city in the state of Guanajuata, Mexico, on the Mexican Central railroad, 219 miles of N. Mexico City, 6,000 feet above the sea. It was founded in 1547, and has several old convents and churches. It is the center of an important agricultural district. Population, about 15,000.

IRBY, JOHN L. M., a United States Senator; born in Laurens County, South Carolina, Sept. 10, 1854. He was educated at the University of Virginia and Princeton College, and entered the profession of law in 1876. In politics he was a Democrat, and an active member of the Farmers' Alliance. He was elected a member of the state house of representatives in 1886, 1888 and 1890. In 1890 he was elected by the South Carolina legislature to the United States Senate, to succeed Wade Hampton.

IREDELL, JAMES, an American jurist; born in Lewes, England, Oct. 5, 1751. Emigrating to America in 1768, he was admitted to the North

Carolina bar in 1775, and from 1774 until the Revolution was collector of customs at Edenton. In 1777 he was chosen a judge of the superior court of the state, and in 1787 was appointed a commissioner to compile and revise the laws of the state. The results of his work were published in 1791 under the name of Iredell's Revisions. In 1790 he became associate justice of the United States supreme court. He died in Edenton, North Carolina, Oct. 20, 1799.

IREDELL, JAMES, a United States Senator, son of the preceding; born at Edenton, North Carolina, Nov. 2, 1788. He was educated at Princeton, fought during the War of 1812, was admitted to the North Carolina bar, and in 1816 became a member of the legislature, serving for many years, being speaker in 1817 and 1818. In 1827 he became a judge of the superior court; in the same year was elected governor of the state; and from 1828 to 1831 was in the United States Senate. He afterward practiced his profession in Raleigh, and for many years was reporter of the decisions of the supreme court. He was also one of three commissioners who were appointed to collect and revise the laws in force in the state. He published a *Treatise on the Law of Executors and Administrators*, and a *Digest of All the Reported Cases in the Courts of North Carolina, 1778 to 1845* (1839-46). He died at Edenton, April 13, 1853.

IRELAND. See IRELAND, Vol. XIII, pp. 214-72; and GREAT BRITAIN and HOME RULE, in these Supplements.

IRELAND, JOHN, an American Catholic prelate; born in Kilkenny, Ireland, Sept. 11, 1838; emigrated to the United States when a child, and settled in Minnesota. On Dec. 21, 1861, he was ordained at St. Paul. After serving as an army chaplain he became rector of the cathedral at St. Paul, and in 1875 was made coadjutor bishop. He was a prominent member of the Vatican Council of 1870; engaged in the work of establishing colonies of Catholics in

ARCHBISHOP IRELAND.

Minnesota and the Northwest; and was made archbishop of St. Paul in 1888.

IRELAND AND THE IRISH QUESTION. See HOME RULE, in these Supplements.

IRIDACEÆ, a family of monocotyledonous plants, mostly herbaceous, with bulbous, tuberous, or creeping root-stocks. The leaves are generally sword-shaped and in two rows. The colored perianth is six-merous. The stamens are three, with anthers turned outward. The ovary is inferior; there is one style, with three stigmas, which are often petal-like. The fruit is a three-celled, three-valved capsule. Numerous species are known, of which the greater number are natives of warm countries, and many are in cultiva-

tion for ornament. Some of the common genera are *Iris*, commonly known as "flag," *Crocus*, and *Gladiolus*. Saffron is obtained from the stigmas of *Crocus sativus*, and "orris-root" from the root-stocks of various species of *Iris*.

*IRON AND STEEL. The technical and commercial changes in the iron and steel industry since 1880 have not been due mainly to any revolutionary new inventions, such as the Bessemer or the open-hearth process, or their "basic" modifications. They have been brought about by the steadily increasing application and improvement of the processes introduced twenty years or more ago, and by the erection of plants and machines embodying in most economical and effective form the principles of modern practice. Yet the results have been far greater than could be measured in 1880, thus furnishing a fresh illustration of the law that the effects of new inventions are most profoundly felt after they have become incorporated into the body of practice, and developed, perfected, modified and applied by innumerable experts. It required a hundred years to bring to fruit the seed planted by the invention of the steam-engine, or of the steam-railway. The last twenty years have proved equal to any former century in analogous developments. The space available for the present article will permit only a brief summary of the most important factors in this result.

As will be seen in the statistical tables at the close of this article, the world's product of pig-iron reached in 1895 the amount of 29,868,239 metric tons, which is nearly 15 per cent greater than the total for 1894, and double that of 1880. This increase is largely due to the increased use of steel, of which over 15,000,000 metric tons were made in 1895, as against less than 13,000,000 in any previous year. In 1874 (see A. S. Hewitt's Presidential Address, *A Century of Mining and Metallurgy in the United States*, Transactions American Institute of Mining Engineers, Vol. V, p. 172), the world's product of pig-iron was estimated at 13,260,000 tons, of which the United States furnished 18.1; Great

* Copyright, 1897, by The Werner Company.

Britain, 45.2; Germany, 12.1; and France, 10.3 per cent. In 1889 (see Mr. Hewitt's second Presidential Address, id., Vol. XIX, p. 482), the world's product was estimated at nearly 25,000,000 tons, of which the United States produced 30 and Great Britain 33 per cent. In 1895 the totals given above are roughly divided as follows: *Iron*—United States, 32; Great Britain, 27; Germany, 19; and France, 7 per cent. *Steel*—United States, 41; Great Britain, 21; Germany, 19; and France, 4.5 per cent. The causes of this striking change in the relative standing of the leading nations lie mainly in the utilization of domestic iron-ores by the United States and Germany, due in the former case to the development of new sources of immense supply, and in the latter to the effect of the "basic" processes in rendering phosphoric ores available for the steel manufacture. The great increase in the use of steel for rails, structures and castings is not merely a replacement by that material of cast and wrought iron. The consumption of all forms of iron has been immensely augmented, and amounts, in the United States, to some three hundred pounds *per capita* annually. This enlargement of the use of iron has been the result of the cheapening of price, coupled with improvement in the quality; and for this the world is indebted to chemists, metallurgists and mechanical engineers. No more striking illustration of the benefits conferred upon mankind by science can be adduced.

Iron-Ores. The most important development of new sources of iron-ore supply has been in the Lake Superior region, already known as highly productive. The Menominee, Gogebic, Vermilion and Mesabi ranges have furnished since 1880 some fifty million tons of ore; and the product for 1895 (including two million tons from the old Marquette region) was more than ten million tons. The latest field is the Mesabi, which produced 4,245 tons in 1892 and 2,781,587 tons in 1895. This range is at least 40 miles long—probably longer—and promises to be much more productive than any of the others. The Marquette range is 30 miles; the Menominee, 50 miles; and the Gogebic, 30 miles long; but these distances do not indicate continuous ore-deposits. On the Vermilion range, mines are worked at two points only, 23 miles apart. Moreover, the Mesabi ore-deposits occur in beds, usually covered only by glacial "till," which can be removed by "stripping," so that the ore can be quarried, or even mined with the steam-shovel. Apart from royalty to the land-owner, the cost of mining by this method is often only 25 to 50 cents per ton. The rapid construction of railroads, docks and ore-carrying steamers has facilitated the cheap delivery of Lake Superior ores at Chicago, Cleveland, Erie, Buffalo and other lake ports; and they have been sold in competition with other domestic ores as far east as the Lehigh valley. In 1895 the Lake Superior region furnished 61.5 per cent. of the iron-ore mined in the United States.

Another important development of iron-ore, leading to the establishment of an extensive industry, has been that of the Clinton fossiliferous red hematite in the Southern states. The Clinton formation presents probably the most extensive iron-ore deposit

in the world, constituting as it does a distinct geological horizon, which ranges from Clinton, in the state of New York (whence its name), through Pennsylvania, Virginia and West Virginia, Georgia, Tennessee and Alabama. It is essentially a bed of limestone of fossil origin, which has been altered by the removal of lime and the deposition of ferric oxide, so as to form in many places a calcareous iron-ore of commercial value. (Under present conditions, 42 to 47 per cent. of iron would be the range of practically available ore.) In many localities, and very generally in depth from the outcrop, the percentage of iron is below this limit; and in the Northern states, where the bed is narrow and fluctuating, it has not been, on the whole, profitably exploited. In the South, however, and particularly in Alabama, the formation is exceptionally thick (up to 30 feet as a maximum) and easily mined, and has yielded per annum since 1889 between two and three million tons of ore to be smelted with coke from the Alabama and Tennessee fields. The ore contains too much phosphorus for the acid Bessemer-steel process; but the cheapness of mining, fuel and railway transportation has made it possible to put the Southern irons made from it into Northern markets, and even (though only to a small extent thus far) to ship them to Great Britain.

Titaniferous Iron-Ores. The presence of titanium (in the form of titanic acid) in iron-ores has long been recognized as a source of trouble in blast-furnace practice. There is no resulting injury to the quality of the product, for nearly all the titanic acid passes un-reduced into the slag; and the minute proportion which may appear as titanium in the pig-iron is apparently rather beneficial than otherwise. Moreover, ores high in titanic acid are usually low in phosphorus, which does pass into the pig-iron, and is (except for special purposes) a deleterious ingredient. The practical objection to titanic acid is, that it passes into the slag, and diminishes its fusibility, thus tending to choke the blast-furnace, and to form ultimately in the hearth masses of the nitrocyanide of titanium, which it is impossible to fuse, and very difficult to remove after blowing-out. The fluxing of titaniferous ores with alumina has been practiced with partial success. But the most radical and promising remedy is that suggested by Mr. A. J. Rossi, of New York, who has succeeded in smelting such ores so as to make a fusible titanate-slag, in which titanic acid plays the part assumed by silica in ordinary blast-furnace slags. The immense deposits of such ores in the United States (to say nothing of other countries) justify the belief that their successful treatment will certainly become extensively practicable. For the present this improvement, like many others, is commercially delayed by the low price of ores generally, and the sharp competition of the pure, rich and cheap ores of the Lake Superior region. It must be remembered that, as titanic acid enters into an iron-ore largely as an isomorphic constituent, replacing the oxide of iron, high titanium is not, as a rule (though there are exceptions), accompanied with high iron; and at the present time, when 50-per-cent magnetites can scarcely be mined at a profit, titaniferous ores (which are usually hard) would have little chance to compete at the ruling market prices.

Magnetic Concentration of Iron-Ores. The separation of magnetite from non-magnetic minerals by means of magnets was attempted long ago, permanent horseshoe magnets being at first employed. In 1882 a machine furnished with electro-magnets was erected at Moriah, Essex County, New York, to separate magnetite from apatite. As late as 1880 magnetic iron-ore was separated from zinc-blende at Przbiam, Bohemia, with permanent magnets arranged around a wooden cylinder. In this case the zinc-blende was the desirable

product, and the iron-ore was waste. It was not until electricity could be cheaply generated by the dynamo that the magnetic concentration of iron-ore came into general use. One of the earliest successful machines was that of Jonas Wenström of Sweden. But the greatest development of magnetic concentration has been effected in the United States, where a large number of machines have been invented for this purpose. Some of the leading types are represented by the Buchanan, Conkling, Edison, Ball-Norton and Paine separators. The Edison separates by the action of a magnet on a falling stream of pulverized material. The others employ variously a traveling belt, or rolls, and are operated on wet or dry material, as the case may be. Sometimes the same machine may be employed for either class. The technical results of magnetic concentration have been, on the whole, satisfactory. But its commercial success has been hindered thus far by the prevailing low prices of iron-ore; and it may be said that hitherto there has been no profitable enterprise based on the mining of lean ore and its magnetic concentration. The present sphere of the process lies in the treatment of waste material, already mined and otherwise worthless. It has been proposed by Clemens Jones and others to roast the hydrous or anhydrous ferric oxides (himonite or hematite) so as to produce the magnetic oxide, to be subsequently separated by magnetic concentration. This has proved technically practicable; but commercial conditions have not permitted hitherto its general use. The difficulty in all such cases lies in the cost of handling and treating a material which, after all, must be sold at a low price, in competition with crude ores not subjected to that cost. A special difficulty in all magnetic concentration has been that in order to avoid loss, in the tailings, of particles of iron-ore attached to non-magnetic material, it is usually necessary to crush fine before separation, and consequently to produce, as concentrate, a fine sand or powder, which was deemed undesirable by blast-furnace managers, because it tended to produce an irregular descent of the charge, and an excessive amount of flue-dust. To overcome this objection, it has been proposed to form the fine concentrate into briquettes, with some cementing material such as lime, which would be itself useful as a flux. This operation, involving an additional expense, has not been commercially practicable under existing market conditions. Meanwhile, many furnace-men have found it practicable to use a much larger proportion of fine material in the charge than was formerly deemed practicable; and it may fairly be said that material of this class, if free from deleterious ingredients, is salable at a price dependent upon its contents in metallic iron, and not greatly, though perhaps somewhat, below the price of equally rich and pure ores delivered in the ordinary form of the "run-of-mine," that is, in lumps, with a small percentage of "fines" made in mining, handling and transportation.

A novelty in magnetic concentration is the Wetherill machine, by which so-called "non-magnetic" materials, such as franklinite, garnet, hematite, and generally minerals containing any oxide of iron or manganese, can be separated from other minerals, which are still less attracted, or are even repelled, by the magnetic pole. The theory of this separation is based on the fact that of the two classes, paramagnetics and diamagnetics, established by Faraday, the former, which are attracted by the magnet, are divided into two groups, distinguished by the degree of their magnetic susceptibility, and separated in this respect by a wide gap. One group comprises iron and its alloys, magnetite, and pyrrhotite, nickel, and some varieties of native platinum (which seem, however, to owe their magnetic properties to the presence of iron or nickel). These substances are visibly attracted by the ordinary hand-magnet. The other group is so weakly attracted as to be popularly considered non-magnetic. The gap between the two groups may be estimated by the fact that, according to the careful experiments of Plücker (*Pogg. Ann.* LXXIV, 1848) the force of magnetic attraction for iron being taken as 100,000, the attraction for magnetite is 40,227; while the highest attraction found in the second group, that of compact specular iron ore, is only 761. Since Plücker

found the attraction of prepared ferric oxide to be but 500, it is not improbable that his specular iron-ore (though theoretically anhydrous ferric oxide) contained some magnetite. In any event, the gap between 40,227 and 761 is wide enough to justify the usual treatment of the latter class as non-magnetic. The Wetherill machine, by effecting an extreme condensation of the magnetic lines at the pole-points, attracts these "non-magnetic" paramagnetics, and thus effects a separation of franklinite, garnet, hematite, limonite, siderite, pyrolusite, etc., substances not hitherto thus separated. The process has been successfully practiced at Bethlehem, Pennsylvania, on the ore of the Lehigh Zinc and Iron Company (franklinite, garnet, zinc silicates and calcite), and experiments with many iron-ores, especially with the Clinton fossil-ores of Birmingham, Alabama, have resulted favorably.

Blast-Furnace Practice. The astonishing progress of the last few years in this department is indicated, in one aspect at least, by the increased production per furnace, the largest records thus far made for a single stack being 12,800 gross tons in a month, 3,240 tons in a week and 526 tons in a day. These were made by different furnaces at different times, but all with Lake Superior ores and coke and in the production of Bessemer pig.

A more significant expression of this progress, however, is found in the increase of the average product per furnace. In the United States (which has taken the lead in this respect) the average yearly product of a blast-furnace was, in 1874, 6,298; in 1880, 9,369; and in 1895, 44,953 metric tons. The table exhibits in a striking manner the steady increase of furnace capacity, independent of fluctuations in trade, and the decrease in the total number of furnaces, indicating that the smaller ones of former type have been abandoned, under the pressure of competition. In other countries the change has not been so great. In Germany the product (1895) per furnace was about 28,840 metric tons; in Great Britain (1895), 23,319 metric tons. But these figures still indicate an important advance.

This result has been achieved by many co-operating agencies, chief among which are the enlargement of blast-furnaces, the employment of larger quantities and higher pressures and temperatures of blast, and, consequently, more rapid driving. Incidentally it has been necessary also to improve the material and construction of walls and hearth, and to provide for the handling of the increased amount of raw material and product involved in the new practice. Moreover, an exact knowledge of the chemical constituents of ore, flux and fuel, and of the nature of the reactions which they undergo in the furnace, has become more important than ever, because the quantity of material in the furnace at a given time, and to be affected by any irregularity in its operation, is so much greater than formerly. Constant chemical analysis of ore, flux, fuel, slag, furnace-gases and product is therefore required, especially when the pig-iron is to be used in the Bessemer converter. Among the arrangements for cheapening the handling of materials is the automatic hoist and charger, which elevates the charge to the top of the furnace, and deposits it in the stack, doing away with the labor of the "top-fillers." For the lining of the hearth and even of the bosh, carbon bricks, composed of coke and clay or coke

and tar, have been used with advantage, in both Germany and the United States. The efficacy of carbon as a protection against the fusion of fire-brick linings was shown before its intentional use for that purpose by the effect of the natural deposition of carbon on furnace-walls. Mr. James Gayley, of Pittsburg, Pennsylvania (*The Preservation of the Hearth and Bosh-Walls of the Blast-Furnace*, Transactions American Institute of Mining Engineers, vol. 21, 1893, p. 102), says that simultaneously with the commencement of the smelting operation there is deposited on the walls a coating of carbonaceous material, which, as the process advances, replaces the brick to the depth of several inches. This formation is promoted by the presence of basic cinder in the bosh.

Additional protection is given to hearth and bosh-walls by water-cooling. Cooling-plates and tuyères have been advantageously made of bronze. Mr. Gayley says that before the introduction of bronze plates the usual experience as to fuel-consumption was a minimum quantity at the commencement of the blast, gradually increasing until at the end it was abnormally high; but where the walls are equipped with bronze cooling-plates, it is a common experience that the fuel-consumption shows very little increase at the end of the blast. The first cost of bronze plates and tuyères is somewhat greater than that of iron ones; but the difference is covered many times over by increased economy. The material can, of course, be recast when worn out.

Edgar Thomson furnace A, near Pittsburg, which was erected and put in blast in 1879, is recognized as the pioneer in the new practice, and as such has become famous throughout the world. Its regular yield of 650 tons per week was regarded with astonishment, in view of its small dimensions (66 feet high by 13 feet bosh). But the succeeding furnaces of the same company followed in rapid succession, each eclipsing its predecessor in output, until 1,400 to 1,500 tons per week was a regular average, and this amount has now been more than doubled. The preservation of linings has been so successfully effected at the same works that over 400,000 tons of pig have been made on a single lining. It has thus been demonstrated that the American method of rapid driving does not involve, as foreign critics once believed it did, a ruinous destruction of the furnace. The principal remaining question is that of fuel-economy. In this respect, also, the furnaces making the highest records of product have taken the lead. In November, 1887, the four furnaces at South Chicago made 23,530 tons of pig with a consumption of 1,834 pounds of coke per ton. In 1892 a furnace of the Illinois Steel Company, at Milwaukee, Wisconsin, showed a fuel-consumption (best month) of 1,824 pounds of coke per ton of pig-iron.

Fig. A, showing the lines of Edgar Thomson furnace F, built in 1886, may serve as a type of modern construction.

The foregoing statements apply to furnaces using the rich and easily-reduced Lake Superior ores, with coke as fuel. But anthracite and charcoal furnaces exhibit a similar though less startling progress.

E. C. Potter (*Review of American Blast Furnace Practice*, Transactions American Institute of Mining Engineers, Vol. 23, 1893, p. 379) describes the Hinkle furnace in Wisconsin, 60 by 12 feet in size, as having made in a single week 1,009 gross tons of iron on 80 bushels (of 22 pounds) of charcoal to the ton. The Warwick (anthracite) furnace, Pennsylvania, as rebuilt in 1889, 70 by 16 feet, and 8 feet 9 inches hearth-diameter, had made in 1890 (ib., Vol. XIX, p. 967) forty thou-

FIG. A.

sand tons of pig, with an average fuel-consumption of 2,464 pounds (one fourth coke and three fourths anthracite) per ton of iron. Best week, 873 tons; lowest fuel for five consecutive weeks, 2,268 pounds per ton.

Interruptions in operation are much more injurious under the modern system, both technically and commercially, than they were before. Thus the ancient practice of an open fore-hearth, to be cleaned out at every cast, with a loss of two to four hours in

twenty-four, has long been abandoned; and the principle of the Lürmann closed front and water-cooled cinder-tap has become universal. Another characteristic feature of modern American rapid-running blast-furnace plants is the avoidance of such concentration of motive power or function as would, in case of accident, involve the stoppage of the whole or a large part of the plant. Each furnace is built and operated separately, having its own blowing-engine (or, still better, two or three engines instead of one), hoist, hot-blast stoves, etc., and cross-connections are provided, so that in a plant of two or more furnaces any engine or stove may be applied to any furnace. Each boiler, or pair of boilers, has its own chimney, and can be fired independently with solid fuel if furnace-gas fails. A separate chimney for each stove is also favored, instead of one large chimney for the whole plant. The separate chimney is a feature of the Durham iron stove, designed by Edward Cooper, and has proved so advantageous in that apparatus as to warrant its adoption in a number of the latest types of brick stoves.

That uniform quality of product has been secured by the new practice, is indicated by the fact that the largest productions named have been of Bessemer pig.

Foundry Practice. The most significant advance in this department, during the last fifteen years, has been the increasing utilization of chemical analysis to control the operations of the iron foundry, and particularly the choice of pig-irons for castings. The ancient practice (not yet wholly extinct) was to employ certain irons or mixtures, empirically shown to give the special results desired. The irons so selected were made from certain ores, in a certain way, were presumed to be uniform in quality, and often commanded, on this account, an extra price. The most important instance, perhaps, was the universal exclusive use of charcoal-pig for the manufacture of cast-iron car-wheels, which would "chill" in casting, so as to give at the rim a hard surface, resisting wear, while they retained strength and toughness in the interior mass. This tradition was rudely broken by the chemists, who traced the "chilling" property to a certain composition of the pig-iron, and taught the blast-furnace managers to make, with fuels cheaper than charcoal, iron which could be successfully used, alone or in mixture, for car-wheel castings. The action of railroad companies, steel manufacturers and other large consumers, in buying pig-iron on chemical specifications, has led to the general employment of chemists at blast-furnaces, and the pressure of similar conditions has finally affected the iron foundries; so that it is now a not uncommon practice in the latter business to choose or mix irons for a desired result according to their chemical composition. Physical tests of the pig-iron as to strength, shrinkage, etc., are also taking the place of the old method of judging by the "grain," as shown on a fractured surface of the pig. There are also indications of a further advance in practice, consisting in the treatment of the liquid metal, to alter its composition. The feasibility, for instance, of making "No. 1 foundry-iron" out of lower grades by the addition of ferro-silicon in the ladle, is established; and it is not improbable that the quality of the blast-furnace product may ultimately come to be of relatively smaller importance in the foundry, so that the cheapest pig-iron may be employed for castings, being corrected in composition at the foundry. For the present, the relative cheapness of pig-iron of high quality supersedes the necessity of such improvements. That is to say, the price of the best foundry pig is, in most cases, not sufficiently greater than that of inferior grades to warrant the special extra treatment of the latter.

In connection with iron castings, Mr. A. E. Outerbridge,

Jr., has published the interesting discovery (*Transactions American Institute of Mining Engineers*, vol. 26) that they are materially strengthened by subjection to repeated light shocks or blows. His experiments included the treatment of castings in a "tumbling-barrel," used to clean the sand from their surfaces, and also the treatment of six cast-iron bars by striking each, upon one end only, three thousand times with an ordinary hand-hammer. Subsequent tests showed a considerable gain in tensile strength (in one case, nearly nineteen per cent) for the bars thus "tumbled" or hammered. Mr. Outerbridge ascribes this result to a mobility of the molecules. He says: "All that is claimed is, that every iron casting, when first made, is under a condition of strain due to difference in the rate of the cooling of the metal near the surface, as compared with that nearer the center, and also to difference of section; and further, that it is practicable to relieve these strains by repeatedly tapping the casting, thus permitting the individual metallic particles to rearrange themselves, and assume a new condition of molecular equilibrium."

Hydraulic Presses. A highly important development in the treatment of malleable metal has been the progressive substitution of the hydraulic press for the hammer. The superior economy of the press is evident. It saves both power and time. The hammer operates by blows, and its energy depends upon the final velocity of its fall; whereas in the press this velocity is so small that it plays no part in the effect. But the greater the velocity of the hammer, the less time is given for the transfer of its effect from the surface to the interior of the mass under treatment; and, in consequence, much energy is lost in mere useless jarring of die and foundation. This loss is the greater the larger the mass to be forged. Moreover, there is a loss of time, and consequently of labor, through the intermittent action of the hammer; and, finally, it is now generally admitted that the effect of slow compression upon the structure of large masses is superior to that of percussion, though the latter is still often preferred for comparatively small masses, like loops and blooms, from which slag is to be expelled. It is an incidental evil of the hammer that it produces a change of form, even when its blow is too light to affect the whole mass. In such cases the surface only is affected, and not the structure. The consequent lack of uniformity in the compression of the metal has been the cause of many fractures of hammer-forged steel. Fig. B illustrates the press built by the Bochum Company, in Westphalia, and Fig. C the Whitworth press, designed for the compression of steel in the ingot-mold, at Bethlehem, Pennsylvania.

Howe (*Metallurgy of Steel*, 1st ed., p. 156) says the pressure on the steel is gradually increased, usually till it reaches six tons, occasionally twenty tons, per square inch of the horizontal section of the ingot. In 1893 a 14,000-ton armor-plate press was started at the Bethlehem Iron Company's works, giving 7,000 pounds of hydraulic pressure per square inch, and operated by pumps of 16,000 horse-power.

Mannesmann Tubes. The invention of the brothers Mannesmann, of Remscheid, Germany, effects the direct rolling of metal tubes without welding. This is done by feeding a solid, highly heated round bar of ingot-metal between rolls which both revolve in the same direction while their axes are oblique to the axis of revolution. The metal of the surface of the bar thus acquires an increased motion in a spiral direction, and is drawn over

its core, receiving consequently the form of a pipe. The interior space thus created can be widened, if necessary, by further operations over a mandrel. Pipes thus made and enlarged have been produced of all diameters up to 400 mm. They are specially characterized, not only by their strength, but by their freedom from leakage. On the latter account, they are recommended (see the remarks of Professor Lunge on the paper of Professor Wedding, in *Transactions American Institute of Mining Engineers*, Vol. 19, 1890, p. 397) for making high-pressure vessels to store and carry liquid carbon-dioxide, ammonia, sulphur-dioxide, chlorine, compressed oxygen, hydrogen, etc. Hydrogen has been kept for weeks in a piece of Mannesmann pipe, closed at both ends. Being much stronger than ordinary wrought-iron or steel tubes of the same weight, they can be made correspondingly lighter, thus removing an objection which has been, in some cases, prohibitory of the commercial supply of the substances named. The Mannesmann tubes are now extensively used in the manufacture of bicycles.

For ELECTRIC WELDING, see WELDING, in these Supplements.

Microstructure of Steel. In this department an immense amount of interesting and important investigation has been performed during recent years by Sorby, Arnold and others in Great Britain; Osmond, Le Chatelier, Müller, Wedding, Martens and

others in Europe, and Howe, Sauveur and others in the United States. It is not possible to give here more than a bare outline of the results, following generally the summary given in the latest paper on the subject, by A. Sauveur of Chicago (*Transactions American Institute of Mining Engineers*, vol. 26, now in press). All carbon-steels, whether quenched or slowly cooled, are made up of one or more of the following constituents, recognizable under the microscope: Ferrite (iron free from carbon); cementite (iron combined with cement-carbon, *i.e.*, carbon as it exists in unhardened steel, and constituting a carbide, Fe_3C); pearlyte (a mixture of ferrite and cementite, sometimes granular and sometimes lamellar, the latter variety having a pearly appearance); and martensite (the constituent which exists at a high temperature, and, being retained by sudden cooling, confers hardness upon quenched steel). Of these names, the first three were proposed by H. M. Howe and the fourth by F. Osmond. They have not been universally accepted (Arnold, for instance, objects to giving special names in the present stage of inquiry); but they are convenient for a brief statement. The composition of ferrite, cementite and pearlyte

is known with reasonable certainty. Of that of martensite there is no direct proof. If its composition were positively known, the problem of the hardening of steel would be solved. Meanwhile, every theorist on hardening attributes to martensite the composition demanded by his theory. It contains carbon, but not in definite proportions, like pearlyte, the amount varying from 0.12 per cent in very soft to 0.90 in very hard steel. All unhardened steels are composed of pearlyte alone, or pearlyte associated with ferrite or cementite. All hardened steels are composed of martensite alone, or martensite associated with ferrite or cementite. M. Osmond (*Méthode Générale pour l'Analyse Micrographique des Aciers au Carbone*, Paris, 1895) distinguishes two other constituents, which he calls sorbite and troostite. They seem to be merely transition-forms, having but brief existence during the structural changes induced in steel by heat treatment, the former coming between ferrite and cementite, and the latter between ferrite and martensite. In unhardened steel, the carbon present unites with a portion of the iron to form cementite, Fe_3C , which contains 6.67 C to 93.33 iron. This cementite combines structurally with an additional amount of iron, in the proportion of 12 cementite to 88 iron, forming pearlyte; and the remainder of the steel is made up of structurally free ferrite. It is thus possible to calculate approximately the physical constitution of any unhardened steel of which the percentage of carbon is known, bearing in mind that if the steel contains more than a certain amount of carbon, there will be free cementite, instead of free ferrite, in excess. At that point (called by Professor Arnold the saturation-point of steel) there will be neither free ferrite nor free cementite, but the steel will consist of pearlyte only. The calculation, however, is affected by other ingredients present, besides carbon and iron. Thus Arnold finds the saturation-point for the nearly pure carbon-alloy to be about 0.90 per cent of carbon, at which point, and not before, all structurally free ferrite has disappeared; while Sauveur finds that in commercial steels, containing from 0.4 to 1 per cent of manganese and 0.75 to 1.25 per cent of total impurities, the saturation-point is very near 0.80 carbon.

The behavior of steel under heat-treatment, involving the formation and effects of martensite, presents a more intricate and doubtful problem. If a piece of steel containing 0.5 per cent or more of carbon be heated to a high temperature and allowed to cool slowly, there is, at about 700° C., a retardation in the progressive fall of its temperature, often amounting to a sensible recalescence, after which the normal rate of cooling is resumed. This must indicate some internal reaction, evolving heat, and the point of temperature at which it occurs (first determined accurately with the Le Chatelier's pyrometer, by Osmond) is called a critical point and designated (according to Chernoff's nomenclature) by the letter A. In heating steel, the reverse occurs. There is a point at which the rise of temperature is retarded, doubtless by some internal reaction which absorbs heat. The two retardations do not, however, take place at exactly the same temperature, and the critical points are therefore distinguished as Ar for cooling and Ac for heating. Ac is about 30° C. higher than Ar . The one is, however, practically the correlative of the other. Osmond and Howe have shown that by hastening the cooling, the critical point Ar is proportionally lowered until, when

the cooling is (as in quenching) sufficiently rapid, there is no retardation; the change Ar does not take place. Hence certain conditions which existed above Ar are retained by quenching; and to this retention the various theories attribute the hardness of quenched steel. It is with regard to the nature of what is thus retained that they differ. The theoretical investigation is still further complicated by the discovery that, while high-carbon steels and those of medium hardness exhibit in heating and in cooling only one critical point, soft steels present two, or even three, which are distinguished as Ar^3 , Ar^2 , Ar^1 , and Ac^3 , Ac^2 , Ac^1 ; the latter being, as in hard steel, the correlatives of the former. Certain accessory constituents, especially manganese, nickel, chromium and tungsten, lower the critical points decidedly. Manganese and nickel, when present in sufficient quantity, apparently eliminate them (probably by lowering them below atmospheric temperature, and thus beyond observation). Ingeniously measuring in the micrograph the proportion of each constituent in the section, Sauveur has shown that in carbon-steel heated beyond Ac^1 the iron and carbon unite during Ac^1 to form martensite containing up to 200 iron for 1 carbon. Hence if the steel contains more than 0.50 carbon, the whole of the iron will be thus combined, and no other critical point or structural change is noted in further heating. As martensite never contains more than 0.90 per cent of carbon, some structurally free cementite will be found. On the other hand, if the steel contains less than 0.50 carbon, some iron will remain above Ac^1 , as structurally free ferrite, and on further heating there is a second retardation, Ac^2 , during which the saturation-point is raised to 1 carbon: 400 iron, additional ferrite is absorbed by the martensite, and a new structural equilibrium is established. For steel containing less than 0.50 and more than 0.25 carbon, Ac^2 causes all free ferrite to disappear; and such steel has no third critical point. But steel containing less than 0.25 carbon leaves some ferrite still unabsorbed above Ac^2 , and has a third critical point, Ac^3 , which raises the saturation-point to 1:800, and enables additional ferrite to be absorbed by the martensite. If more than 0.12 per cent of carbon is present, all the ferrite disappears; if less, some ferrite will remain unabsorbed beyond Ac^3 . The reverse phenomena occur during slow cooling at Ar^3 , Ar^2 and Ar^1 ; the ferrite which was absorbed at Ac^3 and Ac^2 being set free at Ar^3 and Ar^2 , while at Ar^1 the martensite is replaced by pearlyte.

The two main theories of hardening have been the carbon theory, which assumes that at and above a certain critical range (Osmond's A) the carbon passes spontaneously from its normal condition (cement-carbon) to a special condition (hardening-carbon); and the allotropic theory, which assumes that the iron under these conditions passes from its ordinary (*alpha*) condition to a strong, hard, brittle, allotropic (*beta*) state.* The hardening carbon of the one theory and the β iron of the other return under slow cooling to their former states, but may be preserved by sudden cooling. Mr. Howe has suggested (*The Hardening of Steel*, Journal of Iron and Steel Institute, No. 2, 1895) that the hardening of steel is due to the existence, at a high temperature, and the retention by sudden cooling, of a carbide of an allotropic form of iron. This he calls the carbo-allotropic theory. Prof. Arnold (*On the Influence of Carbon on Iron*, Proceedings Institute of Civil Engineers, Vol. 123, London, 1896) attributes the hardening, not to the carbon as such, but to the existence, above the critical range, of a very attenuated and very hard carbide of iron. This Sauveur calls the sub-carbide theory, and sums up the views and evidence advanced for each theory in the table here given, with which the present sketch of the subject must conclude.

Steel Manufacture. The revolution which has taken place in the relative use of cast and wrought iron and steel or ingot-iron affects also the relations of the different kinds of the latter (acid or basic Bessemer and open-hearth; crucible steel). The great change consists in—(1) the universal

* In the table below, a third form (*gamma*) is designated, being the martensite of steel cooled above Ar^3 .

THEORIES OF THE HARDENING OF STEEL.

	CARBON THEORY.	ALLOTROPIC THEORY.	CARBO-ALLOTROPIC THEORY.	PROF. ARNOLD'S SUB-CARBIDE THEORY.		MICROSTRUCTURAL EVIDENCE.
Conditions of carbon and iron above A_1^3 .	Iron and hardening-carbon.	Carbon diffused in γ iron.		Carbon and iron combined as $Fe^{2+}C$.	?	Very mild steel, made up of martensite and ferrite.
Cause of the evolution of heat at A_1^3 .	?	Passage of the iron from the γ to the β state.		Dissociation of $Fe^{2+}C$.	Formation of $Fe^{2+}C$	Separation of a certain amount of ferrite previously included in martensite.
Conditions of carbon and iron between A_1^3 and A_1^2 .	Iron and hardening-carbon.	Carbon diffused in β iron.		?	Carbon and iron combined as $Fe^{2+}C$.	Soft and medium hard steel made up of martensite and ferrite.
Cause of the evolution of heat at A_1^2 .	?	Passage of the iron from the β to the α state. Steel become magnetic.		Passage of iron from a plastic to a crystalline condition.		Separation from the martensite of an additional amount of ferrite.
Conditions of carbon and iron between A_1^2 and A_1^1 .	Iron and hardening-carbon.	Carbon diffused in α iron.		?	Carbon and iron combined as $Fe^{2+}C$.	Soft steel: martensite and ferrite. Medium hard steel: martensite. Hard steel: martensite and cementite.
Cause of the evolution of heat at A_1^1 .	Passage of carbon from hardening to cement-state.	Carbon combining with α iron to form Fe^3C .		Carbon combined with iron to form Fe^3C .	Dissociation of $Fe^{2+}C$ and formation of Fe^3C .	Disappearance of martensite and appearance of pearlyte.
Conditions of carbon and iron below A_1^1 .	Iron and cement-carbon combined as Fe^3C .	Iron and cement-carbon combined as Fe^3C .		Iron and carbon combined as Fe^3C .		Soft steel: pearlyte and ferrite. Hard steel: pearlyte and cementite.
Cause of hardening.	Retention by sudden cooling of the carbon in its hardening state.	Retention by sudden cooling of a hard allotropic state of iron, which retention is helped by the presence of C.	Retention by sudden cooling of a hard carbide of γ or β iron.	Retention by sudden cooling of a hard sub-carbide of iron $Fe^{2+}C$.		Retention of the martensite by sudden cooling.

substitution of strong, durable and cheap-Bessemer rails for those of iron; (2) the immense extension of the use of Bessemer steel in other directions, as a substitute for puddled and refined iron; (3) the successful establishment of the open-hearth manufacture for boiler-plates, sheets and all manner of "mild" steels, in which uniformity of quality is most important; (4) the development of the basic open-hearth process for the production of a metal superior for finer uses to other Bessemer or open-hearth steels, and less costly than crucible steel; (5) the successful production of steel castings. The basic Bessemer process has been chiefly advantageous to English and European makers by enabling them to utilize phosphoric ores. But the quality of the product has not been so much better than that of the acid Bessemer as to command additional fields of use. The reason, as stated by William Metcalf (*Eng. Mag.*, New York, Vol. IX, 1895, p. 1075), is that the two processes are subject in common to certain limitations, such as the absence of power to manipulate beyond very narrow limits (overblowing and underblowing being beyond adequate and convenient remedy). Moreover, the basic Bessemer requires phosphorus in the pig-iron as a source of heat; and the afterblow is liable to be carried a little too far. In the basic open-hearth, on the other hand, the source of heat being extraneous, it is not necessary to introduce phosphorus as a fuel; and the operation is so continuously under control that phosphorus in the charge can be eliminated to a considerable degree before the carbon has been burned out, so that it is possible to produce steel containing 1 per cent or more of carbon and less than 0.05 phosphorus,

from a charge containing 0.10 phosphorus. And this can be done, practically without recarburizing, by "melting down" to the required percentage of carbon. Mr. Metcalf says this fact has given the basic open-hearth an enormous field of usefulness not successfully occupied by the Bessemer, and previously belonging in large degree to the crucible, which is now greatly narrowed in application, and limited to the finer requirements of the arts. "It will hold this field until future developments shall remove the last elements of weakness from the cheaper processes. When that time comes, crucibles will be used no longer for making steel." Yet the puddling-furnace, the extinction of which was prophesied before 1880, "dies hard." The British product of puddled-bar in 1894 was 1,148,012 tons, against 1,535,225 tons of Bessemer ingots and 1,724,737 tons of open-hearth ingots; and 1,775 puddling-furnaces were still running in Great Britain.

Bessemer Steel. Important mechanical improvements have been introduced in the plant and machinery of this process, such as the casting of the ingots in moulds, which stand on cars, instead of in a casting-pit. The stripping and removal of the ingots can thus be performed with greater ease, in a cool and convenient space, and "sticking" ingots can be extracted by machinery. Another improvement is the pig-mixer, used at those works in which the fluid iron from the blast-furnace is conveyed to the converter. This is a large, brick-lined, tipping reservoir, into which the iron from several furnaces is poured, so as to equalize variations in its composition. Mixing is promoted by rocking the reservoir and by thrusting into the molten metal a

wooden pole, which, being destructively distilled, gives off gas copiously, stirring up the mass. The result is greater uniformity in the composition of the steel, a smaller production of scrap and greater convenience in the supply of metal to the converters, since iron from the furnaces can be kept hot in the mixer until required. Moreover, the iron itself may be improved in the mixer by the elimination of sulphur, either through simple standing or by the addition of manganese or manganiferous iron (Hilgenstock's process, which is said to reduce 0.50 to 0.05 per cent of manganese), or of chloride of lime with lime or limestone (the Saniter process, used at Wigan).

The Darby process of carbonization with solid carbon, is a means of restoring carbon to the decarburized metal without introducing an undesirable quantity of manganese. (See Ledebur's *Handbuch der Eisenhüttenkunde*, 1895, Vol. III, p. 920; also *Stahl u. Eisen*, 1890, p. 925; and A. Thielen, *The Darby Process of Recarburization*, *Transactions American Institute of Mining Engineers*, Vol. XIX, p. 790). It is applied to both acid and basic Bessemer, or open-hearth metal, by simply feeding ground coke to the ladle containing it. This does away with a large part of the spiegeleisen otherwise required, and effects, besides this economy, a considerable increase in the certainty of control over the composition of the final product.

Soaking-Pits. The desirability, both on account of economy in fuel and also of the quality of product, of rolling steel ingots without reheating, is now admitted. Stead showed experimentally that the margin of heat is ample. If the highest heat required for rolling an ingot and given to it in a heating-furnace be represented by 100, the heat in the fluid steel, as poured into the ingot-mould, is 150. But the difficulty of utilizing this heat was long deemed insuperable. The original practice was to let the ingots become quite cold, and then reheat them for the rolls. It was supposed that good work could not be done otherwise. Afterward it was found quite practicable and economical to put the ingots as hot as possible into the heating-furnaces, in which their temperature was not merely raised, but equalized. The soaking-pit, invented by John Gjers, of Middlesborough, England, effects an equalization and preservation of the initial heat, and puts the ingots in a condition suitable for rolling without the intervention of a heating-furnace. It is a vertical cell, lined with brick or other refractory material, in which the ingot is placed as soon as possible after it has been stripped of its mould. This cell is previously heated by gas-firing; when, however, the brickwork of the pits has become thoroughly heated and the operation of preparing ingots goes on continuously, there is no need of extraneous heat. The loss of heat being very slow, the excess from each ingot, which passes into the surrounding brickwork, makes it nearly as hot as the ingot itself. Hence the heat of the interior will tend to be distributed throughout the mass. Whatever be the surface-heat, however, the ingot will always be hotter inside, which is the reverse of what happens in the furnace-heating of a comparatively cool ingot.

The use of fired and unfired soaking-pits has rapidly increased in Great Britain and Europe; but it is not general in the works of the United States.

Mechanical Conveyors. In the Bessemer, as in the open-hearth and the blast-furnace practice, there has been an immense extension of the use of machinery to handle the larger quantities and masses now involved. Electric, as well as steam and hydraulic power, is applied to cranes, carriages, locomotives, feeders, etc.

Open-Hearth Steel. The principal improvements in this branch have been in the enlargement and better construction of furnaces (e.g., the Batho and the Lash furnaces; see A. E. Hunt's *Recent Improvements in Open-Hearth Steel Practice*, *Transactions American Institute of Mining Engineers*, Vol. XVI, p. 963, and a paper by H. H. Campbell, *ib.*, Vol. XXII, p. 345), the use of natural gas as fuel, the employment of a wider range of raw materials, and the accompanying increase in accuracy of chemical control and in facilities for mechanical handling. Among the improvements in this line is the use of the large tipping open-hearth furnace. Six of these, at Steelton, Pennsylvania, each having the capacity of 100,000 pounds of ingots per cast, are all commanded by a 75-ton electro-hydraulic crane. The furnaces can be lined with either acid or basic, and have been successfully operated in both ways. Open-hearth furnaces of 30 and 40 tons' capacity are now common, and "the reproach of the open-hearth process, its small output, is to disappear." (H. M. Howe, *Certain Advances in Iron and Steel Metallurgy*, and H. H. Campbell, *The Open-Hearth Work at Stulton*, both in Rothwell's *Mineral Industry*, Vol. II, 1894.)

The basic open-hearth process commands the widest range of materials, and permits the most effective control of product. Krupp, of Essen, produced in 1895 basic open-hearth metal containing—

	PER CENT.
Iron	99.710
Manganese	0.079
Nickel and cobalt	0.039
Copper	0.068
Silicon	0.013
Carbon	0.070
Sulphur	0.013
Phosphorus	0.007
Total	99.999

(See *Journal Iron and Steel Institute*, 1895, No. 2, p. 151.)

The process is therefore able to compete with the crucible on the one hand and the puddling-furnace on the other; and its consequent rapid extension has involved the employment of large plants and heavy machinery, such as are required by the Bessemer process. Indeed, the handling of a charge of forty or fifty tons of liquid steel exceeds in difficulty anything called for in Bessemer practice.

The open-hearth is also specially available for the manufacture of special steels, of which several are mentioned below.

Basic Slags. An incidental advantage of the basic processes for the manufacture of steel is the commercial utilization, as a fertilizer, of the slag

produced. This is more particularly and generally true of the basic Bessemer slag, because that process necessarily involves the use of pig-iron high in phosphorus; whereas the basic open-hearth process, being conducted with the aid of extraneous heat, does not require phosphorus as a heat-generating constituent of the charge, and may therefore yield a slag not rich in this ingredient. The basic Bessemer slag produced at Pottstown, Pennsylvania, averaged per cent 21.37 phosphoric acid and 45.26 lime. In Great Britain and Europe, all the slag of this character is used as a fertilizer, and it is estimated that over 7,000,000 tons have been thus consumed. For this purpose the slag is ground very fine (usually with ball-pulverizers), and applied to the soil in its crude condition, without chemical treatment (such as is given to the fossil phosphates) to convert the phosphoric acid into soluble form. According to the statement of Mr. W. H. Morris, of Pottstown (*Transactions of American Institute of Mining Engineers*, Vol. XXI, p. 232), the grinding is carried so far that at least 60 per cent of the material will pass through a 150-mesh screen, and 90 per cent through a 100-mesh screen. This fine grinding is apparently the main condition of successful use. From the material thus prepared, the phosphoric acid is taken up by the soil, though not as rapidly as the more soluble phosphates produced by chemical treatment. The effect, however, is believed to be proportionally more lasting. This fertilizer is reported in Germany to be best adapted to sandy, silicious and peaty soils. Being essentially a waste product, it is sold at low prices, and thus commands a market in the face of all competition from mineral phosphates or guanos, which have to bear the entire cost of mining and preparation.

Manganese-Steel. The importance of manganese in the manufacture of iron and steel has been long recognized. Metallurgical practice takes into account its effect upon the absorption of carbon, the formation of graphite, the contents of sulphur, the temperature of fusion and the hardness and strength of cast-iron, and upon the structure, malleability, weldability, etc., of wrought-iron; the part which it plays in puddling and refining; its value in the crucible-process, and as a minute admixture in crucible and other steels; and, above all, its operation as a deoxidizer when added as spiegeleisen or ferro-manganese to the steel produced by the Bessemer or the open-hearth process, a function which, in the former process at least, is essential to success. But all these instances involve but an extremely small percentage of manganese, either in the course of the process or in the final product; and none of them can be said to foreshadow the qualities of an alloy of iron in which manganese is a principal ingredient to the amount of more than, say, 1.25 per cent. According to Mr. R. A. Hadfield, of Sheffield, England, the introducer of commercial manganese-steel (see *Transactions American Institute of Mining Engineers*, Vol. XXIII, p. 148), ordinary carbon-steel, whether cast or forged, may contain as much as 1.25 per cent of manganese without showing any marked change in quality, provided the carbon is low. But after this point is passed there is a decrease in strength

and ductility; and somewhere between 3.5 and 5 per cent of manganese an exceedingly hard and brittle material results. Beyond about 6.5 per cent a remarkable change occurs, and toughness and ductility gradually return. The alloy becomes also less and less subject to magnetization, and at 13 per cent is practically non-magnetic. At about 14 per cent the maximum of strength is reached for cast manganese-steel, as practically manufactured (i.e., with the use of ferro-manganese, which inevitably introduces carbon). A reduction in carbon would probably permit the manganese to be increased without loss of strength, but is, on other accounts, not desirable. Forged manganese-steel is most brittle at about 5 per cent. At 10 per cent, when water-toughened, it exhibits the ductility of mild carbon-steel, but much higher tenacity. At 13 per cent there is a considerable increase, both of tenacity and ductility. At about 22 per cent malleability ceases. There seems to be no commercial advantage in manufacturing either cast or forged manganese steel containing more than 14 per cent of manganese. The carbon usually ranges from 1 to 1.3 per cent. Tests of the forged steel, made by disinterested authorities, indicate the qualities of the metal. (See Hadfield's paper, already cited.) The specimens were water-toughened, and showed: limit of elasticity, 19.8 to 29.9 tons per square inch; breaking-strain, 58.8 to 73.8 tons; elongation, 39 to 49 per cent; reduction of area, 34 to 45 per cent. These figures are here given approximately, exceptions due to special treatment being disregarded. Professor Kennedy, of London, obtained a tenacity of 63 tons per square inch with 42 per cent elongation on 8 inches. The application of manganese-steel has been restricted by the difficulty of machining and finishing it, due to its extreme hardness. Many articles now made of it are put to use without any tooling. The castings are exceptionally free from blow-holes. Manganese-steel car-wheels have shown surprising toughness and resistance to wear. Dredger-bolts of this material are said to outwear those of carbon steel four times. Stamp-shoes, dies, jaws, rolls and balls for crushing are also made of it, and it has been successfully employed in plowshares, rakes, shovels, etc.

Chrome-Steel. Chromium by itself appears to have little hardening influence upon iron; but as a third element in a carbon-alloy it produces a steel of great hardness. This property has been recently utilized in the manufacture of armor-piercing projectiles. The Carpenter steel, which has thus far given the best record in this respect, contains tungsten as well as chromium.

Nickel-Steel. The presence of nickel in meteoric iron, and its similarity to iron in many respects, naturally suggest it as an alloy. But it is only in recent years that the peculiar properties of nickel-steel have been recognized and utilized. The first effective public presentation of these qualities was made by Mr. James Riley (*Alloys of Iron and Steel*, Journal Iron and Steel Institute, No. 1, 1887, p. 54); and the first important application of nickel-steel was in the manufacture of armor for warships. A nickel-steel armor-plate made in America was reported by Ledebur to contain 0.28 carbon, 3.21

nickel, 0.08 silicon and 0.03 phosphorus; manganese and sulphur not determined. The French government used (1894) an armor-plate containing 0.4 carbon, 1.0 chromium and 2.00 nickel. In this alloy, the chromium furnishes hardness; and the nickel, toughness and elasticity. Hardness is communicated to nickel-steel armor-plates by the Harvey process of carburizing a part of the plate, after manufacture, and subsequently hardening it in a torrent of water. This is applied to the outside of the plate only, and produces a regularly decreasing carburization and consequent hardness from the outer surface inward, to the depth of several inches, leaving the rest of the plate soft and tough. The Harveyized nickel-steel plates have given the following results, as compared with other varieties:

	RELATIVE PENETRATION OF PROJECTILES.	RELATIVE RESISTANCE TO PROJECTILES.
Harveyized nickel-steel armor-----	1	1
All-steel armor-----	1.64	0.609
Compound armor-----	1.75	0.572
Soft-steel armor-----	2.2	0.455

Thus, for equal power of resistance there can be a saving of 43.8 per cent in weight, in favor of the Harveyized plate, as compared with the compound armor, made up of a hard-steel face and soft-steel backing, adopted by the British Admiralty in 1878. The value of nickel-steel for structural uses is indicated by the test of specimens from the nickel-steel propeller-shaft of the United States ship *Brooklyn*, showing an average tensile strength of over 93,000 lbs. per square inch, with an elastic limit of over 59,000 lbs., an elongation of 25.8 to 28 per cent, and a contraction of area of 59.81 to 61.33 per cent. The elastic limit of this shaft was about equal to the tensile strength of an ordinary mild-steel one, while elongation and contraction were nearly the same as for mild steel. (See *Nickel and Nickel-Steel*, by Francis L. Sperry, Transactions American Institute of Mining Engineers. Vol. XXV, 1895, p. 51).

Steel Castings. A noteworthy feature of the period under review has been the increased use of castings of steel (including ingot-iron) instead of forged iron or steel. These are made of Bessemer or open-hearth steel, the latter being the most convenient, because the same charge can be used for both ingots and castings, the part intended for the latter being left in the hearth at tapping until it has been prepared by suitable additions of spiegeleisen, ferro-silicon, etc. Basic metal can be used; but the peculiarities of the basic process (rapid combustion of silicon and carbon in the iron) are not important here, and when an open-hearth furnace is used exclusively for castings, it is generally operated with an acid (silicious) bottom. (See Ledebur's *Handbuch der Eisenhüttenkunde*, Vol. III, 2d ed., 1894, *passim*.) To make such castings solid and free from cavities due to shrinkage (piping) or to occluded gases, various means have been used, which may be classed as follows:

1. Regulation of the chemical composition of the metal, to diminish development of gases. Under this head falls the addition of manganese (in spiegeleisen, etc.), or silicon (in ferro-silicon), or aluminum. The last is the means employed in the so-called Mitis castings (made in crucibles, of very soft low-carbon metal), in which it is claimed that the minute proportion of aluminum added lowers the fusion-point of the metal, and is thus equivalent to the production of a higher temperature and a more perfect fluidity. The latest process under this head is the Walraud-Legénisel (see *Journal Iron and Steel Institute*, 1894, No. 1, p. 26), which is essentially an addition to the Bessemer operation, consisting in the addition of ferro-silicon at about the time of flame-drop in the ordinary process, and in making an after-blow, in which the silicon, rapidly burned immediately before pouring, produces a considerable increase of temperature, but no gas—since it burns to solid silica, which passes into the slag. The same temperature obtained by the combustion of carbon, for instance, would involve gas-generation.

2. The use of a casting-head, i.e., of an upward prolongation of the ingot or other mould, to receive metal, in which blow-holes, etc., may accumulate, and which may be then cut off from the casting.

3. The casting of large masses, which, cooling more slowly, give more time for the escape of gases. This is, of course, not applicable in the manufacture of direct castings for use.

4. Casting from below, with which may be classed as Whitworth's process of cooling under pressure. The latter, which requires expensive machinery, is used in a few places only.

Crucible Steel. Concerning this industry little can be said here, except that it has availed itself of the Siemens furnace as a means of heating, and that by the use of chemical analysis and control it has enlarged the range of its raw materials. Thus, in some places, basic, open-hearth and Bessemer scrap have been successfully substituted for more expensive irons.

Direct Processes. The attempts to produce malleable iron by the direct reduction of ore have taken the modified form of the production by such means of material for further treatment in the open-hearth. The Siemens process (described at length in *IRON*, Vol. XIII, pp. 347, 348) never proved a commercial success; and it is doubtful whether the conditions of permanent profit attach to any direct process, though special circumstances may render such a method locally or temporarily advantageous. (For a forcible discussion of the question, see the paper of Sir Lowthian Bell on *The Probable Future of the Manufacture of Iron* (1890), Transactions American Institute of Mining Engineers. Vol. XIX, 1891, p. 834.) The Husgafvel high bloomery, a modification of the old *Stückofen*, in which the hearth is movable and the working continuous, has been used with reported success in Russia. The process of the Carbon Iron Company and the Adams process, both practiced for a while at Pittsburg, Pennsylvania, were suspended when the natural-gas supply became scantier and dearer. The former employs as a reducing-agent coke or graphite, which is charged upon a hearth with ore, both materials

being ground and mixed with a little water. A reducing-flame of natural gas is allowed to play over the charge from jets at both ends of the furnace. After an hour and a half the charge, reduced to one-third its original depth, shows beads of metallic iron over its surface, and is balled as in ordinary puddling. After all the balls are ready they are squeezed and rolled or shingled, or (preferably) are taken hot to the open-hearth bath. The sponge-balls are protected from oxidation by the adhering graphite, and as the ore employed is pure and rich

(Lake Superior, 62 per cent), the product is of excellent quality. The Adams process, as improved by Blair, and operated in Pittsburg, employs natural gas as the reducing-agent. The gas is heated, introduced into a vertical brick-lined chamber filled with ore, and, after reducing the ore to sponge, passes out through other chambers, in which it is burned to heat the walls. On the other side of these walls the incoming gas is heated without combustion. The reducing-chamber is built immediately over an open-hearth furnace, into which the sponge is dropped, without exposure to air. The quality of the product is excellent, rich and pure ore being used; and, so long as natural gas was available at a low cost, the process was successful. See IRON, Vol. XIII, pp. 278-359.

R. W. RAYMOND.

IRONCLADS. See NAVY, Vol. XVII, pp. 284-288; and NAVY, in these Supplements.

IRON CROWN, the ancient diadem of the Lombard kings. It was said to have been given to Theodelinda, wife of King Antharic, in 590, by Pope Gregory I. Charlemagne was crowned with it in 774, then it was worn by various monarchs, down to Charles V (1530), and later Napoleon I (1805). It was taken to Vienna by the Austrians in 1859, but was given to Victor Emmanuel, King of Italy, in 1866. The crown is made of a golden loop with enameled flowers and precious stones, and having inside a narrow band of iron which, it was claimed, had been made out of a nail from the true cross.

IRON MOUNTAIN, a city and the capital of Dickinson County, central north Michigan, 51 miles W. of Escanaba, at the junction of the Chicago, Milwaukee and St. Paul and the Chicago and North-Western railroads. In its vicinity there are extensive iron-mines. Great quantities of excellent ore are mined, this being the main industry of the town. The great Chapin mine, which employs nearly 1,000 men, is located here. Population 1900, 9,242.

IRON MOUNTAIN OR IRON MOUNT, a hill in St. François County, Missouri, 81 miles S.W. of St. Louis. It is about 300 feet higher than the adjacent plain, and covers 500 acres. It yields from 50 to 60 per cent of good iron, free from sulphur, magnetic, and softer than that of Pilot Knob. The amount of iron appears to be immense, as it is 50 feet in thickness and of unknown depth. Iron Mountain village contains blast-furnaces and factories, and is situated on the St. Louis, Iron Mountain and Southern railroad. Population 1890, 1,101.

IRONTON, a village and the capital of Iron County, southeastern Missouri, on the St. Louis, Iron Mountain and Southern railroad, 73 miles S. of St. Louis. Good iron and granite abound near this place. The surrounding country is fertile farmland. Population 1890, 955; 1900, 797.

IRONTON, a city and the capital of Lawrence County, southern Ohio, situated on the Ohio River, 30 miles above Portsmouth. The city is built on a small plain, or bottom, at the base of hills which abound in iron-ore and bituminous coal. At Ironton there are several rolling-mills, iron foundries, furnaces and manufactories of machinery, boilers, nails, stoves, fire-brick and furniture. Iron is the chief article of export. Population 1880, 8,857; 1890, 10,939; 1900, 11,868.

IRONWOOD, a city of Goebig County, western north Michigan, on the Wisconsin Central and the Chicago and Northwestern railroads, two miles from the Montreal River. It is in the rich Goebig iron region, iron-mining being the principal industry. Population 1890, 7,745; 1900, 9,705.

IROQUOIS, a confederation of tribes of North American Indians, composed originally of the Mohawks, Oneidas, Onondagas, Senecas and Cayugas, known as the Five Nations. Later, in 1712, when joined by the Florida Tuscaroras, the union was known as the Six Nations. When first visited by the Jesuits they occupied central and western New York, but soon took possession of the greater part of the basin of the Great Lakes and of the upper valley of the St. Lawrence, driving out the weaker tribes, among these being the Hurons (q.v., in these Supplements). They were never friendly to the French, but were strong allies of the English. On account of their great power, their aid was frequently sought in the colonial wars, and their assistance was secured by the British during the Revolution. During early colonial times it is estimated that they numbered 12,000, of whom 2,000 were warriors. Constant warfare reduced their power, and several severe defeats during the Revolution diminished their numbers, so that in 1784 they were glad to treat with the United States, and the greater part went across the lakes into Ontario. The confederation was broken up at that time, and afterward, in the War of 1812, some of the tribes were with the British and others with the American forces. But few remain of the once powerful Iroquois. In 1895 there were remnants of all the tribes, but the Mohawks, living in the United States, and under the jurisdiction of the government. These were distributed as follows: Cayugas, 168, having no reservation of their own, but residing chiefly in the Seneca reservation, in Cattaraugus County, New York; Oneidas, 2,107, of whom 179 lived on the Oneida reserve, Madison County, New York, 87 on the Onondaga reserve, near Syracuse, New York, and 1,841 on Green Bay, Wisconsin; Senecas, 2,981, of whom 2,693 were in New York, on the Allegheny, Cattaraugus and Tonawanda reserves, and the remainder, 288, on the Quapaw reservation, Indian Territory; Onondagas, 534, living on the Onondaga reserve, near Syracuse, New York; and Tuscaroras, 378, living on the Tuscarora

reserve, near Niagara Falls. For early history and tribal affinities, see INDIANS, Vol. XII, p. 827.

*IRRIGATION. Farming by irrigation is one of the oldest of industries. Evidences exist that water was applied artificially to land to supplement the natural rainfall in prehistoric ages. In the United States are found the remains of vast irrigation systems, of very ancient origin. In Arizona and New Mexico the lines of great canals can yet be traced on the surface, the rivers that supplied them having long vanished, buried beneath the drifting sands of the desert, or changed in their courses, leaving the canals high and dry, often leagues away from any source of water-supply at present apparent. In the Salt River valley, in Arizona, some modern canals follow more or less closely the contour of prehistoric works of this character, and the farmers of today often are saved the labor and expense of leveling the land to fit it for irrigation, from the fact of the work having been performed centuries ago by some forgotten race.

Ancient as the pursuit may be, the essential features of irrigation appear to have changed but little from the first. Of course, modern engineering skill now enables us to impound vast bodies of water in reservoirs, and to throw immense dams across mighty rivers, and divert their waters into canals of great width and length, all of which was impossible to the ancients. But this, after all, is only a question of degree; for the men of olden times constructed their small reservoirs and diverted little streams, and then, much as we do at present, led the water by canals to the point where it was required, and finally, by ditches, distributed it to the irrigators, who utilized it on their lands.

As ages have passed, and water has become more valuable, less wasteful ways of distribution have been learned; thus the flow of a cubic foot of water per second, which, under crude methods, would water only from twenty-five to fifty acres of land, to-day, by the use of scientific means, may be made, as is done in southern California, to do duty for fifteen hundred acres. On the whole, however, the art of irrigation is, and must remain, the simple application of an elemental principle that cannot be greatly modified, except in matters of detail.

The area in the United States which is entirely or partly dependent upon the artificial application of water for successful cultivation amounts to about one million square miles, or one third of the entire country, excluding Alaska. Journeying through the central states until the 99th degree of longitude is arrived at, the region is reached where agriculture without at least partial irrigation is a very risky undertaking. This north and south danger-line swings back somewhat toward the east as it goes south, and forward toward the west as it goes north. When the 102d degree is reached, irrigation becomes an indispensable adjunct to farming. This line also swings east and west as described above. The district lying between these two degrees of longitude is described as the subhumid region; that west of them, as the arid region. The arid region stretches across the continent until the rain belt along the Pacific Coast is reached. This rain belt, which is

due to the precipitation of chilled vapor arising from the warm Japan current, which sweeps along the coast, is comparatively narrow in southern California, but broadens as it goes north, the depth of rainfall increasing in proportion to the increase of width. From the arid region may be deducted small detached areas, situated high amongst the peaks of mountains, where more frequent showers permit of a precarious agriculture without irrigation.

The western portion of the following states are included in the subhumid region, where the practice of agriculture is hazardous without the aid of irrigation: North Dakota, South Dakota, Nebraska, Kansas and Texas, and also the territory of Oklahoma. The total area actually under irrigation in this region at the present time is calculated to be, approximately, 77,500 acres. The census of 1890 showed it to have been, in that year, but 66,965 acres; the increase during six years being thus practically 15 per cent. There is opportunity for immense development of irrigation in this region. The average size of the irrigated farms in this subhumid area in the census year varied between twenty-nine acres in Texas and eighty-three acres in South Dakota, figures which have not changed materially since.

The states and territories, part or all of which are included in the arid region, where irrigation is essential, are as follows: Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming. As before intimated, in most or all of these commonwealths there are some few circumscribed localities situated in the higher elevations of the mountain ranges, where, because of the increased precipitation resulting from mountain showers, farming can be carried on, with varying degrees of success, without the artificial application of water; and with the exception of southern California (where irrigation is necessary for certain crops), the rainfall is generally sufficient throughout the coast districts of California, Oregon and Washington to obviate the necessity of irrigation. In the eastern parts of these three states, separated by mountain ranges from the Pacific Ocean and the immediate influence of the Japan current, irrigation is necessary.

The monthly average rainfall for a period of 15 years at Los Angeles, southern California; and Portland, Oregon, two cities situated in the coast rain-belt, is shown by the following diagram, and is indicative of the conditions prevailing in the districts surrounding them. It will be observed that the precipitation in both instances is greatest in the winter and spring months and least in the summer and autumn. In the Oregon district the rainfall is ample during the greater part of the year, and usually adequate, though scanty, in the driest months, to sustain plant-life. At Los Angeles, also, during the winter and early spring months, the rainfall is, on an average, sufficient, but inadequate during the late spring, summer and autumn. Hence, in southern California, crops, such as the cereals, that attain their growth during the winter and early spring, and are harvested in the early summer, do not necessarily require irrigation, but most of those

of other habit must, except in particularly favored localities, where the soil is unusually retentive of moisture, be more or less artificially watered to produce profitable results.

The area under irrigation in these eleven states is, approximately, 4,250,000 acres, or nearly 20 per cent greater than in 1890, when the census showed it to be 3,564,416 acres, which area, however, was considered by many authorities to be somewhat an underestimate. The total irrigated area in the United States is thus shown to be 4,327,500 acres. The average size of the farms in the arid region was 68 acres, the largest being in Nevada, where the average area was 192 acres, and the smallest in Utah, where the average was 27 acres. These figures may be accepted as being unchanged and practically correct in 1896.

The average value per acre of irrigated lands in the arid region is calculated, by the United States Department of Agriculture, to be \$83.28, ranging from \$31.40 per acre in Wyoming to \$150 per acre in California. This wide divergence in value is chiefly due to the different character of the products suitable to and grown in the several districts. In Wyoming, for instance, ordinary farm crops are raised, of which there is a surplus in the country as a whole, and of which, therefore, the price is low; while in California a large proportion of the produce consists of subtropical fruits, such as oranges, lemons, olives, etc., of which a sufficiency is not raised in the country, as a whole, to supply the demand, and of which, therefore, the price is high. As a natural consequence, California irrigated land is of much greater value than similar land in Wyoming. This general law, however, is modified sometimes by local conditions. There are many districts in which only the ordinary farm crops can be grown, where the local irrigated areas are insufficient to supply the local demand for such products. In such places the price of grain, etc., is equal to the price of like articles at the nearest point where there is a surplus to draw from, plus the cost of carriage from there. In those districts, therefore, where the farmer is afforded a protective tariff by the imposition of freight rates, the value of land is naturally higher than where the irrigated area is more than ample to supply the local demand, and where, therefore, no outside produce is imported to supply the deficit.

The average annual value per acre of the crops

raised on irrigated lands in the eleven arid states is calculated by the United States Department of Agriculture to be \$14.89, ranging from \$8.25 in Wyoming to \$19 in California. Such figures, however, are apt to be misleading, unless due consideration be given to the circumstances under which the averages are arrived at, the general average being, in all instances, far below the results attained by intelligent farmers in carefully selected locations. The average for California, in particular, is affected by another condition, which exists, also, in some degree, in all other places; namely, that the average for the large area devoted to raising ordinary low-priced crops lowers the average of the comparatively small area bearing citrus fruits and other high-priced products, the value of which per acre is immensely greater than the general average. These and other modifying conditions must be accorded due weight when the average value of crops is being considered.

It is claimed very generally by irrigating farmers in the United States, and indeed the world over, that the benefits accruing from irrigation more than compensate for the expense and labor incurred by its practice. Before investigating the accuracy of this claim an estimate of the cost of irrigation in this country is necessary.

The average cost of bringing water to the land on which it is used, throughout the subhumid and arid regions, is \$8.15 per acre, varying from \$3.62 in Wyoming to \$12.95 in California. This preliminary expense, however, in the large majority of cases, is not made directly by the farmer, the water more often being conveyed to the land by canals owned by companies incorporated for the purpose. It is usual for the farmer in such cases to contract for the perpetual annual supply of a specified amount of water. The water thus contracted for, or otherwise procured, is termed a "water right." The present average value of water right in the region the above figures apply to is \$26 per acre, varying from \$8.69 in Wyoming to \$39.28 in California. A water right is thus seen to be valued at present at more than three times its original cost. The value of water right, plus the value of land prepared for irrigation, forms the value of irrigable land, as already quoted. It must not, however, be forgotten, in this connection, that, in the arid region, the fact that any certain piece of land is situated so as to be capable of being irrigated adds immensely to its worth, even if at present it is not supplied with water. Of land that it is impossible to irrigate there is a vast abundance, and its value is almost nominal. The outlay for water right, whether incurred by purchasing from a company, or by the farmer himself constructing the necessary works, should be considered a capital expenditure and added to the first cost of the land when comparing the relative merits of farming with and without irrigation. The cost of water right must not be confused with annual water rental, which is the yearly sum paid for the regular delivery of the water to the land, an outlay necessitated by the cost of keeping the canals and other works in repair. Another preliminary expense to be borne by the irrigating farmer,

and to be charged to capital account, is the preparatory leveling and preparing of the land. The cost of this varies so widely that the quotation of an average figure would be misleading and worse than useless. Sometimes, on level prairie or valley land, the expense is merely nominal; but, where much clearing of brush, grubbing of roots and leveling of inequalities has to be done, the cost may run up to \$10 or \$20 an acre. This wide difference in the cost of preparing land is equalized largely, however, by the fact that the price of rough land is proportionately much lower than smooth land, other conditions being equal. Water rental, or in other words, the annual cost of the delivery of the water called for by the possession of water right, averages \$1.07 per acre throughout the arid and subhumid regions, varying from 44 cents in Wyoming to \$1.60 in California. It will be noted that the cost of water right and the annual rental increase and decrease in proportion. The reason for this fact is not far to seek. In Wyoming, for instance, where low-priced crops alone are produced, only such irrigation-works are constructed as can supply water cheaply; whilst in California, where the fruit crops are of high value, irrigation-works, which are very costly to construct and maintain, can be utilized profitably.

A quotation of the average cost of actually applying the water to the land would be misleading and useless, as it varies so widely, according to circumstances.

It is calculated that in Colorado, under very favorable conditions, one man can irrigate 25 acres of growing grain per day. Twelve acres per day, however, may be taken as a fair average for that class of crop. Presuming the irrigator's wages to be \$1.50 per day (including his board), and that four irrigations are necessary during the season (including one before seeding), the cost of actually applying the water would be 50 cents an acre each season. It must be borne in mind that this figure applies merely to grain-fields on the comparatively level prairies of Colorado. The calculation bears no relation to the cost of irrigating other crops elsewhere.

It will thus be seen that the irrigating farmer is called upon to pay, first, for the land in its natural condition; secondly, for a water right; thirdly, for fitting the land for irrigation; fourthly, the annual water rental; and lastly, the cost of applying the water to the land; whilst the farmer who depends upon natural rainfall to supply moisture is free from all these expenditures, excepting the first and sometimes a part of the third, where the removal of brush or timber is called for. At first glance it would thus appear as if the conditions were strongly in favor of the agriculturist, who relied upon rainfall, but a little deeper investigation leads to an opposite conclusion. In the first place, the average cost of land in the arid region with water right, and prepared for irrigation, is, if anything, lower than the cost of land in the humid region, if the value of the produce raised on the land be taken as the basis of estimation. This is an important consideration, often overlooked. Another material fact is, that,

when irrigation is practiced intelligently, the raising of a crop every season is as nearly certain as anything human can be. Exactly the amount of water necessary to the perfect development of any given crop can be applied exactly at the time it will do the most good. The disastrous vagaries of nature, as exhibited by abnormal rainfall or prolonged drouth, are overcome by the ingenuity of man. In the arid region it never (or so seldom that it is hardly worth while considering the possibility) rains too much, so that the farmer is relieved of the apprehension that his crops may be drowned out. Neither does the dread of drouth and parched fields weigh upon his mind; for he knows that by the mere opening of a sluice an adequate supply of water will be carried over his land. Nor will cold or cloudy weather retard the maturing of his harvest; for almost constant sunshine is present throughout the day to force plant-life to early and vigorous maturity. In short, he is largely freed from the anxieties that are the lot of the farmer who depends upon natural moisture. Another condition in his favor is, that, the quality of the soil, etc., being equal, he is assured every season of a crop as heavy as an exceptionally abundant one in the humid region; for every year his artificially produced climatic conditions equal those of the most favorable season in the country of rainfall. No better condition can prevail in the best of years anywhere than almost constant sunshine and exactly adequate moisture, and this happy state of affairs exists every season, with uninterrupted regularity, in the arid portion of the United States, where irrigation is conducted properly.

Another condition in favor of the irrigator is the fact that, with certain exceptions hereinafter to be mentioned, the water applied in irrigating enriches the land as well as moistens it, and partly, fully, or more than fully, compensates for the impoverishment caused by the growing of crops. As a stream flows along, there are washed into it, and it collects from its crumbling banks, fertilizing elements, the most valuable of which it carries with it, precipitating the valueless coarse sand and gravel in its bed. The rich elements eventually are carried upon and remain in the land irrigated by such water. The Nile has long been famous for the fertilizing qualities of its water, the lands irrigated by it having been cropped for unnumbered centuries, and showing no decrease in richness, although fertilizer, other than that supplied by the water, seldom or never is applied by the natives. In this country the Rio Grande del Norte, running south through Colorado and New Mexico, is exceptionally rich, especially in its lower reaches, where its muddy flow deposits at each irrigation about a sixteenth of an inch of smooth, greasy mud, which analysis shows to be of the highest nutritive value to plant-life, presented in a form particularly easy of absorption. Irrigators in southern New Mexico, and lower down the river, are fully aware of this characteristic, and often take advantage of it to make rich land out of barren sand. A few soakings with Rio Grande water on the most hopeless-looking sand will enrich it sufficiently to yield a fair crop, and each season, as irrigation is continued, the soil becomes more

mellow and fertile, until finally it is as good as the best in the neighborhood.

Mr. R. J. Hinton, in his able report to the government, in 1891, on irrigation in the United States, says, in regard to this matter: "The value of irrigation as a fertilizer of the soil may be seen in the fact that the Pima Indians of Arizona have cultivated the same land—a portion of which they now occupy—for at least five hundred years. Their cultivation, though rude, has been extensive and well conducted. Nothing has ever been applied to the land but the water, which quickens and fructifies it. As large crops are now raised as any of which the traditions of these Indians bear record." Scientific European, Asiatic and African investigations bear testimony to like facts.

As is natural to suppose, some streams are more potent in their power to enrich than others, the amount and quality of fertilizing matter they carry being regulated by the nature of the soil prevailing in the country through which they flow. Also, a stream is usually unequal in richness in its different parts, it generally diminishing in fertilizing quality as it nears its source, where its water necessarily has gathered less alluvial wash. It is not, therefore, intended to be asserted that the practice of irrigation always and altogether obviates the necessity of artificial fertilization of land; but it is an undoubted fact that such is sometimes the case, and that, generally, it more or less enriches the soil, and lessens the quantity of manure necessary to produce the best results. This beneficial characteristic does not, however, apply to water derived from artesian or other wells, which, from its nature, cannot carry fertilizing elements of the nature described.

The chief factors that count in favor of the irrigating farmer in the arid or semi-humid portions of the United States having thus been stated, it is now necessary to discuss such drawbacks as may exist.

The first objection that may be urged is, that the art of successful irrigation is one that can only be acquired by close study and experience.

In other words, an irrigator must not only possess all the knowledge that a farmer in the humid region possesses, but, besides, he must understand the art of artificially applying water to land and growing crops—a knowledge not as easily acquired as might be supposed, as many an inexperienced irrigator has found, to his cost, a crop is ruined easily by an ill-timed or disproportionate application of water. Different soils call for different amounts of water, and different methods of applying it, according to their character and the nature of their subsoils. The amount of moisture best suited to the several crops also varies very greatly, as do, also, the seasons when it should be applied to them. These are details that can only be learned by experience, and often are gained at considerable cost. Another danger exists in the quality of the water that is to be used,—a matter which should be made the subject of exhaustive test, for there may be carried in solution an amount of alkali that will in time render the land it is applied to utterly worthless. Many farms in the West that formerly were prolific are to-day barren from this cause.

The water applied in irrigation filters itself in soaking through the earth, and leaves behind, in the soil it moistens, the greater part of all matter it holds in suspension or solution; hence, when it is charged with alkali, each irrigation adds to the normal quantity of alkali in the soil, until at length it becomes so supercharged with this substance that it is poisonous to plant-life. Land with an impervious subsoil is ruined much more rapidly in this way than when the subsoil is gravelly and open; for when the latter condition prevails, the filtration is more complete, and therefore less alkali is retained in the surface soil. The converse of this land-poisoning by alkaliwater is also true; for when land is naturally supercharged with alkali, and water that is free from alkali can be obtained wherewith to irrigate it, the alkali is washed out gradually, and in time the soil becomes fertile. It may be taken as an axiom by irrigators that alkali land is bad, but alkali water is fatal. One of the greatest irrigation systems in the United States, that of the Pecos River in New Mexico, did not at first meet the high expectations of its promoters, from the fact of alkali being present in unexpectedly large quantities in the water. Eventually, expensive modifications were made in the plant, by which the water from a certain highly alkaline creek was cut off and the cause of failure was removed, and success resulted.

The methods of applying water to land are many. There are, however, but two found in general practical operations; viz., flooding, and distribution through furrows. A third method, that of sub-irrigation by pipes, is used occasionally, where water is very scarce, and where the value of the crop is such as to admit of the great expense necessitated. It is practiced in some few citrus orchards in southern California. The plan, in short, is to run underground an iron pipe along each row of trees, there being opposite each tree an orifice through which the water escapes. By this plan, when the pipes are charged with water, the soil surrounding each tree is moistened and a minimum of water is used. This plan, economical in theory, is not found generally practical in operation, the outlets, and sometimes the pipes themselves, becoming choked. A modification of this plan, where porous earthenware pipes are used, has been tried, with, however, only partial success. The most ordinary method of irrigation, especially for cereals, alfalfa, etc., is by flooding. This is the easiest way, but the most wasteful of water. Its operation is as follows: After the land has been leveled, it is divided into compartments by ridges of earth, called "checks," six inches or so high. Each compartment thus formed is connected with a small ditch, known as a "lateral," which runs from the main ditch. The size of these compartments is regulated by the slope of the land and the volume of water obtainable. The object aimed at is to fill each compartment to a certain depth, as nearly as possible equal, over its entire surface. Supposing the fall of the land to be one inch in each 100 feet, and it is the intention to supply an average depth of four inches of water, it is obvious, that, in a compartment measuring 200 feet in the direction of

the slope, at the upper end there would be a depth of three inches and at the lower end five inches of water, where it would be within an inch of the top of the dividing ridge. If the compartment measured only 50 feet in the direction of the slope, the difference in depth of water at the upper and lower end would be only half an inch. As, however, the smaller the compartment, the slower and more expensive the irrigation becomes, it is well to let the compartments be as large as the lay of the land will allow. When one compartment is filled, the water flowing into it is shut off from it and allowed to flow into the one adjoining, and so on from compartment to compartment. The ridges or checks should be broad at the base, the sides sloping up gradually, so that when the crop is being harvested they will not interfere with the easy working of the reaping-machine, as they would do if the sides rose abruptly. The annexed illustration shows clearly the operation of this method.

It will be noticed that the ridges do not run in a straight line. The bends are caused by the necessity of exactly following the contour of the land. If this were not done, and the ridge were to be run in a straight line, it would undulate, and the water would flow over the low places before the compartment was full. Irrigation by the furrow system produces better results than flooding, in orchards and vineyards, and is practically the only system that can be followed with such crops, for instance, as potatoes, as are grown in rows. Also less water is used by this system than by flooding, which is

often an important consideration. It has been found that flooding the entire surface around fruit-trees and vines tends to bring the roots to the surface, necessitating more frequent watering, besides incurring the risk of injury to the roots from scorching in very hot weather. The method most successfully followed is to plow a fresh furrow for each irrigation, the furrow running in such a direction as to have a fall of about two inches per 100 feet. The water then is turned into the furrow, down which it slowly flows, soaking the adjoining soil beneath the surface as it goes. After the water is turned off and the earth has become dry enough to permit, the soil is plowed back into the furrow, thereby permitting only minimum of loss by evaporation. With young trees or vines, two furrows, about four feet apart, one at each side of the row of trees, will supply sufficient moisture; but, as the trees grow and the roots spread, other furrows have to be added, about six feet distant from each other. It is the opinion amongst experienced horticulturists that it is injurious to trees or vines to allow the water to touch the trunks. Sometimes holes are made in the ditches opposite the trees, by driving a stake down a few feet and pulling it up. By this means the water more easily reaches the deeper roots.

As has before been stated, the necessary number of irrigations a year, and the amount of water required, vary so much that it is impossible to lay down any definite rule. Such is the divergence of practice, that farmers on adjoining farms, where the quality of soil is similar and the same crops are being raised, may differ 50 per cent in the number of times they irrigate and in the amount of water they use. Generally, however, it is conceded by the most experienced irrigators that the best results are attained where a minimum application of water in frequency and amount is adhered to, consonant with a vigorous and healthy condition of plant-life. In southern California, oranges are watered usually from three to five times during the summer, and not at all in the winter, when the rainfall is generally sufficient. In southern New Mexico, vineyards are irrigated where sufficient water is obtainable, every two or three weeks during the spring and summer; and in Colorado, on wheat, alfalfa, etc., three or four waterings are the rule. The character of the soil and subsoil, the slope of the land, the amount of rainfall, the temperature and dryness of the air, the method of irrigation, the character of the crop, and the ability of the irrigator, are some of the factors which go to regulate the amount of water required.

Irrigators usually express the measurement of water in cubic feet per second, and speak of the amount of land a given measurement of water will irrigate as the "duty of water." Thus, if a canal has a flow of 100 cubic feet of water per second, and irrigates 5,000 acres, the duty of that water is said to be 50 acres per cubic foot per second. The census report on irrigation of 1890 gives the duty of water in California, where great economy is practiced, as 200 acres per cubic foot per second, rising sometimes, in rare cases, as high as 500 acres; whilst in Colo-

rado it was calculated to be from 90 to 200 acres. The lower figure is probably about the average duty of water throughout the arid region, where farm crops are grown, and 150 acres where orchards and vineyards are in question. As high a duty as 1,500 acres has been obtained in southern California by the use of subirrigation by pipes, as already described.

The duty of water in America is lower than it is, on an average, in either India or Europe, where the regulations regarding its use are enforced much more rigidly. The duty will increase in this country as water become scarce and more valuable, and economical methods of using it force themselves upon irrigators. An increased duty of water will also occur when it becomes more generally understood that thorough and constant cultivation of the surface, besides being beneficial in other ways, forms a covering that tends to prevent evaporation from the lower soil, thereby retaining the moisture and necessitating less frequent irrigation. The lessening of evaporation and seepage whilst the water is flowing in the canals and distributing-ditches will be another source of economy. It is calculated by a reliable Colorado authority that the average loss of water to irrigators in that state, from these two causes, amounts to 12 per cent, whilst in India the loss is computed by government engineers to amount, in some cases, to as high as 69 per cent. The porosity of the soil through which canals and ditches pass, and the dryness and heat of the atmosphere, vary so greatly in different localities that the calculation of an average loss from these causes would be valueless. In the Tulare irrigation district of California a loss of 36 per cent was allowed for by P. J. Flynn, the engineer who planned the works there. This, however, is no indication of the allowance that should be made in other districts, where the soil and climatic conditions are dissimilar. The loss by seepage is obviated entirely, in some irrigation systems, by the sides and bottom of the canals and distributing-ditches being rendered impervious by a lining of concrete. Piping, also, in some instances, has been resorted to to prevent seepage and evaporation, but the great cost of such a method prevents its use except in instances where water is extremely valuable. Pipes for this purpose, where they are subject to pressure, usually are made of wrought iron, or of wood bound with iron bands, and of continuous concrete where the water flows by gravitation without pressure.

In planning an irrigation-canal or distributing-ditch, one of the first and most important points to be considered is the slope that should be given to the bed. It is obvious that, the steeper the grade, the more rapid will be the flow of water; in other words, the greater the fall is, the smaller need a channel be to deliver a given amount of water in a given time. It is economy, therefore, to allow as much slope as conditions will permit of to a canal or ditch. If the grade be too steep, and the flow of water too rapid, destructive abrasion of the sides will take place, and, also, the channel will deepen itself, until in time it will cut below the level of the land to be irrigated, and thereby be rendered use-

less. If, on the contrary, the channel be given too little slope, and the water flow too slowly, besides incurring the expense of constructing an unnecessarily large channel, silt will be deposited, which, from time to time, will have to be removed, necessitating turning the water out of the canal whilst the work is being performed, and the expenditure of time and money.

Dubuat, the famous French hydraulic engineer, gives the following maximum velocities as suitable to channels passing through various soils.

SOILS.	FEET PER SECOND.
Soft brown earth-----	0.328
Soft loam-----	0.656
Sandy soil-----	1.312
Gravelly soil-----	2.625
Pebbles-----	3.938
Broken stone, flint-----	5.579
Conglomerate, soft slate-----	6.564
Stratified rock-----	8.204
Hard rock-----	13.127

Practical experience in this country teaches that these velocities may be exceeded 15 or 20 per cent without material injury to the works.

The following table, computed by Kutter's formula, which is accepted by engineers generally as the most reliable, shows the grade to be allowed a canal passing through gravelly soil so that the maximum safe flow of water (2.625 feet per second) according to Dubuat's calculation may be attained:

WIDTH OF BED IN FEET.	DEPTH IN FEET.	GRADE PER MILE.	DISCHARGE IN CUBIC FEET PER SECOND.
6	2.5	5 feet	52.0
10	3.0	4 feet	103.0
20	4.0	2 feet	233.3
40	4.5	19 inches	504.6

These grades should be lessened or increased according to the nature of the soil through which the channel passes, this formula applying to gravelly soil, as above stated. It will be noted, by reference to this table, that the speed at which water flows down a given grade increases as the body of water increases; hence, the larger the ditch, the less should be the grade to attain a desired velocity. It sometimes occurs that the character of soil through which a channel passes will not permit of a flow rapid enough to obviate the deposit of silt. When such a condition prevails, it may prove an economy to provide an apparatus to remove as much as possible of it at a point close to where the water enters the canal. The adoption of such a contrivance, and the saving resulting therefrom, has transformed many irrigation companies from unprofitable to paying concerns. One of the most simple and effectual plans is as follows: For a thousand feet or so from the head, the width of the canal is increased, and its grade lessened, in such proportion that, though somewhat more water is carried than will be required to fill the canal at its normal width and grade, the flow will be only an inch or two per second. Before the point is reached where the canal narrows to its normal width, a double bottom is built, so that the lowest six or eight inches of water will flow beneath a plank flooring, carrying with it a large percentage

of the silt which has been permitted by the slow current to gravitate toward the bottom, whilst the upper water, largely divested of deposit, flows over the flooring onward into the canal. The lower water from under the flooring is allowed to escape back into the stream from which it was diverted, through a sluice in the side of the canal.

It is usually necessary to construct a dam or weir across a stream at the point where water is diverted from it into a canal. Such works vary in construction from a temporary obstruction formed of brush and rocks to the most costly and scientific engineering-works. Where more than the former is necessary, the advice of a competent engineer is essential, each case requiring its own particular treatment, no general rule being capable of application.

It has sometimes been found profitable to build submerged dams to bring subterranean water to the surface, so that it can be utilized for irrigation. In many instances the underflow of Western streams exceeds the surface flow, and it sometimes occurs in considerable volume where there is no surface flow at all, or only in seasons of flood. The method of ascertaining if there be underflow is usually as follows. After diverting the surface flow, if there be any, shafts are sunk across the channel to bed-rock. If, in the water in these shafts, a current is observed, it is a sure indication of considerable underflow; or if, when it is colored by a dye, the colored water is replaced soon by clear water, it shows that some water is passing through the shaft. If, after these experiments, it is decided that there is sufficient water to justify the expense of bringing it to the surface, a trench is dug across the channel to bed-rock, and an impervious dam of masonry, concrete or puddle is erected to cut off the subterranean flow, and bring it above-ground. Many works of this character are in successful operation in California and elsewhere in the West. Large areas, also, are irrigated with water obtained from artesian wells in several districts in the arid region; but water from such sources carries with it little or no fertilizing elements, and thus is less valuable than good river water for the purposes of irrigation, as is also the case with that drawn from lakes or large reservoirs, in which the greater part of the valuable matter held in suspension has been deposited.

The laws governing irrigation and the proprietorship of water vary somewhat in the different states and territories, the general object being, however, in all cases, to preserve to the prior appropriator of water his continuous right thereto. It is obvious that agriculture by irrigation would be too risky an occupation to be entered upon if it were permissible that a newcomer should locate above nearer the source of a stream or canal than an older settler, and cut off the water-supply of the latter. Statutes covering this important point exist in all the arid and subhumid states and territories, safeguarding the rights of the prior appropriator. In California an important law was enacted in 1887, known as the Wright Law. This act provides for the creation of irrigation districts, if the wish of the majority of the inhabitants is indicated so, by the ballot-box. Bonds can then be

issued, secured by all the lands in the district, the proceeds of their sale being used for the construction of irrigation-works. This law has proved by no means an unqualified success, perhaps the chief cause of failure being that the local farmers and business men, who are called upon to control the expenditure of vast sums of money and manage vast irrigation systems, are usually not fitted by any previous experience in that direction to undertake the task. Under such conditions the failure to attain the best results is not to be wondered at. The constitutionality of the law was questioned, thus putting in jeopardy vast sums of money already invested in irrigation district bonds, but in November, 1896, the Supreme Court upheld its validity.

The tendency, in districts where farming is carried on by irrigation, is toward the subdivision of land into small holdings. As has before been stated, 68 acres is the average size of irrigated farms in the 11 arid states and territories. If the averages of Nevada and Wyoming (where large areas of meadowland are flooded with little care and attention) were omitted, the figures would be reduced to 59 acres. Small farms more highly cultivated than those in the Eastern humid states are the rule, large bodies of irrigable land in the hands of individuals or corporations being the exception in the arid region. This segregation of land into small holdings is a condition that is being promoted by both state and national legislation, as far as possible. The provisions of what is known as the Carey Law, by which one million acres of land in each arid state has been transferred from United States to local control for the purpose of its reclamation by irrigation, are purposely drawn with the object of insuring a continuance of these conditions. Comparatively dense population, with all the social and educational advantages attached to it, results from this division of land into small farms.

One finds to-day, in all the arid states and territories, cultivated and prosperous communities, where, if it were not for irrigation, a ranch-house or two, and a few cowboys tending cattle, would be the only indications of human occupancy. In short, irrigation has been the chief means of conferring upon the far West a settled and stable civilization. By it the desert has literally been made to bloom, and vineyards and orchards, meadows and fields of smiling grain, churches and school-houses, the possessions of cultivated, law-abiding communities, have replaced the barrenness of a region that, a few years ago, was chiefly the resort of herds of bison and roving bands of Indians. And it must not be forgotten that the work is yet only in its infancy. There are still millions of cubic feet of water flowing away unutilized, that can be brought under control, and millions of acres of arid land awaiting only the quickening touch of moisture to yield up its richness. The people of the United States are not slow in developing the resources of their country, and there is little danger in prophesying that before this generation has passed the present area under irrigation will be tenfold enlarged, and support a correspondingly increased population. What has already occurred points to such a consumma-

tion, and even higher expectations may be fulfilled. When it is remembered that the population of the eleven counties in California most deeply interested in irrigation, increased 753 per cent during the decade that intervened between 1880 and 1890, it is not easy to place a limit to the possibilities held by the future. See also AGRICULTURE, in these Supplements.

H. F. GRIERSON.

IRRITABILITY, in plants, depends upon the irritability of their protoplasm, and relates plants to their external conditions. Sudden changes in external conditions, or in the direction or intensity of the forces acting upon the plant, act as stimuli, the most evident response to which are movements. The common stimuli which result in movement are contact or pressure, variations of temperature, variations in intensity of light, changes in direction of the rays of light, changes of position in relation to gravity.

IRRITANTS. See POISONS, Vol. XIX, p. 277.

IRISH. See SIBERIA, Vol. XXII, p. 5.

IRVINE, WILLIAM, an American Revolutionary soldier; born near Enniskillen, Ireland, Nov. 3, 1741. He graduated from Dublin University, and served in the navy as surgeon during the war between Great Britain and France (1756-63). In 1764 he moved to America and settled in Pennsylvania; served in the Colonial army during the Revolution, rising to the rank of brigadier-general in 1779; was on the board of court-martial which tried General Charles Lee in 1778; in 1781 had command on the western frontier; was a member of the Continental Congress in 1786; and was one of a commission appointed to settle the accounts of the United States with the several states. He was a member of the Third Congress; afterward moved to Philadelphia, where he was in command of military stores, and was president of the State Society of the Cincinnati at the time of his death, July 29, 1804.

IRVING, DAVID, a Scotch biographer; born in Langholm, Dumfriesshire, Scotland, Dec. 5, 1778. He was educated at the University of Edinburgh, and published, while there, a *Life of Robert Ferguson*. From 1820 to 1849 he was librarian to the Faculty of Advocates in Edinburgh. He was the contributor of the biographies of Scotch authors to the seventh edition of the *Encyclopædia Britannica*, and wrote *Elements of English Composition* (1801); *The Lives of Scottish Poets* (1804); *Memoirs of the Life and Writings of George Buchanan* (1807); *Observations on the Study of Civil Law* (1815); and a *History of Scottish Poetry from the Middle Ages Down to the Close of the Seventeenth Century* (1861). He died in Edinburgh, March 10, 1860.

IRVING, SIR HENRY, the adopted name of John Henry Brodribb, the British actor, who has long been associated with Miss Ellen Terry in the histrionic art, was born at Keinton, near Glastonbury, England, Feb. 6, 1838. In his eighteenth year, after a brief education in London, he made his first public appearance at the Sunderland

Theatre. It was not until 1870, however, that he made any distinct mark as an actor. His

SIR HENRY IRVING.

first indubitable success was as Mathias in *The Bells*, from which early triumph Mr. Irving may be said to date his great career. Other fine impersonations succeeded, including those which have since become favorites on the boards, Richelieu, Louis XI, Charles I, Eugene Aram and Hamlet. His *Hamlet*, which was produced in 1874, had a run of two hundred nights, and though his impersonation of the melancholy Dane was at first hotly challenged by the critics, they afterward accepted his rendering of the character, and in this as well as in other Shakespearean parts, admitted him to the first rank among English tragedians.

To his Shakespearean repertoire, Mr. Irving added *Macbeth* in 1885, *Othello* in 1886, and *Richard III* in 1887, the production of which largely extended his fame. In conjunction with Miss Ellen Terry, he put upon the stage, with fine artistic effect, Tennyson's drama of *Queen Mary*, in which Mr. Irving assumed the part of Philip of Spain. Later on, he produced *The Cup* and *The Foresters*, by the late poet laureate, both of which were set on the stage with magnificent scenic effect, but did not prove drawing pieces. Among his successes, in the next few years, was his appearing in *The Lyons Mail*, in *The Corsican Brothers*, in *Faust* and in *The Dead Heart*. His great reputation, however, was secured by a return to Shakespeare, of whose dramas he had become an intelligent and acute student, and whose dramas he placed on the boards with the most tasteful and ingenious settings.

Mr. Irving first visited America in 1883. A second visit was made in the following year, when, in addition to his performances at Daly's Theater in New York, and other theaters in the chief cities of the United States, he delivered an *Address on Acting* to the students of Harvard University, published in his four addresses on *The Drama* (New York, 1893). This volume also included the lecture delivered at Oxford on the invitation of the late Chancellor Jowett. In 1894 he received the honor of knighthood from the Queen. In no character, perhaps, has Mr. Irving won greater or more deserved applause than in *Macbeth*, for his delineation of the part was marked by the highest qualities of the actor's art, rendered still more successful by the magnificent scenery, costumes, and mounting of the play. His later productions include Shakespeare's *Henry VIII*, in which he played the part of Wolsey (1892); Tennyson's *Becket* (1892); *King Arthur* (1895); *Peter the Great*, a powerful but gloomy drama, by his son Laurence Irving (1898); and Sar-

dou's *Robespierre* (1899), written specially for the actor. He wrote several papers on his art in the *Nineteenth Century*, and an introduction to W. H. Pollock's translation of Diderot's *Paradox of Acting*.

IRVING, JOHN BEAUFAIN, an American painter; born in Charleston, South Carolina, Nov. 26, 1825. At the age of 22 he went to New York to study art, but did very little until 1851, when he went to Düsseldorf to study under Leutze. On his return to South Carolina he painted portraits until the war, after which he opened a studio in New York. His work as a *genre* painter is superior to his portraits, though the latter were often very successful. The coloring, finish, and composition of his pictures were especially fine. Among his paintings are *Cardinal Wolsey and his Friends*; *The End of the Game*; *The Last Rally*; *The Connoisseurs*. He was elected associate member in 1869, and full member in 1872, of the Academy of Design. He died in New York City, April 20, 1877.

IRVING, WILLIAM, an American merchant, brother of Washington Irving; born in New York City, Aug. 15, 1766. He was a fur-trader on the Mohawk River until 1793, when he settled near New York and married a sister of James Paulding, one of the authors of *Salmagundi*. He was elected for three terms in Congress (1814-18), when he resigned on account of failing health. His contributions to *Salmagundi*, if collected, would give him a distinct place among American humorists. He died in New York, Nov. 9, 1821.

IRVINGITES. See CATHOLIC APOSTOLIC CHURCH, Vol. V, p. 237.

IRVINGTON, a village of Marion County, central Indiana, on the Pittsburg, Cincinnati, Chicago and St. Louis railroad, five miles E. of Indianapolis. It is a suburb of that city, and has several elegant residences; also an organ factory employing 200 men. It is the seat of Butler University (Christian), founded in 1850, which has 22 instructors and 215 students, and a library of 6,123 volumes. Population 1900, 1,799.

IRVINGTON, a village of Westchester County, southern New York, on the Hudson River railroad, 24 miles from New York. Sunny Side, the former residence of Washington Irving, is in the immediate vicinity. It is beautifully located, and is the home of many New York business men. Population 1890, 2,299; 1900, 2,231.

IRWIN, a borough of Westmoreland County, southwestern Pennsylvania, at the junction of the Pennsylvania and Youghiogheny railroads, 22 miles S. E. of Pittsburg. Several coal-mines are here and mining-supplies and glass are manufactured. Population 1900, 2,452.

IRWIN, JARED, an American statesman; born in Mecklenburg County, North Carolina, in 1750; removed to Georgia with his parents while yet a boy. He served in the American army the last four years of the Revolution; was a member of the first state legislature, and a member in 1787, when the constitution of the United States was adopted; was a member of the state constitu-

tional conventions of 1789 and 1795, and president of the convention that formed the constitution in 1798; was elected governor of the state in 1796 and again in 1806. It was during his first term that the famous law, which permitted the "Yazoo frauds," was rescinded. He died at Union Hill, Georgia, March 1, 1818.

IS. See HIT, Vol. XII, p. 24.

ISABELLA II, MARIA ISABELLA LOUISA, ex-Queen of Spain; born in Madrid, Oct. 10, 1830.

ISABELLA II.

Her father, Ferdinand VII, had been induced by the influence of his wife to issue the pragmatic decree, revoking the Salic law; and at his death, Sept. 29, 1833, his eldest daughter, then a child, was proclaimed queen, under the regency of her mother, Maria Christina. This event proved the signal for civil warfare, as the claims of the late king's brother, Don Carlos, were warmly supported by certain classes of the people. The war of succession lasted seven years, until the Cortes confirmed the claims of Isabella by exiling Don Carlos and his adherents. In 1840 the queen-regent, finding it impossible to carry on the government without making concessions to public feeling, for which she was indisposed, retired to France, resigning her power into the hands of Espartero, whom she had been previously compelled to summon to the head of affairs. She was declared by a decree of the Cortes to have obtained her majority Oct. 15, 1843. She married her cousin, Don Francisco d'Assisi, Oct. 10, 1846, and reigned until, on Sept. 16, 1868, a revolution broke out, which was speedily followed by the formation of a republican provisional government and the flight of Queen Isabella to France. On June 25, 1870, she renounced her claims to the Spanish throne in favor of her eldest son, the prince of Asturias. After eight years of exile she returned to Spain.

ISABEY, EUGÈNE LOUIS GABRIEL, a French artist; born in Paris, July 22, 1804. He studied art under his father, and in 1830 went on a government expedition to Algiers, where he was able to find many striking subjects for his work. His coloring was fine, and he had much individuality. Among numerous awards he received the cross of the Legion of Honor. Among his pictures, which are *genre*, landscape and marine, several of which are owned by Americans, are *French Hospitality* and *L'Embarquement de Ryter*. He died at Langres, April 26, 1886.

ISHPEMING, a city in Ishpeming township, Marquette County, central north Michigan, 15 miles W.S.W. of Marquette, on the Chicago and Northwestern and the Duluth, South Shore and Atlantic railroads. It contains a foundry, a machine-shop, a blast-furnace and a carriage factory, besides several important public institutions. It is supported mainly by the iron-mines, which are very rich, and there are several iron-furnaces in the vicinity. Population 1880, 6,039; 1890, 11,197; 1900, 13,255.

ISLAM. See MOHAMMEDANISM, Vol. XVI, p. 553.

ISLAMABAD, a town of Kashmir province, northern India, 33 miles S.E. of Seringar, at the head of navigation on the upper Jhelum River, situated on a long, low ridge in the Himalayas. It has three hundred establishments where Kashmir shawls are made. Population, 10,500.

ISLE OF FRANCE. See MAURITIUS, Vol. XV, p. 639.

ISLE OF MAN, a British island in the Irish Channel. In 1891 the population was 55,608. Douglas, its principal town, had a population of 15,719. The principal towns are now all connected by rail. See also MAN, ISLE OF, Vol. XV, pp. 450-454.

ISLE OF PINES. See CUBA, Vol. VI, p. 679.

ISLE OF PINES. See NEW CALEDONIA, Vol. XVII, p. 376.

ISLE ROYAL, an island in the northwestern part of Lake Superior, belonging to Michigan. It is about forty miles long and from eight to twelve broad. Its resources consist chiefly in timber and copper, the copper having been mined from pre-historic times by the Indians. Fish, also, are quite abundant. Its best harbor is Washington Harbor, at its western end. Its population is less than 200.

ISLES OF SHOALS, a group of eight small islands, 10 miles S.E. of Portsmouth, New Hampshire, on the boundary between Maine and New Hampshire, inhabited chiefly by fishermen. On White Island is a revolving light, 87 feet above the level of the sea, and on Appledore and Star islands there are hotels for the accommodation of summer visitors, who resort to the islands to enjoy the sea air.

ISLIP, a township and village of Suffolk County, Long Island, southeastern New York, situated on Great South Bay and the Long Island railroad, 35 miles E. of Brooklyn. It has flour, paper and planing mills, a marine railroad, a shipyard and establishments for putting up canned goods. This is the headquarters of several sporting-clubs, and here fishing and the rear-

ing of trout are important industries. Population 1890, 8,783; 1900, 12,545.

ISMAELIANS OR ASSASSINS. See Vol. II, p. 722.

ISMAIL PASHA, Khedive of Egypt; born in Cairo, Dec. 31, 1830, the son of Ibrahim Pasha.

ISMAIL PASHA.

After Ismail's education at Paris had been finished he returned to Egypt in 1849, his father having died. Said Pasha, viceroy of Egypt in 1856, employed Ismail in various missions to European courts; and in 1862, when Said Pasha visited Europe, he left the administration in charge of Ismail, and when Said Pasha died, in 1863, Ismail succeeded as viceroy. By means of his wealth he obtained, in 1866, from the Sultan of Turkey, the privilege of succession in direct line for his dynasty, and soon afterward he obtained other concessions, which freed him from Turkish supervision, and procured for him the title of "Khedive." He introduced many foreign customs; opened the first Egyptian Parliament in 1866; and pushed his conquests in the valley of the White Nile with the aid of Sir Samuel W. Baker. In 1869 he performed the ceremonies connected with the opening of the Suez Canal. By contracting many loans in England and France he created a public debt of four hundred million dollars, which forced him, in 1875, to sell his shares in the Suez Canal to the British government. In 1876 he suspended payment of interest on the bonds he had issued, and was compelled to relinquish his estates to the creditors. As the army and the people became discontented, especially at his introduction of many foreign officials, and the heavy taxation, Ismail abdicated in 1878 in favor of his son, Tewfik Pasha. He had foreseen this state of affairs, and had secured a large fortune abroad; so in 1879 he left Egypt and lived in different parts of Europe until 1886, when, having visited Constantinople, he was retained in sumptuous captivity. Died in Constantinople, March 2, 1895.

ISOBAR. See METEOROLOGY, Vol. XVI, pp. 139-143.

ISOGAMY, a term in botany indicating the fact that the sexual process consists of the fusion of similar gametes. The act of fusion is known as *conjugation*, as opposed to *fertilization*, which occurs in *heterogamous* plants; that is, those with dissimilar gametes. The product of conjugation is called a *zygospore*. Only the lower algæ and fungi are isogamous. See figure under CONJUGATION.

ISOGEOSTHERMS, layers or strata within the earth, more or less parallel with its surface, and having each a temperature the same throughout

its own extent, but different from every other. The zones made by isogeothermals, layers terminating in the surface of the earth, are called isogeothermal zones or lines.

ISOMORPHISM. See CRYSTALLOGRAPHY, Vol. VI, p. 675.

ISOPATHY (*ἴσος*, equal; *πάθος*, suffering;) is the treatment of a disease by administering (1) some portion of the body of another individual, either affected with the same disease or associated with its causation; or (2), a portion of the products of the same disease in another individual, e.g., powdered worms as a vermifuge, the hair of a rabid dog in rabies, the matter from a small-pox pustule in variola.*

The Hindus make their children inhale the fumes from a burning scorpion, on a Sunday or a "new-moon day," so as to make them proof against the effects of the scorpion sting. †

In southern Africa, among some of the tribes, a poison doctor is made by a strong, healthy man taking to bed with him a scorpion, which bites him continually; and, in turn, a large, haired spider, the crowned serpent and the "puff adder." During this time a poison-doctor, made in the same way, attends him, watching the reaction and giving him to drink a solution of his perspiration, and, in bad cases, his urine. ‡

The treatment of disease by attenuation of virus was first made a science by Pasteur. By attenuation of virus is meant the cultivation of the poison of disease, by different methods, depriving it of some of its pathogenic qualities, so that a portion of the virus so cultivated, introduced into a susceptible animal or person, produces a modified disease similar to the original and immunes the individual from future attacks of the disease. Pasteur made his experiments with chicken cholera, and found that cultures became attenuated as to their pathogenic power when they had been kept for some time in the laboratory, and that fowls inoculated with cultures suffered a comparatively mild and non-fatal attack, and were subsequently immuned against the pathogenic action of the most virulent cultures, or against contracting the disease by contact with fowls suffering from it. He supposed it was the action of the atmosphere or oxygen.

Attenuation has since been effected by cultivation at certain temperatures, in different culture-media, by exposure to certain antiseptic agents, in the body of a non-susceptible animal, and also by exposure to sunlight and compressed air.

The virus of tetanus and anthrax may be successfully attenuated. The attenuation of the virus of the rabid dog is the basis of the celebrated treatment of rabies by Pasteur.

The treatment of disease by the juice of any of the organs is following out the principle that the

*Foster's Medical Dictionary.

†Indian Medical Record, April 16, 1896.

‡Vienna Journal of Medicine, 1845.

system takes out of the food whatever of nutriment it needs for its nourishment or fortification against the ravages of disease. If the need is very great, as in disease, the food does not supply enough, and it has long been customary to take from the lower animal the organ corresponding to the individual's need, and give it to him to eat: as, the testicles of the sheep or ox for impotence. The fresh juice, by hypodermic injection, was first used in treatment of disease, but afterward, when it was found that this caused abscesses, an extract was prepared (Dr. Hammond), the dose of which is five (5) drops, hypodermically administered. The most rigid antiseptic precautions are used in the preparation, the time required being more than six months.

Doctor Hammond has prepared cerebrine, from the brain; medulline, from the spinal cord; from the testicle, testine; from the ovaries, ovarine; from the pancreas, pancreatine; from the stomach, gastrine; and from the heart, cardine.

There is also prepared from the thyroid gland a substance called thyroidine, which seems to have an almost immediate effect upon the disease known as goiter, and is used with success in the treatment of several other diseases. It is now claimed that the active principle is a compound of iodine which has a peculiar effect upon the animal economy. J. THOS. KELLEY, JR.

ISOPLEURA. See MOLLUSCA, Vol. XVI, p. 641.

ISOPODA. See CRUSTACEA, Vol. VI, pp. 658, 659.

ISOSPORY, a term in botany sometimes used instead of *homospory*, and indicating that the sporophyte produces similar spores. All the lower plants are isosporous, only certain fern-plants and all seed-plants being *heterosporous*.

ISOTHERMS. See METEOROLOGY, Vol. XVI, pp. 132-137.

ISRAELS, JOSEF, a Dutch painter; born at Gröningen in 1824. He studied in Amsterdam, under Kruseman, and next in Paris, under Picot; and received gold medals of honor in Paris, Brussels and Rotterdam. He also had conferred upon him the Belgian Order of Leopold, and was nominated a member of the French Legion of Honor. His principal paintings are *The Tranquil House*; *The Shipwrecked*; *The Cradle*; *Interior of the Orphan's Home at Katwyk*; *The True Support*; *The Mother*; and *The Children of the Sea* (in the Queen of Holland's collection). In 1873 he exhibited at the French Gallery in Pall Mall *Minding the Flock*, which added considerably to his reputation. Mr. Israels resided in The Hague for many years, and was foreign editor of the *New York World*.

ISSUE IN LAW, a single, material point which is shown by the pleadings in an action, which point is affirmed by one side and denied by the other. An issue may be of fact or law. An issue of fact is the disputed fact upon which the result of a suit depends, and is generally triable by the

jury. An issue of law is one involving the application of the law to the facts as shown by the pleadings. An issue of law is generally raised by a demurrer, and is for the court to decide. The general issue is the plea of a defendant denying in general terms the whole of the plaintiff's declaration, or the material parts thereof.

ITACOLUMITE OR FLEXIBLE SANDSTONE. See *Diamond*, under MINERALOGY, Vol. XVI, p. 381.

ITALY. For general article on the Kingdom of Italy, see ITALY, Vol. XIII, pp. 434-516. The latest and most reliable survey of the kingdom places its area at 110,646 square miles. The population (estimated) in 1899 was 31,667,946. By the new official census, that of 1901, the area was given at 114,610 square miles, and the population was estimated at 35,000,000. To its original territory, however, must now be added its African colonial possessions of Assab and Massowah on the Red Sea, the Dahlak archipelago, and a strip of territory for some distance inland from Massowah, and along the coast from Ras Kasar (18° 2' N.) to the southern limit of the sultanate of Raheita, a territory which, under the general name of Eritrea, has an area of about 88,500 square miles, and a population of about 450,000. In 1889, the negus, Menelik of Abyssinia, acknowledged the protectorate of Italy, but renounced it in 1896. Italy also claims a portion of Somaliland, east Africa, of unknown extent, lying between British Somaliland, on the north, and British East Africa on the south.

On April 22, 1892, however, a somewhat more cautious and conservative colonial policy was inaugurated, when the Italian ministry decided to limit the national possessions in Africa. For an account of the disastrous results following Italy's attempt at colonization, see ABYSSINIA, in these Supplements.

In 1890, in continental and peninsular Italy, the population included, in Piedmont, about 120,000 French and some 3,000 of Teutonic origin, and in southern Italy at least 60,000 of Albanian and 20,000 of Greek origin. In Sardinia there are from 7,000 to 8,000 of Spanish descent. The emigration from Italy is considerable, the number in 1894 being 225,346; in 1895, 293,181; and in 1896, 307,482. In 1897 the number was 299,899; of these, 125,310 went to other European countries, 47,000 to the United States, 80,984 to Brazil, and 39,538 to other South American countries.

The urban population of Italy is upon the increase. Rome in particular shows a remarkable increment within the last decade. Numbers of magnificent modern residences have been erected, while the neighborhood of the city is dotted with splendid villas and suburban residences. The foreign population of Rome is continually receiving additions from other countries. It has become, more than ever, the objective point of the student of the fine arts, to which almost every country of the eastern and western hemispheres contributes its annual quota.

GOVERNMENT. The deputies of the lower house are chosen according to the electoral law of March 28, 1895, by ballot, by all citizens who are 21 years of age, can read and write, and possess one or other of the following qualifications: a certain standard of elementary education; or pay at least 19.80 lire in direct taxation; or, if peasant farmers, pay at least 500 lire annually for rent; or are managers of farms on which at least 80 lire are paid in direct taxes; or pay an annual rent as lodger or leaseholder of from 150 to 400 lire. Members of academies, professors, persons who have served under arms for two years, and other classes are qualified to vote by their position. In the beginning of 1897 there were 372 senators and 508 deputies. The number of enrolled electors in 1896 was 2,120,909, exclusive of 39,029 temporarily disfranchised on account of military service. Money bills must originate in the lower house. The Parliaments are quinquennial, but may be dissolved by the sovereign at any time. The ministers, 11 in number, are not necessarily members of either house. Should the King dissolve Parliament, he is bound to order new elections and convoke a new meeting within four months. It is incumbent upon the executive to call the Parliament together annually. The ministers have the right to attend the debates of both the upper and the lower house; but they have no votes unless they are members.

The executive power is exercised, under the King, by a ministry, divided into the following 11 departments: The Presidency of the Council and the Ministry of the Interior, the Ministry of Foreign Affairs, of Finance, of the Treasury, of Justice and Ecclesiastical Affairs, of War, of Marine, of Commerce, Industry, and Agriculture, of Public Instruction, of Public Works, and of Posts and Telegraphs. The government of the provinces, with a prefect at the head of each, is very much the same as in France.

THE ARMY. By the law of June 28, 1897, the army consists of the permanent army, the mobile militia, and the territorial militia. Personal military service is compulsory on all citizens from their 20th to their 30th year.

The annual levies are divided by lot into three categories. 1. In the first category, in the permanent army, the non-commissioned officers and carabinieri serve five years under arms, and four years with unlimited leave; in the territorial militia they serve ten years, with unlimited leave. 2. Those in this category remain eight or nine years in the permanent army, with unlimited leave, three or four years in the mobile militia, and seven years in the territorial militia. 3. Those in the third category do not join either the permanent army or the mobile militia, but serve their nineteen years in the territorial militia, with unlimited leave. The strength of the Italian army in June, 1897, was as follows:

Permanent Army: Officers under arms, 14,324; officers on unlimited leave, 9,811; troops under arms, 237,660; troops on unlimited leave, 556,984; total under arms, 251,984; total on unlimited leave, 566,795.

Militia: Mobile officers, 1,214; mobile troops, 475,972; territorial officers, 10,793; territorial troops, 1,992,681; total territorial, 2,003,474; grand total for the army, 3,299,439.

The army consists of 12 army corps, as follows: 1. Turin; 2. Alexandria; 3. Milan; 4. Placentia; 5. Verona; 6. Bologna; 7. Ancona; 8. Florence; 9. Rome; 10. Naples; 11. Bari; 12. Palermo. A special African corps, partly Italian and partly native, was organized in 1887. The Italian army is provided with the Vetterli repeating-rifle and sword-bayonet.

There is a staff college and a school for engineer officers at Turin, others for infantry and cavalry officers at Modena and Parma, for cavalry officers at Pinerolo, and for the sanitary corps at Florence; and military colleges at Milan, Florence, Rome, Naples, and Messina. A chain of fortresses has been erected along the northern frontier. There are numerous forts and batteries in the basin of the Po and along the coast. Rome is protected by a circle of 15 forts.

Under the terms of the tripartite agreement, called the triple alliance, between Austria, Germany, and Italy, the Italian government is bound, equally with its allies, to contribute to the defense of allied territory in case of its invasion by hostile troops, receiving, in its turn, the coöperation of the Austrian and German arms.

THE NAVY. For purposes of local naval administration and defense the Italian littoral is divided into three prefectures: 1. Spezia; 2. Naples; 3. Venice. In 1898 the navy consisted of 10 first-class battleships, 2 second-class, 2 third-class; 1 port-defense vessel; 2 first-class, 5 second-class, and 10 third-class cruisers; 17 torpedo gunboats; 10 first-class, 103 second-class, and 73 third-class torpedo-craft—a total of 235.

MERCANTILE MARINE. On Dec. 31, 1896, there were 6,002 sailing-vessels and 351 steam-vessels; in all, 6,353. In 1896 there entered Italian ports 89,808 Italian vessels, and 10,807 foreign vessels; in all, 100,615. There cleared from Italian ports 89,371 Italian vessels, and 10,787 foreign vessels; in all, 100,158.

On Dec. 31, 1896, the number of boats and vessels employed in fishing was 23,096, with an aggregate tonnage of 64,677. At the same date there were 77,109 fishermen, of whom 6,648 were engaged in deep-sea or foreign fishing. The value of the fish caught in 1896 (excluding foreign fishing) was estimated at 14,948,884 lire; the value obtained from tunny-fishing was 1,780,985 lire, and from coral-fishing, 1,013,700 lire.

INTERNAL COMMUNICATIONS.—Railways. A large portion of the Italian railways belong to the state, but in accordance with a law of April 27, 1885, the working of the state lines has been transferred to private enterprise. The contracts are for sixty years, but at the end of twenty and forty years they may be terminated.

On Jan. 1, 1893, there were 5,346 miles of state railway, 96 miles jointly state and private, and 3,216 miles of private railway; in all, 8,658 miles. In 1892 the total receipts were 253,135,975 lire.

of which 98,912,077 lire were for passenger traffic. In the same year the expenses were 174,151,182 lire.

Up to Jan. 1, 1891, there had been constructed 2,539 kilometers of tramway in the principal cities.

Waterways. There are few large rivers, and of these only a small number are navigable. There are, however, numerous canals, both for navigation and irrigation. The length of the navigable canals is 655 miles. The most notable of these are the Canal Cavour in Piedmont, the Grand Canal in Lombardy, besides smaller ones in Pavia, Martisana, Venetia, and Emilia.

Posts and Telegraphs. During the year ending June 30, 1896, there were transmitted 217,237,611 letters and postal-cards, to which must be added 40,495,849 government official letters. There were sent also 5,361,337 manuscript papers, and 249,761,929 periodicals and other printed matter. The money orders numbered 10,484,037; value, 873,287,982 lire. There were 7,435 post offices and collecting-boxes.

The public telegraph service is a monopoly of the government, certain concessions, however, being made to the railway and tramway companies. In 1894, the length of line and wire on land was, in English miles: lines, 25,449; wires, 98,318.

During the year ending June 30, 1894, there were dispatched from the government and railway telegraph offices 7,214,927 private telegrams inland; and there were sent or received from abroad 1,995,312 telegrams. The receipts amounted to 66,438,946 lire, and the expenses to 55,018,028 lire. Number of state offices, 3,549; other offices, 2,236.

There are 17 miles of railway from Massowah to Saate, and 16 between other centers. In 1895-96 the post office at Massowah forwarded 181,925 letters and postal-cards, and 18,976 manuscripts. There is a telegraph line of 319 miles from Massowah to Assab, and one of 62 miles from Assab to Perim. In 1895-96 19,329 messages were sent.

COMMERCE AND MANUFACTURES. In 1894 Italy ranked eighth among the great continental nations in commercial supremacy. Her foreign trade is facilitated by her extensive seaboard, and has lately received an extraordinary impulse through railroad connections with countries beyond the Alps, by means of those gigantic engineering works, the St. Gothard and Mt. Cenis tunnels, thus connecting Italy with central and western Europe. The imports of the kingdom for 1897 (excluding gold, coined silver, and goods in transit) were 1,192,138,168 lire, and the exports 1,092,719,241 lire. The imports of the precious metals for the same period were 8,676,200 lire, and the exports, 23,096,400 lire.

Partly because of the high cost of fuel, Italy does not rank among the great manufacturing countries of Europe, but in some branches of trade her productions are of considerable importance. The manufacture of thread and cotton tissues shows a steady advance, as does also the spinning and weaving of wool. Machinery, manufactured principally at Turin and Milan, was valued at over \$20,000,000 in 1892. Manufac-

tures of glass and ceramics, \$12,500,000. About 6,000,000 tons of wheat and maize are ground annually. The manufacture of tobacco is a government monopoly. In 1895 the annual production exceeded 40,000,000 pounds. The output of the tanneries is estimated at \$20,000,000, and there is a considerable export of gloves. There are numerous paper-mills in Piedmont, Lombardy, and Campania, and factories of straw hats, the principal being at Florence, and of cloth, silk, and felt hats, in Piedmont especially.

AGRICULTURE. The vast majority of the population of Italy finds employment in agricultural pursuits. Of the entire area of the kingdom, 70.6 per cent is returned as productive, the unproductive tracts embracing only the higher mountain districts and the marshes; and even these latter are being gradually drained. The production of cereals falls below the needs of the population. Hence large importations of wheat and maize are made annually.

In 1890 Italy had 5,000,000 cattle, 6,900,000 sheep, 1,800,000 goats, 1,800,000 swine. In 1897 Italy exported 37,226 and imported 17,850 cattle; exported 38,603 and imported 8,134 sheep; exported 887 and imported 5,152 goats; exported 40,066 and imported 3,779 swine. The wool product is not, however, sufficient for consumption, the imports in 1897 being valued at 31,151,690 lire; with little or no export.

Silk-culture, though flourishing most extensively in Piedmont and Lombardy, is carried on all over Italy. In 1895 there were 550,048 persons employed in rearing silk-worms, and 172,000 skilled and other workers (nine-tenths of whom were women and children) were employed in the treatment and manufacture of silk.

The total weight of the cocoon harvest was in 1890, 89,866,800 pounds; 1891, 85,494,748; 1892, 69,283,000; 1893, 104,991,900; 1894, 88,184,000; 1895, 90,534,400; 1896, 87,656,800; 1897, 80,797,200.

In the census of December 31, 1881, there were 5,024,826 males of 15 years of age and upwards described as engaged in agriculture. The entire agricultural population, male and female, of 15 years and upward, was thus about 10,000,000. According to the last census the number of persons of 15 years of age and upward was to the whole population in the ratio of 678 to 1,000; thus the whole agricultural population was computed to be 14,900,000.

The forest area is about 10,109,710 acres, and the annual yield is valued at 88,000,000 lire. The average value of the total yield from land and animals is: Cereals, fibres, wine, fruit, etc., 2,639,000,000 lire; animals, wool, milk, cocoons, etc., 1,424,000,000 lire; forest yield, 88,000,000 lire; total 4,151,000,000 lire.

MINERALS. There is a singular lack of deposits of bituminous coal in Italy, nor is iron to be found save in a very few localities. A small quantity of anthracite coal and about 300,000 tons of lignite are mined every year, most of the latter being found in Tuscany and Umbria.

Peat is largely used for fuel, and is found in many districts. Nearly all the iron is mined in the island of Elba, and some in Lombardy and Piedmont. The great mineral product of Italy is sulphur, which represents nearly half of the annual value of all minerals mined in the kingdom; of this, nearly nine-tenths is obtained in Sicily. The number of persons employed in this industry was 24,775 in 1896. The value of the mineral products was in 1893, 57,906,180 lire; in 1896, 48,969,105 lire. In addition to these industries must be mentioned the quarrying of marble, granite, and alabaster, valued at nearly \$5,000,000 annually, and employing some 30,000 men.

FINANCES. In addition to the cost of the war with Austria and the debts of the old Italian states, the young kingdom has had to face the extraordinary expenses connected with the placing of its army upon a suitable war footing and the reconstruction of its navy. In addition to this, it has had to meet the expenses entailed upon it by its signature of the tripartite agreement, which compels the government to keep itself in a position to assist its allies effectually. In the year 1898-99 the revenue was 1,696,791,355 lire; and the expenditure 1,686,793,409 lire.

The capital of the consolidated and redeemable debt amounted to \$2,393,431,450 on July 1, 1897.

There is no national bank in Italy. There are three banks authorized to issue notes.

In 1895 there were 950 coöperative credit societies and popular banks, with assets at the end of 1891 amounting to \$150,814,531, and liabilities \$149,157,889; 150 ordinary credit companies, with assets \$345,382,376, and liabilities \$340,788,139. Eleven agrarian credit companies had assets \$9,962,069, and liabilities \$9,951,807. There are 10 *crédit foncier* companies with assets \$214,263,621, and liabilities in 1894, \$212,683,698.

The post-office savings banks have been in operation since Jan. 1, 1876. In these in 1895 the total deposits were 536,634,812 lire, by 3,013,004 depositors. Private savings banks are subject to certain statutory rules and to government inspection.

There are several taxes which, in the opinion of leading financiers, should be done away with. Some of the state monopolies are also viewed with disfavor by the people. However, the more objectionable imposts have been removed, such as the grist tax. In 1883 the forced paper currency was withdrawn from circulation.

Money, Weights, and Measures. The metric system of money, weights, and measures of France has been adopted, the names only being slightly altered, the franc changing into the lira, divided into 100 centesimi, the kilogramme into the chilogramma, the mètre into the metro, the hectare into the ettaro.

Religion. The Roman Catholic Church is, nominally, the ruling state religion of Italy; but many acts of the legislature, passed since the establishment of the kingdom, have subordinated the power of the church and the clergy to the authority of the civil government and secured perfect religious freedom to the adherents of all

creeds without exception. However, scarcely any other creed exists, as yet, but Roman Catholicism. At the census of 1881, of the total population about 62,000 were Protestants and 38,000 Jews. The relation of the Holy See to the kingdom is set forth in a royal decree of Oct. 9, 1870, which declared that "Rome and the Roman provinces shall constitute an integral part of the Kingdom of Italy." The Pope was acknowledged supreme head of the church, preserving his former rank and dignity as a sovereign prince.

Social Conditions. The sanitary condition of nearly three fourths of the entire population of Italy continues most deplorable. There is lack of drinking-water in the houses and an almost total absence of sewers in the cities. In such cases the prevalence of disease is not to be wondered at. Matters, however, are improving gradually, and deaths from the *pellagra*, a wretched complaint superinduced by insufficient diet, are less frequent than in former years. The condition of women and young girls is not what could be desired. Of 11,290,000 females in Italy over the age of nine years nearly two millions are employed in industrial labor and over three millions are engaged in agricultural pursuits. The figures regarding juvenile labor—below the age of 15—are still more striking, as showing at how much lower an age Italian girls go to work than do Italian boys.

Education. Education is under a Minister of Public Instruction. Nearly \$9,000,000 has been set aside by the state annually for education, and to this the communes and provinces add \$12,500,000. At the formation of the kingdom the general ignorance was incredibly profound, but notable progress has been made of late in the education of the masses of the people. Although possessed of many universities and learned societies of almost world-wide celebrity, since the stormy times of her struggle for national life Italy has produced few men who have achieved eminence in literature. The name of the poet Carducci is the only one of great distinction.

In all cases the proportion of illiterate women is greater than that of men. The notion of intellectual equality between the sexes is confined to a few earnest reformers, and there is much less adequate provision for the higher education of girls, although the universities nominally are open to women as well as men. The convent schools teach mainly embroidery and devotions, and the government and superior schools are not satisfactory. In 1861, however, a good high-school for girls was opened at Milan and its success has led to the establishment of many similar schools in other towns. Primary education is compulsory, and separate boys' and girls' schools are to be found in all but the very poorest communes. From 1861 to 1895 the number of pupils (male and female) in these elementary schools increased from 885,152 to 2,585,000; in 1896 there were 50,526 such schools open, besides 9,000 private elementary schools. There were also 2,813 asylums for children, many of them con-

ducted on the kindergarten system, with 317,117 children; and there were 4,687 night-schools, with 151,369; and 5,886 Sunday-schools with 169,609 pupils enrolled, besides 148 normal schools with 24,152 pupils. In 1896 the gymnasiums numbered 708 (255 episcopal and 141 private), with 59,578 scholars; the lyceums, 332 (124 episcopal and 55 private), with 17,689 pupils. Also, there were 455 technical schools and institutes (84 private), with 47,467 students; 21 mercantile marine schools (19 governmental), with 917 pupils; and 22 collegiate institutions and superior special schools, with 3,481 students and 200 "hearers." Finally, there are in Italy 21 universities, 17 of them governmental and four "free"—i. e., maintained by the provinces and communes; the total number of students and "hearers" was 22,440 in 1897-98, besides 203 who were entered at three lyceums that provide a university course.

The principal towns of Italy are Naples, Rome, Milan, Turin, Palermo, Genoa, Florence, Venice, Bologna, Messina, Catania, and Leghorn. The late King Humbert I, son of Victor Emmanuel II, who succeeded to the throne Jan. 9, 1878, was assassinated at Monza, July 29, 1900, by an Italian anarchist known in Paterson, N. J., as Gaetano Bresci. His death was profoundly deplored. He was at once succeeded by his only son, then Prince of Naples (born Nov. 11, 1869), who now reigns as Victor Emmanuel III. The new Queen is Princess Helena (born Jan. 8, 1873), daughter of Nicholas, Prince of Montenegro.

ITASCA LAKE, Beltrami County, Minnesota, the source of the Mississippi River. Its elevation is 1,575 feet, and it is 2,555 miles from the Gulf of Mexico. The Mississippi here leaves the lake as a stream 12 feet wide and two feet deep.

ITHACA, a village and the capital of Gratiot County, central Michigan, on the Ann Arbor and the Detroit, Lansing and Michigan railroads. It contains a furniture factory, a foundry, iron-works and a creamery, and is supplied with city water and electricity. Population 1900, 2,020.

ITHACA, a city and the capital of Tompkins County, southwestern central New York, situated at the south end of Cayuga Lake, 37 miles S. of Auburn, on the Elmira, Cortland and Northern, the Delaware, Lackawanna and Western and the Lehigh Valley railroads. Ithaca is built partly on an alluvial plain and partly on the slopes of high hills which inclose that plain on all sides except the north and are nearly six hundred feet higher than the lake. The town contains many public buildings, and also manufactories of flour, paper, carriages, farming implements, iron castings, machinery, clocks, spokes and hubs, horse-rakes, glass, leather, musical instruments and fire-arms. The city has a public library, water-works, electric lights and street-railways. It is the seat of Cornell University (q.v.). Population 1880, 9,105; 1890, 11,079; 1900, 13,136.

I TO, COUNT, a Japanese statesman; born in the Province of Chosu, in 1840. A secret journey to Europe convinced him of the superiority of western civilization, and since that time he has been one of

the leaders in westernizing his native land. In 1871 he visited the United States to investigate the coinage system, and upon his return to Japan he assisted in establishing the mint at Osaka. On a second trip to Europe, in 1880, he was favorably impressed with the German methods of government, and his attempts to introduce them into his own country have given him the name of the Japanese Bismarck. In 1886 he assumed the leading place in the Japanese Cabinet, and under the title of Minister President of State, instituted sweeping economical reforms, and during the next two years everything was done to make Japan the Asiatic counterpart of the German Empire. A reaction in 1888 resulted in Ito's retirement from the Premiership, to which, however, he was recalled in 1892. In the war with China, in 1894-95, he played a leading part, being Premier of the empire and High Admiral of the Japanese fleet. In recognition of his services he was made a marquis. An unsuccessful attempt to assassinate him was made in 1895. He retired to private life in August, 1896.

ITURÆA, a small province on the northeastern border of Palestine, lying along the base of Mount Hermon. The district, the modern name of which is Jedur, contains 38 towns and villages.

ITYS, in Greek mythology, son of Procne and Tereus. After the birth of Itys, Tereus concealed Procne in the country, that he might marry her sister Philomela, whom he deceived by saying Procne was dead. At the same time he deprived Philomela of her tongue. She, however, soon found out the truth, and made it known to her sister by a few words which she wove into a peplus. Procne thereupon killed her own son, Itys, and served up the child's flesh in a dish before Tereus. She then fled with her sister. When Tereus was about to overtake the fleeing sisters, the gods, in answer to their prayer, changed all three into birds: Tereus into a hoopoe or hawk, Philomela into a swallow and Procne into a nightingale, which from that time to this has never ceased to cry out "Itys, Itys."

LUKA, a post village, capital of Tishomingo County, northeastern Mississippi, situated on the Memphis and Charleston railroad, 115 miles from Memphis, Tennessee. It has an institute for women, an academy for men, and valuable mineral springs. Here occurred an indecisive battle between Generals Rosecrans and Price on Sept. 19, 1863. Population 1890, 1,019; 1900, 882.

IVANHOE TUNNEL. The Ivanhoe tunnel, the construction of which was begun in August, 1890, runs from Busk, a hamlet 15 miles W. of Leadville, Colorado, through the backbone of the Rocky Mountains to Ivanhoe, a village on the west side of the range. The length of the tunnel is 9,400 feet, being only surpassed in America by the Hoosac and Boulder, the latter being 300 feet longer. It is 21 feet high and 15 feet wide in the clear. Where the Ivanhoe tunnel enters the mountain at Busk the altitude is 10,800 feet. Owing to the high altitude, doors are placed at each end to keep out the snow, and the tunnel itself, for several hundred feet from each end, is heated by steam. The distance between Busk and Ivanhoe is lessened seven miles.

IVES, LEVI SILLIMAN, an American Protestant Episcopal clergyman; born in Meriden, Connecticut, Sept. 16, 1797. He served in the War of 1812, and afterward entered Hamilton College; studied for the Protestant Episcopal ministry, and after his ordination had pastorates in Batavia, New York, and in Philadelphia and Lancaster, Pennsylvania. In 1831 he was elected bishop of North Carolina, where he became deeply interested in work among the negroes. On Christmas day, 1852, while in Europe, Bishop Ives made formal submission to the Pope at Rome and became a Roman Catholic. On his return to the United States he lectured in the Catholic schools of New York City, and established the Catholic protectorate of destitute children. He wrote a *Catechism*; *Manual of Devotion*; and *The Trials of a Mind in its Progress to Catholicism* (1853). He died in New York City, Oct. 13, 1867.

IVISA, IVIZA OR IVICA, the most southerly of the Balearic Isles. See BALEARIC ISLANDS, Vol. III, p. 278.

IVORY-BLACK, a black pigment prepared from calcined ivory or bones. See IVORY, Vol. XIII, p. 524.

IVRY-LA-BATAILLE. See IVRY-SUR-SEINE, Vol. XIII, p. 525.

IXCAQUINTLA, the chief town of the Chucon Indians, situated in the southern part of the state of Pueblo, Mexico, 10 miles S.E. of Tepeji. It is noted in Mexican history as the scene of a battle, fought Jan. 1, 1817, between Mexican insurgents under General Mier of Teran and Spanish troops under La Madrid. There are extensive remains of antiquity in the vicinity. Population, 5,000.

IXTACCHUATL, a Mexican mountain, 15,700 feet high. See POPOCATEPETL, Vol. XIX, p. 512.

IXTAPALAPA, a town of Mexico, 10 miles S.E. of the capital. It was a large and important city at the time of the conquest of Mexico, and was celebrated for its splendid gardens belonging to the Aztec emperors. Few traces of its former importance now remain. Near the town is the Cerro de la Estrella, or Star Hill, where the Aztec priests performed peculiar religious rites. Remains of the ancient altar and temple still exist on the summit of the hill.

INTLILXOCHITL, FERNANDO DE ALBA, a Mexican historian; born in Texcoco about 1568; a lineal descendant of the ancient emperors of Texcoco, who devoted himself to the collection and translation of hieroglyphic records concerning his ancestors. Comparatively little was known of his writings until their importance was made known by Calegero and Humboldt. His history was divided into thirteen books, and covered the period from the earliest times to the destruction of the Mexican Empire. Prescott, who made use of these works in his *History of Mexico*, calls the author the Livius of Anahuac. He died at Texcoco, in 1648.

IYÉYASU, TOKUGAWA. See JAPAN, Vol. XIII, p. 583.

IZABAL, a town, also a lake. Sometimes called Dulce. See GUATEMALA, Vol. XI, pp. 239-241.

IZABAL DE BRAGANÇA. See EU, COMTE D', in these Supplements.

IZALCO. See SAN SALVADOR, Vol. XXI, p. 268.

IZAMAL, PYRAMID OF. See YUCATAN, Vol. XXIV, p. 759.

IZARD, RALPH, an American statesman; born near Charleston, South Carolina, in 1742; educated at Cambridge, England. He was a man of large wealth, and pledged his estate to aid in carrying on the war for independence against England. In 1776 Congress appointed him a commissioner at the court of the Grand Duke of Tuscany, and in 1780 he returned to the United States. It is said that no one had the confidence of Washington to a higher degree than Izard, and that he was largely instrumental in securing the appointment of General Greene to the Southern army. In 1782-83 he was a delegate to the Continental Congress, and from 1789 to 1795 was a United States Senator from South Carolina. His *Correspondence from 1774 to 1784* was published in 1844. He died in South Bay, near Charleston, May 30, 1804.

IZDUBAR. See ZODIAC, Vol. XXIV, p. 792.

IZUCAR, a town of Mexico, state of Pueblo, at the foot of the volcano Popocatepetl, in a fine sugar district. It is sometimes called Matamoras Izucar, in honor of the Mexican patriot of that name. Population, about 12,000.

J

JABLOCHKOFF CANDLE—JACKSON

JABLOCHKOFF CANDLE. See LIGHTING, Vol. XIV, p. 632.

JABNEEL. Same as JAMNIA, Vol. XIII, p. 563.

JACARE ALLIGATOR. See CROCODILE, Vol. VI, p. 594.

JACK, a name given to one of the bread-fruit trees, *Artocarpus integrifolia*, of the family *Moraceæ* or mulberries. It is a native of the South Sea Islands, and is cultivated for its fruit in tropical countries. It has a large spherical inflorescence, whose bracts and perianths and axes become fleshy and united into one pulpy mass.

JACKASS, LAUGHING. See KINGFISHER, Vol. XIV, p. 82.

JACK-O'-LANTERN OR IGNIS FATUUS. See PHOSPHORESCENCE, Vol. XVIII, p. 813.

JACK-RABBIT, the popular name of a certain very large rabbit inhabiting the Western states. The animals have immense ears, sometimes six inches long. These rabbits are noted for their great speed, and the great leaps which they can make. *Lepus callotis* and *L. Californicus* are the most common species.

JACKS. Mechanical and hydraulic jacks are used universally for raising heavy weights that are situated inconveniently for management with cranes, derricks, or the like. The simpler forms are the screw-jack and the rack-and-pinion jack, which have a column between two and three feet high, and a lever for elevating a sliding piece by the mechanism named. They are manufactured only in cheap forms since the introduction of the hydraulic jack, which is vastly superior. This has a stout upright cylinder set in a base, which also usually contains the reservoir. Within the cylinder slides the ram, which is raised by pumping water under it. If the lower face of the ram be 50 square inches, and the water be pumped in through a hole of one half square inch capacity, it is apparent that the man who operates the pump can raise a weight 200 times as great as the power he exerts on the pump-lever, less the friction involved. Sometimes the pump is placed in the same column with the ram, and sometimes in a side position. A jack is of small size compared with the force which it develops. A fifty-pound jack will lift four or five tons, and a jack made to lift 40 tons weighs 300 to 350 pounds. A laborer of fair strength will raise ten tons one foot in one and a half minutes, with a hydraulic jack. Dudgeon's latest improved hydraulic jack appears from the outside to be a simple upright cylinder, with a base, handles and a pump-lever. The pump-lever is attached to the head of the ram, which is a cylinder sliding within another cylinder. When the ram is down the liquid is within it, but the operation of the lever pumps the water through a valve in the bottom of the ram into the outer cylinder, thus raising the ram. The piston and valves are

protected with packing, like those of a steam cylinder. The side-pump jack is preferred where there is little room for its use, as it stands about five inches lower for the same capacity. It is made with a lowering-valve on the reservoir, for convenience in bringing the ram back to its lowest position after a hoist.

C. H. COCHRANE.

JACKSON, a village and the capital of Amador County, northern central California, 55 miles S.E. of Sacramento, at the confluence of the north, middle and south forks of Jackson Creek. It has quartz-mills, and the chief occupations are gardening, farming, quartz and placer mining. The nearest station is Lone, 10 miles to the east, on the Southern Pacific railroad. Pop. of county (1900), 11,116.

JACKSON, a village and the capital of Butts County, northern central Georgia, on the Southern railroad, 40 miles S.E. of Atlanta. It has an academy, an oil-mill, lumber-mills, and it ships considerable cotton. Population 1900, 1,487.

JACKSON, a village of East Feliciana Parish, western Louisiana, on Thompson's Creek and on the Jackson railroad, 26 miles N. of Baton Rouge. It is the seat of Centenary College (Methodist Episcopal), founded in 1825, and the State Insane Asylum, and an institute for young ladies. Population 1890, 1,276; 1900, 2,012.

JACKSON, a city and the capital of Jackson County, central southern Michigan, situated on Grand River, 76 miles W. of Detroit, 37 miles S. of Lansing, on the Grand Trunk, the Lake Shore and Michigan Southern and the Michigan Central railroads, eight branches of which radiate from here. It contains flouring-mills, machine-shops, foundries, sash-and-blind factories, planing-mills, breweries, manufactories of furniture, agricultural implements, carriages and wagons, railroad-cars, pumps and cigars, and also has several coal mines. It has electric lights and street-railways. Its manufactories have an aggregate capital of \$5,000,000, and their annual products average \$5,100,000. They employ, on an average, 3,250 hands. Population 1890, 20,779; 1900, 25,180. See JACKSON, Vol. XIII, p. 533.

JACKSON, a village and the capital of Jackson County, southwestern Minnesota, on the Des Moines River, and the Chicago, Milwaukee and St. Paul railroad, 53 miles S.S.W. of New Ulm. It has grist-mills, a wagon factory and flour-mills. It is in a wheat-growing district. Population 1900, 1,756.

JACKSON, a city of Hinds County, southwestern central Mississippi, the state and county capital. It is on the Illinois Central and the Alabama and Vicksburg railroads, whose lines run in six directions from the city. Its newer institutions include the Jackson Collegiate Academy, Millsaps College, the Mary Holmes Industrial Seminary for Colored Girls and a library. It is situated in a cotton-grow-

ing region. A large part of the city was destroyed during the Civil War. Population 1890, 5,920; 1900, 7,816. See also JACKSON, Vol. XIII, p. 533.

JACKSON, a village and the capital of Jackson County, southern Ohio, on the Ohio Southern and the Baltimore and Ohio Southwestern railroads, 30 miles N.E. of Portsmouth. It is an iron and coal-mining region, and has iron furnaces, rolling-mills, foundry and machine-shop, planing, woolen and flour mills. Population 1890, 4,320; 1900, 4,672.

JACKSON, a city and the capital of Madison County, western Tennessee, on the south fork of the Forked Deer River. The Mobile and Ohio, the Illinois Central and the Norfolk and Western railroads run through the city. It is the seat of the Southwestern Baptist University, the Memphis Conference Female Institute, and has a court-house, a bank, an opera-house, a colored female seminary, gas-works, spoke, carriage and ice factories, engine and boiler works, woolen, flour, cottonseed-oil and planing mills, an iron foundry and railroad workshops. Cotton is the chief article of export. Population 1890, 10,039; 1900, 14,511. See JACKSON, Vol. XIII, p. 533.

JACKSON, FORT, a fortification, 78 miles S. of New Orleans, at the Plaquemine Bend, which, in conjunction with Fort St. Philip, defends New Orleans from attack by way of the river. It was built mainly from 1824 to 1832, but since 1841 has been modified and repaired extensively. One of Admiral Farragut's great naval exploits during the Civil War was the capture of these works.

JACKSON, ABRAHAM REEVES, an American surgeon; born in Philadelphia, June 17, 1827. After completing his education at the Pennsylvania Medical College, he practiced at Stroudsburg until 1870, when he removed to Chicago, and founded the Woman's Hospital of the State of Illinois, of which he became surgeon-in-chief. In 1872 he was elected to the chair of diseases of women, a position which he held until elected president of the College of Physicians and Surgeons, at Chicago. He published a large number of valuable articles on diseases peculiar to women. Died in Chicago, Nov. 12, 1892.

JACKSON, CHARLES, an American jurist; born at Newburyport, Massachusetts, May 31, 1775; graduated from Harvard; studied law under Chief-Justice Parsons. In 1796 he was admitted to the practice of law in Newburyport, Massachusetts, and in 1803 removed to Boston, where he attained a high rank at the bar. From 1813 to 1824 he was judge of the Massachusetts supreme court, and in 1833 was chairman of a commission to codify the state laws, and drew up the second part of the *Revised Statutes*. In 1828 he published a treatise on *Pleadings and Practice in Real Actions*. He died in Boston, Dec. 13, 1855.

JACKSON, CHARLES THOMAS, an American scientist; born at Plymouth, Massachusetts, June 21, 1805. After studying medicine in America and Europe he settled in Boston, Massachusetts, and began the practice of his profession. In 1838 he opened a laboratory for research in analytical chemistry, the first of its kind in the United States. In 1836 he was made state geologist of Maine, in 1839 of Rhode Island, and in 1841 of New Hampshire,

retaining the last office until 1844. In 1847 Congress appointed him to survey the mineral lands of Michigan, but, after two years devoted to this work, he was displaced in consequence of political changes. Dr. Jackson made many important scientific discoveries, one of the most valuable being that of etherization, for which he received a prize of 2,500 francs from the French Academy of Science. There have been several other claimants for the honor of having made this discovery, among them Horace Wells and W. G. T. Morton. He published many papers and reports, besides a *Manual of Etherization, with a History of its Discovery* (1861). He died at Somerville, Massachusetts, Aug. 29, 1880.

JACKSON, GEORGE THOMAS, an American dermatologist; born in New York City, Dec. 19, 1852; studied medicine at the College of Physicians and Surgeons in New York City, and later at Berlin, Vienna and Strasburg; was appointed chief of clinic and instructor in dermatology in the College of Physicians and Surgeons in 1887; and was a member of numerous medical societies. He published valuable articles on *Diseases of the Hair and Scalp* (1887); *The Ready Reference Handbook of Diseases of the Skin* (1892).

JACKSON, HELEN MARIA FISKE, an American authoress, a daughter of Professor Nathan W. Fiske; born at Amherst, Massachusetts, Oct. 18, 1831. She was educated at the Ipswich (Massachusetts) female seminary, and in 1852 became the wife of Major E. B. Hunt, of the United States Engineers. She was left a widow in 1863, and in 1875 she contracted a second marriage with William S. Jackson, of Colorado Springs, Colorado, where much of her after-life was spent. In 1879 she became interested in the treatment of the Indians by the United States government, and in 1883 was appointed special commissioner to examine into the condition of the Mission Indians of California. Her literary productions, over the signature of "H. H.," began to attract attention about 1870, and soon won considerable popularity. Among her works are *Verses by H. H.* (1871); *Hetty's Strange History* (1877); *A Century of Dishonor* (1881); *Romona* (1884). She died at San Francisco, California, Aug. 12, 1885.

JACKSON, HENRY ROOTES, an American soldier; born at Athens, Georgia, June 24, 1820; studied at Princeton and afterward at Yale, where he graduated; after being admitted to the bar he practiced law in his own state; served with distinction as colonel in the Mexican War. In 1854 he was appointed *chargé d'affaires* at Vienna, Austria, and afterward was raised to the rank of minister resident at the same court, a position which he held until 1858. During the Civil War he served as brigadier-general in the Confederate army until captured and taken to Johnson's Island, where he remained till the close

HELEN M. F. JACKSON.

of the war. In 1885-86 he was United States minister to Mexico. He wrote *Tallulah, and Other Poems* (1850), which met with popular favor. Died at Savannah, Ga., May 23, 1898.

JACKSON, HOWELL EDMUNDS, an American jurist; born at Paris, Tennessee, April 8, 1832. He graduated from the West Tennessee College, at Jackson, in 1849. In 1850 he entered the University of Virginia, and completed the course there. He began the practice of law at Jackson, and in 1858 removed to Memphis. When the Civil War broke out he was appointed receiver, under the Confederate Sequestration Act, for West Tennessee. At the conclusion of hostilities he returned to Memphis and resumed the practice of his profession. In 1880 he was elected to the Tennessee legislature, and was elected United States Senator by that body in 1881. On April 12, 1886, he was nominated by President Cleveland as circuit judge of the United States for the Sixth Judicial Circuit. In February, 1893, he was appointed associate justice of the United States supreme court by President Harrison, to succeed Justice Lamar. In politics Judge Jackson was a Democrat. He died Aug. 8, 1895, in West Meade, Tennessee.

JACKSON, JAMES, an American soldier; born at Moreton Hampstead, Devonshire, England, Sept. 21, 1757, and emigrated to America in 1772. He studied law in Savannah, Georgia, and in 1776 was active in repelling the British from that city. He afterward took part in many important battles and attained the rank of brigadier-general. In 1788 he was chosen governor of Georgia, but declined to serve, and from 1789 to 1791 was a member of the First Congress. From 1793 to 1795 he was United States Senator from Georgia, from 1798 to 1801 governor of the state, and from 1801 to his death was again Senator. Hedied in Washington, District of Columbia, March 16, 1806.

JACKSON, JOHN, an English portrait-painter; born at Lastingham, Yorkshire, in 1778. He removed to London in 1797 and was enabled to study at the Royal Academy. He was successful from the first, and in 1817 was elected a member of the Royal Academy. He left many portraits of eminent men, among them Canova, Flaxman, Chantrey and Sir Robert Peel. He died in 1831.

JACKSON, JOHN ADAMS, an American sculptor; born at Bath, Maine, Nov. 5, 1825. After studying in Boston, Paris and New York, he settled in Florence, where he produced numerous popular works, among which are *Evil and the Dead Abel*; *The Culprit Fay*; and *Dawn*. He also designed a number of groups and monuments for American cities. He died at Prachia, Tuscany, Aug. 30, 1879.

JACKSON, MERCY BISBEE, an American physician; born at Hardwick, Massachusetts, Sept. 17, 1802; practiced medicine at Plymouth, Massachusetts, and Boston, and in 1860 graduated from the New England Female Medical College. She was the first woman admitted to the American Institute of Homœopathy. She became professor of the diseases of children, in the Boston University School of Medicine, in 1873. She died in Boston, Dec. 13, 1877.

JACKSON, SAMUEL MACAULAY, an American clergyman; born in New York City, June 19, 1851; studied at the College of the City of New York, at Union Theological Seminary and at Leipsic; became Presbyterian pastor at Norwood, New Jersey (1876); was assistant editor of Schaff's *Bible Dictionary* (1878-80); joint editor with Dr. Schaff of the *Encyclopædia of Living Divines* (1886); editor of *The Magazine of Christian Literature* (1889-91.) He wrote several volumes of Dr. Schaff's *Church History*, and published in 1891 *A Concise Dictionary of Religious Knowledge*.

JACKSON, SHELDON, an American missionary; born at Minaville, New York, May 18, 1834; educated at Union College and Princeton Theological Seminary. He engaged in missionary work in 1859 in Wisconsin and Minnesota, later in Nebraska and Dakota, and in 1870 superintendent of missions west of Denver, Colorado. He was in New York City from 1882 until 1885 on the business staff of the *Presbyterian Home Missionary*. In 1885 he was sent by the United States Interior Department as general education agent in Alaska. Under his supervision schools have been established and an extensive system inaugurated. His biennial report to the Commissioner of Education is published by the Commissioner in the latter's report to the Secretary of the Interior. Among his published writings are *Alaska and Missions on the North Pacific Coast* (1880); and *Education in Alaska* (1881).

JACKSONVILLE, a town and the capital of Calhoun County, northeastern central Alabama, on the East and West and the Southern railroads, 13 miles N. of Anniston. It is the trade center of a cotton, corn, wheat and general-produce raising region, in which iron, marble and limestone are found in abundance. Coal, iron, lumber and cotton are extensively shipped. It contains a young men's college and ladies' seminary and a state normal school. Its mild climate makes it frequented as a summer resort. Population 1890, 1,237; 1900, 1,176.

JACKSONVILLE, a city of northeastern Florida and the capital of Duval County. Jacksonville has several churches and banks, a high-school, the Stanton Institute and manufactories of lumber, marmalade, moss, soap and machinery. Lumber is the chief article of export. Population 1860, 2,118; 1870, 6,912; 1880, 7,650; 1890, 17,201; 1900, 28,429. See also JACKSONVILLE, Vol. XIII, p. 536.

JACKSONVILLE, a city and the capital of Morgan County, western central Illinois, situated 34 miles W. by S. of Springfield, on the Chicago and Alton, the Jacksonville, Louisville and St. Louis and the Wabash railroads. Jacksonville contains many handsome buildings, and is noted for its educational and charitable institutions. It is the seat of Illinois College, a high-school, a ladies' athenæum, the Illinois Female (Methodist) College, the Jacksonville Female College, a musical conservatory, a public library, a state asylum for the insane, an asylum for the idiotic, an institute for the education of the blind, and an institute for the deaf and dumb. The institutions for the blind and the deaf and dumb are supported by the state. Illinois College is a non-

sectarian institution, founded in 1829, having 15 instructors, 214 pupils and a library of 15,000 volumes. The city has a large woolen-mill, flour-mills, machine-shops, a carriage factory, and soap, ice and brick and tile factories, car-works, water-works, a foundry, and manufactories of candy, paper, furnishing-goods, boilers, etc. Population 1880, 10,927; 1890, 12,935; 1900, 15,078.

JACKSONVILLE, a village and the capital of Jackson County, southwestern Oregon, on the Rogue River Valley railroad, which connects with the Southern Pacific. It has a Roman Catholic academy for girls, and is occupied in agricultural and gold-mining pursuits. Population 1900, 653.

JACME, JAYME or PEDRO, same as JAMES, two kings of Aragon. See SPAIN, Vol. XXII, pp. 322, 323.

JACOBÆAN LILY (*Spreckelia formosissima*), a plant of the family *Amaryllidaceæ*. The leaves are directly from the bulb, which is long-necked, protruding above the surface of the ground; the flowers are large, irregular, and of a brilliant crimson color. It is native in Mexico, and extensively cultivated.

JACOBI, ABRAHAM, an American physician; born at Hartum, Germany, 1830. After studying at the Universities of Greifswald, Göttingen and Bonn, at the latter of which he received his medical degree, he settled in New York City. In 1861 he was made professor of diseases of children in the New York Medical College; from 1867 to 1870, held a similar chair in the medical department of the University of the City of New York, and in the latter year in the College of Physicians and Surgeons. He held important offices in various scientific societies; wrote many valuable works on medical topics, among them *Infant Hygiene* (1872-74); *Treatise on Diphtheria* (1880); *Therapeutics of Infancy and Childhood* (1892).

JACOBI, HERMANN GEORG JAKOB, a German Sanskrit scholar; born at Cologne, Feb. 11, 1850; studied at Bonn and Berlin, where he made a specialty of Sanskrit; spent a year working on the Sanskrit manuscripts of the India office in London, and in 1873 went to India with Dr. Bühler, whom he accompanied on his tour through the Rajputana. One of his chief works was the computation of tables for the verification of Hindu dates. He made a careful study of Jainism and Prâkrit, the language in which the sacred books of the Jainas are written. In 1885 he became Professor of Sanskrit at the University of Kiel, and in 1889 accepted the Sanskrit professorship at Bonn.

JACOBI, MARY PUTNAM, an American physician; daughter of G. P. Putnam of New York; born in London, England, Aug. 31, 1842. She studied medicine in Philadelphia, New York and Paris, being the first woman admitted to the *École de Médecine*. In 1873 she was married to Dr. Abraham Jacobi. For twelve years she was dispensary physician in Mount Sinai hospital, was professor of materia medica in the woman's medical college of the New York infirmary, and later became professor in the New York post-graduate medical school. She contributed much to medical literature. Among her published writings are *The Value of Life*

(1879) and *Essays on Hysteria, Brain Tumor, etc.* (1888).

JACOBIN. See DOVE, Vol. VII, p. 379.

JACOBINS. See FRANCE, Vol. IX, pp. 596, 600-607.

JACOB OF EDESSA. See SYRIAC LITERATURE, Vol. XXII, pp. 839, 840.

JACOB OF HUNGARY, called THE MASTER; a French religious fanatic who played an important part in French history during the seventh crusade. Upon hearing of the surrender of St. Louis in Egypt, the "Master of Hungary" commenced preaching throughout the provinces of France a crusade for the liberation of the king. He soon gathered about him in Flanders some 30,000 peasants and shepherds called *pastourels*, and at their head started for Paris. The mob obtained arms and recruits at Amiens, and had increased to 100,000 when it arrived before Paris. As soon as the mob got within the walls of the city it began to commit depredations and to murder the monks, while Jacob himself assumed priestly functions. He divided his followers into several bands, and sent them by different routes toward the Holy Land. At Orleans they massacred the monks, and at Bourges the Jews. Owing to these excesses, Jacob was killed by the Queen's orders; and his followers, left thus without a leader, were dispersed quickly.

JACOB OF VITRY, a French preacher of crusades, and a historian; born at Argentine, in the second half of the twelfth century; was a zealous apostle of Maria of Oignies; and, led by his enthusiasm, he undertook to preach a crusade against the Albigenses, but finally devoted himself to the interest of the Holy Sepulchre. In 1217 he was appointed, by Pope Honorius III, Bishop of Acre, where he brought about great conversions of Saracen children. Pope Gregory IX, in 1229, appointed him Cardinal Bishop of Tusculum, and papal legate of France, Brabant and the Holy Land. He was considered one of the most fluent preachers of his time, but he is best known as the writer of *Historia Orientalis* or *History of Jerusalem*. He died at Rome, in 1240.

JACOBS, HENRY EYSTER, an American educator and writer; born at Gettysburg, Pennsylvania, Nov. 10, 1844; educated at Pennsylvania College and Gettysburg Theological Seminary; was three years tutor in Pennsylvania College, and in 1870 was called to the chair of Latin at Gettysburg, from which he was transferred ten years later to the chair of Greek in the same institution. In 1883 he became professor of systematic theology in the Theological Seminary at Philadelphia. Among his writings are a translation of Hutter's *Compendium of Lutheran Theology* (1867); Schmidt's *Doctrinal Theology of the Evangelical Lutheran Church* (1875); and *Commentary on the Revelation of St. John* (1887).

JACOBS, JOSEPH, an English critic and editor; born in 1854; studied at Sydney University and later at St. John's College, Cambridge. He was philosophical critic of *The Athenæum* from 1878 to 1888, and contributed to it the necrologies of George Eliot, Browning Newman and Matthew Arnold. He also wrote necrologies of Tennyson and Renan in *The Academy*. He became editor of *Folk-lore*, and

chairman of the literary committee of the International Folk-lore Congress.

JACOBS, PAUL EMIL, a German painter; born at Gotha, about 1800; studied at Munich, and later at Rome. He painted portraits with success, but his chief fame rests on his treatment of religious subjects, his best-known production in this line being the *Resurrection of Lazarus*. He traveled much in Greece and Italy, and did considerable historical painting. He exhibited widely in both Europe and America. He died Jan. 6, 1866.

JACOBSEN, JENS PETER, a Danish novelist; born in Denmark, April 7, 1847. He early devoted himself to scientific studies, and made a translation of Darwin. He published his first novel, *Mogens*, in 1872. It is the first specimen of realistic fiction in Danish literature, and shows the influence of Brandes. Among his later works are *Niels Lyhne* (1880); and *Mogens og Andre Fortaellinger* (*Mogens, and other Tales*) (1882). Jacobsen's influence on modern Danish fiction is considered greater than that of any other writer except Georg M. C. Brandes. He died April 30, 1885.

JACOBSON, WILLIAM, an English bishop; born in Norfolk, July 18, 1803; graduated at Lincoln College, Oxford, in 1827; was vice-principal of Magdalen Hall from 1832 to 1848; and later regius professor of divinity. In 1865 he was appointed Bishop of Chester. He was one of the most eminent scholars of his day, and while at Oxford edited for the University Press a large number of works, among them *Remains of the Apostolic Fathers* (1838); Nowell's *Catechism* (1844); and the *Collected Works of Bishop Sanderson* (1854). He died July 13, 1884, in Chester.

JACOBSON'S ORGAN. See SMELL, Vol. XXII, p. 166.

JACOBUS DE VORAGINE. See VORAGINE, Vol. XXIV, pp. 296, 297.

JACOBY, LUDWIG SIGISMUND, a German theologian; born at Alt-Strelitz, Oct. 21, 1811, of Jewish parents. He was converted to Christianity and joined the Lutheran church. In 1839, after pursuing a medical course, he emigrated to the United States and settled as a physician in Cincinnati. In 1841 he joined the Methodist Episcopal Church, in which he became a preacher, and in 1849 returned to Germany, to introduce Methodism into that country. His efforts resulted in the establishment of many missions, together with a publishing-house and theological seminary. Mr. Jacoby returned to the United States in 1871, and died in St. Louis, June 21, 1874.

JACQUEMART, JULES FERDINAND, a French artist; born in Paris, 1837. A son of Albert Jacquemart, a writer on the subject of porcelain and ceramics. His best work was in etching, and many of

his most worthy productions were executed for the illustration of his father's writings. His most remarkable work is a series of large etchings of the beautiful agate, jasper, crystal and porphyry vases, the ancient goldsmith work and fine enamels in the Louvre, the *gemmes et bijoux de la Couronne*. He died at Nice, Sept. 28, 1880.

JACQUEMONT, VICTOR, a French traveler and naturalist; born in Paris, Aug. 8, 1801. He made a study of botany, and visited the United States and the West Indies, whence he returned to Paris with a fine collection of plants. Under the appointment of the Museum of Natural History, he led an expedition through Hindustan and Tibet. He wrote a *Geological Treatise on the Alps and Travels Through India from 1828 to 1832*. He died prematurely at Bombay, Dec. 7, 1832.

JACQUERIE, the name given to an insurrection of peasants in France in 1358, when the French king, John, was a prisoner in England. The nobles called the peasants contemptuously "Jacques Bonhomme"; hence the word *Jacquerie*. The rising was caused by long-continued oppression on the part of the nobles. It broke out in the neighborhood of Paris, but extended to the banks of the Marne and Oise. The magnitude of the danger forced the nobles to make common cause, and on June 9th the peasants were defeated near Méaux. This put an end to the insurrection.

JAEGER-GULL, a name given to the skuas or gulls of the family *Stercorariidæ*. They are large birds which pursue smaller gulls and rob them of their prey. Their habits are more like a hawk than a gull. Sometimes they capture and devour small birds. One species is antarctic and the others northern. Locally they are sometimes called gull-catchers.

JAGIC, VATROSLAV. See SERVIA, Vol. XXI, p. 691.

JAGO, JAMES, an English physician and writer on medical subjects; born Dec. 18, 1815, near Falmouth, Cornwall. He was educated at Cambridge University, and studied also at London, Dublin and Paris. In 1870 he was admitted a fellow of the Royal Society. In 1853 he published his treatise on the *Opening of the Eustachian Tube*, then first rightly explained. On attaining the seventieth anniversary of his birthday, Dr. Jago retired from the practice of his profession.

JAHN, FRIEDRICH LUDWIG, a German educator; known as "Turnvater Jahn," born at Lanz, Prussia, Aug. 11, 1778. He studied theology at Halle and Göttingen, and in 1805 went to Jena to continue

his studies, but soon afterward decided to enlist in the Prussian army. In 1809 he went to Berlin, and in the following year became a teacher in a gymnasium and published his *Das Deutsche Volksthum*. In 1811 he opened the first *turn* establishment in Berlin, and rendered the science of gymnastics so popular that it soon attracted the attention of the youth throughout the kingdom. It at once formed centers around which German patriotism gathered and developed, and its influence on the whole system of education was lasting and beneficial. In 1814 Jahn was placed in command of a volunteer corps, served in the subsequent campaigns, and entered Paris in 1815. After the war, however, he opposed the reactionary policy of the government, the *turn* places became nurseries of liberal thought, and in 1818 he was seized by the Prussian government and imprisoned. He was liberated in 1825, but was not allowed to reside in any university town. He settled at Freiburg, where he wrote *Neue Runenblätter* in 1828, and *Merke Zum Deutschen Volksthum* in 1833. In 1848 he was elected to the national assembly, but took no prominent part in its deliberations. The Jahn Stiftung was founded in his honor at Leipsic, in 1863, and a statue of Jahn was erected in the Hasenheide, near Berlin, in 1872. He died at Freiburg, Oct. 15, 1852.

JAMAICA, the largest island of the British West Indies. Total population 1892, 649,524; capital, Kingston, with 48,500 population; Spanish Town (old capital), now second city. The government includes a governor and a legislative council of 16 members (nine elected, five official and two nominated by the crown). See also **JAMAICA**, Vol. XIII, pp. 548-558.

JAMAICA, a village, and the capital of Queens County, on southern Long Island, 10 miles E. of New York City, on the Long Island railroad. It is in a truck-gardening region, and has manufactories of wagons and carriages. It has Union Hall Academy, a public library, and has received an appropriation of \$100,000 for a normal school from the state legislature. It is a residence village for New York business men. Pop. 1900, included in Greater New York.

JAMES, EDMUND JANES, an American political economist and educator; born at Jacksonville, Illinois, May 21, 1855; educated at Northwestern University, Harvard University and the Universities of Halle, Leipsic and Berlin. He was principal for some time of the high-school at Evanston, Illinois, and later, of the Illinois State Normal School, Normal, Illinois. In 1883 he became professor of public finance and administration in the Wharton School of Finance and Economy, University of Pennsylvania. In 1892, under commission from the American Bankers' Association, he visited Europe for the

purpose of studying the business methods of other countries. In 1896 he was called to Chicago University as professor of public finance. He published a number of articles on economic subjects, besides numerous papers and addresses on university extension. Among his writings are contributions to Lalor's *Cyclopadia of Political Economy*; *Chairs of Pedagogics in Our Universities* (1887); *Our Legal-Tender Decisions* (1888); and *The Education of Business Men* (1890).

JAMES, HENRY, an American theologian; born in Albany, New York, June 3, 1811. He studied theology both in America and abroad, and became a follower of the tenets of the Sandemanian sect, and later, of the Swedenborgian. For many years he resided in New York City, and for some time in Newport, Rhode Island, but in 1866 went to Cambridge, Massachusetts, where he remained until his death. He was a constant contributor to periodical literature. Among his writings are *Moralism and Christianity* (1852); *Substance and Shadow* (1863); and the *Secret of Swedenborg* (1869). He died at Cambridge, Massachusetts, Dec. 18, 1882.

JAMES, HENRY, JR., an American novelist and essayist, and leading representative of the analytical school of modern fiction;

born in New York, April 15, 1843. His father was the late Rev. Henry James, a well-known philosophical writer, who died in 1882. In 1854, the James family went abroad, and resided for about six years in England, France and Switzerland. On returning to the United States the family took up its residence first at Newport, Rhode Island, and after-

HENRY JAMES, JR.

ward at Cambridge, Massachusetts, where Henry James the younger began the study of law. Being delicate in health (the reason why he never took a university course), and possessed of a modest competence, he again went abroad, living alternately in France, Italy and England, with occasional visits to the United States. In 1870 he seriously began his literary career by contributing a story to the *Atlantic Monthly*, followed by two novels, *Watch and Ward* (1871), and *Roderick Hudson* (1875). His European life led him to steep himself in the subtleties of the French and Russian contemporary school of novelists, an influence which has not only thoroughly un-Americanized him, but has imparted to not a few of his character-creations an air of the fanciful and ideal. On the other hand, it has made him essentially cosmopolitan and able to treat national characteristics and types from a neutral standpoint, particularly in those stories, such as *The American* (1878), and *The Europeans* (1878), which may be said to represent the "international novel." He thus became, to some extent, an innovator in literature, the more so as his stories are for the most part without plot, and concern themselves mainly with the mental development of human character.

His fine culture and delicate wit make him a favorite with people of intellectual tastes, though his want of vigor and his philosophic refinements are an occasional weariness to the general reader. As a critic he has been awarded high praise for his literary and biographical studies, such as *Partial Portraits* (1888); *French Poets and Novelists*, with an essay on Turgenief (1878); and his monograph on *Nathaniel Hawthorne* in the English Men of Letters series. His more important novels, besides those already mentioned, are *Confidence* (1878); *Daisy Miller: a Comedy* (1878); *Diary of a Man of Fifty* and *A Bundle of Letters* (1879); *Washington Square* (1880); *The Portrait of a Lady* (1881); *The Bostonians* (1886); *Princess Casamassima* (1886); *The Tragic Muse* (1890); *Watch and Ward* (1890); *Terminations* (1891); and *The Wheel of Time* (1892). Besides these, Mr. James has published many collections of stories and a few books of travel and miscellaneous pen-sketches, the chief of which are *Trans-Atlantic Sketches* (1875); *Theatricals*, 1st and 2nd series (1879-81); *Portraits of Places* (1884); *A Little Tour in France* (1884); *The Reverberator* (1888); *The Aspern Papers* (1888); *A London Life* (1889); *The Siege of London*, including *The Pension Beaurepas* (1893); *Picture and Text* (1893); *Lesson of the Master, and Other Stories* (1892); *The Wheel of Time* (1892); *The Real Thing* (1892); *The Private Life* (1893); *What Maysie Knew* (1897); *The Two Magics* (1898); *In the Cage* (1898); and *Essays in London*, with a sketch of *Pierre Loti*, papers from the *Century* and the *Fortnightly Review*. Mr. James also produced in London, in 1891, a play founded on his novel, *The Americans*; also a drama, *Guy Domville*, with an eighteenth-century hero.

JAMES, SIR HENRY, an English engineer and inventor; born at Rose-in-Vale, near St. Agnes, Cornwall, in 1803. He was educated at the Royal Military Academy, Woolwich, and in 1825 passed into the Royal Engineers. In 1844 he was appointed director of the Geological Survey of Ireland; in 1846, head of the Admiralty Works at Portsmouth; in 1852, director of the ordnance survey of the United Kingdom; and in 1857, chief of the Statistical and Topographical Department of the War Office. He was knighted in 1860, made major-general in 1868, and lieutenant-general in 1874. He is best known for his successful efforts to introduce applications of photography into the service of the exact sciences. By means of photozincography, a process which he invented in 1859, he produced fac-similes of *Domesday Book*, and of national manuscripts of England, of Scotland and of Ireland. He is the author of several works on geology, surveying, etc. Among these are *Photozincography* (1860); and *Plans and Photographs of Stonehenge and Eurusachan* (1867). He died at Southampton, June 15, 1877.

JAMES, THOMAS LEMUEL, an American publicist; born at Utica, New York, March 29, 1831; was a pupil at the Utica Academy until he was 15 years of age. Upon the formation of the Republican Party Mr. James entered the new organization, and during the Frémont canvass for the presidency became proprietor and editor of the *Madison County Jour-*

nal, which he retained for ten years. Upon the inauguration of President Lincoln in 1861 he was appointed inspector of customs. In 1874 he was made weigher, and in 1876 deputy collector of customs, in 1877 postmaster at New York City. He removed the office entirely "out of politics," making merit the only test for appointments and promotions, largely increased its revenues, introduced many mechanical improvements, and in other ways added greatly to its usefulness. President Garfield appointed him Postmaster-General in March, 1881. In Jan., 1882, he retired from political life to the presidency of the Lincoln National Bank in New York city.

THOMAS L. JAMES.

JAMES, WILLIAM, an American psychologist; born in New York city, Jan. 11, 1842; educated in the schools of New York, at Harvard, and in Europe. In 1872 he became professor of anatomy and physiology at Harvard, later of philosophy, and finally of psychology. Besides magazine articles, he has written *Principles of Psychology* (1890); *Psychology, Briefer Course* (1892); and *Human Immortality* (1898).

JAMES BAY, an arm of Hudson Bay, extending from the southeastern part southward. It extends from lat. 51° to 55° N. and from long. 79° to 82° 30' W. It contains many islands, and receives the Big, East Main, Abbitibi, Mosse, Albany, Attahwahpsiskat, Equan and other rivers. Its name is derived from Captain Thomas James, who wintered here in 1631, while attempting to find the northwest passage.

JAMES ISLAND, one of the Galapagos Islands, near lat. 0°, long. 90° W. It is formed of volcanic basalt, and, except in small portions, is arid. It belongs to Ecuador.

JAMES OF HEREFORD, LORD, better known under his earlier title of Sir Henry James; a British lawyer and statesman; born at Hereford, England, Oct. 30, 1828; received his education at Cheltenham College and was called to the bar of the Middle Temple in 1852. In 1850, as again in 1851, he attained legal distinction as lecturer's prizeman at the Inner Temple. He became a Queen's counsel in 1869, a bencher of his Inn in 1870, and in 1869 entered the House of Commons for Taunton, which he continued to represent in the Liberal interest until 1885. In 1873 he was appointed Solicitor-General, and was Attorney-General in 1873-74, and again from 1880 to 1885. During the latter period he introduced and carried through Parliament the Corrupt Practices Act. Returned for Bury in 1885, he refused to follow Mr. Gladstone upon the Home Rule question, although offered the Lord Chancellorship, and was afterward one of the active leaders of the Liberal Unionist party. Sir Henry defended the case for the *Times* before the commission appointed to investigate the charge against Mr. Par-

nell and the Irish members. In 1892 he was again returned for Bury and took a leading part in the discussion of the Home Rule Bill in 1893. He was created a peer in 1895.

JAMESON, JOHN ALEXANDER, an American jurist; born in Irasburg, Vermont, Jan. 25, 1824. He was tutor at the University of Vermont, where he graduated in 1846, from 1850 to 1853, and then began the practice of law in Freeport, Illinois, where he remained three years. In 1856 he removed to Chicago, and from 1865 to 1883 was judge of the superior court of that city. He wrote *The Constitutional Convention: Its History, Powers and Modes of Proceeding* (1867). He died in 1891.

JAMESON, LEANDER STARR, an English colonial administrator of Mashona and Matabeleland, whose firebrand dash into the territory of the South African Republic embroiled England with Germany and the Boers. He was born in Edinburgh, Scotland, in 1853; was educated in University College Hospital, and at the London University, where he graduated with honor in 1875. He traveled in America for his health, and then went to South

LEANDER S. JAMESON.

Africa. In 1878 he settled at Kimberley, and soon acquired a lucrative medical practice. Daring to a degree, he went into the heart of Matabeleland to treat Lobengula, its king, and numbered President Kruger among his patients.

In 1888, having become associated with Cecil J. Rhodes (q.v., in these Supplements), he proceeded on a mission to Lobengula, and again in 1890, when the South Africa Chartered Company had commenced operations. Soon afterward he settled at Fort Salisbury, in Mashonaland, as the representative of C. J. Rhodes, and while there successfully conducted a surveying expedition into Mashonaland and a commission to a neighboring savage king. In 1891 he became administrator of the South Africa Company's territory, and was at the head of the Matabele campaign which resulted in the acquisition of much territory by the South Africa Chartered Company.

Jameson was involved in the raid which resulted from the Uitlander agitation in Johannesburg, and on Dec. 29, 1895, started from Pitsani Potlugo with a large force of South African police, having first cut the telegraph wires, and with the intention of proceeding to Johannesburg. On January 1st, after having been ordered on his allegiance, to return, he was opposed, by a force of Boers at Doornkop, and his advance toward Johannesburg checked. Next day he surrendered to the Boer commandant at Krugersdorp.

He was taken to England and arraigned with his officers on March 10, 1896, and was subsequently convicted and sentenced to 15 months'

imprisonment as a first-class misdemeanant, on July 28th of the same year.

Personally, he was a man of indomitable courage, who had done much for the colonists of South Africa. While apparently the tool of designing men—for it was questionable whether the entire agitation had any other end than the commercial aggrandizement of its principal promoters—Jameson's hasty action is said to have been in defiance of positive orders from the reformers in Johannesburg, who were not sufficiently prepared with arms and ammunition to assist his advance. Sir R. E. R. Martin was appointed administrator of police in his place in 1896.

JAMES RIVER is formed by the union of the Jackson and Cowpasture streams in Allegheny County, central western Virginia, and has its entire course in that state. It flows in a generally east-southeast direction, passing Lynchburg and Richmond, and, widening into an estuary for the last sixty miles of its course, it falls into Chesapeake Bay at its southern extremity. It is 450 miles in length, and is navigable for large steamers to City Point, at the mouth of the Appomattox. The James River and Kanawha canal, a part of the proposed route between the Mississippi Valley and the Atlantic, which extends from Richmond to the White Sulphur Springs, follows the windings of the river for a considerable distance.

JAMESTOWN, a city of Chautauqua County, western New York, on the navigable outlet of Chautauqua Lake and on the Chautauqua Lake railroad and the New York, Lake Erie and Western railroad. It contains several churches, national banks and hotels, and also has a union school, the Jamestown Collegiate Institute, a piano factory, a woolen-mill, a large manufactory of alpaca, and manufactories of tools, furniture, worsted goods, plush goods, boilers and engines and boots and shoes. It has electric and natural gas lights, Holly water-works and electric street-railways. Pop. 1890, 16,038; 1900, 22,892.

JAMESTOWN, a city and the capital of Stutsman County, southeastern central North Dakota, on the James River and the Northern Pacific railroad, 90 miles W. of Fargo. It is the third city in the state, and contains the state insane asylum. It is in a grain, stock and vegetable producing section. Population 1900, 2,853.

JAMESTOWN, a ruined village of James City County, Virginia, where in 1607 the first permanent English settlement was made in America. The place was burned by Bacon in 1676, and never rebuilt. Its site is about lat. 76° 48' N., long. 76° 48' W. In consequence of fluctuations in the channel of the James River, the old site is practically under water now.

JAMNA. See **JUMNA**, Vol. XIII, p. 773.

JAMNOTRI or **JUMNOTRI**, hot springs in the northwest provinces of India, near the source of the Jumna or Jamuna, 10,849 feet above the sea, in lat. 30° 59' N. and long. 78° 35' E. Their temperature is 104° 7' F. (a little higher than blood heat) at their elevation. They are over-

hung by three connected mountains known as the Jumnotri Peaks, 25,500 feet high.

JANAUSCHEK, FRANCESCA ROMANA MAGDALENA, a Bohemian actress; born at Prague, July 20, 1830; appeared first at Cologne in tragic rôles, and later at Dresden, Frankfort and the principal theaters of Germany. On her first visit to the United States, in 1867, she achieved great success, though performing in German only. Returning to Germany, she devoted herself to the study of English, and returning to the United States in 1873, successfully represented in English the most difficult rôles of Shakespearian tragedy. In 1884 she visited Australia, and in 1896 made her third visit to the United States, appearing in *The Diamond Robbery*. Her leading impersonations are those of Medea, Lady Macbeth and Marie Stuart.

JANES, EDMUND STORER, an American Methodist Episcopal bishop; born at Sheffield, Massachusetts, April 27, 1807; after receiving a common-school education he taught school for a time, after which he studied law, but gave up the profession for that of the ministry. In 1830 he was admitted to the Philadelphia conference, and from 1840 to 1844 was financial secretary of the American Bible Society. In the latter year he was elected and ordained bishop, and in 1854 he visited Europe as a delegate to the British Wesleyan conference. From his election to the episcopacy until his death he resided in New York City. He died Sept. 18, 1876.

JANESVILLE, a city and the capital of Rock County, central southern Wisconsin, situated on both sides of Rock River, 70 miles W.S.W. of Milwaukee, on the Chicago, Milwaukee and St. Paul and the Chicago and Northwestern railroads. It contains a court-house, several churches and banks, a high-school, a state institution for the education of the blind, several musical schools, a public library, a cotton factory, woolen factories, flouring-mills, machine-shops, foundries, manufacturing of farming implements, carriages, boots and shoes, and it has blooded-horse breeding farms. Population 1880, 9,018; 1890, 10,836; 1900, 13,185.

JANET, PAUL, a French author; born in Paris, April 30, 1823; and educated at the École Normale, graduating in 1848. He was in turn teacher in the gymnasium at Bourges, and professor of philosophy in the faculty at Strasburg, and of logic in the Lyceum Louis-le-Grand. In 1864 he was elected to the Academy of Moral and Political Sciences, and afterward lectured in the Sorbonne, at Paris. M. Janet is a leading representative of modern French philosophy. His best-known works are *Final Causes* (1876); *Theory of Morals* (1884).

JANISSARIES, a corps of Turkish foot-soldiers, organized in the first half of the fourteenth century, in the reign of the Sultan Orkhan. It was at first made up of men captured as children from Christian parents and brought up as Mussulmans. They were forbidden to marry, had no habitation but their quarters, but had many special privi-

leges, and were obliged to take the field only when the Sultan commanded in person. No more unnatural and formidable military organization ever existed. For more than two centuries the Ottoman victories were mainly due to their ferocity and courage. In time, however, the Janissaries became lawless and insubordinate; they put to death more than one sultan and deposed others, and became cowardly and treacherous in battle. When, in 1826, being called upon to contribute to the regiments for the approaching war with Russia, they revolted, Mahmoud II determined upon their destruction. They made desperate resistance, but 16,000 of them were killed in the streets, 7,000 were burned in their barracks and 25,000 were exiled, thus annihilating the corps.

JAN MAYER'S LAND. See NORWEGIAN SEA, Vol. XVII, pp. 592, 593.

JANNEY, SAMUEL MACPHERSON, an American preacher and author; born in Loudoun County, Virginia, Jan. 11, 1801. He was a minister of the Society of Friends, and traveled extensively in that capacity. In 1869 he was made United States Superintendent of Indian Affairs in the northern superintendency. Among his writings are *The Country Schoolhouse*, poem (1825); *Historical Sketch of the Christian Church* (1847); and *History of the Religious Society of Friends* (1867). He died in Loudoun County, Virginia, April 30, 1880.

JANS, ANNEKE, or more correctly, ANNETJE (JANSEN) BOGARDUS, a Dutch heiress in New Amsterdam (New York), the litigation over whose property was the *Jarndyce versus Jarndyce* of New York's courts. Born in Holland about 1600, in 1638 she married Eberhardus Bogardus, New Amsterdam's second minister. Her husband resigned under charges in 1647, and she sailed with him for Holland. The vessel was wrecked on the English coast, Sept. 27, 1647, Bogardus and 80 others being drowned. In 1654 his widow obtained a patent in her own name of a farm of 62 acres, comprising the most valuable part of the present city of New York. She died at Beverwyck, N. Y., March 19, 1663. The claimants to her estate have been plentiful to an extreme degree. After the title to the major portion of the property had been confirmed by the New York legislature to the Trinity Church Corporation, which had come into possession, pretended heirs arose to claim inheritance. In 1899 several societies of so-called Anneke Jans heirs were in existence, which, regardless of a first essential of civilized government—a statute of limitations—spent much hard-earned money annually in pursuit of an *ignis fatuus*, and enriched the unscrupulous persons who deluded them with false hopes. The subject of the Anneke Jans estate was dealt with in an article on *Unclaimed Estates*, by H. Sidney Everett, in *The Atlantic Monthly* of Feb., 1896.

JANSON, KRISTOFER, a Norwegian clergyman; born in Bergen, Norway, May 5, 1841. While in Norway he was interested in the movement which had in view the replacing of the Danish language, which is the Norwegian language of

literature, by the truly Norwegian language, and wrote a large series of novels in this language. He also published a large number of poems and religious songs. In 1882 he removed to the United States and settled in Minneapolis, Minnesota, taking charge of the Unitarian parish in that city. Among his books translated into English are *The Spellbound Fiddler*; *The Children of Hell*. He died in Frankfort-on-the-Main, Dec. 24, 1891.

JANSSEN, PIERRE JULES CÉSAR, a French astorian; born at Xanten, April 10, 1829; studied at Bonn, and became professor of history in the gymnasium at Frankfort-on-the-Main. He became widely known by his *Geschichte des Deutschen Volkes Seit dem Ausgang des Mittelalters* (1876-88), a history of the German people from the close of the middle ages to the beginning of the Thirty Years' War. His work has been accepted as the ultramontane answer to the Protestant attacks upon the Roman Church of the sixteenth century. He died in Frankfort-on-the-Main, Dec. 21, 1891.

JANSSEN, PIERRE JULES CÉSAR, a French astronomer; born in Paris, Feb. 22, 1824; served as professor in the Lycée Charlemagne, and in the Special School of Architecture. From 1857 to 1867 he visited Peru, Italy, and the Azores in charge of astronomical expeditions. He went to India in 1868 to observe the total eclipse of the sun, especially by making spectroscopic observations of the protuberances. He found that with his powerful spectroscope he could continue to follow the protuberances after the eclipse was over. In 1875 he was appointed director of a physical observatory at Mendon, near Paris. In 1892-93 he founded an observatory on the top of Mont Blanc.

JANVIER, THOMAS ALLIBONE, an American author and journalist; born in Philadelphia, Pennsylvania, July 16, 1849; he traveled extensively both in Spain and Mexico, making an exhaustive study of the history, geography, architecture and scenery of the latter country. His books, some of which were written over the pseudonym of "Ivory Black," were suggested largely by these travels. Some of his best-known works are *The Mexican Guide* (1889); *The Aztec Treasure-House* (1890); *Stories of Old and New Spain* (1891); *An Embassy to Provence* (1893); *In Old New York* (1894); and *The Women's Conquest of New York, by a Member of the Committee of Safety of 1908* (1894).

JAPAN. See JAPAN, Vol. XIII, pp. 569-95. The total area of Japan, according to the official returns of 1896, is 147,655 square miles, with a population of 42,708,264 (21,561,023 males, and 21,147,241 females). In 1895, Formosa and the Pescadores Islands were ceded to Japan by China. Formosa has an area of 13,541 square miles, and a population of about 1,996,989. The Pescadores have a population of about 44,820. On Dec. 31, 1897, the census gave a population of 43,228,863.

In 1896 the population was divided among the various classes as follows: Imperial family, 45; kwazoku, or nobles, 4,375; shizoku, or knights (formerly retainers of the daimios), 2,067,997; common

people, 40,635,892. The number of foreigners in 1896 was 9,238, of which 4,533 were Chinese, 1,960 English, 1,025 Americans, 476 Germans, 343 French. The number of Japanese residents abroad in 1896 was 54,342.

On Feb. 11, 1889, a constitution was promulgated, laid out on German lines, which, while jealously careful of the prerogatives of the throne, established two houses, whose approval is necessary for the passage of every law, debates being held in public.

Provincial assemblies were instituted in 1879, and have been growing in importance and efficiency. For administrative purposes Japan is divided into forty-three *ken* or prefectures and three *fu* or city governments (Tokio, Kioto, Osaka). The succession to the throne has been definitely fixed on the male line. The civil list amounts to 3,000,000 yen per year, a yen being equivalent to half a dollar.

DEFENSE. *Army*. The Emperor has the supreme command of the army and navy. According to the present law, all males of the age of twenty are liable to serve in the standing army for seven years, three in active service and four in the army of reserve. After quitting the army of reserve they have to form part of the *landwehr* for another five years, and every male from seventeen to forty years of age who is not in the line, the reserve or the *landwehr*, must belong to the *landsturm*, and is liable to be called to service in times of national emergency. Including miscellaneous services, the army strength on the peace footing in 1897 amounted to 3,261 officers, 89,945 non-commissioned officers and men, 2,400 students, 220 field-guns, 106 mountain-guns, and 29,000 horses. There are a staff college, military college, cadet college, military school, gunnery school, a school for non-commissioned officers, etc. The reserve has a strength of 83,080, and the *landwehr* of 104,954. All the firearms, ordnance, and ammunition used in the imperial army are manufactured at the arsenals of Tokyo and Osaka. The rifle now used in the army is the Murata rifle, which was invented in Japan about 1881.

Navy. Japan is divided into five naval districts, each with a commander-in-chief. In 1896 only three such offices had been actually established, viz.: at the naval port of Yokosuka in the first district, the naval port of Kure in the second, and the naval port of Sasebo in the third.

The naval strength of Japan in 1897 was as follows: 3 first-class battleships, and 3 in course of construction, 7 armored cruisers, 16 protected cruisers, 5 third-class; and 12 gun vessels. The torpedo flotilla consisted of 16 first-class, 23 second-class, and 28 third-class boats. There were 14 admirals, 613 officers, 134 engineers, 57 constructors, 136 surgeons, 140 commissariat officers, and 10,161 men. The *personnel*, trained as in the navies of Europe, gave excellent proofs of bravery, steadiness, and discipline during the war with China.

MERCHANT MARINE. In 1897 the merchant navy of Japan consisted of 735 vessels of European build, of 253,326 tons, and 668 native craft above 50 tons, of 51,152 tons.

Of the total foreign ships entered in 1897, 1,020 were British; 361, German; 76, American; 26, French; 85, Norwegian; 63, Russian; 9, Korean; 3, Dutch; 4, Chinese; 854, of other countries. Of the total shipping, 590 vessels of 827,937 tons entered Nagasaki; 358 of 422,150 tons, Yokohama; 350 of 457,223 tons, Kōbē.

All open ports and other important cities and towns are connected with each other, and with Europe, by lines of telegraph. In 1897 there were 11,720 miles of telegraph, besides 387 miles of submarine cable. The number of telegrams carried was 10,978,153 in the fiscal year 1896-97. There were 1,114 offices in Japan.

There were in 1897, 528 miles of telephone, with 6 exchange offices, 25 calling-offices, and 3,232 subscribers.

PUBLIC FINANCES. *Imperial.* The following are the revenue and expenditure for the fiscal year 1897-98: Revenue, \$238,709,484; expenditure, \$249,547,286.

The public debt of Japan stood as follows, March 31, 1897: Home debt, 7½ per cent, \$4,000,000; 5 per cent, \$378,615,020; no interest, \$27,486,363; total, \$410,101,383. Foreign debt, 7 per cent, \$233,752. Total debt, \$410,335,135. Paper currency, \$9,045,082.

Local. The estimated revenue of Fu and Ken for 1896-97 was \$21,298,049, and expenditure \$22,314,940. The treasury was to grant to local governments \$1,061,758.

COMMERCE. The value of the commerce of Japan for 1897 was: Imports, \$219,300,772; exports, \$163,135,077. The foreign commerce of Japan is carried on through the open ports of Yokohama, Kōbē, Nagasaki, Hakodate, and Niigata. The exports of bullion and specie in 1897 amounted to \$19,219,163, and imports to \$81,466,713.

INTERNAL COMMUNICATION. *Roads.* There were in 1894, 4,481 miles of state roads, and 15,362 miles of provincial roads.

Railways. Railways are of two classes: (1) State railways; (2) railways owned by private companies, twenty in number, four of them guaranteed a certain rate of interest by the government. In 1896-97 there were 631 miles of the former, which carried 1,276,658 tons of goods and 22,681,161 passengers; there were 1,873 miles of the latter, which carried 5,421,013 tons of goods and 42,426,737 passengers.

POSTAL SYSTEM AND TELEGRAPHS. During the fiscal year 1896-97 there passed through the mails 403,818,612 letters and postal-cards, 86,801,875 newspapers, and 6,617,114 books. The income of the post office for the year 1895-96 amounted to \$8,341,042, and the expenditure to \$5,433,825.

MONEY AND CREDIT. Since Oct., 1897, the standard of value has been gold. The unit is the gold yen, .900 fine, weighing 83 grammes, and con-

taining 75 grammes of pure gold. The ratio to silver is 32⅓ to 1. There is a state bank, the Nippon Ginko, whose paper notes, redeemable in silver, have largely taken the place of the former fiat currency. The currency, though no longer fiat, is still practically entirely of paper, except subsidiary silver coins of 50, 20, and 10 cents, 5-cent nickels, and 2, 1, and ½ cent copper coins.

WEIGHTS AND MEASURES. The English pound is largely used in the cities for the *kin* (= 1.325 pounds). The lineal foot = .994 English. In measures of capacity, 10 *go* = 1 *sho* = 108.5 cubic inches, a little more than 1½ quarts.

It is stated to be the policy of the government to introduce at an early period a new system of weights and measures, based on the metric system.

Mean solar time for 135° long., or 9 hours east of Greenwich, has been adopted.

As before intimated, the progress which has been made by the Japanese in the civilization of the West is very remarkable. Young men of exceptional promise have been sent to the great universities of Europe and America, to return, upon the completion of their education, and mingle with the people as a leavening factor of the most potent quality. The empress and her suite have recently adopted foreign costume, being followed, to a certain extent, by the fashionable ladies of the capital. Japan's expeditions to Formosa to punish piracy; her annexation in 1879 of the Loo Choo Islands, notwithstanding China's remonstrances and threats; her spirited policy in Corea in 1873, 1882, 1894 and 1895; her conscription law of 1883 and subsequent army reorganization; her development of a strong navy; her coast-defense scheme of 1887, subscribed to liberally by wealthy private individuals, sufficiently attest the nation's assertive spirit. While so hurried an assimilation of Western ideas as was made necessary owing to her complete previous isolation has undoubtedly been accompanied by numerous minor imprudences and extravagances, yet through it all the patriotic spirit of the nation has triumphed, and her administration may now (1896) be said to be in a highly satisfactory condition. During the past few years, especially since the promulgation of the popular constitution in 1889, the court has emerged entirely from its seclusion. By the new constitution, absolute freedom of religious belief and practice is secured, so long as it is not prejudicial to peace and order. Education is general and compulsory. There is a complete system of local elementary, middle and normal schools and a central university in the capital, with five higher middle schools as feeders. There is also a higher normal school at Tokio. Education is perfectly free from class restrictions. The printing-press is very active, and newspapers are comparatively dearer than in the United States. The Japanese police is a most efficient force. The convict system is an excellent one, and the establishments are so conducted as to be a source of revenue to the government. Penal and civil codes have been drafted on a European basis.

Taxation mostly falls upon the land and upon the wine, which is called saké.

The United States, perhaps, of all the nations of the earth, entertains for Japan the most sincere feelings of friendship. The way in which she has struggled to attain to the standard of Western civilization, so that she might acquire the coveted position of equal among the best, has constituted a strong and pathetic appeal to the democracy of America. From a feudal despotism she has become a constitutional government; she has produced a code of laws in harmony with that constitution. She is educating her judges and fitting them for the highest judicial functions. She grants by that constitution civil and religious liberty to all her subjects. There is a growing feeling in this country that the foreign treaties of the great powers with Japan should be revised, and that the judicial and tariff autonomy, which was taken from her in the days of her weakness and ignorance, should be restored.

In the spring of 1889 the combination of treaty powers was broken through by the action, first of the United States and then of Germany and Russia, who formed treaties on their own account, abolishing extra-territoriality and sanctioning mixed residence under certain mild restrictions. These treaties were to come into force in 1890. Mexico, not a treaty power, had also arranged an independent treaty in November, 1888. Other powers prepared to follow, but treaty revision was at length shelved by the Kuroda Cabinet.

On Oct. 28, 1891, one of the severest earthquakes ever known in Japan occurred. Without any previous warning, shocks were felt from Tokio to beyond Kobé, a distance of more than 375 miles.

The city of Nagoya, with a population of 165,000 and 40,000 houses, was almost totally destroyed. According to the police reports, it lost 2,007 in killed and 2,158 wounded, with a total destruction of 31,764 houses. Gifu, with a population of 28,000 and 7,000 houses, lost in killed more than 2,000 and about an equal number wounded, with the total destruction of more than one half of the city; of the remaining half, the streets were so badly littered with the débris caused from above and below, that it seemed as if the city could never be rebuilt. Ogaki, with a population of 20,000, lost in killed 1,000 (estimated) and in wounded about an equal number, with the almost complete destruction of the city; in fact, only four streets are said to remain, the others being completely upheaved and filled with wreckage. Great damage was done to the railway and telegraph lines, an iron bridge over the Nagaragawa River being demolished.

Near Lake Biwa, saline water was forced from the earth and rose to a height of several feet; but the flow soon ceased from these cracks. Immediately following the convulsion, the water in Owari Bay became greatly agitated, the waves rising to an unusual height and seeming to flow from all directions, causing the wreck of a great many junks and other vessels.

In July, 1894, Japan became embroiled in a fierce war with China. For the causes which led to this war, the battles on land and sea-fights of the conflict, and the results to China, Corea, and Japan, see COREA, in these Supplements.

JAPAN AFTER THE WAR. After the war was over the Japanese intended going ahead, and everything seemed to portend that they would carry out this intention successfully. For a considerable time past there has been exceptional activity in the direction of improvements in the system and methods hitherto existing in commerce, industries, and agriculture. High government officials, members of the diet, and private individuals of standing and experience have been constantly lecturing on a vast diversity of subjects, with the object of stimulating the energies of all concerned. All sorts of guilds and associations have been formed to promote the material welfare of the nation, and commissioners have been sent all over the Empire, as well as to foreign countries, in the interest of more extended commercial business. The expansion of direct trade appears to be what influential men seek to bring about; they hold that, although there have been some failures, the successful manner in which others have been carrying on direct transactions is a good proof of the possibility of dispensing with outside aid.

In recent years, Japan has continued to develop on Western lines and to adopt Western ideas. In July, 1899, foreign jurisdiction in the treaty ports was abolished and the whole Empire was thrown open to American and European trade. Foreign residents are henceforth to have the same privileges and advantages as natives. Christianity is henceforth also to have the same protection as the native religions. Of late, however, there would seem to be a reaction in favor of the native creeds. Education has become compulsory. Trouble continues to be expected with Russia in regard to Corea. The attitude of Japan towards the American and European Powers in regard to the Boxer disturbances in China has been most friendly and helpful.

JAPAN CLOVER, the common name of *Lespedeza Striata*, one of the *Leguminosæ*, introduced into the southern United States from eastern Asia. It is especially prevalent in the Southwestern states. Desert soils present no obstacle to its spread, and it is of great value for grazing purposes. It is low and spreading, diffusely branched, with oblong or wedge-shaped leaflets, and one to three small purplish flowers in the axils.

JAPANESE LANGUAGE AND LITERATURE. See JAPAN, Vol. XIII, pp. 585-588.

JAPP, FRANCIS ROBERT, a Scotch scientist and author; born at Dundee in 1848; educated at the Universities of St. Andrew's, Heidelberg and Bonn. His various researches, which deal exclusively with questions relating to organic chemistry, have been published chiefly in the *Journal of the Chemical Society*. Professor Japp, jointly with Professor Frankland, published a text-book on inorganic chemistry. In 1885 he was elected a fellow of the Royal Society.

JAPURA OR YAPURA, a river of Brazil and Colombia which rises in the Cordillera Centra of the Andes in southwestern Colombia, near Bolivar, flows E.S.E. through that country, being known there as the Caqueta. It enters Brazil near lat. $1^{\circ} 25'$ S. and long. $69^{\circ} 44'$ W. It keeps the same general course, and reaches the Amazon through numerous channels, which extend over two hundred miles. Most of these channels, however, carry water from the Amazon to the Japura, the united body of water entering the Amazon lower down. It is lined with luxuriant forests, which are inhabited only by a few Indians and by rubber and sarsaparilla gatherers. Length, 1,750 miles, of which 760 are navigable by river boats. Of its upper course little is known.

JARDINE, SIR WILLIAM. See ORNITHOLOGY, Vol. XVIII, pp. 13, 16, 18.

JARGOON. See JACINTH, Vol. XIII, p. 532.

JARVES, JAMES JACKSON, an American critic and traveler; born in Boston, Massachusetts, Aug. 20, 1818; traveled extensively, visiting California, Mexico and Central America; and served as United States Consul in Honolulu, establishing a newspaper there, the *Polynesian*. He published a history of the Sandwich Islands, and having traveled in Europe produced *Art Hints* (1855) and *Art Studies* (1861), being critical considerations of famous pictures and statuary. He resided alternately in Paris and Florence for a long time, meanwhile accumulating a gallery of old masters, illustrating the history of Italian art, which subsequently became the property of Yale College. *Italian Rambles* (1884) and *The Art of Japan* (1876) were later works of his. He died in Switzerland, June 28, 1888.

JARVIS, ABRAHAM, an American Protestant Episcopal bishop; born in Norwalk, Connecticut, May 5, 1739; was graduated at Yale, and in 1764 was ordained a priest in the Protestant Episcopal Church; in the same year became rector of Christ Church, Middletown, and in 1797 was consecrated bishop of Connecticut. He took up his residence at New Haven, where he died, May 3, 1813.—His son, SAMUEL FARMER JARVIS, was born in Middletown, Connecticut, Jan. 20, 1786; was graduated at Yale in 1805, and in 1810 was ordained to the ministry; took charge of a church at Bloomingdale, New York, and afterward of a church in New York City, which he retained until 1819, when he was chosen professor of biblical learning in the General Theological Seminary, in New York. From 1820 to 1826 he was rector of St. Paul's Church, Boston. He then went to Europe for research in church history and the study of art. Nine years later he returned, and became professor of oriental literature at Trinity College, Hartford, but resigned in 1837 to become rector of Christ Church, Middletown, and in 1838 was appointed historiographer to the American Episcopal Church. In this connection he published in London, in 1844, a *Chronological Introduction to the History of the Church*. In addition, he wrote *No Union with Rome* (1843) and *The Church of the Redeemed* (1845). He died in Middletown, March 26, 1851.

JARVIS, EDWARD, an American author and physiologist; born in Concord, Massachusetts, Jan. 9, 1803; was graduated at Harvard in 1826, and practiced medicine in Massachusetts, where he became well known as an authority on insanity. In 1852 Dr. Jarvis became president of the American Statistical Association, and in this capacity prepared a large number of reports and tables on public health, longevity, mortality-rates and other matters pertaining to state medicine. He also wrote *Practical Physiology* (1848); and *Primary Physiology* (1849). He died at Dorchester, Massachusetts, Oct. 31, 1884.

JASHAR, BOOK OF. See HEBREW LANGUAGE AND LITERATURE, Vol. XI, p. 598.

JASPER, a town and the capital of Dubois county, southwestern Indiana; on the Patoka River and the Louisville, Evansville and St. Louis railroad; forty-five miles N.E. of Evansville. Block coal and iron are mined here, and lumber, flour, carriages, farming-implements, office-desks and wood-work are manufactured. Tobacco is the principal agricultural product. Population 1890, 1,281; 1900, 1,863.

JASPER, WILLIAM, an American soldier; known in history as SERGEANT JASPER; born in South Carolina about 1750; enlisted at the outbreak of the Revolutionary War, in the Second South Carolina Regiment, and was one of the garrison of Fort Moultrie when it was attacked by the British fleet in 1776. Early in the action the colors were shot away, but Jasper, leaping through an embrasure in a perfect storm of cannon-shot, recovered the flag and planted it again upon the walls. In recognition of his bravery, Governor Rutledge gave him his own sword and offered him a commission, which he refused, because, as he said, he was "not fit to keep officers' company, but only a sergeant." Colonel Moultrie, however, gave him command of a roving squad, and in operations upon the outposts he often distinguished himself. In the attack upon Savannah, Oct. 9, 1779, Sergeant Jasper accompanied D'Estaing and Lincoln, and was killed while attempting to fasten the colors of his regiment to the parapet.

JASTROW, MARCUS MORDECAI, a Polish-American rabbi, born at Rogasen, Prussia, June 5, 1829. After studying at Berlin and graduating at Halle, he became preacher and assistant rabbi at Warsaw in 1858. Being banished in 1862 he became rabbi at Mannheim, but was soon recalled to Warsaw, where he remained till 1864. In 1866 a German-Hebrew congregation called him to Philadelphia, Pennsylvania, where he acted as rabbi. His principal works are *Four Hundred Years of Jewish History* (1865); *Episodes of Jewish History*; and a *Complete Talmudic Dictionary* (1889).

JATAKA (literally, "relating to birth"), folk-lore. See BUDDHISM, Vol. IV, p. 430.

JAVA DEER, the pigmy musk-deer (*Tragulus Javanicus*), common in the East Indies and in southern Asia. There are several species in this region. They are easily tamed.

JAVARI OR YAVARI, a river of South America, rising in the northwestern part of Bolivia, and taking a semicircular course, flowing N.W., N.N.E. and E., forming the boundary between Brazil and Peru,

and emptying into the Amazon at Tabotinga, lat. 70° W. It is 450 miles long, and is navigable for 200 miles. It is surrounded by heavily forested lands. See BRAZIL, Vol. IV, p. 221.

JAVA SPARROW, a large finch (*Padda oryzivora*), common in the East Indies and in southern Asia. The general color is gray, with white cheeks and black tail. See WEAVER BIRD, Vol. XXIV, p. 463.

JAVELLE WATER. See EAU DE JAVELLE, in these supplements.

JAXARTES, river. See SYR DARIA, Vol. XXII, pp. 818, 819.

JAY, JOHN, an American diplomatist; son of William Jay; born in New York City, June 23, 1817; graduated at Columbia College, in 1836. He was admitted to the New York bar in 1839, and in 1869 was sent as minister to Austria. He negotiated a naturalization treaty, and a convention on trademarks, and supervised the United States commission to the World's Fair of 1873 at Vienna. He resigned in 1875, and in 1877 was chairman of the commission to investigate the system of the New York custom-house. Mr. Jay was a member of various geographical and historical societies, and published many speeches and pamphlets; among them *America Free or America Slave* (1856); *The Church and the Rebellion* (1863); *Rome and America* (1868); and *The Public School a Portal to the Civil Service*. He died in New York City, May 5, 1894.

JAY, WILLIAM, an American jurist, son of Chief Justice John Jay; born in New York City, June 16, 1789; graduated at Yale, and studied law. In 1818 he was appointed to the bench of Westchester County, New York, and was reappointed until 1842, when he was superseded on account of his anti-slavery views. He was active in anti-slavery and temperance movements; was for several years president of the American Peace Society, and one of the chief founders of the American Bible Society. Among his writings are the *Life of John Jay, with Selections from His Writings* (1833); *A View of the Action of the Federal Government in Behalf of Slavery* (1839); *War and Peace* (1848). He died at Bedford, New York, Oct. 14, 1858.

JAY'S TREATY. See FEDERALIST PARTY, in these Supplements.

JEAFFRESON, JOHN CORDY, an English author; born at Framlingham, Suffolk, Jan. 14, 1831. He was educated at Pembroke College, Oxford, and called to the bar at Middle Temple, in 1859. He contributed to *Fraser's Magazine*, *The Dublin University Magazine*, *Temple Bar*, *The Athenæum* and the daily press of London. Among his numerous novels are *Crewe Rise* (1854); *Not Dead Yet* (1864); *A Woman in Spite of Herself* (1872); and *Cutting for Partners* (1890). He published a series of now well-known books from 1860 to 1874, which deal with social history. The titles of these are *A Book About Doctors* (1860); *A Book About Lawyers* (1866); *A Book About the Clergy* (1870); *Brides and Bridals* (1872); *A Book About the Table* (1874). Besides these works of fiction, Jeaffreson also contributed to the history of English literature *Novels and Novelsists from Elizabeth to Victoria* (1858); *The Real Lord*

Byron (1883); *The Real Shelley* (1885); *Lady Hamilton and Lord Nelson* (1888); *Victoria, Queen and Empress* (1893); and *A Book of Recollections* (1893).

JEANETTE, a borough of Westmoreland County, southwestern Pennsylvania, on the Pennsylvania railroad, 21 miles E.S.E. of Pittsburg. It has manufactures of plate, window and decorated glass, tableware, tannin, carbon and bricks. Population 1890, 3,296; 1900, 5,865.

JEBB, RICHARD CLAVERHOUSE, an English educator; born at Dundee, Scotland, Aug. 27, 1841. He passed with marked distinction through St. Columba's College, Dublin, Charterhouse School, London, and Trinity College, Cambridge, graduating as senior classic in 1862. Soon after, he was elected fellow of his college, and took a prominent part in organizing the system of inter-collegiate classical lectures, and served as secretary of the newly founded Cambridge Philological Society. In 1869 he became public orator of the university, in 1872 classical examiner in the University of London, and tutor of his own college, in 1875 professor of Greek in the university of Glasgow, and in 1891 regius professor of Greek at Cambridge. He received from the King of Greece the Gold Cross of the Order of the Saviour, in recognition of his services in promoting the study of both classical and modern Greek. Among the most important of his works are *Modern Greece* (1880); a *Life of Richard Bentley* (1882); and *The Attic Orators* (1893). He began on a translation of the complete works of Sophocles. In 1892 he was elected to Parliament by Cambridge University. He contributed the articles on ARISTOPHANES, DEMOSTHENES and other classical subjects and on RHETORIC to this ENCYCLOPÆDIA.

JEDDAH. See JIDDAH, Vol. XIII, p. 691.

JEDDO. See TOKIO, Vol. XXIII, pp. 432-434.

JEFFERIES, JOHN RICHARD, an English naturalist and author; born at the farm-house of Coate, near Swindon, Wiltshire, England, Nov. 6, 1848. Commencing life as a journalist, he soon attracted popular attention as a writer on rural subjects, his vigor and felicity of style, rare acquaintance with animal life and passionate love of nature obtaining grateful recognition among his readers. Like White of Selborne and Thoreau of Concord, he possessed the happy faculty of transfiguring the humblest objects related to his daily surroundings, investing them with vivid and abiding interest. Yet his excursions at times led him far afield, and many comparatively unfamiliar spots, by his tender, lucid insight were endeared to the British public—to the rustic dwellers amid the haunts he loved, as well as to metropolitan denizens. His descriptions of nature were luminous and poetic, transfused with grace and the meditative hue of his own engaging personality, and of a finely

JOHN R. JEFFERIES.

native quality seldom observed in writings of this order. It is pathetic to remember that the intensity of feeling for human life and the fervid longing for perfection of animal health and spirits which constitute the brightness and charm of his creations, were in sad contrast with a wasted physique and the distress of a lingering, incurable malady. His works, considering his brief experience as an author, are voluminous, ranging over a wide field of philosophical experience, among the best known, perhaps, being *The Gamekeeper at Home* (1878); *Wild Life in a Southern County* (1879); *The Amateur Poacher* (1879); *Nature Near London* (1883); *The Dewy Morn* (1884); and *The Open Air* (1885). His last essays, *Field and Hedgerows* (1889), collected by his widow, reflect the early enthusiasm with which his boyhood musings are aflame, powerfully portrayed in *The Story of My Heart* (1883), in the pages of which the subtlest emotions of his throbbing spirit are eloquently recorded. He died Aug. 14, 1887, after a long and painful illness. Beneath the bust of the author unveiled in Salisbury Cathedral is the following appreciative tribute: "To the memory of Richard Jefferies, . . . who, observing the works of Almighty God with a poet's eye, has enriched the literature of his country and made for himself a place among those who have made men happier and wiser." *The Eulogy of Richard Jefferies* has been fittingly written by Sir Walter Besant.

JEFFERSON, a town and the capital of Greene County, Iowa, situated on Coon River, fifty miles northwest of Des Moines, on the Chicago and Northwestern and the Des Moines, Northern and Western railroads. It has manufactories of flour and cigars, and is in a natural-gas field. Population 1890, 1,875; 1900, 2,601.

JEFFERSON, a village and the capital of Ash-tabula County, northeastern Ohio; on the Franklin division of the Lake Shore and Michigan Southern railroad, thirteen miles south of Lake Erie. It is surrounded by a rich grazing, grape-raising and dairy country. Population 1900, 1,319.

JEFFERSON, a city and the capital of Marion County, northeastern Texas, at the head of navigation on Big Cypress Bayou, and on the Sherman, Shreveport and Southern and the Texas and Pacific railroads. It is a thriving manufacturing city, the largest of northeastern Texas, and the center of river commerce, exporting cattle, barreled beef, tallow, hides, wool, osage-orange seed, lumber, iron and large quantities of cotton. Large beds of coal and iron are found in the vicinity. Population 1890, 3,072; 1900, 2,850.

JEFFERSON, a city and the capital of Jefferson County, southeastern Wisconsin, situated at the union of Crawfish and Rock rivers and on the Chicago and Northwestern railroad, 48 miles W. of Milwaukee. It is the center of a rich agricultural district, and has manufactories of cream-brick, agricultural tools, boots and shoes, furniture and cigars; and it has tanneries, pork-packing houses and breweries. Population 1900, 2,584.

JEFFERSON, JOSEPH, an American actor; born in Philadelphia, Feb. 20, 1829. His grandfather and great-grandfather were distinguished actors, and

his mother, Mrs. Burke, was a celebrated vocalist. He appeared on the stage at a very early age, in the character of the child in *Pizarro: or, the Death of Rollo*, and in 1843 traveled through Mexico and Texas with a company of strolling players. He soon rose to the front place as a comedian, and his merits are recognized in both England and America. His range of characters was very wide, covering almost the entire field of comedy and farce, without degener-

JOSEPH JEFFERSON.

erating into burlesque. His most famous rôle is that of Rip Van Winkle in Dion Boucicault's play of that name, founded upon the story by Washington Irving, a character which Mr. Jefferson may be said to have created as well as to have made his own. As he first appeared in it the play was crude and inartistic, but it was rewritten especially for him by Mr. Boucicault in 1865, and put on the stage of the London Adelphi in September of that year, where it ran for over 150 nights. He repeated his triumph in New York the next year, and for several years thereafter he played in nothing else. Perhaps he was equally successful as Bob Acres in *The Rivals*. In 1890 he published an autobiography. His son, Joseph Jefferson, Jr., is also an actor of decided ability. He appeared in 1896 at the head of a special company, made up of the leading actors and actresses of the United States, in a star production of *The Rivals*.

JEFFERSON CITY, the capital of the state of Missouri and of Cole County, situated on the south bank of the Missouri River, 150 miles from its mouth, on the Missouri Pacific and the Chicago and Alton railroads. Jefferson City contains the state-house, a court-house, the state-prison, the Lincoln Institute, a female seminary, several banks and churches, and manufactories of farming-implements, wagons, shoes, brick; and brewery, foundry and machine-shop products. Coal and limestone are found in the vicinity. The city is supplied with water-works, electric and gas lights. Population 1900, 9,664. See JEFFERSON CITY, Vol. XIII, p. 616.

JEFFERSONIA, a North American genus of *Berberidaceæ*, of one species, *J. diphylla*, native in rich woods throughout the states east of the plains. From the root-stock in early spring the rears a solitary white flower upon a long scape, the sepals falling off when the flower opens, and a little later a pair of long-petioled and lobed leaves. The ovate pod opens by a conical lid. The popular names are twin-leaf and rheumatism-root.

JEFFERSON MEDICAL COLLEGE, an institution, originally the medical department of Jefferson College, at Cannonsburg, Pennsylvania; founded in 1826, largely through the efforts of Dr. George McClellan, but in 1836 incorporated as a separate institution, under the name of the Jefferson Medical College of Philadelphia. Its graduates number about

10,000. In 1893 there were 73 instructors and 624 students.

JEFFERSONVILLE, a town and magisterial district in Montgomery County, Ky. The town is supplied with city water and gas and electric lights, and has new manufactories of farming tools and flour and lumber mills. Pop. district and town, 1900, 2,280. See **JEFFERSONVILLE**, Vol. XIII, p. 616.

JEFFRIES, JOHN, an American surgeon; born in Boston, Massachusetts, Feb. 5, 1744; graduated at Harvard, and studied medicine in London and Aberdeen. He returned to Boston in 1769; but on the evacuation of that city in 1776, accompanied the British army to Halifax, and was appointed surgeon-general of the forces in Nova Scotia by General Howe, and in 1779 surgeon-general of the British forces in America, with headquarters in Savannah. Returning to London at the close of hostilities, he devoted himself to practice with great success, and also to scientific experiments upon atmospheric phenomena; and, to test the practicability of aerial navigation, made two balloon ascensions; in the second, Jan. 7, 1785, ascending from the cliffs of Dover and alighting in the northeastern part of France. In 1789 Dr. Jeffries returned to Boston, where he gained great eminence, and still greater notoriety by attempting to give public lectures on anatomy; but on account of the great popular sentiment existing against dissection, he was compelled by mob violence to discontinue his course of instruction. He died in Boston, Massachusetts, Sept. 16, 1819.

JEHU. See **ISRAEL**, Vol. XIII, pp. 407, 408.

JEISK OR YEISK, a town of southern Russia, Province of Kuban, at the mouth of the Tscherbineoka River, on the sea of Azov. It has a large trade in grain, oil and linseed. Population 1886, 25,915.

JELLACHICH VON BUZIM, COUNT JOSEPH, Austrian general. See **AUSTRIA**, Vol. III, p. 137.

JELLY-FISH, a popular name given to those cœlenterates which have a soft, gelatinous, transparent body. The name is given chiefly to the discophorean hydrozoa (*Scyphomeduse*), which consists of a bell-shaped mass of jelly-like substance. They are very common at the seashore, and vary in shape from a thimble to a saucer. Some resemble in form an expanded umbrella. They swim freely by the contraction of their bodies. The body varies in diameter from a fraction of an inch to three or four feet. Tentacles are arranged like a loose fringe around the margin of the bell or umbrella. Sense organs are found in definite positions on the margin of the body. The name is applied also to the comb-bearers or ctenophores, and to the medusoid body of the *Hydromeduse*. The latter are bell-shaped forms of small size, which at the breeding-season grow upon the branching colony among the feeding-polyyps. They are set free and lead a free-swimming life. In them are produced the eggs and spermatazoa, and therefore they are reproductive animals.

JEMBA. See **EMBA**, in these Supplements.

JENCKES, THOMAS ALLEN, an American statesman; born at Cumberland, Rhode Island, Nov. 2, 1818. After graduating from Brown University, in

1838, he studied law and attained eminence in his profession. In 1841, during the disputes which led to Dorr's Rebellion, he was secretary of the landholders' convention, and in 1842 of the convention which framed the constitution of the state. He served in both Houses of the legislature, and in 1862 was elected to Congress, where he remained until 1871, being recognized as a high authority on legal questions. He was the author and advocate of a bill which established a uniform system of bankruptcy throughout the United States, and still more important were his efforts in introducing and securing the passage of a bill improving and regulating the civil service. He died at Cumberland, Nov. 5, 1875.

JENKIN, HENRY CHARLES FLEEMING, an English engineer and electrician; born at Stowting Court, Kent, March 25, 1803; educated at Jedburgh, Scotland, at Edinburgh Academy, and afterward on the continent, chiefly at Frankfort, Paris and Genoa. At the last he was graduated. Returning to England in 1851, he served for three years in one of the large engineering works of Manchester. For some time after this he was interested in railways, but in 1857 was put in charge of the electrical and engineering work pertaining to the manufacture of wire for the first Atlantic cable. Many years of his life were devoted to the laying of submarine cables in various parts of the world. He was appointed professor of engineering at the University of Edinburgh, in 1868. His most widely known work is *Electricity and Magnetism* (1870), which was translated into several languages and adopted as one of the series of *Text-Books of Science*. He also wrote the article on **BRIDGES** in this **ENCYCLOPEDIA**. He died in Edinburgh, June 12, 1885.

JENKINS, CHARLES JONES, an American jurist; born in Beaufort District (now County), South Carolina, Jan. 6, 1805; removed when quite young to Jefferson County, Georgia; educated at Georgia University and Union College, from the latter of which he was graduated; and, after being admitted to the bar, became a lawyer at Augusta. In 1831 he was elected attorney-general for the state, and from 1836 to 1850 was prominent as a Whig in the legislature, being speaker for several years. The Georgia Convention of 1850 adopted resolutions presented by him in favor of the Union, yet declaring that the state would resist any act of Congress abolishing slavery. In 1860 he was appointed a judge of the state supreme court, a position which he held till the close of the Civil War. He was a prominent member of the constitutional convention of the state, called under proclamation of President Johnson in 1865, and in the same year was elected governor under the new constitution. This constitution not being recognized by Congress, Jenkins retired into private life, but in 1877 was president of the state constitutional convention. He died at Summerville, Georgia, June 13, 1883.

JENKINS, EDWARD, a British author; born in Bangalore, India, in 1838. He was educated at McGill College, Montreal, and at the University of Pennsylvania. He was admitted to the bar in London in 1864 and practiced till 1873, when he entered

politics. From 1874 to 1876 he was agent-general for Canada, and then became a member of Parliament. Among his published works are *Ginx's Baby* (1870), a clever article on the problems of British pauperism and over-population; *The Colonies and Imperial Unity* (1871); and *The Coolie* (1871).

JENKINS, JAMES G., an American jurist; born at Saratoga Springs, New York, Jan. 18, 1834. His mother was the eldest child of Reuben H. Walworth, the last chancellor of New York state, and a jurist of national reputation. Mr. Jenkins was educated for the bar in his own state, and in 1855 was admitted to practice before the supreme court of the United States. He went to Wisconsin in 1857, and for many years was a successful practitioner there. He succeeded Judge Andrew J. Miller, on his death, on the bench of the United States district court, in 1885. In March, 1893, he was appointed by President Cleveland to fill the place made vacant by Judge W. Q. Gresham, on the bench of the seventh circuit court of the United States, on that gentleman's acceptance of the portfolio of Secretary of State in the Cleveland Cabinet. Judge Jenkins's decision in 1894, in which he denied the right of employees to combine for the purpose of striking, attracted very wide attention.

JENKINS, THORNTON ALEXANDER, a United States naval officer; born in Orange County, Virginia, Dec. 11, 1811. He entered the navy in 1828 as a midshipman; was made a lieutenant in 1839; was engaged in several important actions during the Mexican War; in 1852 became secretary of the light-house board; was promoted commander in 1855; was made captain in 1862; commodore in 1866, and rear-admiral in 1870. He was retired in 1873, and at the Centennial Exhibition at Philadelphia in 1876 had charge of the exhibit of the Naval Department. He wrote many reports for the government. Died in Washington, D. C., Aug. 9, 1893.

JENKS, JEREMIAH WHIPPLE, an American educator; born at St. Clair, Michigan, Sept. 2, 1856; educated at the University of Michigan and at Halle, Germany; was professor of political science and English literature at Knox College, Galesburg, Illinois; professor of economics and social science at Indiana State University, Bloomington, and in 1891 became professor of political, municipal and social institutions at Cornell University. He wrote *Henry C. Carey, Als National-ökonom* (1885); *Road Legislation for the American State* (1887); and numerous other articles.

JENKS, JOSEPH, an English inventor; born at Hammersmith, near London; emigrated to Lynn, Massachusetts, about 1645, and on May 6, 1646, the first patent issued in North America was granted him by the Massachusetts general court "for the making of engines for mills to go by water." He later got patents for making scythes and other edged tools. The scythe which he invented was essentially the same as the hand-implement in use to-day. He is said to have made the dies for the silver coinage of the colonies in 1652; he was the first founder in brass and iron in America, and also gave considerable attention to the drawing of wire. He died in Lynn, in 1683.

JENNER, SIR WILLIAM, an English physician; born at Chatham in 1815; and educated at University College, London, where he himself was professor from 1848 to 1879. In 1861 he was appointed physician to the Queen, and attended the Prince Consort in his last illness. He was a member of numerous scientific societies, contributed largely to medical literature, and was the first to establish the difference in kind between typhus and typhoid fevers. He wrote several series of papers on fever, the acute specific diseases, diphtheria, diseases of children, diseases of the heart, lungs, skin, etc. He was created a baronet in 1868 and made a K.C.B. Jan. 20, 1872, in recognition of services rendered during the severe illness of the Prince of Wales. He was president of the College of Physicians from 1881 to 1889, when he retired from professional practice. Died in Bishop's Waltham, Dec. 11, 1898.

JENNET OR HINNY. See MULE. Vol. XVII, p. 13.

JENNIE JUNE. See CROLY, JANE CUNNINGHAM, in these Supplements.

JEQUITINHONHA, river, BRAZIL. See Vol. IV, p. 222.

JERICHAU, JENS ADOLF, a Danish sculptor; born at Assens, Island of Fünen, April 17, 1816. After studying at home, he went to Rome and became a pupil of his countryman, Thorwaldsen. While in Rome he married the artist Elizabeth Baumann, and in 1849 returned to Copenhagen. His principal works are *The Marriage of Alexander and Roxana*; *Hercules and Hebe*; *Penelope's Ascension*, which took the grand prize given by the Princess Albert of Prussia; and *The Panther Hunter*. Besides these works are the monuments to Oersted and Hans Christian Andersen, at Copenhagen. Jerichau died July 24, 1883. His wife—ANNE MARIE ELIZABETH BAUMANN JERICHAU, born at Warsaw, Poland, in 1819; studied art at the Academy of Düsseldorf until 1845, when she went to Rome. Her work was principally of genre subjects. In 1861 she had an honorable mention at Paris. Among her works are *The Joys of a Mother*; *The Wounded Soldier*; and *A Scene on the Nile*. She died in 1881.—A son of these two artists, HARALD ADOLPH NIKOLAI, born Aug. 17, 1852, died March 6, 1878, was a landscape painter of note.

JERICÓ, a city of Colombia, in the department of Boyocá, near the Chicamocha River. The climate of the region is very healthful, and stock-raising is the principal industry. The city is modern, has a good trade and is growing rapidly. Population 1892, 11,593.

JEROBOAM. See ISRAEL, Vol. XIII, p. 406.

JEROME, JEROME KLAPKA, an English humorist; born at Walsall, Staffordshire, May 2, 1861; was educated at the Philological School of Marylebone. He was employed first as a clerk at the Euston offices of the London and

JEROME K. JEROME.

Northwestern Railroad Company, and subsequently became in succession actor, journalist, tutor, shorthand writer and solicitor's clerk till 1889, when he published *On the Stage and Off*, and then the *Idle Thoughts of an Idle Fellow*. *Three Men in a Boat* made its appearance in 1889; *Novel Notes*, in 1893; and *John Ingerfield and Other Stories*, in 1894. As a dramatic author he also earned distinction. In 1892 he became part proprietor of a magazine, *The Idler*, and in November, 1893, proprietor of *To-day*, a new weekly magazine journal.

JERROLD, WILLIAM BLANCHARD, an English author; born in London, in 1826. After being educated partly in France, he became a journalist, and also produced many farces and comedies; among others, *Cool as a Cucumber* (1851); and *Cupid in Waiting* (1870). In 1855 he attended the Paris Exhibition as agent of the London *Daily News*. In 1862 he wrote a series of articles on the London poor for the *Morning Post*, and during the next year he went to Paris to examine its institutions for the poor, and some years later he visited the Netherlands for the same purpose. Among his published writings are *At Home in Paris* (1871); *Trip Through the Vineyards of Spain* (1864); *The Cockaynes* (1871); *Life of Napoleon III* (1874-82); and *Egypt under Ismail Pasha* (1879). He died March 10, 1884.

JERSEY CITY, a city and the capital of Hudson County, northeastern New Jersey. See JERSEY CITY, Vol. XIII, p. 635. The streets are generally laid out at right angles, and are of good width, well paved, sewered, lighted with gas and electricity and bordered by many handsome residences. Jersey City is the terminus of the Red Star line of steamships to Europe, and of a dozen railroads running in various directions. Immense quantities of iron, coal, produce and general merchandise are brought to and shipped from this city. There are horse and electric railroads to Hoboken and various parts of the city itself. It contains upward of sixty churches, a high-school, a normal-school, several banks and many charitable and educational institutions. The city is supplied with water conveyed in pipes from the Passaic River by means of hydraulic works, which are at Belleville, six miles distant. Jersey City has many and various manufacturing establishments, among which the more recently developed are locomotive and railroad supply works, planing-mills, potteries, manufactories of chemicals, jewelry, fireworks, lead-pencils, hydrants, chains, rubber goods, castor and linseed oil, copper-ware, oakum, chains and spikes, car-springs, etc. European markets, as well as those of the United States, obtain their crucibles from the works of Jersey City. There are also large stock-yards and an extensive abattoir, where vast quantities of cattle and sheep are slaughtered for the New York markets. The capital of all the manufactories aggregates over \$18,000,000, and the value of their annual products averages over \$37,000,000. They employ 13,000 hands, and pay about \$8,000,000 a year in wages. Of these, the manufacture of machinery, soap and candles and of chemicals, paints and varnishes has the largest investment. The city is governed by a mayor and board of aldermen, assisted by numerous

executive boards. There is an efficient police force and a well-equipped fire department. The valuation of taxable property is about \$85,000,000; the tax-rate was 2.75 per cent, and the net debt \$8,400,000. The site whereon Jersey City stands was formerly called Paulus Hook, but in 1820 was chartered as "The City of Jersey," and in 1838 as "Jersey City" Pop. 1890, 163,987; 1900, 206,433.

JERSEY SHORE, a borough of Lycoming County, northeastern central Pennsylvania, 10 miles S.W. of Williamsport, on the west branch of the Susquehanna, and on the Pennsylvania, the Fall Brook and the Beech Creek railroads. The region has fine scenery, is fertile, and produces lumber and tobacco. Population 1900, 3,070.

JERSEYVILLE, a city and the capital of Jersey County, southwestern Illinois, on the Chicago and Alton and the St. Louis, Chicago and St. Paul railroads, 33 miles N. of St. Louis. It manufactures flour, plows, reapers, carriages and wagons, watch-making machinery, and contains railroad repair-shops, and a farm for raising thoroughbred horses. It is lighted with electricity, and has an artesian well water-supply. Population 1900, 3,517.

JERUSALEM ARTICHOKE. See HORTICULTURE, Vol. XII, p. 283.

JERUSALEM CHERRY, the common name of *Solanum Pseudocapsicum*, a shrubby house-plant from Maderia, cultivated for its bright red berries, which resemble cherries. It is a smooth plant, with lance-oblong entire leaves and small white flowers.

JERVIS, JOHN, EARL. See ST. VINCENT, Vol. XXI, p. 201.

JERVIS, JOHN BLOOMFIELD, an American engineer; born at Huntington, New York, Dec. 14, 1795. He was employed in the construction of the Erie canal, and afterward superintended the construction of the Delaware and Hudson canal. He invented the locomotive-truck, and was chief engineer of the Albany and Schenectady railroad; in 1836 he was appointed engineer in charge of the construction of the Croton aqueduct. He was later consulting-engineer of the Boston water-works, of the Hudson River railroad, of the Chicago, Rock Island and Pacific railroad, and of the Pittsburg, Fort Wayne and Chicago railroad, retiring from active duty in 1866. He published *Railway Property* (1866); *Labor and Capital* (1877); and was the author of several papers and lectures. He died Jan. 12, 1885.

JERVOIS, SIR WILLIAM FRANCIS DRUMMOND, military engineer and administrator; born at Cowes, Isle of Wight, Sept. 10, 1821; educated at the Royal Military Academy, and entered the Royal Engineers in 1839; after serving in South Africa (1841-48) he returned to England, and in 1856 was appointed assistant inspector-general of fortifications. In 1859, as secretary of a royal commission to report upon the defenses of the country, he prepared a memoir in which a system of fortifications for the security of vital points was proposed, and a plan for the defense of London suggested. He planned the fortifications for the principal English ports. He was sent on special missions in 1863-65 to examine into the state of the defenses in Canada.

In 1871 he was sent to India to advise with the Indian government respecting the defenses of Bombay, Aden, and other posts. In 1875-77 he was governor of the Straits Settlement, and quelled an insurrection in the Malay peninsula; was governor of South Australia, 1877-83, and of New Zealand, 1883-89. In 1890-91 he was on a Commission of Military Defenses. Died Aug. 17, 1897.

JESI OR IESI. See JESI, Vol. XIII, p. 644.

JESSAMINE. See JASMINE, Vol. XIII, p. 594.

JESSEL, SIR GEORGE, an English jurist; born in London, of Hebrew parents, in 1824. After studying at the University College, London, he was called to the bar at Lincoln's Inn in 1847, and in 1865 became a queen's counsel. He was elected to Parliament from Dover in 1868. In 1871 he was appointed Solicitor-General by Mr. Gladstone; knighted in 1872; made Master of the Rolls in 1873, and became the usual president of the Court of Appeals. He was the first of his race to hold a judicial office in England. He was regarded as the best equity lawyer in Great Britain. In 1880 Jessel was made vice-chancellor of the University of London. He died March 21, 1883.

JESSUP, HENRY HARRIS, an American missionary; born at Montrose, Pennsylvania, April 19, 1832; after graduating from Yale and Union Theological Seminary, he went as missionary to Tripoli, and later to Syria, where he took a leading part in the work of the Presbyterian station and college at Beirut. In 1879, while on a visit to the United States, he was elected moderator of the General Assembly at Saratoga. He published *Women of the Arabs, and Syrian Home Life* (1873); a translation into Arabic of Mosheim's *Church History* (1876); and *The Greek Church and Protestant Missions* (1891).

JESTER. See FOOL, Vol. IX, p. 366.

JESUITS IN NORTH AMERICA. (On JESUITS in general, see Vol. XIII, pp. 645-656.) In 1611 the Jesuit Fathers Biard and Masse accompanied the French expedition which laid the foundation of Acadia. Called upon by the original Recollet missionaries to take part in their labors in the then new colony of Quebec, the Jesuits settled in the valley of the St. Charles, near the confluence of that river with the Lariat, and there established the nursery of their order in America, known as Notre Dame des Anges, in 1625. When Quebec was captured by the English four years later, the Jesuit mission was suspended and the fathers driven off. In 1632, when the French recaptured the St. Lawrence River, the Jesuits returned, opened schools, established the College of Quebec, and sent out missionaries, who went up the river in canoes. After many hardships, and a journey of 900 miles by land and water, the missionaries found themselves in the Huron country, near the shores of Lake Huron. Here they founded mission schools, preached, farmed, and traded in furs with the French of Montreal and Quebec. In the year 1649 the Iroquois conquered the Hurons, burnt their villages, devastated their corn-fields, took their women and children prisoners, and burnt and tomahawked the Jesuit fathers.

But the Jesuits did not give up the task of estab-

lishing missions among the Indians. In 1649 they had establishments at Montreal, Three Rivers, and Quebec, a missionary post on the island of Miscon, in the Gulf of the St. Lawrence, another at Tadousac, near the mouth of the Great Saguenay River; and also posts among the Algonquins, on the Kennebec River, in Maine. Besides their activity as missionaries we find the Jesuits in North America taking part in many exploring expeditions. In 1671, when the Intendant Talon of New France resolved to take possession of the large valley of the Ottawas in the name of the King of France, the Jesuit Father Claude Allouez assisted him very materially, and took the chief part in the ceremonies incident to the great meeting of Indian tribes at Sainte-Marie-du-Sault. In the following year the French, under St. Simon and the Jesuit Father Albanel, rediscovered Hudson Bay.

Talon also sent, in the same year, a Quebec merchant named Joliet, and the Jesuit Father Marquette west to discover "Cathay" and the "South Sea." After wintering at Machelimackinac, these two explorers advanced early the next spring into the valley of the Illinois River, passing by way of the Fox River and the Wisconsin into the Mississippi as far as its confluence with the Arkansas. They returned in the fall and wintered at St. Francis Xavier, a missionary station on the west of Lake Michigan.

For the next hundred years the Jesuits continued their missionary, farming, teaching and exploring work with undiminished zeal and gratifying success, so that in 1720, when Charlevoix, a member of their society, visited Canada, he was prompted to congratulate his brethren warmly on their eminent services. But the English were at war with the French everywhere. So it came that Father Sebastian Rasle was shot down on the battle-field at Norridgewock, Maine, surrounded by his Indian neophytes; and when, in 1769, the British conquered New France, the College of Quebec, after flourishing for nearly 150 years, received its first severe blow. But it was still further crippled in 1773, when Pope Clement XIV suppressed the whole Jesuit order by a papal bull. Father Well, the last Jesuit survivor in Montreal, died in 1791, and Father Cazot, the last one in Quebec, passed away in 1800. After this the British government took all the Jesuit property in Canada, and turned the College of Quebec into barracks. It served as such until 1869, when England withdrew her troops from Canada. In 1880 the college building was torn down by order of the provincial government. In 1888 the Quebec Legislature, after prolonged discussion in and out of the Chamber, ratified an agreement by virtue of which \$400,000 was paid to the Society of Jesus in full settlement of the "Jesuit Estates Claims."

The work of the Jesuits begins in the United States when it ends in New France. After the War of Independence, Father John Carroll, an ardent Jesuit in Maryland, corresponded with the Holy See with the view to establishing a hierarchy in the United States. His scheme was accepted, and he himself was appointed and consecrated first bishop of Baltimore in 1790. The diocese of Baltimore remained for years the only Roman Catholic diocese

in the United States, and embraced all the states and territories of the Union. Carroll was the founder of Georgetown College, near Washington, in 1791, and he established a theological seminary in connection with this college, which, in 1792, was merged in that of St. Mary's, Baltimore. In 1815 Georgetown College was chartered as a university by act of Congress, and in 1833 it was empowered by the Holy See to confer degrees in philosophy and theology. This university is at present the largest school under Jesuitic control in the Union, and withal one of the best in the land. One of its principal offshoots is the College of the Holy Cross, at Worcester, Massachusetts.

In 1823 two Jesuits from Maryland traveled to Missouri and took ten young Marylanders with them. At Florissant, a few miles northwest of St. Louis, Missouri, they opened a school for Indian boys. In 1828 the Missouri Jesuits founded the St. Louis University, which was the first scholastic institution west of the Mississippi, and stands to-day high on the roll of American schools. Similar schools were gradually established by the Missouri fathers in Cincinnati, Ohio; Louisville and Bardstown, Kentucky; Grand Coteau, Louisiana; Chicago, Illinois; Milwaukee, Wisconsin; Detroit, Michigan; and Omaha, Nebraska. They have also auxiliary stations in all the important towns of the West.

In their efforts to convert and civilize the Indians, the Jesuits penetrated into the various Indian countries, beginning with the Pottawottomies in Kansas, ascending the Missouri to the Sioux encampment, and the Yellowstone to the Blackfeet. They labored among the Flatheads and the various other tribes of Indians west of the Rocky Mountains. One of them, Father De Smet, was on several occasions deputed by the United States government to pacify the Indians when they became violent by their unjust treatment at the hands of Indian agents or swindling traders. Father De Smet visited many of the tribes, and obtained from the government even the right of nominating agents for Catholic tribes.

During the revolutionary troubles in Europe in 1847-48, many Jesuits were driven from their colleges and sought refuge in America. The provinces of Maryland and Missouri obtained large reinforcements from the refugees. A number of the latter went to California in 1854 and began there a mission and a school, the college of Santa Clara, near San Francisco. The mission has since spread into Oregon and New Mexico. Some French Jesuits took possession of St. Mary's College, Marion County, Kentucky, in 1833, and laid, also, the foundation of another college in Louisville, Kentucky, in 1845. Early in 1846 they left the latter to take charge of St. John's College, New York, and also to establish a college for externs in New York City. About the same time a number of Jesuits went to New Orleans, where they opened a house, and took, soon after, also, the flourishing college of Springhill, near Mobile, Alabama. They have since added several stations throughout the Southwest.

The order of Jesuits was restored in 1814 by Pope Pius VII. After an absence of more than forty

years from Canada, the Jesuit fathers appeared once more on the banks of the St. Lawrence, in 1839; and the old College of Quebec was soon replaced by St. Mary's College, at Montreal, which stands unrivaled among the many flourishing institutions in Canada. In 1865 the Jesuits opened their beautiful church in Montreal, which is the counterpart of the Gesu, the mother-temple of their society in Rome. In 1885 the College of St. Boniface, opposite Winnipeg, in Manitoba, was transferred to the Jesuits of the Dominion.

At Woodstock, Maryland, a central institute has been established in which young Jesuits are thoroughly instructed in philosophy, physical science, mathematics and theology, with a view of preparing them for the priestly offices, and also for teaching all the higher branches of learning in the colleges and schools of their order.

JESULMIR OR JAISALMER, a town of Rajputana, western India, situated on a broad belt of low, rocky ridges, near a considerable lake. It is substantially built, of yellow sandstone chiefly, and overlooking it is a fort of great strength, in which are some Jain temples. It is the capital of the native state of the same name, a monotonous desert country, with a severe climate. Cattle, barley and millet are raised by the inhabitants. Population, 11,000.

JETTISON. See AVERAGE, Vol. III, p. 146.

JEUNE, SIR FRANCIS HENRY, an English jurist; born in 1844; educated at Balliol College, Oxford, and called to the bar in 1868; made queen's counsel in 1888. In 1891 he was made judge of the Probate, Divorce and Admiralty Division; in 1892 president of the Probate and Divorce Court, and later advocate-general of her Majesty's forces. He was junior counsel for the claimant in the Tichborne case.

JEVONS, WILLIAM STANLEY, an English political economist; born in Liverpool, Sept. 1, 1835. He was educated at the University College, London, and at the London University; spent five years at Sydney, Australia, as an employee in the mint. In 1866 he was appointed professor of logic, political economy and mental philosophy at Owens College, Manchester. In 1876 he became professor of political economy at University College, London. After 1881 he devoted himself entirely to literary work. He published *A Serious Fall in the Value of Gold* (1863); *Pure Logic* (1864); *The Coal Question* (1865); *Elementary Lessons in Logic* (1871); *The Theory of Political Economy* (1871); *Principles of Science* (2 vols., 1874); *Money and the Mechanism of Exchange* (1875); *Investigations in Currency and Finance* (1884). Died at Boxhill, Aug. 13, 1882.

JEWELL, MARSHALL, an American statesman; born in Winchester, New Hampshire, Oct. 20, 1825. His father removed to Hartford and started a leather-beltng business. The son learned the trade and then went West, learned telegraphy and was an operator for three years. He returned in

1850 and re-entered his father's business. In 1869 he was elected governor of Connecticut and again in 1871 and 1872; in 1873 appointed minister to Russia; in 1874 chosen Postmaster-General in Grant's Cabinet, but resigned in 1876. He was chairman of the National Republican Committee during the Garfield campaign in 1880. Jewell's policy while Postmaster-General led to the discovery of the star-route scandals and was the cause of many wholesome reforms in the department. He died in Hartford, Feb. 10, 1883.

JEWETT, MILO PARKER, an American educator; born at St. Johnsbury, Vermont, April 27, 1808; graduated at Dartmouth in 1828, at the Andover Theological Seminary in 1833; accepted a professorship at Marietta College; became a Baptist in 1838; resigned his professorship and founded the Judson Female Institute in Marion, Alabama; in 1855 established a school for girls at Poughkeepsie. In 1862 he was chosen the first president of Vassar College, having suggested to Matthew Vassar the institution of such a school some time before. He resigned in 1864, and three years later settled at Milwaukee, Wisconsin, where he died, June 9, 1882.

JEWETT, SARAH ORNE, an American authoress; born at South Berwick, Maine, Sept. 3, 1849.

SARAH ORNE JEWETT.

She was educated at the Berwick Academy, and traveled in Europe and America. Her writings consist largely of short stories and novels portraying provincial life in New England. Among her works are *Deephaven* (1877); *Old Friends and New* (1879); *A Marsh Island* (1885); *The King of Folley Island* (1888); *A Native of Winby* (1893); and *The Life of Nancy* (1895). Miss Jewett resided in South Berwick and Boston.

JEWFISH, a local name of several American fishes of the family *Serranidae*. The name is applied chiefly to the genus *Promiclops*, the largest serranoid fish in American waters. It reaches a weight of 600 pounds. The names black grouper, guasa or warsau are also used. The *Stereolepis* of the warmer waters of the Pacific coast is also known as jewfish. It is almost as large as the first-mentioned, and is an excellent food-fish.

JEX-BLAKE, THOMAS WILLIAM, an English scholar and ecclesiastic; born in London, Jan. 26, 1832. He was graduated with honors at Oxford in 1855, and was elected a fellow of Queen's College in the same year. He was ordained priest in 1857, and became assistant master at Rugby in 1858; head master in February, 1874, a position which he re-

signed in 1886. In 1887 he was appointed rector of Alvechurch, in the diocese of Worcester; and dean of Wells in 1891. He was the author of *Long Vacation in Continental Picture-Galleries*, and a volume of sermons entitled *Life by Faith*.

JOAB, a Jewish general, the son of Zeruiah, the sister of David, was born about 1053 B.C. He first came into prominence in the battle of Gibeon, as the leader of the people of Judah, who supported King David against the people of Israel under Abner, the former commander-in-chief of Saul, and the supporter of Saul's son in his pretensions to the throne of Israel. In this battle Abner slew the brother of Joab. Later, however, Abner became reconciled to David, and Joab, either fearing his influence in the kingdom, or in revenge for the death of his brother, killed Abner. Joab's advance was rapid now, and for a long time he was acting general in all of David's wars. He also made his influence felt at court. When Absalom lost the favor of the king by the murder of Amnon, Joab secured his reinstatement by a clever trick. But in Absalom's rebellion Joab sided with the king, and even slew Absalom, against David's own command. Later, another rival to Joab's ambitions presented himself, in the person of Amasa, to whom David transferred the chief command of his armies. Him also Joab murdered while pretending to welcome him. At last, however, "though he had not turned after Absalom, he turned after Adonijah," and was slain in the tabernacle at Gibeon by Benaiah, 1012 B.C., by order of King Solomon.

JOACHIM, JOSEPH, a German violinist; born June 28, 1831, at Kittsee, near Pressburg, Hungary, of Jewish parents. He displayed great talents on the violin at the age of five, and was placed under Szervacsinsky, the opera conductor at Budapest. In 1841 he became the pupil of Boehm in Vienna, and two years later went to the Conservatorium in Leipsic, which was then under the direction of Mendelssohn. Here, at the age of 12, he made his first public appearance, Mendelssohn being his accompanist. He remained in Leipsic until 1849, pursuing his musical studies under David, and at the same time acquiring a thorough general education. In 1849 Joachim accepted the leadership of the grand duke's orchestra at Weimar, but gave up this post in 1854

JOSEPH JOACHIM.

to accept the appointment of conductor of concerts and solo-violinist to the King of Hanover. In 1868 he went to Berlin to take charge of the new school of musical execution which had been founded as a department of the Academy of Arts. Joachim was a master of technique, and his style was recognized universally as a model. His repertoire consisted almost entirely of the classical works for the violin by Bach, Beethoven, and Mendelssohn. As a composer he belongs to the school of Schumann. His most important work is the Hungarian Concerto (op. 11).

JOGUES, ISAAC, a French Jesuit missionary to Canada; born at Orleans, Jan. 10, 1607; joined the order of Jesuits in 1624; became a priest, and was sent to the New World as missionary to the Hurons in 1636. He sailed up the St. Lawrence and Ottawa rivers into the Huron country, east of Lake Superior. After five years' missionary work he started to return to Quebec, was taken prisoner by the Mohawk Indians and tortured, but finally escaped to Albany, and returned to France by way of New York. He soon returned to Canada, negotiated a treaty between the French and the Mohawks in 1646, and began a mission among the latter, but was killed as a sorcerer by them, Oct. 18, 1646, in a part of the country which is now Montgomery County, New York. In 1884 a chapel was built on the spot, and steps have been taken toward his canonization. His *Life* was published by Felix Martin in 1873.

JOHANNESBURG, the largest town in the Vaal River colony, and the mining centre of the Witwatersrand gold-fields. It is situated 298 miles N. E. of Kimberley and 35 S. of Pretoria, the capital of the colony. The town was originally known as Ferreira's mining-camp and has had a phenomenal growth. Three railroad lines connect it with the Delagoa Bay, Durban, Port Elizabeth and Cape Town. The first line was opened in 1892 and the Pretoria-Delagoa Bay railway was completed in the autumn of 1894. The extension of the Rand line to Charlestown, where it meets the Natal railway, was opened for traffic in 1895. Fine banks, churches, hotels, clubhouses, stores, private houses and a handsome stock exchange have been erected. The population in 1895 exceeded 40,000, with an additional 32,000 in the adjoining gold-fields. The water-supply and sanitary arrangements are insufficient and defective. Dust-storms are frequent and epidemics of fever occasional.

In December, 1895, the Uitlander or foreign-born population petitioned the Volksraad to remove the franchise qualifications, which then required 15 years' residence in the Transvaal, the renunciation of British allegiance and membership in the Dutch Reformed Church. The proposal was treated contemptuously by the Boer Volksraad, and as a result the agitation started which ended in the Jameson Raid. The administration of the South African Republic has been hitherto corrupt and oligarchical in the extreme. The railroad, whiskey, and dynamite concessions were in the hands of Germans, and all foreigners were heavily taxed, without any right of representation in local affairs. On the surrender of Dr. Jameson and the failure of his

raid, the reformer's committee were arrested by the Boer authorities, and on April 28, 1896, the four principal leaders were sentenced to death. The sentence was immediately commuted, and on June 11th they were released, after paying fines of \$125,000 each. The Boers then commenced to erect forts commanding Johannesburg, and were said to have received the assistance of many German military men. In 1899, the Uitlander element in the city and adjacent mining region continued to be the object of hatred, suspicion, and petty tyranny, on the part of the Boer government at Pretoria. This became so intolerable that a petition, signed by 21,000 British subjects, was addressed to Her Britannic Majesty complaining of grievances and of the failure of the Transvaal authorities to grant reforms. This led to many months of diplomatic parley between the Boer Republic and the suzerain power, the Republic insisting that before any conference was agreed to on the part of the burghers, Britain should waive suzerainty and abandon what rights she had through the conventions of 1881 and 1884. The English government repeatedly assured the Boers that it had no desire to interfere with the autonomy of the Transvaal or in any degree to aggress upon the Republic. All she desired was justice and fair dealing to British subjects in the Republic, with such representation in the Raad (Legislature) as they were entitled to, and which would enable them to secure that fair and just treatment promised them in 1881 when Britain granted self-government to the Transvaal. The negotiations, however, came to nothing, and the state of tension was broken by President Kruger's ultimatum of Oct. 9, which precipitated war. With the outbreak of hostilities the region was denuded of its British population and the Boers continued their preparation for the defence of the city. Seven months afterwards (May 31, 1900), on the advance of the imperial forces under Lord Roberts through the Orange Free State, which had thrown in its lot with the neighboring Republic in the war, Johannesburg was captured and occupied by the British. See the BOER WAR, in these Supplements. See also the TRANSVAAL, Vol. XIII, p. 518. G. M. A.

JOHANNOT, a family of French artists. FRANCIS, a German merchant of French descent, and an amateur painter of flowers. In 1806 he tried to introduce lithography in Paris, but failed. For a time he was librarian at Mannheim.—CHARLES, his eldest son, was born at Offenbach, in Hesse-Darmstadt, in 1783; died in Paris in 1825. He was a promising engraver, but died early, on account of hard work.—CHARLES HENRI ALFRED, youngest son of Francis; born at Offenbach, March 21, 1800. He learned engraving under his brother and attracted attention by his engravings, after Scheffer and Gerard. He illustrated editions of Cooper, Scott, and Byron, and at the time of death, in Paris, Dec. 7, 1837, was employed in decorating the chapel of Notre Dame de Lorette. Two of his pictures, *Mademoiselle de Montpensier* and *The Battle of Brattelen*, are at Versailles.—TONY, a brother of the two preceding, was born, also, at Offenbach, Nov. 9, 1803. He gave his

attention largely to book-illustrating, and in this excelled all others of his time. His illustration of a book insured its success. Among the authors whose works he illustrated are George Sand, Lamartine, Scott, Goethe, Rousseau, De Musset and Saint-Pierre. His most important work is considered to be the series of etchings illustrating Goethe's *Werther*. He died in Paris in 1852.

JOHN, EUGENIE, a German novelist writing under the *nom de plume* "E. Marlitt"; born at Arnstadt, Dec. 25, 1825. She was gifted with a fine voice, and in 1842 was sent, by the aid of the Princess Schwartzburg-Sundershausen, to Vienna to study music. She remained here three years and began to sing on the stage, but lost her voice. Thereafter, until 1863, she acted as reader to her former patroness, and then gave her entire attention to the writing of romances of a popular character. Among her works are *Goldelse* (1866); *The Old Mamsell's Secret* (1867); *Princess of the Moor* (1871); *Second Wife* (1873); and *At the Councillor's* (1877). Most of her books have been translated into English. She died June 22, 1887.

JOHN, JOHANN BAPTIST JOSEPH FABIAN SEBASTIAN, an Austrian archduke; born in Florence, Jan. 20, 1782, the sixth son of Emperor Leopold II and the Infanta Maria Louisa. He was thought, in his youth, to possess military talents, but while in command of the Austrian armies during the Napoleonic wars he was almost invariably defeated. He lived in retirement after the battle of Wagram, giving his attention to the study of natural science until 1848, when he was chosen regent of the Germanic empire by the Parliament of Frankfort. He was, however, too strong a partisan of Austria for such a position, and resigned Dec. 20, 1849. He died at Gratz, May 11, 1859.

JOHN, FREDERICK, "The Magnanimous." See SAXONY, Vol. XXI, p. 353.

JOHN, GEORGE I, Elector. See SAXONY, Vol. XXI, p. 354.

JOHN OF LEYDEN. See ANABAPTISTS, Vol. I, p. 787.

JOHNS HOPKINS UNIVERSITY, a non-sectarian institution of learning in Baltimore, Maryland, named after Johns Hopkins (q.v., in these Supplements), a merchant of Baltimore, by whose bequest it was founded. The university provides instruction for three classes of students. First, for undergraduates, those pursuing a regular collegiate course leading to the degree of bachelor of arts. The student is required to choose one of seven courses extending over a period of three years, and to confine his election of studies to the course chosen. This department was instituted largely for the convenience of young men living in and near Baltimore. Second, for those not candidates for a degree, who come to study or make investigation in some special line. Third, graduates either of the undergraduate department of the university or of some other college of recognized standing, who wish to pursue an advanced course of study leading to the degree of bachelor of philosophy. Here the latitude of election is greater than in the collegiate course, although the candidate must give evidence

of having done a certain prescribed amount of work. It was for this sort of work that the university was originally founded, the undergraduate department being forced upon it as an unpleasant necessity. The courses of study include instruction in Greek, Latin, Sanskrit, Semitic, Teutonic and Romance languages; philosophy, history, economics and pedagogics, mathematics, astronomy, physics, chemistry, biology, mineralogy, pathology, geology and morphology. The student is encouraged to carry on individual investigation, and clubs, semi-

MC COY HALL, JOHNS HOPKINS UNIVERSITY.

naries and societies are organized for mutual assistance. Johns Hopkins University was the first among American universities to give preponderance to post-graduate work.

The university annually awards 21 fellowships of \$500 each; 20 scholarships to graduate students of \$200 each; 40 scholarships to undergraduate students from Maryland, varying in amount. The fellows are urged to teach in the university. Besides the regular courses of study, two lectureships have been founded,—the Percy Turnbull lectureship of poetry and the Levering lectureship on religious subjects. These are of a popular nature, and are open, by invitation, to the public. A prominent feature of the institution is the publication of journals devoted to particular branches of learning. These are *American Journal of Mathematics* and *American Journal of Philology*, quarterlies; *American Chemical Journal*, eight times a year; *Studies in Historical and Political Science*, monthly; and *Studies from the Biological Laboratory*; *Contributions to Assyriology*; *Modern Language Notes*; and *University Circulars*. There were, in 1896, 86 instructors connected with the institution, 589 students, and, up to 1896, 748 degrees had been conferred. The buildings are situated in the city of Baltimore, and include an administration building with recitation halls, given by John W. McCoy; a public hall, a library containing 70,000 volumes; a gymnasium; physical, chemical and biological laboratories; and a hall for the Young Men's Christian Association, given by Mr. Eugene Levering. Several of the departments are housed temporarily, awaiting the erection of more suitable buildings.

Mr. Hopkins announced his intention of founding

a university some time before his death, and selected its trustees from among his friends. The institution was incorporated in 1867, and in 1870 the trustees met, organized, and adjourned until after the death of the founder. This occurred in December, 1873. Another meeting was then called, the plan of the university laid out and Daniel C. Gilman elected its first president. In the fall of 1876 the department of philosophy was opened. The endowment of the university comprised Mr. Hopkins's country seat at Clifton and funds invested in Baltimore and Ohio railroad stock and other securities, amounting, in all, to over \$3,000,000. Mr. Hopkins strongly advised that the Baltimore and Ohio stock should not be sold, and, in consequence, in 1887, and for several years after, when the failure of this company caused a suspension of dividends, the trustees of the university were at first unable to procure revenue for running-expenses. However, over \$100,000 was subscribed as an emergency fund, which enabled the institution to pass through the difficulty. In 1890 a conversion of the stock was effected, and the financial future of the university assured. As yet the department of philosophy is the only one opened, but steps have been taken for the institution of a medical school, to be maintained in connection with the Johns Hopkins Hospital, which will be open to both sexes. Five hundred thousand dollars have been subscribed for this purpose, including \$350,000 from Mary Elizabeth Garrett of Baltimore.

JOHNS ISLAND, an island of Berkeley County, southeastern South Carolina, 6 miles S.W. of Charleston, a member of the Sea Island group. It is 16 miles long and 10 wide, and had, in 1890, a population of 2,016.

JOHNSON, a village in Lamoille County, northern Vermont, on the Lamoille River, and on the St. Johnsbury and Lake Champlain railway, 28 miles N. of Montpelier. It has lumber, flour and woolen industries. Population 1900, 1,391.

JOHNSON, BARTON W., an American educator; born in Tazewell County, Illinois, in 1833. He was educated in Bethany College, West Virginia, and for a time after graduation was tutor there; was president of Eureka College, Illinois; later of Oska-loosa College, Iowa; served on the staff of the *Christian Evangelist* and the *Christian Quarterly*, both of St. Louis, Missouri; author of *Commentary on St. John*; *The People's New Testament*; *Young Folks in Bible Lands*. He died May 24, 1894, in De Leon, Texas.

JOHNSON, BUSHROD RUST, an American general; born in Belmont County, Ohio, Oct. 7, 1817. He graduated at West Point in 1840; served in the Seminole and Mexican wars, and became superintendent of the Western Military Institute of Kentucky. In 1861 he entered the Confederate service; was taken prisoner at Fort Donelson, but escaped soon after; commanded a division at Chattanooga; and was promoted major-general in 1864. He was afterward chancellor of the University of Nashville. He died Sept. 11, 1880, in Brighton, Illinois.

JOHNSON, EASTMAN, an American artist; born at Lovell, Maine, July 29, 1824. From the age of 17 he devoted himself to art-work; in 1849 went to

Düsseldorf, where he studied two years, and afterward resided for four years at The Hague, where, besides numerous portraits, he executed *The Savoyard* and the *Card-Players*, his earliest pictures in oil. After visiting the principal European galleries, he established himself in Paris, but was soon after called home to Washington. In 1858 he settled at New York. In 1860 he was elected to the National Academy. His favorite subjects are American rural and domestic life, including the negro and other subjects, though in later years he devoted himself almost exclusively to portrait-painting. Among his works are *The Old Kentucky Home*; *Corn-Husking Bee*; and *The School of Philosophy at Nantucket*.

JOHNSON, SIR GEORGE, an English physician; born at Goudhurst, Kent, November, 1818; educated at King's College, London, from which he received his M.D. in 1844; was tutor in the college, and in 1857 became professor of materia medica; in 1863 professor of principles and practice of medicine; in 1876 professor of clinical medicine in King's College Hospital; in 1889 physician extraordinary to the Queen; and in 1892 was knighted. He wrote *On Diseases of the Kidney* (1852); *Lectures on Bright's Disease* (1873); *Medical Lectures and Essays* (1887). Died in London, June 3, 1896.

JOHNSON, HERRICK, an American Presbyterian minister; born in Fonda, New York, Sept. 21, 1832; graduated from Hamilton College (1857); at the Auburn Theological Seminary (1860). He held pastorates at Troy, New York (1860-62); in Pittsburg, Pennsylvania (1862-68); in Philadelphia (1868-74); in Chicago (1880-84). He was professor of sacred rhetoric and pastoral theology at the Auburn Theological Seminary (1874-80); professor of homiletics in the McCormick Theological Seminary in Chicago after 1880. He published *Christianity's Challenge* (1881); *Plain Talks About Theaters* (1883); *Forms for Special Occasions* (1889).

JOHNSON, HERSCHEL VESPASIAN, an American statesman and jurist; born in Burke County, Georgia, Sept. 18, 1812; graduated from the Georgia University in 1834, and practiced law in Augusta; in 1839 he moved to Jefferson County and gave his attention to politics; in 1848 was appointed to fill a vacancy in the United States Senate; was made circuit judge in 1849; governor of Georgia (1853-57); in 1860 was Vice-Presidential candidate with Stephen A. Douglas; opposed secession, but went with his state and became a member of the Confederate Senate; after the war, elected to the United States Senate, but was disqualified by his connection with the Rebellion. Upon the removal of disabilities, he was elected, in 1873, to the circuit bench. He died Aug. 16, 1880, in Jefferson County, Georgia.

JOHNSON, ISAAC, an English colonist in America; born at Clipsham, Rutlandshire. He emigrated to America with Winthrop and Endicott, June 12, 1630, to found a colony in a tract of land in Massachusetts, which, two years before, the Plymouth Company had granted them and others under the name of the Massachusetts Bay Company; they went first to Salem, but in a month removed to Charlestown, and there founded a colony and church. The church was afterward moved across to Boston

and became "The First Church of Boston." Johnson died a few months after his arrival, Sept. 30, 1830. His wife, Lady Arabella, a sister of the Earl of Lincoln, after whom Winthrop named his ship, died a month before her husband.

JOHNSON, JOHN B., an American engineer; born at Marlboro, Ohio, June 11, 1850; graduated at the University of Michigan (1878); government surveyor (1878-83); elected professor of civil-engineering in Washington University, St. Louis, Missouri, in 1883. He was the author of *Theory and Practice of Surveying* (1886); *Modern Framed Structures* (1892). For some years he was engaged in making government strength-tests of American timbers.

JOHNSON, OLIVER, an American editor; born in Peacham, Vermont, Dec. 27, 1809. He served an apprenticeship in the printing-office of the *Montpelier Watchman*, and in 1831 became editor of the *Christian Soldier*, a Universalist semimonthly of Boston. Here he met William Lloyd Garrison and became with him one of the founders of the New England Antislavery Society, the name of which was afterward changed to the American Antislavery Society. He edited until 1865 several antislavery journals, in succession, in Boston, New York, Philadelphia and the West, and after the Civil War became manager of the *Independent*; in 1870, of *The Weekly Tribune*; in 1873, of the *Christian Union*; in 1877, editor of the *Orange Journal*; in 1884 became a member of the staff of the New York *Evening Post*. He published *William Lloyd Garrison and His Times* (1880). He died in Brooklyn, Dec. 10, 1889.

JOHNSON, REVERDY, an American statesman; born in Annapolis, Maryland, May 21, 1796; graduated at St. John's College, studied law and was admitted to the bar in 1815, and began practice in Prince George County, Maryland. In 1817 he removed to Baltimore, and in 1821 became a member of the state senate; was elected to the United States Senate in 1845; was appointed Attorney-General in President Taylor's Cabinet in 1849; in 1863 elected again to the United States Senate. In 1868 he

went to England as minister, and while there negotiated the "Johnson-Clarendon" treaty, which was rejected by the Senate, although the question under discussion—that regarding the *Alabama Claims*—was eventually settled in very much the same way. On his return to the United States in 1869, he resumed the practice of law, which he continued to within a few days of his death, which occurred in Annapolis, Feb. 10, 1876.

JOHNSON, RICHARD MENTOR, an American statesman; born at Bryant Station, Kentucky, Oct. 17, 1780. He was educated at Transylvania University; admitted to the Kentucky bar, and from

1804 to 1807 was a member of the state legislature. He was elected to Congress in 1807, and served until 1819. At the beginning of the war of 1812 he raised a battalion of three companies, and commanded it in active service for ten months. Shortly afterward he raised a regiment of one thousand mounted volunteers, and was himself in command until the fall of 1813, when he was wounded several times, in the battle of the Thames, and compelled to give up his post. It was in this battle that he gained the name of "Tecumseh Killer." From 1819 to 1829 he was a United States Senator, and then was again a member of the House till 1837, when he was chosen Vice-President on the ticket with Martin Van Buren. He was afterward elected again to the state legislature of Kentucky, and was a member of that body at the time of his death. He died Nov. 19, 1850.

JOHNSON, RICHARD W., an American general; born near Smithland, Kentucky, Feb. 7, 1827; graduated from West Point in 1849; became first lieutenant of cavalry in 1855; captain, 1856; major, 1862; appointed brigadier-general of volunteers in 1861; served in Buell's army in Tennessee; given command of a division in the army of Ohio and later in the army of the Cumberland; served on the staff of Gen. G. H. Thomas. He retired in 1867 with the rank of brigadier-general. He was military professor in the University of Missouri, 1868-69; in the University of Minnesota, 1869-70. He was the author of a *Life of General George H. Thomas* (1881) and *A Soldier's Reminiscences in Peace and War* (1886). Died at St. Paul, Minn., April 21, 1897.

JOHNSON, ROSSITER, an American author and editor; born in Rochester, New York, Jan. 27, 1840; educated at the University of Rochester, graduating in 1863; edited, with Robert Carter, the *Rochester Democrat* (1864-68); editor of the *Concord* (New Hampshire) *Statesman* (1869-72). From 1873 to 1877 he was associated with Ripley and Dana in editing the *American Cyclopaedia*, and afterward, with Sydney Gay, in the preparation of the last two volumes of Bryant and Gay's *History of the United States*. In 1883 he became editor of the *Annual Cyclopaedia*. He edited, also, the series of *Little Classics* (1874-75 and 1880); collections of poems entitled *Famous Single and Fugitive Poems* (1877); *Play-Day Poems* (1878); and *Fifty Perfect Poems* (1882), the latter with Charles A. Dana. Among his own writings are *Phaeton Rogers* (1881); *A History of the War between the United States and Great Britain in 1812-15* (1882); *A History of the French War* (1882); *Idler and Poet* (1883); and *A Short History of the War of Secession* (1888).

JOHNSON, SAMUEL, an American clergyman and educator; born in Guilford, Connecticut, Oct. 14, 1696. He was educated at Yale College, which was then located at Saybrook, Connecticut, and when the institution was removed to New Haven, became a tutor, studying theology at the same time. In 1720 he was ordained minister in the Congregational Church and given a pastorate at West Haven. Later, he became converted to Episcopacy, and in 1722 went to England with two friends and was ordained priest. He returned and became pastor

REVERDY JOHNSON.

at Stratford, and during his pastorate was engaged in many theological discussions with "dissenting clergymen." He became acquainted with Dean Berkeley during the latter's residence in Newport, and induced him to make gifts to Yale. He also accepted Berkeley's system of philosophy, which he embodied in his own philosophical works. In 1754 he accepted the presidency of King's (now Columbia) College, which was just founded, and consisted of eight students, who recited in Trinity Church vestry-room. He labored for eight years to set the institution on a firm basis, resigned in 1763 on account of old age, and returned to his old parish at Stratford, where he remained till his death, Jan. 6, 1772. Among his works are *System of Morality*, afterward published under the title *Elementa Philosophica*, in Philadelphia, by Benjamin Franklin, and *An English and Hebrew Grammar*. His *Life* was written by the Rev. E. Edwards Beardsley (1874).

JOHNSON, SAMUEL WILLIAM, an American chemist; born in Kingsboro, New York, July 3, 1830; studied at the Yale (now Sheffield) Scientific School, and in Leipsic and Munich. In 1856 he was chosen professor of theoretical and agricultural chemistry at the Sheffield School. He published *Peat: Its Uses as a Fertilizer and Fuel* (1866); *How Crops Grow* (1868); *How Crops Feed* (1870); also translations of Fresenius's *Manuals of Qualitative and Quantitative Analysis* (1864 and 1869).

JOHNSON, SIR WILLIAM, an English colonist and general in America; born at Warrentown, County Down, Ireland, in 1715. He was intended for a mercantile career, but gave this up, and in 1738 went to America as the steward of a large tract of land on the Mohawk River, in what is now Montgomery and Fulton counties, which his uncle, Sir Peter Warren, had received as the dowry of his wife, Miss Delancy, of New York. Johnson settled on the river, about three miles west of Amsterdam, and began to promote the colonization of the tract and to trade with the Iroquois tribes in the neighborhood. In his transactions with the latter, he was remarkably successful. He was always just and honorable in his dealings with them, and, moreover, gave himself the trouble to become acquainted with their customs and to learn their language, and even at times assumed their dress, treating them always in a manner that was at once affable and dignified. As a result, he won completely their confidence and respect, and to such an extent that he was elected sachem by the Mohawk tribe. Realizing the value of such a man, Governor Clinton appointed him Indian commissioner for New York.

When the French and Indian war broke out, his services were still more valuable. He was now made superintendent of the affairs of the Six Nations, and given command of a force of 3,500 men, English colonists and Indians, with the rank of major-general. He moved northward to Lake St. Sacrement, which he named Lake George, and on Sept. 5, 1755, defeated General Dieskau and the French in the battle of Lake George, although, on account of a wound received by Johnson early in the fight, Phineas Lyman, who commanded the New England militia, had to bear the brunt of the

battle. Johnson, however, was given the credit for the victory, besides a baronetcy and £5,000. In the following year he was commissioned by the king sole superintendent of the affairs of the Six Nations, with a salary of £600. During the following two years he fought in the unsuccessful campaigns of Loudon and Abercrombie, and in 1759 was second in command in Prideaux's expedition against Fort Niagara. Upon the death of the latter, he took command of the entire force. On the 24th of July he defeated D'Aubry, who had attempted to relieve the fort, which was thereby forced to capitulate on the next day. For these services he received a royal patent for 100,000 acres north of the Mohawk River. Here he retired after the surrender of Canada to the English, founded the town of Johnstown, and lived until his death on his estates as a baronial landlord. He still retained his influence over the Indians, and used it to prevent hostilities between them and the whites. In 1768 he made a treaty with the Iroquois which established their frontier at the Alleghany and Ohio rivers, thus including Kentucky with Virginia. He died at Johnstown, New York, July 11, 1774. His *Life* has been written by W. L. Stone.

JOHNSON, WILLIAM SAMUEL, an American jurist; son of Dr. Samuel Johnson; born in Stratford, Connecticut, Oct. 7, 1727; was graduated from Yale in 1740, and was admitted to the bar in 1746; in 1761, and again in 1765, represented Stratford, Connecticut, in the general assembly. In the latter year he was chosen a member of the First Colonial Congress which met to consider the Stamp Act, and in 1766 was sent to the upper house, or governor's council of Connecticut; in 1772 became a judge of the superior court, but held office only a few months; from 1784 to 1787 was a member of the Continental Congress. When hostilities broke out between Great Britain and the colonies, he retired to Stratford, being unwilling to give his support to the latter. After peace had been concluded, he was placed at the head of the Connecticut delegation to the Constitutional Convention, and in 1789 became the first United States Senator from Connecticut. From 1787 to 1800 he was president of Columbia College, and after his resignation from this office, lived at Stratford until his death, Nov. 14, 1819. The Rev. E. Edwards Beardsley wrote his *Life* (1876).

JOHNSON CITY, a city of Washington County, eastern Tennessee, on the East Tennessee and Western North Carolina, the Ohio River and Charleston and the Southern railroads, 22 miles S. of Bristol. It has foundries, machine-shops and manufactories of leather, sashes and blinds and furniture. Population 1890, 4,161; 1900, 4,645.

JOHNSON-GRASS, a local name for *Sorghum halapense*, a grass of the Southern states. It grows luxuriantly, and is regarded as an obnoxious weed, although of some value as a forage-plant.

JOHNSTON, ALEXANDER, an American educator and historical writer; born in Brooklyn, New York, April 29, 1829; was graduated from Rutgers College in 1870; admitted to the bar of New Jersey in 1876; taught in the Rutgers Grammar School for three years, and in 1879 became principal of the

Latin School of Norwalk, Connecticut. In the same year he published his first historical work, *A History of American Politics*. In 1883 he was called to the chair of jurisprudence and political economy at Princeton, which he occupied until his death, July 21, 1889. Among his other works are, *The Genesis of a New England State* (1883); *Representative American Orations* (1884); *A History of the United States*, for schools (1885); *Connecticut*, in the American Commonwealth Series (1887); and *The United States: Its History and Constitution*. He was a contributor to Lalor's *Cyclopædia of Political Science*, and to Windsor's *Narrative and Critical History of the United States*.

JOHNSTON, ALEXANDER KEITH, a Scottish cartographer and geographer, son of Alexander Keith Johnston (q.v., Vol. XIII, p. 730); born in 1846; was educated as a draftsman in his father's firm, and afterward in the Institute of Gotha, under Dr Petermann. He took part in an exploring expedition to Paraguay in 1874, and in 1879 was appointed leader of the Royal Geographical Society's expedition to East Africa, mainly for the purpose of discovering a practical route to the interior. He was scarcely a month on the way when he fell a victim to dysentery at Berobero, between Dar-es-Salaam and Lake Nyasa, June 28, 1879. He was a frequent contributor to the *Geographical Magazine*; wrote a *Physical Geography* (1877); edited and extended Hellwald's *Africa*, in Stanford's Series (1879); and edited a sheet-map of Africa and Boyce's *Gazetteer* (1879).

JOHNSTON, SIR HARRY HAMILTON, an English traveler and author; born at Kennington, Surrey, June 12, 1858. He was educated at King's College; appointed vice-consul for the Cameroons and the Oil Rivers in 1885; consul for Portuguese East Africa in 1888; consul-general and commissioner for British Central Africa in 1891-97; consul-general in Tunis in 1897. He traveled in various parts of Africa; in 1884 conducted a party to Mount Kilimanjaro; and in 1887 surveyed a portion of the Niger delta. He is an artist, and studied and exhibited at the Royal Academy. He wrote *The River Congo* (1884); *The History of a Slave* (1889); *Life of Livingstone* (1891); and *British Central Africa* (1897).

JOHNSTON, JOSEPH ECCLESTON, an American soldier; born at Longwood, in Prince Edward County, Virginia, Feb. 3, 1807. He was graduated from the Military Academy at West Point in 1829, and served in the Seminole and Mexican wars and elsewhere, chiefly as topographical engineer. At the outbreak of the Civil War he was made quartermaster-general, with the rank of brigadier-general. He resigned his commission April 22, 1861, being the highest ranked officer to leave the Union army, and entered the Confederate service as major-general of volunteers. He was commissioned brigadier-gen-

GEN. JOSEPH E. JOHNSTON.

eral in the Confederate army two weeks later, and given command of a force in the Shenandoah valley against General Patterson. He evaded the latter, and reinforced Beauregard at Bull Run, July 21, 1861. He next took charge of the forces in the peninsula campaign of 1862, and was wounded severely at the battle of Fair Oaks, near Richmond, May 31st. In November, having been made lieutenant-general, he was assigned to the command of the military department of Tennessee, and in the following spring made an ineffectual effort to relieve Vicksburg, on the Mississippi, which was then besieged by General Grant. After the defeat of General Bragg at Chattanooga, Nov. 25, 1863, Johnston was assigned to the command of all the Confederate forces in the Southwest, with the rank of general. In 1864 he was at the head of the forces which opposed Sherman in his "march to the sea." Compelled to fall back from point to point, the authorities at Richmond became dissatisfied, and on July 17th, Johnston was ordered by President Davis to turn over his command to General Hood. Near the close of February, 1865, when Sherman had marched into South Carolina, Johnston, at the request of General Lee, was directed to assume the command of the remnant of the army of Tennessee, and of all the forces in South Carolina, Georgia and Florida, to "drive back Sherman." The force which he could concentrate was greatly inferior to that of Sherman, and he was unable seriously to check his march. Having learned that Lee had surrendered the army of Virginia to Grant, Johnston capitulated to Sherman at Durham's Station, North Carolina. From the close of the war until 1885 he was engaged in agricultural, commercial and railroad enterprises. In 1877 he was elected to Congress, and in March, 1885, he was appointed commissioner of railroads by President Cleveland. He published a *Narrative of Military Operations* (1874), and several articles in the *Century Magazine*. Johnston's career as a general in the Civil War was a series of failures and retreats, but he cannot be held as entirely responsible for them. As the highest ranked officer to leave the Union army, he should have been given, according to the law passed by the Confederate Senate, the highest rank in the Confederate army. Jefferson Davis, however, by dating his commission as general later than that of Cooper, A. S. Johnston or Lee, the first two of whom ranked as colonel, the last-named as lieutenant-colonel, made Johnston fourth in command. Johnston protested, but in vain, and thereafter he and the President were continually in conflict. In the campaign which ended with the fall of Vicksburg, his most disastrous one, Johnston claimed that he had urged a concentration of the forces on the Mississippi, and especially that Pemberton should not remain in Vicksburg. The latter, however, was allowed to hold his precarious position and Johnston's suggestions disregarded until it was too late. He died March 21, 1891.

JOHNSTON, RICHARD MALCOLM, an American author; born in Powelton, Hancock Co., Ga., March 8, 1812. He was graduated from Mercer University, Georgia, in 1841, and subsequently was admitted to the bar. He filled the chair of literature in

the University of Georgia until the outbreak of the Civil War, and then moved to his country home,

RICHARD M. JOHNSTON

near Sparta, Ga., and opened a boys' school. In 1867 he removed his school to Baltimore Co., Md. Besides contributions to periodicals, he wrote *Dukesborough Tales* (1871), *A History of English Literature*, in conjunction with W. H. Brown (1872); *Life of Alexander H. Stephens* (1878), *Old Mark Langston* (1884); *Two Gray Tourists* (1885), *Mr. Absalom Billingslea and Other*

Georgia Folk (1888), *Ogeechee Cross-Firings* (1889); *Studies, Literary and Social* (1891-92); *Mr. Billy Downs and His Likes* (1892); *Little Ike Templin* (1894); *Old Times in Middle Georgia* (1897); *Pearse Amerson's Will* (1898). Died in Baltimore, Md., Sept. 23, 1898.

JOHNSTON, MARY, American historical novelist, was born at Buchanan, Va., Nov. 21, 1870, and as she has always been delicate in health she was educated at home. Her childhood and youth were chiefly passed in Virginia, on the banks of the James River. In 1893, her family left West Virginia for New York, where our authoress became for a time practically an invalid. She read and studied assiduously, however, and in the winter of 1896 she wrote and subsequently published *The Prisoners of Hope*, and later on appeared *To Have and to Hold*. The success of both novels, in the United States as well as in England, has been phenomenal. Their plots, though slight, are strong and well conceived, and there is an especial charm in their descriptive scenes. Miss Johnston at present resides in Birmingham, Ala.

JOHNSTON, WILLIAM PRESTON, an American educator, son of Gen. A. S. Johnston; born in Louisville, Kentucky, Jan. 5, 1831. He was graduated from Yale in 1852, and at the Louisville Law School in 1853; served in the Confederate army, as colonel, on the staff of Jefferson Davis; professor of history and literature in Washington and Lee University (1867-77); president of Louisiana State University (1880-83); in 1884, on the foundation of Tulane University, in New Orleans, became its first president; in 1891, chosen regent of the Smithsonian Institution. He published *The Life of General Albert Sidney Johnston* (1878).

JOHNSTOWN, a city of Cambria County, southwestern central Pennsylvania, on the Baltimore and Ohio and the Pennsylvania railroads, at the confluence of the Little Conemaugh River and Stony Creek. The city was almost totally destroyed on May 31, 1889, by the bursting of a dam in the Conemaugh River (see CONEMAUGH FLOOD, in these Supplements). It recovered very rapidly from the effects of this calamity. It is a manufacturing city, having the Cambria Iron Works, which employ about six thousand men. It also has manufactories of wire, cement, fire-brick, leather and woolen goods. The capital invested in the larger

industries here aggregates \$13,300,000, and the value of their annual products averages \$18,400,000. Population 1890, 21,805; 1900, 35,936.

JOIGNEAUX, PIERRE, a French journalist and writer on agricultural subjects; born at Varennes, Côte-d'Or, Dec. 25, 1815. He was educated at the Central School of Arts and Manufactures, took part in the struggles against the government of Louis Philippe, editing secretly several radical papers, and was imprisoned, but afterward released. In 1848 he was elected to the Assembly as an ultra-Liberal, and after the *coup d'état* was banished to Belgium. He was allowed to return, and in 1869 was elected to the Chamber of Deputies; in 1871 was elected to the National Assembly; in 1876 was re-elected to the Chamber, sitting on the Left, and was re-elected thereafter until 1889; in that year he was chosen to the Senate. He founded and edited many journals, and published, among other works, *Dictionary of Practical Agriculture* (1855); *Counsels to the Young Farming-Woman* (1861); *New Letters to Farmers* (1871). He died Jan. 25, 1892.

JOINDER, in law, the uniting of two or more causes of action in one declaration. Thus one action may be maintained upon two notes by uniting a count upon each note in the same declaration. Causes of action cannot generally be joined except when they exist between the same parties, so that one judgment can be given covering all the causes of action. The practice of joining more than one cause of action in one suit is regulated, to some extent, by the statutes of the different states. Different offenses of the same general nature may frequently be joined in one indictment, but not when they constitute two distinct crimes. Joinder in pleading is the act of accepting an issue tendered by the pleading of the other party, whereupon the issue is said to be joined. The term is also used to denote the act of making the proper persons parties to a suit.

JOINT-FIRS, a name sometimes given to species of *Ephedra*, a genus of *Gnetaceæ*, which family is the only representative of one of the three living groups of Gymnosperms, the other two being Cycads and Conifers. *Ephedra* has the general appearance of a shrubby, straggly branching *Equisetum*, and is a desert genus, growing in the desert region of the Mediterranean and western Asia, and represented by several species in the arid regions of the western United States.

JOINT OWNERSHIP. See JOINT, Vol. XIII, p. 731.

JOINT-RUSH, a name sometimes given to species of *Equisetum*, one of the genera of fern-plants, and the sole living representative of one of the three great divisions of fern-plants (Pteridophytes), the other two being ferns proper and club-mosses. The species of *Equisetum* are more commonly known as horse-tails or scouring-rushes. The fact that the stem is made up of a series of easily separated "joints" has suggested the name joint-rush. They grow in bogs or damp ground.

JOINT TENANCY. See JOINT, Vol. XIII, p. 731.

JOINTURE, a joint estate limited to both husband and wife. To constitute a valid jointure, it

is necessary that it take effect immediately upon the husband's death. It must be created before marriage, and must be expressly in lieu of her whole dower. In such case it will bar any claim for dower. In the United States the term signifies a joint estate of the husband and wife. See also **JOINT**, Vol. XIII, p. 731.

JOINVILLE, FRANÇOIS FERDINAND PHILIPPE LOUIS MARIE D'ORLÉANS, PRINCE DE, a French soldier; born at Neuilly, Aug. 14, 1818, being the third son of King Louis Philippe. In 1836 he became a lieutenant in the French navy, and in 1840 he commanded the frigate which brought the remains of Napoleon I from St. Helena to France. In 1843 he married the daughter of Dom Pedro I, Emperor of Brazil. Being made rear-admiral in 1844, he commanded

PRINCE DE JOINVILLE.

the fleet which bombarded Tangiers. His father being driven from the throne in 1848, Prince de Joinville relinquished his command and went to England. Afterward he devoted himself to travel and study; removed to America in 1861, and accompanied General McClellan during his command of the army of the Potomac. After 1870 he lived in retirement in France, and published *L'Angleterre*; *Études sur la Marine*; *La Guerre d'Amérique*; and *Encore un Mot sur Sadowa*.

JOKAI, MAURUS, a Hungarian writer; born at Komorn, Feb. 19, 1825. He studied in Presburg, and was admitted to the bar, but never practiced. His first work, a drama, entitled *The Jew Boy*, was published when he was seventeen years old. Soon after he entered journalism, and when the Revolution broke out took part with the Nationalists. After the restoration of Austrian rule he continued his literary and journalistic work, and was elected to the Hungarian Chamber. In 1863 he established the *Fatherland*, in which many of his novels appeared, and is now editor-in-chief of the governmental organ, the *Nation*. He published 200 volumes, novels, dramas, short stories and historical works. Among his most celebrated novels are *A Hungarian Nabob*; *Sad Times*; *The Accursed Family*; *The Last Days of the Janissaries*; *The Romance of the Next Century*; *Black Diamonds*; and *Transylvania's Golden Age*. See also **HUNGARY**, Vol. XII, p. 379.

JOKJOKARTA OR DJOKJOKARTA, a town of Java, in lat. 7° 47' N., long. 100° 21' E., the capital of the presidency of the same name. It has many European settlers and institutions. Population 59,000.

JOLIBA, an African river. See **NIGER**, Vol. XVII, p. 496.

JOLIET, a city and the capital of Will County, northeastern Illinois. It is on the Atchison, Topeka and Santa Fé, the Chicago and Alton, the Chicago, Rock Island and Pacific, the Elgin, Joliet and Eastern

and the Michigan Central railroads. It contains many handsome stone buildings, several churches, chapels, schools, banks, a Catholic academy, a convent and a state prison. Joliet has extensive flour-mills, machine-shops, breweries, lime-kilns, brickyards, foundries, manufactories of boots and shoes, Corliss engines, agricultural tools, cigar factories, Bessemer-steel works and rolling-mills, wire mills, carriage-shops, marble-works and manufactories of builders' hardware, cooperage, farming implements, stoves, sashes, doors and blinds. The capital of industries reporting in the census of 1890 was \$9,000,000. Their annual product was \$12,000,000 worth of merchandise. The city has a public library with 10,000 volumes, water-works, electric street-railways and lights. At this place there are large quarries of excellent Silurian limestone, called Joliet limestone. Population 1890, 23,264; 1900, 29,353. See also **JOLIET**, Vol. XIII, pp. 735, 736.

JOLIET, CHARLES, a French author; born at St. Hippolyte-sur-le-Doubs, Aug. 8, 1832. He studied at the Collège de Chartres and the Lycée de Versailles, and until 1864 held different positions in the civil service. In the mean time he became a contributor to the newspapers and magazines of the day. In 1864 he began to devote his entire attention to literary production. Among his numerous works are *The Story of Two Young Married People* (1866); *Les Athéniennes*, poems (1866); *The Pseudonyms of the Day* (1867); *Patriotic Novels* (1871); *The Viscountess of Jussey* (1875); *Carmagnol* (1876); *Diane* (1878); *Curiosities of Letters, the Sciences and the Arts* (1884); *Incoherent Novels* (1887); and *Violette* (1890).

JOLIET, LOUIS, a Canadian explorer; born in Quebec, Sept. 21, 1645. He was educated at the Jesuit College of Quebec and went through the preliminaries leading to an entrance into the priesthood, but gave up this calling for that of explorer and trader. In 1672 Governor Frontenac and Talon made an effort to trace the course of the Mississippi River, which was then supposed to discharge itself into the Sea of California. Joliet was intrusted with this enterprise, for which he was provided with a canoe and an assistant. At a Jesuit mission the two were joined by Father Marquette and five others, and proceeded as far as Mackinaw, Dec. 8, 1672. Here they derived information from the Indians, which enabled them to make a rough outline map of their proposed route. The party then ascended the Fox River from Green Bay, crossed over and descended the Wisconsin River, and on June 17, 1673, entered the Mississippi. After visiting several Indian villages on its banks, they became assured that the river emptied its waters into the Gulf of Mexico, and began their return journey. They reached Lake Winnebago at the end of September, where they spent the winter at the mission of St. Francis Xavier, and in 1674 returned to Quebec. On the way Joliet lost his map and papers by the upsetting of his canoe in the Lachine rapids of the St. Lawrence River. He was thereafter made governor of the colony. About 1680 he was granted Anticosti Island, where he built a fort, which was destroyed by the British and his wife taken prisoner. Later

Joliet explored Labrador, and on April 30, 1697, was granted the seigniorship of Joliet, near Quebec. The honor of the earliest exploration of the Mississippi remains unsettled. Joliet, Marquette and La Salle each have their advocates. For a discussion of the claims of each, see Winsor's *Critical and Narrative History* (1884). He died in Canada, May, 1700.

JOLLIVET, PIERRE JULES, a French artist; born in Paris in 1803; studied architecture at first, but afterward turned his attention to painting; entered the School of Fine Arts in Paris, in 1822; in 1835 gained a medal of the first class; was decorated with the cross of the Legion of Honor in 1851. Among his works are eighteen plates in the *Musée de Madrid*, purchased by Ferdinand VII of Spain; *The Bull-Fight* and *Christ Healing the Sick*, paintings; an enamel for the Emperor of Russia, entitled the *Virgin and Child*, and a larger work of the same nature, in the Church of St. Vincent de Paul, in Paris. He died in 1871.

JOLLY, FRIEDRICH, a German writer on nervous diseases; born in Heidelberg, Nov. 24, 1844. He graduated from the University of Munich; held professorships at the universities of Strasburg (1873-90) and Berlin after 1890. He published *Hysteria and Hypochondria* and *On the Electrical Resistance of the Human Body*. He was editor of the *Magazine of Psychiatry and Nervous Diseases*.

JOLLYBALANCE. See BALANCE, Vol. III, p. 261.

JOLY, JOHN, an Irish scientist; born in Hollywood, Kings County, Ireland, in 1857; studied at the Rathmines School and at Trinity College, Dublin; was assistant lecturer in engineering and in experimental physics in Trinity College; and afterward professor of physics in Alexandra College, Dublin. He published numerous papers in the magazines of the English and Irish scientific societies; among them, *On Specific Heat of Minerals* and *A Speculation as to the Pre-material Condition of the Universe*.

JONATHAN, a Jewish warrior, the eldest son of Saul; born about 1095 B.C. He was a man of great strength and courage, and distinguished himself in the wars against the Philistines, and especially by attacking, with his armor-bearer, a garrison of Philistines, twenty of whom he killed and the rest routed. But he is best known for his friendship for David, which began when the latter slew the giant of Gath, and lasted, despite the quarrel between David and Saul, until Jonathan's death. Jonathan was killed, with his father, Saul, in the battle of Gilboa, 1056 B.C. David pronounced an elegy upon him (2 Sam. i, 19). See DAVID, Vol. VI, pp. 838, 839.

JONES, ANSON, an American statesman; born in Great Barrington, Massachusetts, Jan. 20, 1798. He began the practice of medicine in 1820, at Litchfield, Connecticut, and in 1833 settled in Brazoria County, Texas. During the war between Texas and Mexico, he was a surgeon in the Texan army, and in 1837 was chosen to the Texan Congress. From 1837 to 1839 he was minister to the United States government; in 1840 member of the Senate; from 1841 to 1844 Secretary of State; and from 1844 to its annexation to the United States was President of Texas. He strongly opposed annexation, and

after it was accomplished retired and engaged for the rest of his life in agriculture. He died Jan. 7, 1858.

JONES, CHARLES COLCOCK, an American lawyer and historian; born in Savannah, Ga., Oct. 28, 1831; graduated from Princeton in 1852, from Harvard Law School in 1855, admitted to the bar in Savannah in 1856. During the Civil War he served in the Confederate army and reached the rank of colonel of artillery. In 1866-76 he practiced law in New York city, and in 1876 returned to Georgia. He wrote *Indian Remains in Southern Georgia* (1859); *Ancient Tumuli on the Savannah River* (1868); *Antiquities of the Southern Indians* (1873). *De Soto's March Through Georgia* (1880); *History of Georgia* (1883); and *Negro Myths from the Georgia Coast* (1888), etc. Died in Augusta, Ga., July 19, 1893.

JONES, ERNEST CHARLES, an English lawyer, author and political leader; born in 1819, in Germany, where his father was equerry to the Duke of Cumberland. He was educated in Germany, and at 19 went to England; began the study of law and also contributed to the magazines. He was admitted to the bar in 1844, but in 1845 became interested in the Chartist movement, of which he was soon one of the leaders. He issued the *Labourer* and *Notes of the People*, and founded the *People's Paper*, which for eight years was the organ of the Chartists. In 1848 he was sentenced to two years' imprisonment for a seditious speech, and during his confinement wrote an epic, *The Revolt of Hindustan*, it is said with his own blood, on the fly-leaves of the prison prayer-book, pen, ink and paper being denied him. After his release he continued to be the leader of the Chartist organization until its dissolution, never accepting any reward for his service. Three days before his death he was elected to Parliament from Manchester. He made contributions both to political and general literature during his whole life. Among his works are *The Battle-Day* (1855); *The Emperor's Vigil* (1855); *The Maid of Warsaw* (1854); *The Lass and Lady* (1855); *A Tale of Faith and Chivalry* (1860); and *Democracy Vindicated* (1867). He died Jan. 26, 1869.

JONES, HENRY ARTHUR, an English playwright; born at Granborough, Buckinghamshire, Sept. 20, 1851. He received a common-school education, and at 13 began to earn his living. He devoted all his leisure to study and writing, and on Dec. 11, 1878, produced his first play, *Only Around the Corner*, which was acted in the Exeter Theatre. In the following year his comedy, *A Clerical Error*, was played in London. His first great success was *The Silver King*, produced by Wilson Barrett at the Princess Theatre in 1882. Its popularity was immediate and has lasted until the present day. After this he wrote several other successful melodramas; among them, *The Noble Vagabond*; *Heart of Hearts*; and in 1889 produced *The Middleman*, the first of a series of plays, picturing English social life of the present, which made his reputation as a dramatic writer. *The Middleman*, with E. S. Williard in the leading rôle, was immediately successful, and had a run of two hundred nights. In the following year appeared *Judah*, and in 1891 the *Dancing-Girl*. *The Tempter*, Mr. Jones's first drama in blank verse, was

played at the Haymarket in 1893. He also brought out *The Case of Rebellious Susan* (1894), which made a great hit, *The Triumph of the Philistines* (1895); *Michael and His Lost Angel* (1896); *The Liars* (1898), and *The Manœuvres of Jane* (1898); In 1895 he published *The Renaissance of the Drama*. Almost all his plays have been acted in America.

JONES, HUGH BOLTON, an American artist; born in Baltimore, Maryland, Oct. 20, 1848. He studied in Baltimore, and afterward in Europe, and in 1877 made a sketching tour in Brittany and Spain. Among his pictures are *Tangier*; *Return of the Cows*; *Brittany*; *October*; *On Herring Run*; *Baltimore*; *Summer on the Blue Ridge*; *The Poplars*; *The Wayside Pool*; and *The Ferry Inn*. His studio was in New York.

JONES, JACOB, an American naval officer; born near Smyrna, Delaware, in March, 1768. He studied medicine, began to practice, then became clerk in the Delaware supreme court, and April 10, 1799, entered the United States navy as midshipman; was made lieutenant in 1801, and was taken prisoner in the harbor of Tripoli while on the *Philadelphia*, remaining captive for 18 months; made commander in 1810, and given charge of the *Wasp*. On Oct. 18, 1812, war having been declared with England, he met the British brig *Frolic*, and captured her after a desperate encounter. The British ship *Poictiers*, an immensely superior vessel, came in sight two hours afterward and captured both ships and carried them to Bermuda. Jones was paroled and returned to the United States, where he was awarded a medal by Congress for his gallantry. The encounter between the *Wasp* and the *Frolic* was one of the first of the war, and did much to give Americans confidence in the American navy. Jones was made post-captain and given command of the *Macedonian*, in Decatur's squadron. Afterward he was governor of the Philadelphia Naval Asylum. He died in Philadelphia, Aug. 3, 1850.

JONES, JAMES KIMBROUGH, an American soldier and public man; born Sept. 29, 1839, in Marshall County, Mississippi. He was a Confederate soldier in the Civil War; commenced the practice of law in 1873, and became a member of the Arkansas state senate the same year. He was chosen to the Forty-seventh Congress, and was re-elected to the Forty-eighth and Forty-ninth. He was then elected to the United States Senate, and took his seat in 1885, and was re-elected in 1891.

JONES, JENKIN LLOYD, an American Unitarian pastor; born in Llandyssil, Cardiganshire, Wales, Nov. 14, 1843. He graduated from the Meadville (Pennsylvania) Theological School; became pastor of the Unitarian Church at Janesville, Wisconsin, in 1874; after 1883 was pastor of All Souls' Church, Chicago; after 1880 edited the religious journal, *Unity*. He also published *A Chorus of Faith* (1894); and *The Seven Great Religions* and *The Faith that Makes Faithful*, with W. C. Gannett.

JONES, JOHN PERCIVAL, an American public man; born in 1830, in Hay, Brecknockshire, Wales. His parents moved to Ohio while he was an infant, and he attended the public schools of Cleveland. In the early part of the California excitement he went to

that state, and engaged in farming and mining in one of the inland counties, which he subsequently represented in both houses of the state assembly. In 1867 he went to Nevada, and afterward engaged in the development of the mineral resources of that state. In 1873 he was elected, as a Republican, to the United States Senate, and was thrice re-elected.

JONES, THOMAS RUPERT, a British scientist; born at Cheapside, London, Oct. 1, 1819. Apprenticed to a surgeon in Taunton, Somersetshire, in 1835; in 1850 assistant secretary to the London Geological Society; lecturer in 1858, and in 1862 professor at the Royal Military College at Sandhurst; later, professor at the staff college. In 1875 he was the editor of the *Arctic Manual*; edited Dixon's *Geology of Sussex* contributed to the *Cyclopaedia of Anatomy*, Cassell's *Natural History* and the *Encyclopaedic Dictionary*; joint author of the *Nomenclature of the Foraminifera* (1859-72) and the *Micrographical Dictionary* (1874).

JONES, WILLIAM BASIL, a British ecclesiast; born in Cardiganshire, Wales, Jan. 2, 1822; educated at Trinity College, Oxford; held fellowships at Queen's and University colleges; tutor in University College in 1854; vicar of Bishopthorpe in 1865; archdeacon of York in 1867; bishop of St. David's in 1874. He was the author of *Vestiges of Gael in Gwynedd* (1851); *The History and Antiquities of St. David's* (1856); with E. A. Freeman, *Notes on the *Œdipus Tyrannus of Sophocles** (1862); with Archdeacon Churton, *Commentary on the New Testament* (1864). Died in Lampeter, Jan. 14, 1897.

JONESBORO, a town and the capital of Craighead County, northeastern Arkansas, on the Kansas City, Fort Scott and Memphis, the St. Louis, Iron Mountain and Southern and the St. Louis Southwestern railroads, 62 miles N.E. of Memphis, Tennessee. The chief products of the vicinity are cotton, corn and tobacco. It has saw and planing mills, cotton-gins, and stave, box and wagon factories. Population 1890, 2,065; 1900, 4,508.

JONESBORO, a city and the capital of Union County, southern Illinois, celebrated for the fine fruit grown in the region. It is on the Mobile and Ohio railroad, 30 miles N. of Cairo. It has good building-stone, a state insane asylum, mills and factories. Population 1900, 1,130.

JONESBORO, a village and the capital of Washington County, Tennessee, 100 miles N.E. of Knoxville. It is beautifully situated on the Southern railroad, seven miles W. of Johnson City. It is the oldest town in the state, was the first capital, contains an academy for girls, a normal institute, a foundry, tannery and a saw-mill. Population 1890, 937; 1900, 854.

JONESVILLE, a village of Hillsdale County, central southern Michigan, on the Lake Shore and Michigan Southern railroad, 25 miles S. of Jackson. It is in a fruit-growing region, and has large fruit- evaporators and cider-mills. Carriages, harness, staves, flour and machinery are manufactured. Population 1900, 1,367.

JONGKIND, JOHAN BARTHOLD, a Dutch painter and etcher; born at Latrope in 1819. He left his home in his youth, and went to study art in Paris,

under Isabey. He made his *début* in the Paris Salon of 1845. Among his paintings are *View of the Port of Harfleur* (1850); *The Meuse at Dordrecht* (1869); *The Interior of the Harbor of Dordrecht* (1870.) Perhaps he is better known as an etcher. His etchings are mostly of landscapes, and are made in a very rapid, sketchy manner directly upon the copper, but have great freshness and vigor. Among his best are *The Town of Maaslins, Holland* (1862); and *View of the Scheldt at Antwerp—Setting-sun* (1869). He died in Paris, Feb. 11, 1891.

JONGLEURS. See DRAMA, Vol. VII, p. 413.

JONQUIL, a plant. See *Narcissus*, under HORTICULTURE, Vol. XII, p. 257.

JONSSON, FINN. See ICELAND, Vol. XII, p. 626.

JOOST VAN DER VONDEL. See DRAMA, Vol. VII, p. 444.

JOPLIN, a city and railroad center of Jasper County, southwestern Missouri, about fourteen miles S.W. of the town of Carthage, on the Missouri Pacific, the Kansas City, Fort Scott and Memphis, the Kansas City, Pittsburg and Gulf and the St. Louis and San Francisco railroads. It has come into prominence in recent years as a center of commerce for the extensive lead and zinc mining region of the southwestern part of the state, in which it is located. Its annual output in zinc ores averages \$1,500,000; that of the district, \$4,000,000. It has boiler-works, foundries, machine-shops, a soap factory, etc. Population 1890, 9,943; since then it has annexed the mining suburbs, which raised the population in 1900 to 26,023.

JORDAN, a village of Onondaga County, west-central New York, on the West Shore and the New York Central and Hudson River railroads, and on the Erie canal, 15 miles W. of Syracuse. It has manufacturing of flour, furniture, wheelbarrows, sleds, furnaces, strawboards and machinery, and is the seat of an academy. Population 1900, 1,118.

JORDAN, a river of Utah, connecting Utah Lake with the Great Salt Lake. It is used extensively for irrigation purposes. In 1892, 22,000 acres of land were watered by canals from this river. Its direction is due north, and it is 40 miles long. Salt Lake City is situated on this river.

JORDAN, DAVID STARR, an American naturalist and educator; born in Gainesville, New York, Jan. 19, 1851. He graduated at Cornell University in 1872, and at the Indiana Medical College in 1875; taught at Lombard University (1872-73); Appleton (Wisconsin) Collegiate Institute (1873-74); at the Anderson School, at Penikese Island, Massachusetts (1874); in the Indianapolis High School (1874-75); professor of biology, Butler University (1875-79); professor of zoölogy, Indiana University (1879-85); president of Indiana University (1885-91); of Leland Stanford Junior University (1891). He published *Manual of the Vertebrates of the Northern United States* (1876), and over 250 papers, largely upon the ichthyology of the United States.

JORDAN, THOMAS, an American general; born in Luray Valley, Virginia, Sept. 30, 1819. He entered the United States infantry service in 1840,

and served in the war against the Seminole Indians, and later in the war with Mexico. At the outbreak of the Civil War he resigned his commission and entered the Confederate army as adjutant-general of the forces around Manassas, and afterward became chief of staff to General Beauregard; was promoted to the rank of brigadier-general after Shiloh; in 1866 was editor of the *Memphis Appeal*, and in 1869 became chief of staff to the revolutionary army in Cuba; the same year succeeded to the chief command, but a little later resigned because of the fruitlessness of the attempt. Upon his return he became editor of the *Financial and Mining Record*. With J. B. Pryor, he published *The Campaigns of Lieutenant-General Forrest* (1868). He died in New York, Nov. 27, 1895.

JORDAN, WILHELM, a German philosopher and poet; born in Insterburg, Prussia, Feb. 8, 1819; studied philosophy and theology at Königsberg; lived in Leipsic until exiled from Saxony on the charge of atheism and political radicalism; went to Bremen, and in 1848 was elected deputy to the assembly of Frankfort, sitting on the Left; afterward lived in retirement in the same city. Among his earlier works are *History of the Island of Haiti* (1846-49); *Bells and Canons*, a collection of poems inspired by liberal political opinions and by the philosophy of Hegel (1842); and *Popular Songs and Legends of Lithuania* (1844). Later, he wrote a philosophical epic, *Demiourgos* (1852); and the epic, *Nibelunge* (1877), in which he attempted, with no great success, an imitation of ancient German poetry; also the comedies, *Without Love* (1855); and *The False Prince* (1856). He translated the works of Homer, Sophocles and several of the plays of Shakespeare.

JORIS, DAVID GEORGE. See DAVIDISTS, Vol. VI, p. 844.

JORULLO, a volcano of the state of Michicoacan, Mexico. See GEOLOGY, Vol. X, p. 248.

JOSEFFY, RAFAEL, a Hungarian pianist and composer; born in Presburg in 1852; displayed juvenile precocity in music; pupil of Liszt's *protégé*, Carl Tausig, in Berlin; gave concerts in Germany that won instant applause for his technique and sympathetic playing; first visited the United States in 1895; composed a number of pieces for the piano.

JOSEPH, FRANÇOIS LE CLERC DU TREMBLAY, secretary of Cardinal Richelieu (1577-1638). See FRANCE, Vol. IX, pp. 568-570.

JOUBERT, GENERAL PETRUS JACOBUS, late commander of the Boer forces in the Transvaal in the war with Great Britain, was born at Cango, Cape Colony, in 1833. In 1867 he was state attorney for the Transvaal, has acted as president during Paul Kruger's absence in Europe, and on two occasions has himself been an unsuccessful candidate for the high office. In his military career, he first distinguished himself by the defeat, in 1881, of Sir George Colley at Majuba Hill, and in 1896 he was the chief factor in causing the surrender of Dr. Jameson, leader of the famous raid. In the field he was known to be an able tactician, though acting generally on the defensive. In the fall and winter of 1899 he operated chiefly in Natal,

and became an adept in ambuscading British troops. It was the Boer troops under his command that besieged Ladysmith and repulsed General Buller at Chieveley. In Mar. 27, 1900, General Joubert died at Pretoria from peritonitis and was succeeded in the supreme command in the field by General Louis Botha. Though opposed to British domination in South Africa, Joubert was known to favor a liberal policy towards the British.

JOUBERT, BARTHÉLEMY CATHERINE, a French general; born at Pont de Vaux, Bresse, April 14, 1769. He studied for the law, but on the outbreak of the revolution enlisted in the National Guard; was made sergeant in 1791, adjutant-general in 1794, and general of a brigade in the following year. In 1797 he drove the Austrians from Mantua, and subdued the Tyrol; and when the peace of Campo Formio was concluded, Napoleon sent him to Paris with the trophies of the campaign. He was made general-in-chief of the Army of Italy, in 1798 conquered Piedmont, and in Turin captured a vast amount of military supplies. In the following year he resigned his command, when the Directory instigated investigations of the conduct of some of the generals, denying the right of civil interference in military matters. The defeat of his successor, Moreau, led to his recall; but he was killed in a charge against his opponent, General Suwaroff, at Novi, Aug. 15, 1799.

JOUBERT, JOSEPH. See FRANCE, Vol. IX, p. 677.

JOUFFROY, D'ARBANS, CLAUDE, MARQUIS DE, a French mechanic; born in Franche-Comté, Sept. 30, 1751. In early manhood he served in the army, and while in Provence studied the navigation of sailing-vessels. The application of steam to navigation was suggested to him by the sight of a fire-engine, and in Provence, in 1783, while serving in the army, succeeded in making a small paddle-wheel steamboat sail up the Rhone, at Lyons. The vessel was, however, too defective to be available for purposes of actual navigation, and a patent was refused by the French government. Compelled by the Revolution to emigrate, he failed, on account of financial ruin, to float a company, till after Fulton had made his successful experiments on the Seine in 1803. In 1816, having obtained a patent, Jouffroy formed a company, and in the same year launched a steamer on the Seine, but he was unable to compete with other enterprises of the same kind. The French Academy in 1840 indorsed his claim to the discovery of steam navigation. He died of cholera, in Paris, 1832.

JOULE, JAMES PRESCOTT, an English physicist; born at Salford, England, Dec. 24, 1818. In his youth he had the good fortune to have for instructor in science the celebrated Dalton, and he soon showed, by constructing for himself electrical machines and other philosophical instruments, the bent of his genius. His earliest notable experiments were made with reference to electromagnetic engines, from which he passed to quantitative determinations regarding heat, and the transformation of various forms of energy. His investigations resulted in an important communication to the Royal Society *On the Change of Temperature Produced by Rarefaction and Condensation of Air.* With Professor Thom-

son (now Lord Kelvin) he carried on valuable investigations upon the thermal effects of fluids in motion, besides doing much work in several branches of physics, and is justly entitled to be considered as the experimental founder of the modern theory of conservation of energy—the grandest generalization ever made in physical science. Two volumes of his collected papers have been published by the Physical Society of London (1884–87). The universities of Dublin and Edinburgh conferred upon him the degree of LL.D., and the University of Oxford gave him the degree of D.C.L. He also received many marks of honor from abroad; and in 1878 a civil-list pension of £200 was conferred upon him. He died Oct. 11, 1889, at Sale, near Manchester. For discussions of his theories, see *ELECTRICITY*, Vol. VIII, pp. 15, 90 et seq.

JOURDAN, JEAN BAPTISTE, COMTE, a French marshal; born at Limoges, April 29, 1762. He entered the army at the age of 16; served five campaigns under Count d'Estaing in America, returning to France in 1784, when he engaged in business in Limoges. In 1792 he again joined the army, and soon rose to be chief in command of the Army of the North. He succeeded in driving the Austrians out of Maubeuge, but the Committee of Safety, not recognizing his worth, placed him on the retired list in 1793. He was recalled in 1794, and, being placed in command of the Army of the Sambre and Meuse, gained several important victories, but was defeated himself by the Archduke Charles. Resigning his command, he became a member of the Council of Five Hundred, being elected its president in 1798. When Napoleon rose to power, Jourdan would not sanction his revolutionary measures; so there always existed a coolness between them. But he was adviser to Joseph Bonaparte in Naples, and later in Spain. When Louis XVIII was restored he was created a peer, and although he took part under Napoleon on his return, held office again under the King. During the revolution of 1830 he was Minister of Foreign Affairs, but later governor of the Hôtel des Invalides. He died Nov. 23, 1833.

JOUST. See *TOURNAMENTS*, Vol. XXIII, p. 489.

JOWETT, BENJAMIN, an English classical scholar; born at Camberwell, near London in 1817. After being educated at Oxford he became a tutor in 1842, and in the same year he was ordained as a clergyman. He served afterward as an examiner of classical schools and for the Indian civil service. In 1855 he was appointed regius professor of Greek, in 1870 master of Balliol College, and in 1886 vice-chancellor of the University. His most important published works are *Commentary on the Epistles of St. Paul to the Thes-*

BENJAMIN JOWETT.

salonians, Galatians and Romans; The Dialogues of Plato, translated into English, with analyses and introductions (1871); and his translations of *Thucydides* and *Aristotle*. The degree of Hon. LL.D. was conferred on him by Cambridge in 1890. He died in Oxford, Oct. 1, 1893.

JOWF. Two oases in the north and southeast of Arabia. See ARABIA, Vol. II, pp. 254, 255.

JOYCE, ISAAC W., an American Methodist Episcopal bishop; born in Hamilton County, Ohio, Oct. 11, 1836. At the age of 11 he went to Tippecanoe County, Indiana. He was educated at Hartsville University, and entered the ministry in 1859, serving until 1888. He was for four years a presiding elder, took part in the general conference of 1880, and again in 1888, when he was chosen bishop.

JUBILEES, BOOK OF. See APOCALYPTIC LITERATURE, Vol. II, pp. 176, 177.

JUAN Y SANTACILIA, a Spanish navigator; born near Alicante, Jan. 5, 1713. At the age of 21 he crossed the Atlantic and explored part of the American coast. He did much astronomical work, and was made a vice-admiral by Philip V in 1735. In connection with Ulloa, he was sent to the equator to measure a meridian arc, the results of which he published in 1748; followed this soon after with a treatise on the boundary between Spain and Portugal; was appointed commander of marine guards and inspector of harbors in 1753; published a treatise on ship-building (1761) and one on the state of astronomy (1773). His *Compendium of Navigation* appears under NAVIGATION, Vol. XVII, p. 250. He died in Madrid, June 21, 1773.

JUAREZ, formerly known as EL PASO DEL NORTE. A town of the state of Chihuahua, Mexico opposite El Paso, Texas. Its name originating from a pass used for many years by travelers. It is situated in northern Mexico, 280 miles S.S.W. of Santa Fé, and 215 miles N. of the city of Chihuahua, on the Rio Grande River, and on the Mexican Central railroad. The town is composed of a number of settlements, situated in a rich but narrow valley extending about ten miles along the right bank of the river; viticulture is a prominent industry of the locality, and large quantities of well-flavored wines and brandies are made, which are known to the traders as Pass wine and Pass brandy. The inhabitants are nearly all tinged with Indian blood. El Paso del Norte is the principal thoroughfare between New Mexico and the states of Chihuahua, Coahuila and Sonora. Population, about 8,000.

JUCH, EMMA, an American opera-singer; born in Vienna, of naturalized American parents, July 4, 1861. Attention was attracted to her strong soprano voice at an early age, and she studied for the operatic stage under Mme. Murio-Celli. She began her career by singing in concert under the management of her father and others. She at-

tracted the attention of Theodore Thomas during one of her tours, and by him she was engaged for one of his concert tours, and afterward for the Wagner festival concerts of 1884. In 1884 and 1885 was a member of Mapleson's Italian Opera Company, singing secondary *roles* under Patti and others; leading soprano of the American Opera Company in 1886; and afterward organized the Emma Juch Opera Company.

***JUDAISM AND THE JEWS IN THE UNITED STATES**—*Number.* Data are lacking to compute reliably the exact number of Jews in the United States. Owing to the peculiar character of Judaism and its organization in this country, no records are officially kept, and therefore available, from which the Jewish population of the United States might be determined accurately. It is, however, more than probable that at the present moment there are upward of a million Jews in this country. In 1880 an attempt was made, under the auspices of the Union of American Hebrew Congregations, to arrive at the exact figures. From the information then collected—which, however, was anything but complete—the number of Jewish inhabitants was estimated to be in the neighborhood of three hundred thousand. Since then the immigration of Russian Jewish refugees has landed from four to five hundred thousand more on these shores. This, with the natural increase during the 15 years elapsed since the attempted census, would make the million-mark probably a little below the true figures. The greater majority of the Jews are settled in the large cities; New York with upward of three hundred thousand, Chicago with sixty or seventy thousand, Philadelphia with fifty thousand, Baltimore, Boston, Louisville, Cleveland, San Francisco, Buffalo, Cincinnati and New Orleans with from ten to fifteen thousand each, having the bulk, and the smaller towns in New York, Pennsylvania, Ohio, Illinois and other states fully representing two hundred thousand more, it is clear that the Jewish population, on the whole, may be said to be urban. In rural districts Jews are settled in single families and smaller groups, and one is safe to believe that in the central and Western sections there is perhaps no county in which Jews are not located.

History. Jews had settled in America before the Revolution. In Newport, Rhode Island, as well as in New York, there existed, in colonial days, organized Jewish congregations, while in Philadelphia, in Savannah, and other Southern parts, a goodly number of families had founded their homes, whose members were among the most active and respected merchants of their respective towns. These were, almost without exception, descendants of Spanish Jews, the so-called Sephardim. They had drifted to the colonial ports from the West Indies, though direct immigration from the European continent (Holland more especially) also had furnished its quota of these early Jewish pioneers. After the War of independence and the establishment of the constitutional government, the character of the Jew-

ish population, or its location, for many decades did not materially change, nor did the number increase. Though the constitution of the United States guaranteed full liberty of conscience, in some of the states, Maryland and Rhode Island for instance, religious tests required by law operated to the disadvantage, politically, if not otherwise, of the Jews, and it was only after a long and protracted struggle that these disabilities were removed finally from the statute books, and became inoperative. The second period in the history of the Jews in this country may be said to begin about 1835, and to extend to 1880. It may be characterized as that of the advent of the German Jews. The unbearable oppression, by law and governmental administration, under which the Jews in Germany suffered induced, in the fourth and fifth decades of the century, the younger men, and shortly afterward the younger women, among the Bavarian Jews and others to seek a new home and a larger opportunity in the freer fields of America. At first, a few sturdy pioneers ventured on the experiments, and as they succeeded, others took courage to follow their example, and during the fifth and sixth decades the movement had assumed such proportions that in many former centers of Jewish population in Bavaria none remained except the old and feeble, and these, for the most part, were supported in comparative ease by remittances from their children in America.

It was during these years (1835-60) that the more prominent congregations were called into existence along the Atlantic border, as well as in the new towns along the Ohio, Missouri and Mississippi, or by the lakes. The immigration of German Jews, in contradistinction to the Spanish element so designated (Ashkenazim), has continued to the present day, though since 1880 its importance, for the character and development of Judaism, has dwindled almost to insignificance, in comparison with the influx of the Jews from the dominion of the Czar. In 1882 this "tidal wave of misery," this involuntary immigration, first struck our shores, and, with slightly varying intensity, has kept up, landing in the midst of us men, women and children, who, could they have consulted their own wishes, would never have dreamed of leaving Russia, their native land. As it is, no country of Europe but has contributed to a greater or smaller extent to the Jewish population of the United States. The German immigration embraced natives of Holland, France and England, no less than of Germany, Austria and Hungary, and even Poland. By Russian Jews, however, although belonging, also, to the class of the Ashkenazim as distinguished from the Sephardim, as a technical term, are denoted the unfortunate victims of the policy of persecution inaugurated by Alexander III, Czar of all the Russias. It goes without saying, that a new type of Jews is developing rapidly in the United States, which, for good reason, may be said to be distinct from the three so far mentioned, though their combined product as such has the right to

its own name, the American Jew. The Sephardic Jew of the colonial days has disappeared almost entirely. A few congregations, steadily declining in the number of their membership, alone hold together those of their descendants who have not been absorbed in consequence of intermarriage and conversion by Christianity. The German Jew it was who has impressed his stamp upon the synagogue of America, and decided its policy as well as the social proclivities of its members. But now, by death, he is disappearing gradually before his own son and grandson, the American Jew; while, on the other hand, the massed influx of Russian Jews has been attended with peculiar difficulties and produced new problems, the effect of which upon the Jew and Judaism in America at this moment is withdrawn from all calculations.

Religious Condition. The Jews of America, as far as they belong to congregations, are divided into three parties: the Orthodox, the Conservative, and the Radical or Reformed. As state and church are divorced absolutely in the United States, membership in congregations is entirely voluntary. With the exception of the Russian Jews, among whom the very reverse is the case, not more than one half of the (non-Russian) Jews in America are members of congregations. In the smaller country towns the lack of numbers sufficient to support a religious establishment accounts for this circumstance. In the large cities the proportion of those who affiliate with congregations and contribute towards their maintenance, to those that do not, is about one to two, while in the medium-sized cities social pressure is, as a rule, such that almost every Jewish householder is induced to join the local congregational institutions. The polity of the Jewish religious organizations in the United States is strictly congregational; that is to say, every congregation is absolutely autonomous, regulating both its fiscal and religious affairs as best it seems to its members. There is no central religious authority, either synod or conference, or general assembly, exercising control over the individual congregations or their members. The congregations are chartered institutions under the laws of the respective states. At their head generally is a board of directors or trustees, with a president and the other customary executive officers, elected by the members in general meeting for a term of years in accordance with their constitution and by-laws. This board of directors has charge of the financial affairs of the society; the religious matters are in the hands of a rabbi, who is amenable to no higher ecclesiastical body, but is to a certain extent under the control of his board of trustees and his own members. The rabbi, by virtue of his office, has no ecclesiastical power. His influence with his people depends upon his scholarship and ability; it is altogether of a moral kind. In older congregations, the settlement of the rabbi was made for life; in recent years, the practice has become general to elect the rabbi only for a stated term of years. These terms vary in the different

congregations. While in some the rule is to fix the term at ten years, in others the habit has been to have annual elections; on the whole, however, contracts between rabbi and congregations are drawn to cover a five-years' service. The rabbi is expected to have received a thorough education both in Hebrew theology and in the academic branches taught in a good university. As a rule, this requirement is more than fulfilled, though if the congregations should choose to forego any or all of the usual attainments of an aspirant to rabbinical dignity, there is no authority to prevent the execution of their desire, or annul the election to office of a man not properly prepared.

Various attempts have been made to bring about a closer union between the different congregations for the purposes of co-operation in matters vital to all. The earliest movement in this direction resulted, in 1857, during the excitement created by the Mortara affair, in the creation of a board of delegates, chosen by the congregations, to take cognizance of cases of persecution and to enlist the good offices of the United States government in behalf of the oppressed Jews; furthermore, to see to it that the United States government refuse to make treaties with other powers that insisted upon placing the American citizens of the Jewish faith upon a level other and lower than that accorded the citizen of the Christian or no religion (Russia for instance). This board of delegates accomplished but little; it was largely recruited from the ranks of the Orthodox and Conservative, and was looked upon with suspicion by the Reform wing. It was merged, in 1878, into the Union of Hebrew Congregations. This was a creation originally of the Western and Southern Reform congregations, under the leadership of the Cincinnati rabbis, I. M. Wise and Max Lillenthal. It was formed in 1872, and from the start had to meet the opposition of the Orthodox, and the distrust, more or less well justified, of the larger Reform congregations and their rabbis in New York, Philadelphia, Chicago and elsewhere. But in 1878 this reluctance to enter into the Union, on the part of the Eastern societies, was to a large extent overcome, and in 1896 the Union counted 125 congregations, representing every state of the Union. Most of the Reform congregations are members, though not all; the Conservative and Orthodox have kept aloof. The object of the Union, which disclaims any intention to interfere with the autonomy of the component congregations, is to bring about a heartier co-operation for the common good. The central seat of the Union is at Cincinnati. Practically, the Union has accomplished only the founding and maintaining of the Hebrew Union College (1875) in Cincinnati, for the purpose of training rabbis. Officially, the college claims to belong to no religious party, but as the majority of the graduates (since 1883, when the first class of four American rabbis was graduated) have been of the Reform school, the college is looked upon with distrust by the Orthodox, who, to counteract the

growing influence of the Cincinnati men, founded in the city of New York in 1887 the Jewish Theological Seminary. Besides these two seminaries, the University of Chicago and Columbia College, and recently the Johns Hopkins University at Baltimore, in organizing rabbinical departments, have offered facilities for students preparing for the Jewish ministry. Before 1883, almost all the pulpits were filled by foreigners or Americans who had pursued their theological studies at European rabbinical seminaries and universities.

Nor have the attempts been wanting to bring the rabbis into closer touch with each other. In 1877, the Rabbinical Literary Association was founded, but after a precarious existence of only a few years, it died with the death of its founder, Dr. M. Lillenthal. The Ministers' Association, which was the creation of Dr. G. Gottheil of New York, shared the fate of its predecessor. But, in 1891, Dr. I. M. Wise, rabbi of Cincinnati, and president of the Hebrew Union College, with better success called into existence the Central Conference of American Rabbis. This is no legislative body. It is deliberative. One of its results is the preparation of the *Union Prayer-Book*, intended to unify the ritual of the various (Reform) congregations. The conference counts 105 rabbis as members, and its prayer-book has been adopted by seventy congregations. In some cities, New York and Chicago for instance, the local rabbis have formed among themselves rabbinical associations for study and counsel.

The words Orthodox, Conservative, Reform and Radical, in conjunction with Jewish belief, have a somewhat different bearing than in their usual acceptation. The pivotal point of difference between these schools is the problem of the destiny of the Jews. The Orthodox maintain that the Jews will ultimately return to Palestine, and become, under the rule of a personal Messiah of the house of David, again a priestly theocracy, with the Pentateuch as its constitution. Hence they insist upon maintaining all barriers between the Jew and the non-Jew, observing strictly the ritualism and Orientalism of the rabbinical codes,—the "revealed law," as contained in the Pentateuch and the Talmud; they pray in Hebrew exclusively, and regulate, without compromise, their life by the "law of God," the Bible and the rabbinical writings. Most of the Russian Jews belong to this school, as do, also, at least in theory, the few Spanish synagogues still in existence. The other schools reject the belief in the Palestinian destiny of Judaism. In accordance with the position taken by the German rabbis fifty years ago, they hold that Judaism is ethical monotheism, for the exemplifying of which Israel was called, and in the wisdom of Providence sent out into the world to teach God's unity, by lives devoted to all that is good, true and noble. Not a personal Messiah, nor a restoration to Palestine, is the expectation of the Jew, but the advent of a Messianic time when justice will be established, and thus God will be served in truth among all

men, in all climes and countries. These fundamental doctrines of modern Judaism were transplanted to America by great German rabbis—Einhorn, Samuel Adler, Samuel Hirsch and others—and American Judaism accepted them without reserve. The Conservative school would retain as much as possible of the old rites, the Hebrew language in the synagogue, and in the religious practices in the home. The Reform school is ready to reduce Oriental symbolism in life and liturgy to a minimum. The Radical would give the synagogue, without equivocation, a modern aspect. As the traditional Sabbath is not observed, and cannot be observed, in America by the Jews, the Radical has no scruples to open his temple on Sunday, that the civil day of rest might gradually assume for the modern Jews a religious sanction and character. Numerically speaking, the Reform synagogues are in the majority, Conservatism is clearly losing ground, while Radicalism is as yet a pioneer venture, supported by only a few rabbis and congregations. The ethical culture societies, in essence but little distinct from Jewish radical congregations and their teachings, are largely supported by the Jews. Their leader and originator, Professor Felix Adler, is an American Jew, and received his education at a German rabbinical high-school.

Philanthropies. The charities of the American Jews are intercongregational, all congregations contributing to their support and having a share in their administration. Jewish relief societies, hospitals (without religious, racial or other restrictions in the conditions of admission of patients), old people's homes, orphan asylums, schools for manual training, crèches, working-rooms and other agencies for the uplifting of the poor and the prevention of pauperism are found in all large cities of the Union. They are well supported, and, almost without exception, well organized. To meet the emergencies of the Russian immigration, temporary and permanent organizations were called into existence, looking to the Americanizing, in the best sense of the term, of these hapless refugees. Colonization schemes were carried out, with a view to settling some of them on farms. The trustees of the Baron de Hirsch fund in New York have done much in this direction, and the National School of Farming, created by Dr. Krauskopf of Philadelphia, is another enterprise auguring well for the future.

Fraternities. The Independent Order of B'nai-B'rith, founded in New York in 1843, is the parent of many secret orders among the Jews. Its object is to bring Jews into a closer fellowship, regardless of party or position, on the basis of humanity and love, and for practical philanthropy. Many of the benevolent institutions of the Jews in the United States owe their first impulse to this order, which now counts a membership of twenty-five thousand brothers, and covers seven grand lodge districts in the Union, and three more in Europe and Asia-Africa. It has disbursed over fifteen millions for charity. Patterned after

this order of B'nai-B'rith are younger fraternities, such as the Independent Order of Free Sons of Israel, Keshet Shel Barzel, Sons of Abraham, and Sons of Benjamin. The National Council of Jewish Women resulted from the Jewish Women's Congress in Chicago in 1893, at the Fair. It has sections in every city and town. Its object is to diffuse religious knowledge among the women, and enlist their co-operation in behalf of philanthropy and religion. The Jewish Publication Society, founded in Philadelphia in 1888, intends to promote Jewish literature in the English language. Its membership is recruited from all classes and sections. The Jewish Historical Society is also a young claimant for honors, devoted, as it is, to the study of the history of the Jews in the United States and America.

Socially, the Jews, to no great extent, have succeeded in removing the barriers between their non-Jewish neighbors and themselves. Because often excluded from the clubs of their non-Jewish fellow-citizens, they have been forced to maintain clubs of their own.

Politically, the Jews are divided. There is no solid Jewish vote. Most of the Jews have no political aspirations; they are loyal citizens, some of whom have held high office and many of whom have served in the army and navy. During the War of the Rebellion more than eight thousand were enlisted in the North, and that, too, when the Jewish population of the Northern states could not have been much over one hundred thousand souls. They are staunch friends of the public schools, and believers in higher education. They are found in all professions and in every line of trade. They do not burden the public institutions; their percentage of the convict population is less than their numbers would lead one to expect. They have their share of the burdens of pauperism, crime and human folly; but theirs is below the average. On the whole, the American Jews have been among the least dangerous and the most loyal of the many components of American civilization. See also ISRAEL, Vol. XIII, pp. 396 et seq.; and JEWS, Vol. XIII, p. 679.

EMIL G. HIRSCH.

JUDD, JOHN W., a British geologist; born at Portsmouth, England, Feb. 18, 1840. He became interested in mining, and studied at the Royal School of Mines; then accepted a position as analytical chemist in some iron-works at Sheffield, but became interested in geology, to which, later, he gave his attention. Beginning in 1867, he spent four years working out the relation existing between Jurassic rocks of the midland district and those of the northern and southern areas of England. In the Highlands of Scotland he did some important work on the Triassic and Jurassic rocks, besides making some new discoveries. He also investigated the Tertiary volcanoes in Scotland. He was elected a fellow of the Royal Society in 1877; appointed professor of geology in the Royal School of Mines in the same year, and in 1891 accepted the same posi-

tion in the College of Science. He was president of the Geological Society in 1886 and 1887, and in 1891 received their highest gift, the Wollaston medal.

JUDD, ORANGE, an American editor; born near Niagara Falls, New York, July 26, 1822. He was educated at Wesleyan University, Middletown, Connecticut, and after teaching three years took up the study of agricultural chemistry at Yale in 1850. In 1856 he became editor and publisher of the *American Agriculturist*; was also agricultural editor of the *New York Times* from 1855 to 1863; served on the Gettysburg Sanitary Commission (1863), and accompanied the army of the Potomac during the remainder of the Civil War. He was one of the projectors of the present system of railroads in Long Island. He originated a Sunday school lesson-leaf, on which is founded the *International Lesson-leaf*. In 1857 he introduced sorghum-cultivation from Europe; gave to Wesleyan University the Orange Judd Hall of Natural Sciences. Business reverses compelled him to retire from the *American Agriculturist*, and he then went to Chicago, where he founded the *Orange Judd Farmer*. Died in Chicago, Dec. 27, 1892.

JUDD, SYLVESTER. See AMERICAN LITERATURE, Vol. I, p. 727.

JUDGE, WILLIAM QUAN, an American theosophical leader; born in Dublin, Ireland, April 13, 1851; emigrated to the United States with his father in 1864, and became a law clerk; was admitted to the bar in New York (1872); became a member of the law firm of Olcott, Gonzales and Judge, and afterward opened an office of his own, practicing law until 1880; founded, with Mme. H. P. Blavatsky and Col. H. S. Olcott, the Theosophical Society of America, in 1875, becoming its

WILLIAM Q. JUDGE.

first secretary. In 1883 Mr. Judge reorganized the society and established the Aryan Theosophical Society as the local branch, with branches in other cities, the objects being to promote the study of Aryan and other Eastern literatures, religions, sciences, and "to investigate unexplained laws of nature and the physical laws of man." In 1895 there was a secession from the parent society, and Mr. Judge became president of the new organization. He at once began active work to widen the scope and membership of the American society, but failing health compelled him to stop. He died in New York City, March 21, 1896.

JUDGE-ADVOCATE, an officer of a court-martial, whose duty it is to prosecute an offender in the name of the United States before courts-martial. He must also see that the accused is fairly tried, that the witnesses are not asked leading questions, and that the prisoner shall make a proper plea. He shall also swear the members of the court before proceeding with the trial. See also ADMIRALTY,

Vol. I, p. 161; ARMY, Vol. II, p. 587; and COURT-MARTIAL, Vol. VI, p. 518.

JUDGMENT, the decision or sentence of a court of justice given after a hearing of the facts urged by the parties in interest, or after default, as the result of legal proceedings instituted for the redress of a wrong. To be valid, a judgment must be rendered by a court of competent jurisdiction, at a time and place appointed by law, and in accordance with established and proper forms. A judgment must be confined to the actual issue before the court. A final judgment is conclusive upon all the parties as to the issues directly determined by such judgment, except judgments of non suit, and other similar forms of judgment which do not undertake to decide the questions at issue, and except when called in question by appeal to a higher court or other legal method. A void judgment, however, as where the court had no jurisdiction over the parties or the subject-matter of the controversy, may be disregarded, and binds no one. But a judgment, where the court has jurisdiction is absolute in its effect, unless taken to a higher court for review, and cannot be questioned in a collateral proceeding, except in some cases when procured by fraud. Judgments may usually be set aside by the court which rendered them, at any time during the term of court at which they were rendered. Judgments of foreign courts, when properly proven, will generally receive full credit and force. The judgment of a court in one state must be enforced by the courts of other states, under the Federal constitution. See also JUDGMENT, Vol. XIII, p. 764.

JUDGMENT. See LOGIC, Vol. XIV, pp. 788, 797; ANALYTICAL JUDGMENTS, Vol. I, p. 797; and PSYCHOLOGY, Vol. XX, pp. 78-80.

JUDICIAL NOTICE, that notice which courts will take, by reason of their functions and duties, of certain facts and laws with which the law will presume them to be familiar. All such facts may be alleged before the court without offering evidence of their existence, and the judges may refer to books and documents, for their satisfaction, as to such facts or laws. The matters of which courts may generally take judicial notice are such as the laws of the land, the title, flag and seal of recognized foreign powers, public proclamations, the territorial extent of their government, legal weights and measures, abbreviations which are of universal use, and other matters of a similar character.

JUDICIARY. See UNITED STATES, Vol. XXIII, pp. 749, 750.

JUDSON, EDWARD Z. C., an American writer of stories; born in Philadelphia in 1822; known as Ned "Buntline." He served in the United States navy, and during the Civil War was chief of scouts among the Indians, seeing much hard service. He began his story-writing in 1837, in contributions to the *Knickerbocker Magazine*; in 1848, started *Ned Buntline's Own*, a story-paper; was imprisoned in 1849 for seditious writings which appeared in his paper. After his release he began a series of stories from which he is said to have derived a large income. Among these are *The Demon of Fire* (1863); *Life in the Saddle* (1865); *The Sea Bandit* (1870);

and *Wrestling Joe* (1881). He died at Stamford, New York, July 16, 1886.

JUGGLERY. See **LEGERDEMAIN**, Vol. XIV, pp. 414, 415.

JULIA, daughter of Augustus, Emperor of Rome; born 39 B.C. She was one of the most licentious women of her day; married three times, her last husband being Tiberius Nero, whom she married 12 B.C. On account of her profligacy her marriage was dissolved, and her father banished her, in 2 B.C., to Pandataria, an island on the coast of Campania, and later to Rhegium. Augustus, on his death, bequeathed her no legacy, and forbade her ashes to be laid in his mausoleum. Tiberius, when he became emperor in A.D. 14, deprived her of all luxuries. She died the same year.

JULIDÆ. See **MYRIAPODA**, Vol. XVII, p. 118.

JULLUNDUR. See **JALANDHAR**, Vol. XIII, p. 545.

JUMPING-HARE. See **JERBOA**, Vol. XIII, p. 626.

JUNCTION CITY, a city and the capital of Geary County, northwestern central Kansas, finely situated between the Smoky Hill and Republican rivers, at the junction of the Union Pacific and the Missouri Pacific railroads. Its manufactures are various and in a thriving condition, of which the most important are those of agricultural tools, flour, furniture and carriages. It quarries much good building-limestone. Population 1900, 4,695.

JUNEAU, a village of southeastern Alaska, at the mouth of the Taku River, in lat. 58° 20' N., long. 134° 30' W. It is the port of a mining district which produces silver and gold. The metals can only be mined during the summer months, on account of the severity of the climate. There is a steamer line between here and San Francisco. Pop. 1890, 1,253; 1898, about 3,000.

JUNE-BERRY, a name given to the berry-like fruit of *Amelanchier Canadensis*, a genus of *Rosacea*. It is a shrub or small tree, whose white blossoms appear in early spring, followed by purplish, edible, berry-like fruits. It is more commonly called service-berry, and in New England shad-bush.

JUNE BUG (*Lachmosterna fusca*), the popular name applied to a species of beetle, frequenting lighted rooms in May and June. They also swarm in trees and shrubs, sometimes completely denuding them of their foliage. The insect is an inch long, with long, slender legs and sharp claws, by which it can hold to the foliage. It is of a dark chestnut color, and finely dotted.

Soon after pairing, the female bug deposits from forty to fifty eggs in the ground, and dies. The eggs hatch in a month. The young grubs subsist on small roots for two years, cutting them off below the surface and killing the plant. This happens to Indian corn, grass, tender lettuce in the garden, strawberries, potatoes and all kinds of flowering plants. When two years old, this grub is as large as one's little finger. It is soft, dirty white, and has a mahogany-colored head. It is usually found with its body curved in a semicircle, though it can straighten itself out and crawl slowly. In the third year the June bugs form an egg-shaped chamber by sticking particles of earth together with an adhesive

fluid. In this they pass their pupa state. In June of the same year the change into the perfect beetle is completed. An insect related to the June bug is known in England as cockchafer (see Vol. VI, p. 131) and in France as hanneton. The French government has offered a prize for an efficient means for their destruction.

JUNGERMANNIÆ. See **MUSCINÆÆ**, Vol. XVII, pp. 68, 69.

JUNGFRAU ("the maiden"), a mountain in central Switzerland, the highest of the Bernese Alps, having an altitude of 13,670 feet. Its summit is covered with perpetual snow, and this fact, and its beauty of outline, make it one of the most magnificent mountains in the world. It was first ascended in 1811, by the Meyer brothers of Aarau. A railroad up the mountain has been commenced.

JUNGHUHN, **FRANZ WILHELM**, a German naturalist; born at Mansfeld, Prussian Saxony, Oct. 26, 1812. After 1835 he served as a physician in the Dutch colonies of Java, where he studied the ethnological, geographical, geological and botanical relations of the country. He published *Java, Seine Gestalt, Pflanzendecke und Innere Bauart* (1852); *Die Battaländer auf Sumatra* (1847); *Landschaftsansichten von Java* (1853); and other works. He died in Simbang, April 20, 1864.

JUNGLE-GHAU (*Bos sylhetanus*), a species of ox inhabiting Sylhet and other mountainous parts of the northeast of India. It is nearly allied to the common ox, and is easily domesticated.

JUNGMANN, **JOSEPH.** See **SLAVS**, Vol. XXII, p. 152.

JUNIATA, a river of Pennsylvania, rising in northern Bedford County, and flowing generally east, and entering the Susquehanna, 17 miles above Harrisburg. It is about 150 miles in length, unnavigable, very tortuous and the most picturesque stream in the state. The Pennsylvania canal and railroad follow it through its whole extent.

JUNIN, a department and lake of central Peru. The department is very mountainous, being traversed by the Andes in its eastern part. It is drained by numerous streams, the largest being the Jauja, the Perene, the Apuparo and the Pachita rivers. Junin is rich in metals, chief of which is silver, but gold, copper, quicksilver and other metals are abundant. The region is very damp and warm, and in the western part is covered with heavy forests, which are frequented only by uncivilized Indians and cinchona and rubber-gatherers. Lake Junin, or Lake Chinchay-Cocha, lies in lat. 76° W., 13,000 feet above the sea-level, is 36 miles long and seven broad. Its marshy banks are overgrown with reeds, and inhabited by numerous water-fowl, and it abounds in fishes. Its outlet is the Jauja River. Near this lake was fought the battle of Junin. See also **PERU**, Vol. XVIII, p. 678.

JUNK, a Chinese vessel, often of large dimensions, which, although clumsy and admitting of little seamanship or speed, has proven seaworthy on voyages extending even to America and Europe. It has a high fore-castle and poop, and ordinarily three masts.—**JUNK** is also a popular term for the salt meat supplied to vessels for long voyages.

JUNK CEYLON OR SALANGA. See MALAY PENINSULA, Vol. XV, p. 321.

JUNKER, WILHELM, a Russo-German traveler; born April 18, 1840, of German parents resident in Moscow; studied medicine in Göttingen, Berlin, and Prague. Proceeding to Africa in 1874, in the first instance to Tunis and Egypt, he, in 1876-78 carefully explored the Makaraka country. After spending some time in Kabayendi itself, he made Khartum the center from which he traveled on various excursions, returning to Europe in 1887. A friend of Gordon and of Stanley, Dr. Junker held a high place among those who have thrown light on "darkest Africa." His *Reisen in Africa* was translated by A. H. Keane in 1890. Died in St. Petersburg, Feb. 13, 1892.

JUNKIN, GEORGE, an American clergyman and educator; born near New Kingston, Pennsylvania, Nov. 1, 1790. In 1819 he was made pastor of the Associate Reformed Church at Milton, Pennsylvania, with the majority of whose members, in 1822, he entered the Presbyterian Church. In 1830 he founded a manual labor school at Germantown, and in 1832 became president of Lafayette College, which he had assisted in founding. From 1841 to 1844 he was president of Miami University; then, again, of Lafayette College; and from 1848 to 1861 of Washington College, Lexington, Virginia; but resigned at the beginning of the war, and went to Philadelphia, where he resided until his death. Among his publications are *Lectures on the Prophecies* (1844); *Two Commissions, the Apostolic and Evangelical* (1864); and *Political Fallacies* (1862). He died May 20, 1868.

JUPATI PALM, a name given to *Raphia tedi-gera*, one of the pinnate-leaved Brazilian palms, having some economic value. It abounds in the valley of the lower Amazon. The trunk is about ten feet in height, but the long pinnate leaves borne at its crown often attain four times the length of the trunk. The pith of these enormous leaves is used as a substitute for cork.

JUPITER, a planet. See ASTRONOMY, Vol. II, pp. 808-811; and in these Supplements.

JURASSIC PERIOD. See GEOLOGY, Vol. X, pp. 354-357.

JURIEN DE LA GRAVIÈRE, JEAN BAPTISTE EDMOND, a French naval officer; born at Brest, France, Nov. 19, 1812. He entered the navy in 1828; served in the Chinese and Crimean wars as a captain; in 1855 was made rear-admiral and placed at the head of the Asiatic squadron; in 1861 adjusted the treaty of Soledad between Mexico and the triple alliance of England, Spain and France, which was repudiated by Napoleon III. He became aide-de-camp to the Emperor and had command of the Mediterranean squadron. In 1870 he took part in the defense of Paris; after the war, was director of maps and charts in the Naval Office; and was chosen a member of the French Academy in 1888. In 1865 he was made a grand officer of the Legion of Honor, and received the grand cross in 1876. Among his writings are *Voyage en Chine* (1854); *Guerres Maritimes sous la République et sous l'Empire* (1847); *Souvenirs d'un Amiral* (1860); *Doria et*

Barberousse (1886); and *L'Amiral Roussin* (1889). He died in Paris, March 5, 1892.

JURISDICTION, the power or authority to hear and determine a cause by which judicial officers take cognizance of and decide controversies. Personal jurisdiction is that obtained by the appearance of the party before the tribunal or by service of legal process upon him. Territorial jurisdiction refers to the territorial limits within which a court is authorized to act. Jurisdiction of the cause refers to the power of the court to exercise its authority over the subject-matter in dispute. Personal jurisdiction may usually be conferred by consent of the parties, but territorial jurisdiction of the cause is conferred by law and cannot be given by consent.

JURISPRUDENCE. See LAW, Vol. XIV, pp. 354-367.

JURISPRUDENCE, MEDICAL. See MEDICAL JURISPRUDENCE, Vol. XV, p. 778.

JURUÁ OR YURUA, a river of Brazil rising in the Andes Conomamas, western Peru; it flows north-east, and enters the Amazon in long. 65° 44' W. It is 1,100 miles in length, and flows through low lands matted with forests, which are only frequented by Indians and rubber-gatherers. It is navigable for about 564 miles.

JUS CIVILE. See ROMAN LAW, Vol. XX, pp. 678, 695.

JUS EMPHYTEUTICUM OR EMPHYTEUSIS. See ENTAIL, Vol. VIII, p. 451.

JUS GENTIUM. See ROMAN LAW, Vol. XX, pp. 695-702.

JUS NATURALE. See ROMAN LAW, Vol. XX, pp. 703-710.

JUSSERAND, JEAN JULES, a French scholar and diplomat; born at Lyons, France, Feb. 18, 1855. He received the degree of doctor of *belles lettres* from the faculty of Lyons, 1878. After that he was employed continually in the diplomatic services at one post or another. He became an officer of the Legion of Honor in 1892. His literary studies were mostly in English literature, and he wrote *Le Théâtre en Angleterre depuis le Conquête jusqu'aux Prédécesseurs Immédiats de Shakespeare* (1878); *Les Anglais au Moyen Âge; la Vie Nomade et les Routes d'Angleterre au XIV^e Siècle* (1884); *A French Ambassador at the Court of Charles II* (1890); *L'Épopée Mystique de William Langland* (1893).

JUSTE, THÉODORE, a Belgian historian; born in Brussels, Jan. 11, 1818. After finishing his education the Minister of the Interior employed him, and soon afterward he became secretary of the board for public instruction. In 1858 he became custodian of the royal museum of antiquities at Brussels, and in 1870 he was appointed professor of history in the military school. Among his works are *Histoire de la Révolution Belge de 1790* (1846); *Guillaume le Taciturne* (1873); *Léopold I et Léopold II, Rois des Belges* (1878); *La Révolution de Juillet, 1830* (1883). He died in August, 1888.

JUSTIFICATION, a dogma of Christian theology which emerged out of the unformulated material of Scripture at the time and in consequence of the Reformation. Its New Testament basis is in the Pauline writings, and particularly in the Epistles

to the Galatians and the Romans. Luther came to his spiritual liberty through a long familiarity with mediæval ceremony and forensic formulas, and, against all modes of obtaining divine pardon, whether absolution, masses, indulgences or other application of the power of the keys, he raised the cry of "justification by faith," and declared it to be the article "of a standing or falling church." His views were formulated in the Augsburg Confession, which declares that "men cannot be justified before God by their own powers, merits or works, but are justified freely for Christ's sake through faith." Such a declaration was an axe laid at the root of the whole mediæval system of salvation by sacraments, or any other form of priestly intervention. The free act of God proceeding through the faith of the believer left no place for the binding and loosing of sins by sacerdotal function. Justification by faith meant religious liberty to those who first heard the doctrine proclaimed.

The Lutheran conception, however, of justification was formal and forensic. It was a state in which the soul was placed by act of divine grace, and in strict form it did not involve renewed character in the pardoned. As a fact, all Protestants taught and teach that justification is concomitant with renewal, and is the beginning of a progressive sanctification. But they insist with emphasis that the free and sovereign act of divine grace must not be confounded with the regenerating influences of the Holy Ghost. The two are interwoven, but not the same. The formalism of this conception is all the greater because associated with a dogma of imputation. The ground of man's justification is the merit of Christ freely imputed to him who believes. As Calvin states, the doctrine justification "consists in the remission of sins and the imputation of the

righteousness of Christ." No Protestant formularies vary from this forensic view of the dogma. All would accept the definition of Dr. G. P. Fisher, of Yale: "Justification is thus a forensic term; it is equivalent to the remission of sins. To justify signifies not to make the offender righteous, but to treat him as if he were righteous, to deliver him from the accusation of the law by the bestowal of a pardon."

The Roman Catholic church has put more of a moral content into its doctrine of jurisdiction, and does not define it in purely formal or forensic terms. It was formulated in 1547, at the Council of Trent, in a treatise of sixteen chapters, and was a new question forced upon the attention of the council by the emphasis given to it among the reformers. With this formulary, justification is rather a process than a condition. It follows upon the reception of truth and renewing grace. "This disposition or preparation is followed by justification itself," says the *Catholic Dictionary*, "which justification consists, not in the mere remission of sins, but in the sanctification and reward of the inner man by the voluntary reception of [God's] grace and gifts, whence a man becomes just instead of unjust, a friend instead of a foe, and so an heir according to hope of eternal life."

JUTAHÍ, a river of the province of Amazonas, Brazil; rises in the southwestern part, and flows N.E. to the Amazon, which it joins near long. 67° 47' W. It is about 450 miles long, and for the most part unexplored.

KADESH. See ISRAEL, Vol. XIII, pp. 396, 397.

KADIAK, an island of southern Alaska, parallel with Alaska Peninsula and just to the east of it, lat. 58° N., long. 153° W. It is about one hundred miles long and sixty wide, and has an area of 5,000 square miles. It is very rugged, and cut by innumerable inlets; is foggy and rainy, the snow not lying long. On it are ten salmon-canneries, which give employment to over eleven hundred hands, and which are supplied almost entirely from fish caught in the Karluk River (in 1880 over three millions). Its largest village is St. Paul, on the northeast coast, which ships annually furs to the value of nearly \$300,000.

KAFFA, Crimean town. See THEODOSIA, Vol. XXIII, p. 257.

KAGIE. See SUN BITTERN, Vol. XXII, p. 653.

KAGOSHIMA, a town and the capital of the prefecture of Kagoshima, southern Japan, opposite the volcanic island of Lakura, one of the oldest cities of Japan. It was bombarded on Aug. 15, 1863, by a British squadron, and the palace of the daimio and other important buildings were destroyed. It has manufactories of pottery, especially of an imitation of old Satsuma-ware, for which it is celebrated. Population, 1898, 53,481.

KAHAU OR BLANDA, the native name of the proboscis monkey (*Semnopithecus nasalis*). This monkey has a pendent nose about three inches long. The general color of the animal is reddish brown. It is a native of Borneo. Several species of the genus are common in the East Indies.

KAHOKA, a city and the capital of Clarke County, northeastern Missouri, on the Keokuk and Western railroad, 19 miles W. of Keokuk, Iowa. It is situated in a fertile prairie region, which produces grains, butter, hay and pork, principally. It has wagon and plow factories, grain-elevators and a canning factory. Pop. 1890, 1,425; 1900, 1,818.

KAIETEUR, cataract. See GUIANA, Vol. XI, p. 250.

KAILAS GANGRI, a mountain 21,830 feet high. See HIMALAYA, Vol. XI, pp. 834, 835.

KAISER WILHELM OR NORTH SEACANAL. See CANAL, in these Supplements.

KAISER WILHELM LAND, the name of the German portion of New Guinea, together with the islands of New Mecklenburg (New Ireland) and New Pommern (New Britain).

KAKODYLE. See METHVL, Vol. XVI, p. 197.

KALABAGH MOUNTAINS OR SALT RANGE. See PUNJAB, Vol. XX, p. 108.

KALAHARA, a desert of South Africa, lying between the Orange and Zambezi rivers, mostly in Bechuanaland. In general it has many characteristics of the Sahara, but parts of it are periodically covered with vegetation, and resemble steppes rather than desert country. It consists of a large, sandy plateau of recent geological limestone formation, from 3,300 to 5,000 feet above sea-level, and it has numerous salt-pans, which show the existence of former lakes. All the rivers are periodic except the Okavargo, which flows into Lake Ngami, though even this river is supplied from the northwestern regions, beyond the limits of the desert. In summer the temperature is very high and in winter moderately cold. Its inhabitants, chiefly Bushmen, are scattered and few, but near Lake Ngami are permanent settlements of some size. The estimated area is 350,000 square miles. Population, 50,000.

KALAKAUA, DAVID, a king of the Sandwich or Hawaiian Islands; born at Honolulu, Nov. 16, 1836. He was chosen king to succeed Lunailio (1874), by a legislature especially convened for the purpose; but the validity of this election was contested by Queen Emma, widow of Kamehameha IV, who died in 1863, and several outbreaks in her interests followed. In November, 1874, he made an extended visit to the United States, returning in 1891 for the benefit of his health. The irregularities of his later years, however, had irreparably impaired his constitution. He died in San Francisco, Jan. 20, 1891. He was a progressive and strong ruler till near the close of his life, and did much to advance his country.

KALAMAZOO, a city, and the capital of Kalamazoo County, southwestern Michigan. It is situated on the Kalamazoo River, and the Michigan Central and the Grand Rapids and Indiana and the Chicago, Kalamazoo and Southern and the Lake Shore and Michigan Southern railroads. The town is noted for its beautiful streets and public places, and for its excellent institutions. It has various musical academies, an art gallery and public library, water-works and electric and gaslights. Population 1890, 17,853; in 1900, 24,404. See also KALAMAZOO, Vol. XIII, p. 826.

KALAMAZOO, a river of southwestern Michigan, rising in Hillsdale County and flowing west-northwest past Kalamazoo City into Lake Michigan at lat. 42° 40' N. It is navigable for 25 miles, as far as Allegan. It is 200 miles long.

KALB, JOHN, a French-American Revolutionary general; born in Germany, July 29, 1721. His father was a peasant; the "de" prefixed to his name is unauthorized, and he was no baron. In 1743 he became lieutenant in the French army; in 1747 rose to the rank of brigadier-general, and later took part

in the Seven Years' War. In 1768 he visited the American Colonies on behalf of the French government, and made an engagement with Benjamin Franklin and Silas Deane to take a command in the Continental army. On June 3, 1777, in company with LaFayette, he arrived in the bay of Georgetown, and was promptly appointed by Congress a major-general. He was with the army at Valley Forge, and served in New Jersey and Maryland until April, 1780. In Carolina General Kalb was appointed to command the Delaware and Maryland troops, and there united his forces with those of General Gates. At the battle of Camden, Aug. 16, 1780, Kalb commanded the American right, which was surrounded. Dismounted and bareheaded, he had a number of hand-to-hand encounters, and fell pierced by eleven wounds, from which he died three days afterward. A monument was erected to his memory in 1825 by the people of Camden, and on Aug. 16, 1886, a statue was placed in front of the court-house of Annapolis, Maryland.

KALE. See **CABBAGE**, Vol. IV, pp. 617, 618; and **HORTICULTURE**, Vol. XII, p. 279.

KALEVALA. See **FINLAND**, Vol. IX, pp. 219, 220.

KALEVIPOEG, the national poem of the Esthoni-ans, made up of popular songs, which Kreutzwald, imitating the Kalevala, threw into the form of an epic in 1857-59. It is difficult to tell what part of the collection rests upon tradition and what part on the imagination of Kreutzwald, as he destroyed his manuscript materials after writing the poem. Its chief importance lies in the fact that it throws light upon some difficult questions concerning the Kalevala. See **ESTHONIA**, Vol. VIII, p. 562.

KALISCH, DAVID, a German humorist; born at Breslau, Feb. 23, 1820. As a young man he was in Paris as correspondent of German newspapers. Returning to Germany in 1846, he became a contributor to the *Charivari*, a humorous paper published in Leipsic. But in 1848 he founded the *Kladderadatsch*, a similar paper, published at Berlin, which became a factor in German politics. He also published some humorous plays, such as *Hunderttausend Thaler*; *Peschke*; *Berlin, Wie es Weint und Lacht*; *Einr von Unsere Leut'*. He died in Berlin, Aug. 21, 1872.

KALISCH, MARCUS, a German theologian; born at Treptow, Prussia, May 16, 1828, of Jewish parents. After being educated both at the Berlin University and the Rabbinical College, he became embroiled in the political troubles of 1848 and went to England, where he was secretary to the chief rabbi. Subsequently, he wrote *A Historical and Critical Commentary on the Old Testament, Exodus, Genesis, Leviticus* (4 vols., 1855-72); *The Prophecies of Balaam* (1877); and *The Book of Jonah* (1878). He also published a Hebrew grammar. He died at Rowsley, England, Aug. 23, 1885.

KA' -YUGA OR **KALI-YUG**, an era. See **CHROI LOGY**, Vol. V, p. 719.

KA. KASKA, a village and the capital of Kalkaska County, northwestern South Michigan, 137 miles N. of Grand Rapids, on the Grand Rapids and Indiana railroad. The region produces much lum-

ber, while the neighboring streams afford a large supply of brook-trout. It has lumber-mills and wood-work factories. Population 1900, 1,304.

KALLITYPE PROCESSES. See **PHOTOGRAPHY**, in these Supplements.

KALM, PETER, a Swedish botanist; born in East Bothnia, Sweden, in 1715. From 1748 to 1751 he was investigating the botany and natural history of North America for the Swedish government, and then became professor of natural history at Abo, Sweden. He published, besides other scientific works, *A Voyage to North America* (1753), which was an account of the soils and natural curiosities of that country. He died Nov. 16, 1779.

KALMAR OR **CALMAR**, town in Sweden. Pop. 1898, 12,459. See **CALMAR**, Vol. IV, p. 710.

KALMIA, a genus of shrubby Ericads, belonging to the northern United States and the Allegheny region, with evergreen leaves and large clusters of showy white to rose-colored and purple flowers. It is known as the American or Mountain Laurel. Common species are *K. latifolia* (Calico-bush), *K. angustifolia* (Lamkill) and *K. glauca*. The foliage has the reputation of poisoning cattle.

KALMUCKS. See **CALMUCKS**, Vol. IV, p. 710.

KALNOKY DE KÖRÖS PATAK, GUSTAV SIEGMUND, COUNT DE. an Austrian diplomatist; born at Lettowitz, Moravia, Dec. 29, 1832; served for a few years in the army; and in 1850 entered the diplomatic service. In 1860-70 he was councilor of legation at the Austrian embassy in London; in 1874-80 minister to Copenhagen; and in 1880-81 ambassador to St. Petersburg. In 1881 he was recalled to assume the office of the joint Austro-Hungarian Minister of Foreign Affairs, and practically prime-minister, in succession to Baron Baymerle—apost which Count Kalnoky resigned in 1895. He was a strong supporter of the Triple Alliance, and in 1888 was decorated by William I with the star of the Black Eagle, and by the King of Italy with the Order of the Annunciata. Died at Brünn, Feb. 13, 1898.

KALO (*Colocasia esculenta*), a tropical member of the Arum family (*Araceæ*). It is an herb of common occurrence in wet places, and its thick, tuberous root-stalks are the source of *poi*, the national dish of the Sandwich-Islanders. See **HAWAIIAN ISLANDS**, Vol. XI, p. 529.

KALOUSEK, JOSEF, a Bohemian historian; born at Vamberk, Bohemia, April 2, 1838; received his education at the University of Prague; and became professor of history there. His principal work was a *History of Bohemian Constitutional Law* (1871 and 1892). He published also a *History of Charles IV* (1878); *Map of Bohemia in the Fourteenth Century*; and various other articles; and was editor of *Památky Archeologické a Nustopisné*.

KALPA, ceremonial sutras. See **SANSKRIT**, Vol. XXI, pp. 274-277.

KAMA RIVER. See **VOLGA**, Vol. XXIV, p. 279.

KAMAKURA. See **JAPAN**, Vol. XIII, p. 582.

KAMBALU, a Chinese city. See **CAMBALUC**, Vol. IV, pp. 722, 723.

KAMEHAMEHA I; born in Hawaii, about 1753; the conqueror and first king of the entire group of the Hawaiian Islands, better known as the Sandwich

Islands. With the aid of some European vessels and fire-arms he subdued one chief and one island after the other until he became master of the whole group in 1809. He introduced considerable civilization, and kept several white mechanics in his employ. He died May 8, 1819.

KAMEHAMEHA II, LIHOLIHO, son of the preceding, was born in Hawaii in 1797. He was intemperate, and given to pleasure. After succeeding to the throne in 1819 he abolished idolatry, and prepared the way for the missionaries, who came from Boston in 1820 and soon taught the Hawaiian people to read and write, to cipher and sew. The king and queen visited London in 1824, where both died of the measles in the following year.

KAMEHAMEHA III, KAVIKAUVULI, brother of the preceding; born 1814; came to the throne in 1833, at the age of 19. Though educated by the American missionaries, he was wild and dissipated in his youth, but in 1840 he granted his people a written constitution and a code of laws, and made considerable progress in educating and civilizing his subjects; in 1848 granted land in fee simple to nearly all common people, so that each head of a family was a landholder. In 1842 and 1843 the independence of the Hawaiian Kingdom was acknowledged by the United States and by the French and English governments. The king died childless, at Honolulu, when 40 years of age, Dec. 15, 1854.

KAMEHAMEHA IV, ALEXANDER LIHOLIHO, nephew of the preceding, was born in Hawaii, Feb. 9, 1834. He was also educated by the American missionaries. After visiting the United States, England and France, he succeeded to the throne in 1854. He was handsome, amiable, fond of sports and military parades, but when excited with wine he became passionate and reckless. He died at Honolulu, at the age of 29, Nov. 30, 1863.

KAMEHAMEHA V, LOTI, elder brother of the preceding; born Dec. 11, 1830. While his brother was king, he was commander-in-chief of the forces and Minister of the Interior. Although dissipated while young, he reformed when he succeeded to the throne in 1863. Thinking that the constitution was too democratic for the good of the people, he would not take the oath to support it, but called a convention of nobles and delegates of the people to form a new one. He dissolved the convention, however, and granted a constitution of less democratic character. He was strong-minded, fearless and firm, yet superstitious; generous and confiding toward some people, yet close, avaricious and suspicious toward others. He was never married, and left no heir to the throne. He died Dec. 11, 1872.

KAMINISTIQUA, a river of western Ontario, rising near lat. 49° 15' N., long. 89° 40' W., and flowing south-southeast into Thunder Bay, at Fort William, on the northwest coast of Lake Superior. It has numerous cascades and falls, Kakabika Falls being very beautiful and 125 feet in height. They are about thirty miles above its mouth. It is 120 miles long.

KAMPTULICON, a fabric. See CORK, Vol. VI, p. 402.

KANAGAWA. See YOKOHAMA, Vol. XXIV, p. 745.

KANARIS OR CANARIS, CONSTANTINE, a Grecian naval commander; born in the Isle of Ipsara in 1785. He was master of a merchant vessel before the beginning of the Greek war of independence. In 1822 he blew up the Turkish admiral's ship in the Strait of Chios, and another in the harbor of Tenedos. In 1824 he burned a Turkish frigate and transports carrying troops to Samos. In return for his exploits he was made a senator in 1847, and was Minister of Marine for Greece (1854-55). He was prominent in the revolution of 1862. He died in Athens, Sept. 15, 1877.

KANAWHA RIVER, GREAT AND LITTLE, two affluents of the Ohio, in West Virginia; the first is the principal river of the state, and forms part of the proposed Kanawha-James River canal; the second is a smaller stream, about parallel with the first, and some miles to the north. See also WEST VIRGINIA, Vol. XXIV, p. 518.

KANAZAWA, a town of Japan, about the center of the Island of Nippon, 125 miles N.N.E. of Kyoto, the capital of Ishikawa prefecture. It has a castle, used as military headquarters, fine public gardens and an industrial museum. It has potteries, which are famous for their red and gold porcelain-ware, known as Kaga-ware, and it also has manufactories of bronze statuary, overlaid with silver and gold, and of fans. Its mean annual temperature is 54.8° F. Population 1898, 83,595.

KANDHS. See MADRAS, Vol. XV, p. 185; and INDIA, Vol. XII, p. 777.

KANE, a borough of McKean County, northern Pennsylvania, on the Pittsburg and Western and the Pennsylvania railroads, 95 miles E.S.E. of Erie. It is in an oil, natural-gas and lumber region, and is a summer resort. It has manufactories of brush heads and handles, clothespins, lamp-black and glass; foundries, lumber-mills and railroad repair-shops. Population 1890, 2,944; 1900, 5,296.

KANE, SIR ROBERT, an Irish chemist; born in Dublin in 1810. He was educated for the medical profession; in 1832 was received as a member of the Royal Irish Academy, and in the same year projected the *Dublin Journal of Medical Science*. In 1840 he received the gold medal of the Royal Society of London for his researches into the coloring-matter of lichens, and in 1847 the Cunningham gold medal of the Royal Irish Academy for his discoveries in chemistry. From 1834 to 1847 he was professor of natural philosophy to the Royal Dublin Society. In 1846 he originated the Museum of Industry in Ireland; was appointed the first director and the same year received from the Lord-Lieutenant the honor of knighthood. He was for a number of years president of the Queen's College, Cork, resigning this position, together with the directorship of the museum, in 1873. In 1876 he was elected president of the Royal Irish Academy. His chief books are *Elements of Chemistry* (1842); an *Industrial Resources of Ireland* (1844). He died Feb. 16, 1890.

KANGAROO-RAT, the popular name of a small Australian marsupial of the subfamily *Hyssiprym-*

ninae. It is about as large as a rabbit, and very fleet. It does not much resemble the true kangaroo, either in structure or habits. The natives call it "potaroo," and consider it excellent food. The name is also applied to a small North American rodent of the genus *Dipodomys* and its allies. It resembles the jerboa in form and habits.

KANKAKEE, a city and the capital of Kankakee County, northeastern Illinois. Through it pass the Kankakee River and the Illinois Central, the Cleveland, Cincinnati, Chicago and St. Louis, the Indiana, Illinois and Iowa and the Kankakee and Seneca railroads. Limestone is quarried to a considerable extent in its neighborhood. It contains the Eastern Illinois Hospital for the Insane, which cost \$2,000,000. This asylum has accommodations for 2,000 patients, and has 500 employees. Population 1890, 9,025; 1900, 13,595. See also KANKAKEE, Vol. XIII, p. 842.

KANKAKEE, a river of northeastern Illinois, rising in St. Joseph County, Indiana, and flowing W.S.W. into Illinois, past Kankakee city, till it meets the Des Plaines River and helps to form the Illinois. Length, 225 miles.

KANSAS, popularly called the "Sunflower State," has an area of 82,080 square miles, 52,572,160 acres.

STATE SEAL OF KANSAS.

The census returns of 1890 gave the population as 1,427,096. In 1880 the inhabitants numbered 996,096, the gain for the ten years being 43.27 per cent. The number of people to the square mile was 17.47 in 1890, while in 1870 it was but 4.46, a gain in 20 years of more than 300 per cent. The census reports gave nine cities in the state, containing 165,879 people, which was but 11.62 per cent of the population. In 1880 the number of cities was four, the percentage of population residing in them being 5.58. In 1890 the number of males was 752,112, the number of females 674,984; the per cent of native-born population 89.64, of foreign-born, 10.36; the negro population 49,710, an increase of 6,603 in ten years. The 12th census of 1900 gave the population at 1,470,495, an increase of 43,399 since 1890.

The soil of Kansas is well adapted to agriculture, and is highly productive except some of the western part, where the lack of sufficient rainfall has been a drawback to successful farming. Irrigation is being developed rapidly, the Arkansas river, smaller streams, and artesian wells affording abundant water.

Kansas had 166,617 farms according to the census returns of 1890, of the average size of 181 acres, and a total of 30,214,456 acres, about 75 per cent of which is improved. The total valuation of the land, fences, buildings, machinery, implements and live-stock was given as \$706,664,141; the estimated value of the farm products for the year was \$95,070,-

080; the number of horses, 930,305; mules, 95,937; neat cattle, 3,188,033, which included 741,786 milch cows; swine, 4,022,933; and sheep, 401,192. The clip of wool was 2,253,240 pounds.

The census of 1890 shows that Kansas ranked high among the states in both acreage and production of the cereals. The following table shows the area, production and rank held, as well as the percentage of the entire yield in the United States:

PRODUCT.	ACRES.	PER CENT.	R'NK	BUSHEL.	PER CENT.	R'NK
All cereals	10,574,180	7.54	3d	337,753,689	9.60	3d
Corn ----	7,314,765	10.15	3d	259,574,568	12.23	3d
Wheat ---	1,582,635	4.71	9th	30,399,871	6.49	6th
Oats ----	1,463,526	5.17	7th	44,629,034	5.52	5th
Rye-----	199,146	9.17	4th	2,917,386	10.26	4th

The increase in agriculture since the census year has been very great, as will be shown by the returns made for 1895, in which year the area of field crops was 21,576,704 acres, exceeding the previous year by almost 2,000,000 acres. The aggregate value of the crops produced on this acreage was \$77,663,664, while the aggregate value of all crops and products from field, orchard and dairy was given as \$128,503,791, which, added to the value of live-stock on hand March 1, 1895, gave a total valuation of \$201,443,050. Following is a summary of some of the principal crops, the acreage devoted to their culture, and the quantities raised, with the value of the same:

PRODUCT.	ACRES.	BUSHEL.	VALUE.
Winter wheat ----	4,056,514	15,512,241	\$ 7,255,571
Spring wheat ----	115,457	488,819	207,547
Corn -----	8,394,871	201,457,396	46,189,772
Oats-----	1,606,343	31,664,748	5,620,188
Irish potatoes----	96,228	7,635,866	2,506,358
Sorghum -----	312,730	-----	2,533,952
Flax-----	233,903	1,630,530	1,286,471
Broom-corn*----	134,487	60,511,360	1,223,159
Hungarian and millet†-----	301,672	611,160	2,050,786
Kaffir corn†----	184,198	639,993	1,686,389

Other products of great value were rye, barley, buckwheat, sweet-potatoes, castor-beans, cotton, hemp, tobacco, milo maize, Jerusalem corn, timothy, clover, blue-grass, alfalfa, orchard-grass, other tame grasses, and prairie-grass as pasture. Other items that went to swell the grand total of products for the year were animals for slaughter, poultry and eggs sold, the wool-clip, cheese, butter and milk sold, garden products marketed, horticultural products marketed, wine, honey, beeswax and wood.

Stock-raising has been one of the most prominent of the agricultural industries since the settlement of the state. For the ten years from 1885 to 1895 the value of the live-stock of the state averaged about \$120,000 annually, and the yearly value of live-stock

* Production of broom-corn given in pounds. † Hungarian and millet and Kaffir corn in tons.

products over \$40,000,000. For the first four months of 1896 the number of cattle sold in the market of Kansas City, which were raised in Kansas, was 238,913; of hogs, 562,737; of sheep, 184,609; and of horses, 16,401. The census reports of 1890 showed that in the preceding ten years Kansas had added to the "other cattle on farms" almost 1,500,000.

By the census returns for 1890 it was shown that Kansas had 4,471 specified manufacturing industries, employing capital to the amount of \$43,926,002; having 32,843 employees, to whom \$16,328,485 were paid as wages, and turning out \$110,219,805 worth of finished products. Slaughtering and meat-packing at wholesale headed the list, with \$44,592,671 as the value of the annual production; flouring and grist mill products came next, with a return of \$17,420,475; cars and general shop construction was another important industry, as were carpentering, mason, brick and stone work, printing and publishing, and foundry and machine-shop products.

For the year ending June 30, 1895, the report of the different lines of railroads operating in Kansas

CAPITOL BUILDING, TOPEKA.

showed 9,025.20 miles. The census returns for 1890 showed 8,806.45 miles of road in operation, and that the increase during the ten years preceding had been 5,421.71 miles, or a gain of 160.18 per cent. During the fiscal year above mentioned the traffic earnings of the roads had been \$114,838,845, a decrease of over \$10,500,000 as compared with the previous year. The operating expenses amounted to \$80,670,223, the income from operation and other sources a little in excess of \$75,000,000.

The assessed valuation for taxation of the property of the state for 1894 was as follows: Land, \$173,075,265; town lots, \$61,835,141; personal property, \$40,854,934; railroads, \$59,764,683; making a grand total of \$335,530,023.

Few states have the school system so well conducted as has Kansas. By constitutional enactment the interest from the invested proceeds of 500,000 acres, granted by Congress in 1841 to all new states thereafter organized, and also of the sixteenth and thirty-sixth sections of every Congressional township, goes to the financial support of the schools. From the sales of these lands there has been derived nearly \$7,000,000, the interest on which amounts to almost \$500,000 annually, which, with the funds derived from district taxation, amounts to almost \$5,000,000.

The school statistics of 1894 make the following showing:

Number of persons of school age.....	496,139
Number of pupils enrolled.....	393,840
Average daily attendance.....	252,215
Number of teachers employed.....	11,903
Average length of the school year.....	25 weeks
Estimated value of school property.....	\$11,193,396

Almost the entire amount of the school fund of \$5,000,000 was expended, of which \$3,065,118 was for salaries paid to teachers. More than one hundred cities of the state have graded schools; there are numerous county high-schools and three state schools, the University at Lawrence, the Normal School at Emporia and the Agricultural College at Manhattan. Among the institutions of higher education the University of Kansas (q.v., in these Supplements) stands at the head. The denominational colleges are many and well sustained. Among the most prominent of these are the Baker University, located at Baldwin, with about 500 students, and under control of the Methodist Episcopal Church; the Central College, at Enterprise, with 170 students in 1895, under the auspices of the Lutheran Church; Bethany College, at Lindsborg, with 444 students in 1895, also controlled by the Lutheran Church; the College of Emporia, located at the city of the same name, with 120 students in 1895, managed by the Presbyterian Church; Highland University, at Highland, also controlled by the Presbyterians, with 75 students; Kansas Wesleyan, at Salina, with 305 students, and an institution controlled by the Methodist Episcopal Church; Midland College, Atchison, under the auspices of the Evangelical Lutheran Church, with 120 students; Ottawa University, Ottawa, belongs to the Baptist Church, and in 1895 had 402 students; Southwest Kansas College, established by the Methodist Episcopal Church, at Winfield, with 130 students; St. Benedict's College, Atchison, founded by the Roman Catholic Church, with 170 students; St. Mary's College, at the town of the same name, is also a Roman Catholic institution, with 207 students; Washburn College, Topeka, managed by the Congregational Church, with 200 students; Fairmount College, Wichita, also a Congregational institution, had about one hundred students. Other institutions are the Lewis Academy, at Wichita, Presbyterian; McPherson College, at the town of the same name, controlled by the Dunkard Church; St. John's Lutheran College, Winfield. Cooper Memorial College, at Sterling, is under the auspices of the United Presbyterian Church; Soule College, originally under the control of the Presbyterian Church, is now a Methodist Episcopal institution; Bethel College, at Newton, is controlled by the Mennonite Church; and Lane University, at LeCompton, by the United Brethren Church.

The religious element in Kansas is very strong, about one fourth of the entire population being communicants of the 4,114 organizations of the 27 different denominations. The total value of the church edifices in the state is given as \$8,679,608; besides which, large amounts are invested in colleges, schools, hospitals, orphans' homes and other

benevolent institutions. The estimated seating capacity of the churches of the state is 768,000. The larger denominations have membership and property as follows:

DENOMINATION.	MEMBERS.	VALUE OF PROPERTY.
Congregationalists	12,597	\$ 531,900
Presbyterians	24,935	1,900,700
Baptists	27,604	799,899
Lutherans	28,135	624,660
Christians	34,737	498,401
Roman Catholics	72,051	1,309,950
Methodist Episcopalians	101,600	2,322,890

In February, 1896, the number of national banks in Kansas was 116, whose aggregate capital and surplus was \$11,075,500, their deposits amounting to \$16,914,666. On the same date there were 287 state and 117 private banks, whose aggregate capital was \$8,465,000, with deposits amounting to the sum of \$15,522,033.

Coal is found in 24 of the counties of Kansas, and is mined in 20 of these. It is of the bituminous kind, excellent for gas and coke, yielding 63 per cent of the latter, the best Pennsylvania coal only producing 66 per cent. Statistics of the annual production of coal are not kept; but the two counties of Cherokee and Crawford reported nearly 3,000,000 tons mined in 1894, which had at the mines a value of more than \$3,500,000. A single mine at Frontenac produced over 8,000,000 bushels, of a value of more than \$400,000. Oil has been found in many places within the state, and is being developed rapidly. Natural gas also is produced over a wide range of territory, the estimate for both oil and gas being about 8,500 square miles in the southeastern part of the state. Kansas leads all other states in the production of zinc-ore and the manufactured product called spelter. In 1895, 25,775 tons of zinc were taken from a territory less than six miles square, in Cherokee County, located in the southeastern corner of the state, and from the same field 25,000,000 pounds of lead were taken in the same year. In 1896 there were 12 companies, employing about 800 men, engaged in the manufacture of salt, at Hutchinson, in the central part of the state. While the product is of as good quality as any produced in the United States, the industry is hampered by the fact of over-supply, and the amount produced is but a small fraction of the capacity.

The state charitable, correctional and penal institutions, which are many, are well sustained by liberal legislative appropriation. The Institution for the Education of the Deaf and Dumb, located at Olathe; the Institution for the Education of the Blind, at Kansas City; the Institution for the Education of Feeble-Minded Children, at Winfield; the Soldiers' Orphans' Home, at Atchison; the State Soldiers' Home, at Atchison; the State Insane Asylum, at Topeka; the State Insane Asylum, at Osawotamie; the Reform School for Boys, at Topeka; the Industrial School for Girls, at Beloit; the State Industrial Reformatory (for first felons), at Hutch-

inson; and the state penitentiary, at Lansing, are all models in the way of management, and compare favorably with like institutions in any of the states.

Kansas had in 1895 about 20 public libraries of over 1,000 volumes each, in addition to which were about 30 school and college libraries of the same minimum size, in addition to which were many connected with societies and public institutions, in all aggregating about 70, with a total of nearly 225,000 volumes. The total number of public libraries, large and small, was 458, their combined volumes numbering 162,985.

At the opening of 1899 there were 683 newspapers published in the state, 104 of the 105 counties having one or more. Papers were published in 343 of the cities, towns, and villages, of which 104 were county capitals; 53 of these papers were daily issues, 7 semiweekly, 592 weekly, 3 semimonthly, 26 monthly, and 2 quarterly.

The following table shows the population of 20 of the principal cities of Kansas as ascertained by the 12th decennial census of 1900. The number of native-born citizens is also given.

CITIES.	POPULATION. 1890.	POPULATION. 1900.
Kansas City.....	38,316	51,418
Topeka.....	31,007	38,608
Wichita.....	23,853	24,671
Leavenworth.....	19,768	20,735
Atchison.....	13,963	15,722
Fort Scott.....	11,946	10,322
Lawrence.....	9,997	10,862
Pittsburg.....	6,697	10,112
Hutchinson.....	8,682	9,379
Emporia.....	7,551	8,223
Parsons.....	6,736	7,682
Ottawa.....	6,248	6,934
Arkansas City.....	8,347	6,140
Salina.....	6,149	6,074
Argentine.....	4,732	5,878
Newton.....	5,605	6,208
Winfield.....	5,184	5,554
Junction City.....	4,502	4,695
Osage City.....	3,469	2,792
Independence.....	3,127	4,851

The following is a list of the governors of Kansas, with their terms of office: Charles Robinson, 1861-62; Thomas Carney, 1862-64; Samuel J. Crawford, 1864-68; James M. Harvey, 1868-73; Thomas A. Osborn, 1873-76; George T. Anthony, 1876-79; John P. St. John, 1879-83; George W. Glick, 1883-85; John A. Martin, 1885-87; Lyman U. Humphrey, 1887-93; Lorenzo D. Lewelling, 1893-95; Edmund N. Morrill, 1895-97; John W. Leedy, 1897-99; W. E. Stanley, 1899-1901. See also KANSAS, Vol. XIII, pp. 832-34.

KANSAS, a village of Edgar County, central eastern Illinois, on the Peoria, Decatur and Evansville and the Cleveland, Cincinnati, Chicago and St. Louis railroads, 160 miles S.W. of Chicago. It is in a farming region, and has tile factories, a large fruit-canning establishment, grain warehouses; and the repair-shops of the Peoria, Decatur and Evansville railroad are located here. Pop. 1900, 1,049.

KANSAS, a river of northeastern Kansas, formed by the union of the Smoky Hill and Solomon rivers

in Dickinson County. Its direction is east, and its length is about 200 miles.

KANSAS, UNIVERSITY OF, a co-educational institution maintained and controlled by the state of

MAIN BUILDING, UNIVERSITY OF KANSAS.

Kansas; situated at Lawrence. Advantage was taken of the Congressional grant to educational institutions of 1862, and in 1864 the State University was chartered by the legislature. The institution is governed by a board of regents, who are appointed by the governor of the state. The regents in turn elect a chancellor, who is the official head of the institution. The University is divided into five schools or departments: law, pharmacy, engineering, fine arts, and liberal arts. Eight buildings stand upon a campus of forty acres. Completely equipped scientific laboratories, large museums, and a library of about 30,000 volumes furnish a part of the educational facilities. Tuition is free to residents of the state; for non-residents only a nominal fee is charged. The institution is supported by legislative appropriation. In 1898 its income was \$152,000, and the amount of its productive funds \$142,000. In 1898 there were 1,064 students in attendance, with 58 instructors.

KANSAS CITY, the capital of Wyandotte County, Kansas. In 1886 it was incorporated as a city, and was formed by the union of Wyandotte, Armourdale, Armstrong and several smaller communities, all suburbs of Kansas City, Missouri. Kansas City, Kansas, is on the north side of the Kansas River and west side of the Missouri river, where the two streams join. Kansas City, Kansas, and Kansas City, Missouri, are in all respects one city, the only reason for the separation being the state line, which marks the limits of each city and compels two distinct governments. Through the different parts of Kansas City, Kansas, run five railroads: the Atchison, Topeka and Santa Fé, the Missouri Pacific, the Kansas City, Fort Scott and Memphis, the Union Pacific and the Kansas City and Northwestern. While all these roads maintain stations in Kansas City, Kansas, no traffic of any extent is done outside of the Missouri city. A belt line connects the two cities and all railroad lines. Kansas City, Kansas, is also connected with the Missouri side by cable and electric roads. It is the second largest stock market in the world and one of the largest packing-house centers in the United States, the six establishments which have given the Kansas City a world-wide reputation for pork and beef products all being in Kansas. It receives annually about

3,000,000 head of live stock, of which 65 in a hundred are hogs, 26 per cent cattle and 6 per cent sheep. Of the food animals received, about 60 per cent are disposed of at the packing-houses. The live-stock traffic in 1893 amounted to \$92,000,000. In addition, many large grain-elevators are located there in connection with the Missouri grain exchange. Over \$11,000,000 are invested in manufactures, the annual product being valued at \$45,000,000, and over 7,500 persons being employed. Population 1880, 3,200; 1890, 38,316; 1900, 51,418.

KANSAS CITY, the second city in size in the state of Missouri, in Jackson County, on the south bank of the Missouri and east bank of the Kansas rivers, where the latter stream flows into the former. Kansas City, Missouri, and Kansas City, Kansas, are in reality one, but are legally separated by the state boundary-line. In 1854 Kansas City, then known as Westport Landing, was the outfitting and starting point for the California overland parties who followed the "Santa Fé trail." The Missouri River is navigable, and Kansas City, before the advent of the railroads, was one of the most important shipping-points for the then extensive steamer trade.

In Kansas City, Missouri, center 21 lines of railroad, over which the traffic of the two cities is conducted; among them are the Union Pacific, the Atchison, Topeka and Santa Fé, the Chicago, Rock Island and Pacific, the Missouri Pacific, the Wabash, the Chicago and Alton, the Chicago, Burlington and Quincy, the Hannibal and St. Joseph, the Chicago, Milwaukee and St. Paul and the Kansas City, Pittsburg and Gulf. As nearly as can be estimated it is the center of commerce for nearly nine hundred thousand square miles of territory, embracing Kansas, Colorado, the Indian Territory, parts of Missouri, Nebraska and Iowa. Consequent upon this large amount of tributary territory, Kansas City has large wholesale grocery, hardware, implement and other interests, and is the grain-center of the West. The aggregate capital of the manufacturing establishments in 1890 was \$14,000,000, and the annual products were valued at \$32,000,000; 15,000 persons were employed and \$9,500,000 were paid in wages. The packing-house and live-stock interests, which are all in Kansas City, Kansas, are of course not included in these estimates. The average grain receipts are over twenty-two million bushels annually. Kansas City is for the most part situated upon high bluffs overlooking the Missouri. There the retail and residence districts are situated, while in the bottom lands along the two rivers are the wholesale and railroad interests. It is well supplied with cable and electric railways. The passenger traffic of all the railroads is handled in one large union depot. The Missouri River is spanned by a bridge 1,387 feet in length, and five bridges cross the Kansas River. Three large parks are maintained, and a public library. Schools of medicine, dentistry, pharmacy, etc., are located here. The city is well provided with hospitals and charitable institutions. Its growth has been almost entirely since 1870. In 1870 there were 32,290 inhabitants; 1880, 55,276; 1890, 132,416; 1900, 163,752.

KANSUH. See CHINA, Vol. V, p. 638.

KANTEMIR, ANTIOKH DMITRIEVICH. See RUSSIA, Vol. XXI, pp. 105, 106.

KAPP, FRIEDRICH, a German author; born at Hamm, Westphalia, April 13, 1824. He studied at Heidelberg, and practiced law in Germany until 1850, when he removed to New York. He continued his practice, and took part in public affairs. In 1860 he was a Presidential elector; for three years before his return he was commissioner of immigration in New York. His knowledge of America made him valuable at home in International legislation, and in 1870 he returned to Germany, and in 1871 became a member of the German Diet. He published *The Slave Question in the United States* (1854); *Life of General Steuben* (1858); *A History of German Migration into America* (1867); *On Immigration and the Commission of Immigration* (1870); and *Frederick the Great and the United States* (1874). He died in Berlin, Oct. 27, 1884.

KARA, river. See RUSSIA, Vol. XXI, p. 73.

KARACHI. See KURRACHEE, Vol. XIV, p. 160.

KARAJICH, VUK STEFANOVIC, philologist. See SERBIA, Vol. XXI, p. 691.

KARAK OR KHARAJ, an island of Persia, in the northern part of the Persian Gulf, lat. 29° 14' N., long. 50° 20' E. It is about fifteen miles in circumference, and of coral formation; a safe anchorage during southwest storms is obtained here. On its northern side are a Dutch fort and a village inhabited by about 1,000 Arabs.

KARAKORUM MOUNTAINS. See KUEN-LUN, Vol. XIV, p. 153.

KARAMAN. See CARAMAN, Vol. V, p. 82.

KARELIAN. See LAPLAND, Vol. XIV, p. 307.

KARENS, a race occupying part of British Burma. They are related to the Chinese and Siamese, being of Turanian and Mongolian descent. Their Burmese neighbors formerly oppressed them to such an extent that they took to the highlands in central and lower Burma, between the Irawadi and Menam rivers, where they devoted themselves somewhat to agriculture in a small way, but mostly to marauding expeditions. They were among the first tribes to avow fealty to Great Britain, and since professing loyalty have emigrated into the valleys to some extent, removing even into western Siam. In 1828 Christianity was introduced among them, and since that time has spread rapidly, so that it is estimated at present there are some 100,000 Christian converts. A college, theological seminary and numerous schools have been founded, and 500 churches with over one hundred native pastors. As a result, they are becoming civilized rapidly, and modern industries are being introduced among them. The Karens are divided into several tribes and clans, each of which has its own dialect. The three principal tribal branches are the Sgaus, Pwos and Bghais, the last named being least civilized. Their language, like the Chinese, is monosyllabic.

KARLSKRONA, a fortified seaport town of southern Sweden. It is the principal station of the Swedish navy and has a very secure harbor, capable of accommodating vessels of 20 feet draught. Canvas, linen cloths, leather and naval

equipments are manufactured here, and metals, potash and other Baltic products are exported. Population 1897, 23,196. See CARLSKRONA, Vol. V, p. 112.

KARLUK, a seaport town of ALASKA, q.v., in these Supplements.

KARMA, LAWS OF. See BUDDHISM, Vol. IV, p. 433.

KARMATHITES OR CARMATHIANS, a branch of the Ismailian sect of Islam. See MOHAMMEDANISM, Vol. XVI, pp. 586-588, 594.

KARNAK, ruins. See EGYPT, Vol. VII, pp. 777, 778.

KARNOW. See JAGERNDORF, in these Supplements.

KARPINSKI, FRANCISZEK. See POLAND, Vol. XIX, p. 303.

KARR, JEAN BAPTISTE ALPHONSE, a French author; born in Paris, Nov. 24, 1808. After being educated at the Collège Bourbon he became an instructor there. He wrote his personal love romance under the title *Sous les Tilleuls*, which was succeeded by other romances entitled *Une Heure Trop Tard*, and *Vendredi Soir*. In 1839 Karr became chief editor of *Figaro*, and soon after issued *Les Guêpes*, a satirical review, which became very popular, and his fanciful *Voyage Autour de mon Jardin* (1845). For many years he practiced floriculture and horticulture at Nice. His miscellaneous writings have been gathered, and a selection from them published in 1877, called *L'Esprit d'Alphonse Karr*. He died at Nice, Sept. 30, 1890.

KARROO (a Hottentot word signifying "dry or barren"), a term applied in Cape Colony primarily to the barren plateaux lying between the Nieuwveld, Roggeveld, Langeberg and Zwarteberg ranges, and thence to barren plains generally. The soil of the Great Karroo consists of shallow but fertile deposits of red clay on a substratum of blue schistose slate. It is in many places impregnated with saline matter, but when irrigated produces good crops. The Great Karroo is about three thousand feet above the sea-level, and the Little Karroo, or Kannaland, one thousand feet lower. Both are subject to great extremes of temperature. They evidently at one time formed the beds of lakes, and now abound in fossil saurian remains peculiar to this region. Large flocks of sheep are pastured on the Karroo, and the value of land has quintupled with the last few years. See also ORANGE RIVER FREE STATE, Vol. XVII, p. 813.

KARST, THE. See ALPS, Vol. I, p. 631.

KARUIZAWA, a town in the principality of Shinano, Japan, at the foot of the western descent of the Usui pass, 85 miles N.W. of Tokyo, at an altitude of 3,200 feet. Near by is the active volcano, Asama-yama, 8,282 feet high. To the south are the magnificent rocks and groves of Myogi-san. Its delightful surroundings and climate make it a favorite summer resort. In 1893, a railway connecting the termini of the trunk railroad between Tokyo and the west, which was broken by the Usui pass, 4,000 feet high, was opened. This section goes through no fewer than 25 tunnels. Population, 2,000.

KARYOKINESIS, a term applied in botany to the series of changes involved in indirect nuclear division, by far the

most common form of division. In the resting stage of the nucleus the two centrospheres are usually in proximity, and the first stage in division is for them to separate and pass to opposite poles of the nucleus. This position indicates the plane of the coming division,

which is always at right angles to the axis connecting the two centrospheres. In the nucleus itself the fibrillar network then breaks up into a definite number of segments, known as chromosomes. The tangle of somewhat V-shaped chromosomes loosens by the movement of the chromosomes to the surface of the nucleus, where they mass in an equatorial position. At the same time, delicate threads pass from one chromosome to the other about the body of the nucleus, as meridian lines about a globe, forming what is known as the "spindle," of which the centrospheres are the two poles. The chromosomes collected in the equatorial plane now split longitudinally, the two halves of each primary chromosome moving along the spindle-fibers toward opposite poles. This movement continues until the daughter chromosomes are collected at each pole, where they constitute a nucleus, the separated chromosomes uniting to form the fibrillar network of the resting stage. Thus two distinct nuclei are formed, and this division is usually followed by the formation of a cell-wall between the two, in the equatorial plane of the spindle. The accompanying figure shows different stages (I-VI) in nuclear division: *a*, the centrospheres, together in I, in polar position in II-IV, paired again by division in V and VI; *n*, the nucleus showing nucleolus, apparent in I and VI; *s*, the spindle, apparent in III-V; *c*, the chromosomes, entangled in I and II, in equatorial position in III, moving toward the poles in IV, entangled again in the new nuclei in V and VI. (From Guignard and Strasburger.)

KASHAN. See CASHAN, Vol. V, p. 175.

KASKASKIA, a post village of Randolph County, southwestern Illinois, on the right bank of the Kaskaskia River, about seven miles from its mouth, at Chester, which is the nearest railroad station. It was settled by the French about 1680, and was the first capital of Illinois. It was once a large and important place, but has declined. Population 1900, 177.

KASKASKIA, a river of Illinois, rising in Champaign County, in the central eastern part of the state, and flowing southeast into the Mississippi at Chester. Its length is nearly 300 miles, and it is navigable for about 50 miles.

KASSASSIN, a lock on the canal between

Ismailia and Zagazig, in Egypt, 21 miles W. of Ismailia. In the Egyptian campaign of 1882 a sharp action was fought here on August 28th, in which the insurgent Egyptian troops under Arabi Pasha (q.v., in these Supplements), who had attacked the position held by the British troops, commanded by General Graham, were completely routed. The feature of the conflict was the charge made by the Heavy Brigade, it being the first battle in which the Household Cavalry had participated since their charge at Waterloo.

KASSON, JOHN ADAMS, an American statesman; born at Charlotte, Vermont, Jan. 11, 1822; studied law in Massachusetts, and practiced in St. Louis until 1857, when he moved to Des Moines, Iowa; was first assistant postmaster-general in 1861; member of Congress 1863-67; postal commissioner to Paris 1863-67. In 1868-73 he was in the Iowa Legislature, but returned to Congress (1873-77); was minister to Austria (1877-81); in Congress (1881-84); minister to Germany (1884-85); president of the committee on the centennial of the adoption of the constitution in Philadelphia (1887); special envoy to the Samoan Congress at Berlin (1889); special reciprocity commissioner (1897); and member of the Canadian-American Joint Commission (1898-99).

KATHAY. See CHINA, Vol. V, pp. 627-28.

KATHODE OR CATHODE. See ELECTRICITY, § 95, in these Supplements.

KATKOFF, MICHAEL NIKIFOROVITCH, a Russian politician and journalist; born at Moscow in 1818. He studied at the University of Moscow, Königsberg and Berlin, and for some time filled the chair of philosophy at Moscow. In 1856 he founded the *Russian Messenger*, and in 1861 he became editor of the *Moscow Gazette*, the organ of the University, and eventually made it the most influential journal in Russia. At first an advocate of parliamentary government and reform, Katkoff was converted by the Polish rising of 1863 into a leader of the Pan Slavist movement and a supporter of reactionary government in Russia. He acquired much influence, and is said to have been mainly instrumental in persuading Alexander III to adopt his conservative and reactionary policy. He died at Snamensky, Aug. 1, 1887.

KATRINE, LOCH. See GLASGOW, Vol. X, p. 642; and TROSSACHS, in these Supplements.

KATTEGAT, an arm of the North Sea, a continuation of the Skager Rock, between Sweden and Denmark. It is 150 miles in length and from 40 to 70 in width. It connects with the Baltic Sea by the Sound and the Great and Little Belts. Dangerous sand-banks exist in the Kattegat.

KATTIMANDU, the native name of the latex (milky juice) of an East Indian *Euphorbia*, a plant of the spurge family. As all latex has the general properties of caoutchouc, that of this species is of some use in the arts.

KATYDID, the popular name of many American insects of the grasshopper family (*Locustidae*). The name is an imitation of their peculiar shrill

note, heard only at night. They are large green insects of arboreal habits. At least a dozen species occur in the United States, but *Cyrtophyllus concavus* is perhaps the best known.

KAUAI. See HAWAIIAN ISLANDS, Vol. XI, p. 532.

KAUFMAN, a city and the capital of Kaufman County, northeastern Texas, on the Texas Trunk and the Texas Midland railroads, 36 miles S. E. of Dallas. Hay, corn and oats are largely raised, but cotton is the leading product. It has an ice factory, cottonseed-oil mill, and is supplied with city water and electric lights. Population 1890, 1,282; 1900, 2,378.

KAUFMANN, CONSTANTINE VON, a Russian soldier; born near Ivangorod, in Russian Poland, of German parents, May 3, 1818. Entering the army as lieutenant of engineers in 1838, he fought against the Circassians in the Caucasus, and especially distinguished himself at the siege of Kars in 1855. In 1867 he was appointed governor-general of Turkestan, and at once set himself to organize this province, then newly conquered; in 1868 he occupied Samarcand, and in 1873 conducted a successful campaign against Khiva. The strong position of Russia in Central Asia is mainly due to his victories. In 1879, when the Russians had been defeated by the Turkomans, he was put at the head of an expedition against Merv, which was successful. He died May 16, 1882.

KAUKAUNA, a city of Outagamie County, central western Wisconsin, on both sides of the Fox River, and on the Chicago and North-Western railroad, 23 miles above Green Bay. It has pulp, paper and flour mills, sash and blind factories, machine-shops, a foundry and the repair-shops and roundhouse of the Chicago and North-Western railroad. Population 1890, 4,667; 1900, 5,115.

KAVA-KAVA, the native name of *Piper methysticum*, a shrub of the Pacific Islands, belonging to the pepper family. The medicinal value of its roots has long been known to the natives, who make from them a preparation used in treatment of the genital organs. It also receives the name of *karwa* and of *ava-ava*.

KAVELIN, KONSTANTIN DMITRIEVICH, a Russian author; born in St. Petersburg, Russia, Nov. 4, 1818. He was educated at the Moscow University, becoming a professor there in 1844. Later he studied higher education in France and Germany, on which he wrote several articles. During the last few years of his life he was in the Military Legal Academy. One of his aims was the emancipation of the serfs, and the programme which he made out for the work was copied almost exactly in the decree of 1861. His principal writings are *History of the Civil Procedure and of the Organization of the Courts in Russia from the Twelfth Century to the Present Time* (1843). *General Sketch of the Juridical Development of Russia before Peter the Great* (1847); *Problems of Psychology* (1875); and essays on various other subjects. He died May 3, 1886.

KAWI OR KAVL, ancient language. See JAVA, Vol. XIII, p. 608.

Vol. 3—31

KAYE, JOHN, an English Episcopal bishop; born at Hammersmith, Dec. 23, 1783; was educated at Cambridge, and for several years was regius professor of divinity there. In 1820 he became bishop of Bristol, and in 1827 bishop of Lincoln. Among his works are *Writings and Opinions of Alexandria* (1835); *Writings and Opinions of Justin Martyr* (1836); *Government of the Church During the First Three Centuries* (1855); besides many treatises and shorter articles. He died at Riseholme, Feb. 18, 1853.

KEA, a parrot. One of group NESTOR; q. v., Vol. XVII, p. 354.

KEANE, JOHN JOSEPH, an American Catholic bishop; born in Ballyshannon, County Donegal, Ireland, Sept. 12, 1839. The family removed to the United States in 1846. He was educated for the priesthood in Baltimore, at St. Mary's Seminary. After his ordination in 1866 he was assigned to St. Patrick's Church, Washington, District of Columbia, as assistant rector; in 1878 was appointed bishop of Richmond, and in 1886 rector of the Catholic University of America, at Washington. He was made bishop at Ajasso, a titular see, in 1888, and from that time until October, 1896, when he was removed by a papal decree, devoted himself to the upbuilding of a great university. He was offered the choice of his field of labor, but preferred to retire from active priestly duties.

KEARNEY, a city and the capital of Buffalo County, southern central Nebraska, in the Platte River valley, and on the Union Pacific, the Burlington and Missouri Valley, and the Kearney and Black Hills railroads, 125 miles W. of Lincoln. It is in a fertile and well-watered farming and grazing region, and obtains abundant water-power by a canal thirteen miles long, from the Platte River. It has flour-mills, a foundry and machine-shop, brickyards, canning, pickling and cracker factories, and is an important grain-shipping point. Pop. 1890, 8,074; 1900, 5,634.

KEARNEY, LAWRENCE, a United States naval officer; born at Perth Amboy, New Jersey, Nov. 30, 1789. He entered the navy as a midshipman in 1807, serving on board the frigates *Constitution* and *President*, and in 1813 had become a lieutenant. During the War of 1812 he was employed in the defense of the coast of South Carolina, and later cleared the West Indies and Gulf coast of pirates. Subsequently he was active in the suppression of opium-smuggling. He then held various shore appointments, including the command of one of the New York station, and the presidency of one of the naval boards of inquiry. In 1867 he was made commodore on the retired list. He died at his native place, Nov. 29, 1868.

KEARNY, PHILIP, an American soldier; born in New York City, June 2, 1815. He entered the army in 1837, and in 1839 went to Europe to examine the tactics of the French cavalry service. He entered the cavalry school at Saumur, and then enlisted in the French army, attracting the attention of the government by his daring exploits during the campaign in Algeria. In 1840 he returned to the United States, was

made aid to General Alexander Macomb, and was attached to the staff of General Winfield Scott from 1841 to 1845.

GENERAL PHILIP KEARNY.

In 1846 he was made a captain, and during the assault upon the City of Mexico he lost an arm. He was in California during the gold discoveries, and took part in the warfare with the Oregon Indians. In 1859 he returned to France and served with his old comrades at Magenta and Solferino, being decorated with the cross of the Legion of Honor. In 1861 he re-enlisted in the United States army, was promoted major-general, and was killed at Chantilly, Sept. 1, 1862. General Scott referred to General Kearny as "the bravest man I ever knew, and the most perfect soldier."

KEARNY, STEPHEN WATTS, an American soldier; born in Newark, New Jersey, Aug. 30, 1794. At the beginning of the War of 1812 he enlisted in the Thirteenth Infantry as a lieutenant, and the following year was made a captain. In 1846 he became a brigadier-general, and at the outbreak of the Mexican War took possession of New Mexico. In 1847 he was governor of California, in 1848 of Vera Cruz, and the same year of the City of Mexico. He wrote a *Manual for the Exercise and Maneuvering of United States Dragoons* (1837); *Laws for the Government Territory of New Mexico* (1846). He died in St. Louis, Oct. 31, 1848.

KEARSARGE, MOUNT, a prominent mountain in Carroll County, New Hampshire, five miles N. of the village of North Conway. Height, about 3,250 feet. It is also written Kiarsarge, and is the favorite excursion point of the district. The view from the summit—Moosilauke and Lafayette, the Presidential Range, Goose Eye, the peaks toward Lake Umbagog, Portland, Sebago Lake,

UNITED STATES CORVETTE "KEARSARGE."

Monadnock and the other Kearsarge, is particularly fine.—The famous warship which sunk the *Alabama* received its name from this mountain, or, as some claim, from a mountain of similar name in Merrimac County, New Hampshire, 21 miles N.W. of Concord, which has a height of about 2,950 feet. Both mountains have formed the subject of American poets' praises, and the name was rendered famous by the United States wooden

three masted steamer *Kearsarge*, launched at Portsmouth, New Hampshire, October 5, 1861. The dimensions of the *Kearsarge* were: Length between perpendiculars, 198.5 feet; breadth of beam, 33 feet; draft, 15 feet 9 inches; registered tonnage, 1,031; two engines of 400 horse-power each. Her armament consisted of four 32-pounders, two 11-inch rifles, one 12-pounder howitzer, and one 30-pounder rifle. She carried 163 officers and men, and was commanded by Captain John A. Winslow. On Sunday, June 19, 1864, the *Kearsarge* fought the Confederate cruiser *Alabama* off the port of Cherbourg, France, and, after a brief battle, sank the privateer, which had destroyed the American merchant marine. The battle forms the subject of many spirited and warlike poems, especially one by G. H. Boker, and another by Dr. Mitchell, wherein he apostrophizes the mountain:

"Stirred one grand rocky steep,
When rode her sons as victors,
Lords of the lonely deep."

On Feb. 2, 1894, the *Kearsarge* was wrecked on Roncador Reef, in the Caribbean Sea. The officers and crew were saved, but the remains of the vessel were burned by natives before the arrival of a wrecking party.

KEATING, JOHN M., an American gynæcologist; born in Philadelphia, April 30, 1852; received his education at the University of Pennsylvania and Philadelphia Polytechnic; later became a medical lecturer in the University of Pennsylvania and professor of the principles and practice of medicine in the Woman's Medical College. He traveled in the East with General Grant, and after his return was appointed medical director of the Pennsylvania Mutual Life Insurance Company. He published *Cyclopedia of the Diseases of Children; Diseases of the Heart and Circulation in Childhood; With General Grant in the East* (1880); *How to Examine for Life Insurance*; and various other medical works, mostly in reference to children.

KEEL. See SHIP-BUILDING, Vol. XXI, p. 819.

KEELEY, LESLIE E., an American physician; born in St. Lawrence County, New York, in 1836; removed in early life to Michigan; in 1863 graduated from Rush Medical College, Chicago; received the honorary degree of LL.D. from the University of St. Louis; was a surgeon in the Civil War; located in general practice at Dwight, Illinois, in 1866. Dr. Keeley gained much notoriety on account of the methods in his treatment of alcoholism and narcotism. Regarding inebriety a disease rather than a vice, his treatment was essentially therapeutical, though moral and social agencies are auxiliary means. His formulas were not given to the medical profession, which fact was regarded as a violation of professional ethics. His system was used in the United States army, in the national homes for disabled volunteer soldiers, among the Indians, and in state charitable institutions. His book, *The Non-Hereditary of Inebriety*, was published in 1896. The Keeley treatment is also known as the "gold cure" be-

cause of the use of a chloride of gold as the essential drug in the treatment. The method was used extensively throughout the United States in various proprietary institutes known as Keeley Institutes, the graduates of which have organized themselves into a national society called the Keeley League.

KEELHAULING, a punishment used in the navy during the seventeenth and eighteenth centuries. The culprit was suspended from one yard-arm, dropped into the water, and hauled beneath the keel to the other side. Keelhauling was practiced on an Egyptian corvette as recently as August, 1882.

KEEN, WILLIAM WILLIAMS, an American physician; born in Philadelphia, Jan. 19, 1837. From 1862 to 1864 he was a surgeon in the United States army, and after studying two years in Europe, settled in Philadelphia, Pennsylvania, where he lectured for nine years in Jefferson Medical College, also conducting the Philadelphia School of Anatomy. In 1884 he was made professor of surgery in the Woman's Medical College of Philadelphia. He gave most of his attention to surgery of the nervous system, and was the originator of several operations, among them the draining of the lateral cerebral ventricles, first performed by him in 1888. He edited a number of text-books on anatomy; among them, *Heath's Practical Anatomy* (1870); the American edition of *Gray's Anatomy*, and *The American Text-Book of Surgery* (1892).

KEENE, a city of southwestern New Hampshire, the capital of Cheshire County, on the Ashuelot River, 50 miles W.S.W. of Concord, and on the Fitchburg and the Boston and Maine railroads. Keene is a beautiful, well-built city, with wide, shaded streets, with picturesque surroundings; has a fine central square, from which radiate the five principal streets, and in which is a handsome monument to the memory of soldiers who fell in the Civil War. It contains a public library with 10,000 volumes. An abundant water-supply is derived from a lake three miles distant. Keene is the business center of a fertile agricultural region. It has manufactories of furniture, shoes, flannel, toys, glue, carriages, sleighs, sashes and blinds, and has foundries, and the repair-shops of the Fitchburg railroad. Population 1890, 7,446; 1900, 9,165.

KEENE, CHARLES SAMUEL, an English illustrator; born in Hornsey, England, Aug. 10, 1823. He was educated in his own town, and, following his natural bent, went to work for a firm of wood-engravers, for whom he drew engravings for several books, including *Robinson Crusoe*. He did illustrations for various periodicals until he began work on *Punch* in 1851. In a short time he became one of the leading and most popular of artists on that paper. His sketches were in pen and ink, and caught the humorous side of every-day incidents. He illustrated a number of books, such as Douglas Jerrold's *Mrs. Caudle's Curtain Lectures*; Mark Lemon's *Number Nip*; and Charles Reade's *He Would*

be a Gentleman. He died in London, Jan. 4, 1891.

KEENE, LAURA, the stage name of an English actress, whose maiden name was Mary Moss; born in Chelsea, London, 1820. Her first appearance was at the Lyceum in 1845. She married Henry W. Taylor in 1847 and John Lutz in 1857; traveled successfully through the United States and Australia; was manager of a theater in New York City for some years; in 1858 produced *Our American Cousins*, with Joseph Jefferson as Asa Trenchard and Edward A. Sothern as Lord Dundreary. It was while present at one of her representations of the above in Ford's Theater, Washington, that Abraham Lincoln was assassinated in 1865. As a play-writer she was not successful. She died at Montclair, New Jersey, Nov. 4, 1873.

KEESEVILLE, a post village of Essex and Clinton counties, northeastern New York, lying on both sides of the Au Sable River, four miles W. of Lake Champlain, on the Keeseville, Au Sable Chasm and Lake Champlain railroad, which connects with the Delaware and Hudson. The river is spanned here by three bridges. The water-power is abundant, and the leading industry is the manufacture of iron and steel; flour and woolen-mills, furniture, nail, harness and wagon factories are also located here. Population 1890, 2,103; 1900, 2,110.

KEEWATIN, a district of the Northwest Territories of Canada, north of Manitoba, extending to the Arctic archipelago, between 95° 8' and 100° 8' W. long. It contains many large rivers and lakes, draining into Hudson Bay. The country is rough and sterile, with occasional forests, but rich in metals. It has an area of about 498,000 square miles. It was created in 1876, and put under the jurisdiction of the lieutenant-governor of Manitoba. A portion of Manitoba was added in 1883. Its population is very small, consisting of a few Icelanders and Indians.

KEICHO, same as HANOI. See TONG-KING, Vol. XXIII, p. 440.

KEIGHTLEY, THOMAS, an Irish author; born in Dublin, Ireland, October, 1789. He was educated at Trinity College, Dublin, and in 1824 settled in England to a life of letters. His histories of *Rome* (1836), *Greece* (1835), and *England* (1839), long held their place as school manuals. He also wrote *Fairy Mythology* (1850) and *Life, Writings and Opinions of Milton* (1859). He died at Erith, Kent, England, Nov. 4, 1872.

KEITH, GEORGE, an English clergyman; born in Aberdeen, Scotland, in 1638. In 1664 he became a Quaker, and in 1684 emigrated to America. In 1689 he took charge of a Friends' school in Philadelphia, but left it soon afterward to travel in New England. He then formed a society of his own, known as the Christian or Baptist Quakers, or Keithians; but again becoming dissatisfied, he was ordained in the Church of England. In 1702 he was sent on a mission to New Jersey and Pennsylvania, and seven hundred Quakers received baptism in the Episcopal Church, under his influence. Subsequently he became rector of Edburton, Sussex, England, where he died, March 27, 1716. He was

the author of *Journal of Travels from New Hampshire to Caratuck* (1706); *New Theory of Longitude* (1709); and several theological works.

KEITH, GEORGE KEITH-ELPHINSTONE, VISCOUNT, a British admiral; born near Stirling, Scotland, Jan. 7, 1746. Entering the navy in boyhood, he saw service in various parts of the world, and distinguished himself in numerous engagements in the American war and the French wars. He was in command of the expedition in 1795-97 which took possession of Cape Colony, in South Africa, Ceylon, Cochin, Malacca, and the Molucca Islands; had command of the fleet which landed Abercrombie's army in Aboukir Bay in 1801, and of the channel fleet which prevented Napoleon from crossing to England. He died March 10, 1823, in Tullialan, Scotland.

KEITHSBURG, a city of Mercer County, northwestern Illinois, on the Mississippi River, on the Chicago, Burlington and Quincy and the Cleveland, Cincinnati, Chicago and St. Louis railroads, 30 miles W.N.W. of Galesburg. It has flouring-mills, a carriage factory, and is the center of an agricultural region. Population 1900, 1,566.

KELLER, GOTTFRIED, a Swiss poet and novelist; born at Zurich, July 19, 1819. He at first took up painting, but abandoned it for literature, which he studied at Heidelberg and Berlin. From 1861 to 1876 he was secretary of state of his native canton. His principal works are *Der Grüne Heinrich* (1854); *Romeo und Julie auf Dem Dorfe*; *Kleider Machen Leute*; *Sieben Legenden* (1872); *Züricher Novellen* (1876); and *Martin Salander* (1886). He died July 16, 1890.

KELLEY, EDGAR STILLMAN, an American composer; born at Sparta, Wisconsin, April 14, 1857. He studied with local teachers, and then went to Stuttgart, Germany. On his return he settled first in San Francisco, and afterward in New York, where he devoted himself to teaching and composing. His first important work was incidental music to *Macbeth*. Among his later works is a successful opera called *Puritana* (1892).

KELLEY, WILLIAM DARRAH, an American statesman; born in Philadelphia, April 12, 1814; practiced law and became (1845-46) attorney-general of Pennsylvania. From 1846 to 1856 he was judge of the common pleas. Originally a Democrat, he joined the Republican party at its formation, and became an ardent advocate of abolition. From 1862 to the end of 1889 he represented his district in Congress, and was serving his fifteenth term at the time of his death, Jan. 9, 1890, being then the senior member of the House in continuous service. He was a strong protectionist, and from his frequent speeches upon the tariff in its relation to the iron industry, was popularly known as "Pig-Iron Kelley." He published *Letters on Industrial and Financial Questions* (1872); and *Letters from Europe* (1887).

KELLOGG, CLARA LOUISE. See STRAKOSCH, MRS. PAUL, in these Supplements.

KELLOGG, DAY OTIS, an American litterateur, was born March 31, 1837, at Troy, New York; was graduated from Hobart College, New York, in 1857; studied for two years at the Alexandria Theological

Seminary, in Virginia. In 1861 he took orders in the Episcopal Church, and from then until 1870 had charge of churches in Bridgeport, Connecticut, and Philadelphia, and of Grace Church at Providence, Rhode Island. He was professor of English literature and history in the University of Kansas till 1874, when that institution conferred on him the doctorate of divinity. He then returned to Philadelphia as the rector of one of his former parishes. He was a founder and the first secretary of the Philadelphia Charity Organization Society, in 1878. In 1880 he removed to Vineland, New Jersey, abandoning the ministry for literary pursuits. He was on the editorial staff of the *Providence Evening Press*, the *Philadelphia Press*, and a contributor to the *Penn Monthly*, the *American* (Philadelphia), and the *Atlantic Monthly*, and other periodicals. He was on the editorial staff of the *Standard Dictionary*, and the compiler of an index to the *ENCYCLOPEDIA BRITANNICA*, 9th ed., and the editor of the Supplements to the Werner and Sommerville editions of the same *ENCYCLOPEDIA*.

KELOID OR CHELOID, a skin disease. The disease is apparently of two kinds, the first being somewhat like a tumor, and forms often in the scar of a burn. It is incurable, and likely to return after excision. The second is a more general skin disease, and in hot weather spreads over the body, causing itching. It can be cured by certain washes, and is more common among negroes than white people.

KELUNG OR KILUNG, seaport. See FORMOSA, Vol. IX, pp. 416, 417.

KELVIN, WILLIAM THOMSON, BARON, a British physicist and mathematician, was born in Belfast, June 25, 1824. His father, Dr. James Thomson, was lecturer on mathematics at the Royal Academical Institute, Belfast, but removed to Glasgow on his appointment to a professorship in the university of that city. Here young Thomson finished the university course, but afterward he proceeded to Cambridge, where he graduated in 1845 as second wrangler, the bent of his mind being toward sci-

LORD KELVIN.

ence. In 1846 he was appointed professor of natural philosophy at Glasgow University, and held the chair until 1896, when he retired, after celebrating the fiftieth anniversary of his incumbency of the office. The jubilee demonstration was participated in by hundreds of the chief representatives of science from nearly every quarter of the globe. Early in his career Mr. Thomson became editor of the *Cambridge and Dublin Mathematical Journal*, and in its pages appeared many of his papers on the mathematical theory of electricity. In 1848 he published a treatise on the *Distribution of Electricity on Spherical Conductors*, and in 1885 issued the Bakerian lecture, on the *Electrodynamic Properties of Metals*. Pa-

pers on electrostatics and magnetism appeared at frequent intervals from his pen, and his researches led him to invent an instrument for electrostatic measurement, and one, the quadrant electrometer, which is employed for all manner of electric testing in telegraph-construction and for the registration of atmospheric electricity at Kew and other observatories. To the science of magnetism he made other and important additions; but it is in the investigation of the nature of heat that his extraordinary power of scientific analysis is seen to the greatest advantage. The following are some of his more important papers: *On Thermal Effects of Fluids in Motion*; *The Mathematical Theory of Elasticity*; *The Rigidity of the Earth*; *The Determination of a Ship's Place at Sea from Observation of Altitudes*; and *Approach by Vibration*. On the successful completion of the Atlantic cable in 1866, Professor Thomson was knighted, and in 1892 he was made a baron in the peerage of the United Kingdom. Lord Kelvin had much to do with the laying of submarine cables, the efficiency of which was increased by his mirror-galvanometer and siphon-recorder, and was the inventor of an invaluable apparatus for taking deep-sea soundings with a steel pianoforte-wire instead of by the ordinary lead-line. Later Lord Kelvin became identified with the introduction into Britain of the electric light for public and domestic purposes. He is the author, conjointly with Professor Tait of Edinburgh, of a treatise on *Natural Philosophy* (1867-79), and has published a collection of *Popular Lectures and Addresses* (1890), dealing with the *Constitution of Matter*, with *Navigatorial Affairs*, and on *Geology and General Physics*. His theory of vortex-motion has thus far been found consistent with the known properties of matter. He is also one of the chief authorities in the Old World on heat, including electricity and magnetism, and on the dynamical theory of gases. The article on ELASTICITY (see Vol. VII, pp. 796-825), in this ENCYCLOPÆDIA, is from Lord Kelvin's pen.

KELVIN CURRENT-BALANCES. See ELECTRICITY, § 54, in these Supplements.

KEMBLE, FRANCES ANNE, an Anglo-American actress and Shakespearean reader; born in London, Nov. 27, 1809; descended from a long ancestry of actors and actresses. In 1829 she made her *début* at Covent Garden, London, and in 1832 went to the United States with her father, Charles Kemble, where she met with great success. In 1834 she married Pierce Butler of Philadelphia, and retired from the stage; but, the marriage being unhappy, they obtained a divorce,

FANNIE KEMBLE.

and Mrs. Butler went to live in Lenox, Massachusetts. In 1849 she came before the public at Philadelphia in her first course of Shakespearean readings, and these entertainments afterward were re-

peated in many cities of America and Europe. "Fanny" Kemble also wrote *Francis the First*, a drama (1832); *Journal* (1835); *The Star of Seville*, a drama (1837); *Poems* (1844); *A Year of Consolation* (1847); *Plays* (1863); *Journal of a Residence on a Georgia Plantation* (1863); *Records of a Girlhood* (1878); *Records of Later Life* (1882); *Notes on Some of Shakspeare's Plays* (1882); and *Further Records*. She died in London, Jan. 16, 1893.

KEMÉNY, SIEGMUND, BARON, a Hungarian politician and poet; born in Magyar-Kapud, Transylvania, in 1816; entered politics, and in 1841 became editor of the *Erdélyi Híradó* and member of the Transylvania Parliament. In 1848 he removed to Budapest, becoming a member of the Hungarian National Assembly, and in 1849 minister of the interior. After the overthrow of Vilagos he became an advocate of union with Austria. He published *Man and Wife*; *Love and Vanity*; and other biographical romances. In 1870 his critical works were published under the title *Studies by Kemény*. He died at Pussta Kamaras, December, 1875.

KEMPF, REAR-ADMIRAL LOUIS (U. S. N.), late commandant Navy Yard, Mare Island, and at present (1900) on active duty in Chinese waters, was born near Belleville, Ill., Oct. 11, 1841. He entered the Naval Academy in 1861, served on the *Vandalia* in the blockade off Charleston; appointed acting master and took part in the engagement at Port Royal, S. C., Nov. 7, 1861; afterwards served on the flagship *Wabash* and other vessels on the Atlantic and Gulf Coast to the close of the Civil War. In 1862 he took part in the bombardment of Sewell's Point, Va., and in the re-occupation of Norfolk, Va. Was promoted commander March, 1876, captain in 1891 (in command of receiving ship *Independence*), and rear-admiral in 1899.

KENAI INDIANS. See INDIANS, Vol. XII, 827.

KENDAL, MRS. MARGARET BRUNTON, actress. See GRIMSTON, MRS. WILLIAM HUNTER, in these Supplements.

KENDAL, WILLIAM HUNTER. See GRIMSTON, WILLIAM HUNTER, in these Supplements.

KENDALL, AMOS, an American statesman; born in Dunstable, Massachusetts, Aug. 16, 1789. He was educated at Dartmouth, graduating in 1811; studied law, removed to Lexington, Kentucky, and was for a short time tutor in the family of Henry Clay. He then was appointed postmaster of Georgetown, Kentucky, edited the local paper, and in 1816 became co-editor of the *Argus of Western America*, a Democratic newspaper published at Frankfort, Kentucky. In 1824 he supported the nomination of General Andrew Jackson for the Presidency, and in 1829 was appointed fourth auditor of the United States Treasury; in 1835 he was appointed Postmaster-General. President Van Buren retained him in office, from which he retired in 1840. In 1845 he was connected with Professor Morse in the ownership of telegraphic patents, by which he became wealthy. He was the originator of the Washington Deaf and Dumb Asylum, besides contributing largely to several other charities. He died in Washington, District of Columbia, Nov. 11, 1869.

KENDALLVILLE, a city of Noble County, northeastern Indiana, on the Grand Rapids and Indiana and the Lake Shore and Michigan Southern railroads, 27 miles N. of Fort Wayne. It is in a rich grain-raising district and has the East Indiana Fair Grounds. It has manufactures of iron-work, flour, lumber, wind-mills, refrigerators, pumps, clothes-racks, bee-keepers' supplies and barrels and tubs. It is supplied with water and electric lights. Population 1890, 2,960; 1900, 3,354.

KENEALY, EDWARD VAUGHAN HYDE, an Irish barrister, journalist and author, noted for his vehement and injudicious defense of the Tichborne claimant, Arthur Orton (see **TICHBORNE**, in these Supplements). He was born in Cork in 1819, was educated at Trinity College, Dublin, and as a fluent linguist, with a remarkable knowledge of thirteen languages, contributed to several magazines, and published *Brallaghan* (1845), and *Goethe*, a new pantomime (1850), both brilliant and entertaining works. In 1873 he acted as counsel for the notorious Arthur Orton in the Tichborne case, and was, if possible, the greatest dupe of this impostor. In defending Orton upon the trial for perjury, Kenealy mistook every function of the lawyer. Instead of contenting himself with commenting upon the improbabilities of the case for the crown, and endeavoring to secure his client's acquittal, he foolishly set up that which was not in issue, and endeavored by every means to prove, in spite of the previous adverse verdict, that his client was the real Sir Roger Tichborne. In the opinion of eminent jurists of that day, his attacks upon witnesses and behavior toward the court were discreditable to the profession to which he belonged, while the possibilities of an acquittal for his client, had the defense been properly handled, were more than considerable, especially after the dowager Lady Tichborne's identification of the impostor as her son. Orton was convicted, and Kenealy started a violent and undignified crusade in his behalf, in the columns of a paper, called *The Englishman*, which he published for a brief period. He was disbarred, but obtained a seat in Parliament in 1875, and died April 16, 1880, believing to the last in the righteousness of the impostor's cause.

KENESAW OR **KENNESAW MOUNTAIN**, a double-peaked eminence, about 1,200 feet high, lying directly north and northwest of the city of Marietta, in Cobb County, Georgia, and sending out a spur for several miles in a northeasterly direction. It is 25 miles N.W. of Atlanta. With Lost Mountain it forms the base of a triangle, of which Pine Mountain is the apex. Here, in June, 1864, the Confederate general, Joseph E. Johnston, made a stand in his retreat before Sherman and the Union soldiery, who were forcing the way to Atlanta. The rebel front was about four miles long, strongly fortified, and more than aided by the natural advantages of a mountain stronghold. Sherman's first object was to break the rebel line between Kenesaw and Pine mountains. On the 14th, General Polk, the Confederate commander on Pine Mountain, was killed by a Union shell. The Union forces made repeated attacks on the Confederate positions, and

outflanking them, compelled Johnston to abandon his works on the night of July 2d and fall back to the Chattahoochee. The Union loss in the attacks on Kenesaw Mountain approximated 7,500 men; that of the Confederate troops, who fought behind abatis and log parapets in mountain strongholds, probably did not exceed 1,000 killed and 2,000 taken prisoners. Johnston was relieved from his command by President Davis, and General Hood placed in command of the Confederate army of Tennessee.

KENITES OR **KENIZZITES**. See **PALESTINE**, Vol. XVIII, p. 175.

KENNAN, GEORGE, an American traveler and author; born at Norwalk, Huron County, Ohio, Feb. 16, 1845; was educated in the public schools, studied telegraphy, and in 1864 was commissioned by the Russo-American Telegraph Company to superintend the construction of lines in Siberia; spent three years in exploration, location of routes, and construction of a telegraph line between the Sea of Okhotsk and Bering Strait. He returned to America in 1868, and in 1885-86, accompanied by the artist George A. Frost, again journeyed through eastern Russia, exploring the region of the Altai, and visiting the convict prisons and mines of Siberia. His extensive observations were published in a journal of travel, *Tent-Life in Siberia* (1870), and more particularly in a series of illustrated articles in the *Century Magazine*, (1887-90), afterward collected in book-form, *Siberia and the Exile System* (1891). Mr. Kennan's graphic narrative created a profound impression throughout Christendom, his startling revelations of misery and the brutality of Russian officials causing the proscription of the above magazine in the empire and the blacklisting of foreign journals commenting upon the subject.

GEORGE KENNAN.

KENNEBEC, a river of Maine, rises in Moosehead Lake, in Somerset County, and, passing Augusta, runs generally south to the Atlantic Ocean. Its length is over 150 miles. It is navigable for large vessels to Bath, 12 miles, and for steamers beyond Augusta. In its course it falls 1,000 feet.

KENNEBUNK, a town of York County, southwestern Maine, on the Boston and Maine railroad, and on the Kennebunk River, 25 miles S.W. of Portland. The town also extends to the coast, where it has a fine beach. It has several hotels, two public libraries, and is quite a summer resort. It manufactures leatheroid, leather-board, boots, shoes, lumber and twine, and has a considerable coasting trade. Population 1890, 3,172; 1900, 3,228.

KENNEDY, JOHN PENDLETON, author and statesman; born in Baltimore, Md., Oct. 25, 1795; graduated at Baltimore College in 1812; in 1814 took part in the defense of Bladensburg; studied law and was admitted to practice in 1814. In 1820-23 he was

a member of the state legislature; in 1838 he was elected to Congress as a Whig; and in 1840 was a Presidential elector on the Harrison ticket. In 1852 he was appointed Secretary of the Navy, and as such zealously pushed forward Commodore Perry's Japan expedition and Dr. Kane's second polar voyage. During the Civil War he supported the cause of the Union. He is best known as the author of *Swallow Barn* (1832); *Horseshoe Robinson, a Tale of Tory Ascendancy* (1835); *Rob of the Bowl* (1838); *Annals of Quodlibet* (1840); and *A Defense of the Whigs* (1844). Died at Newport, R. I., Aug. 18, 1870.

KENNETT SQUARE, a borough of Chester Co., Pa., 30 miles S. W. of Philadelphia; was founded before 1760; has foundries and factories of road-scrappers and rollers, stone-crushers, engines, phosphates, and pottery. The British troops rallied here before the battle of Brandywine, in 1777. Pop. 1900, 1,516.

KENOSHA, a city, capital of Kenosha Co., Wis., on Lake Michigan, 32 miles S. of Milwaukee; has an excellent harbor, and a growing lake commerce; also parks, two water-cure establishments, and factories of carriages, wagons, furniture, and other wooden articles. Pop. 1890, 6,532; 1900, 11,606.

KENRICK, FRANCIS PATRICK, an American Catholic archbishop; born in Dublin, Ireland, Dec. 3, 1797; educated at Rome, and entered the priesthood in 1821. Later he was sent to America, and became head of the Roman Catholic Seminary at Bardstown, Ky. In 1830 he was made bishop of Arath *in partibus*; in 1842 bishop of Philadelphia; in 1851 archbishop of Baltimore; and in 1859 honorary primate of the United States. In 1832 he founded St. Charles Borromeo Seminary, Philadelphia. He wrote *Theologica Dogmatica* (1840); *Theologica Moralis* (1843); and was engaged upon revisions of the Douai English Bible for several years before his death. Died in Baltimore, July 8, 1863.

KENRICK, PETER RICHARD, an American Roman Catholic archbishop; born in Dublin Aug. 17, 1806; educated at Maynooth, and ordained a priest in Ireland, but soon afterward went to Philadelphia, where his brother, Francis Patrick Kenrick (q. v.), was coadjutor to the bishop. Here he edited the *Catholic Herald* for several years, and published various works, original and translated. He was also made vicar-general of the diocese. In 1841 Bishop Rosati of St. Louis requested his nomination as his coadjutor with the right of succession. He was consecrated bishop of Drasa *in partibus*, and coadjutor of St. Louis, Nov. 30, 1841. In 1843, on the death of Bishop Rosati, he became bishop of St. Louis, and in 1847 the first archbishop of that city. He established a hospital, an orphanage, two convents, and numerous schools and charitable institutions. Died in St. Louis, March 4, 1896.

KENSETT, JOHN FREDERICK, an American painter; born in Cheshire, Conn., March 22, 1816. In 1840 he went to England, where he became employed as an engraver and studied the art of design. In 1845 he exhibited at the Royal Academy of London his earliest painting, *Windsor Castle*. He went to Rome, where he spent two years, and completed a number of Italian landscapes. In 1848 he returned to New York city, and his *View on the Arno* and

Sistine, exhibited at the National Academy in New York city in that year, established his reputation. In 1849 he was made an academician, and in 1859 a member of the decoration commission of the Capitol at Washington. His best works are in American landscapes. Died in New York city, Dec. 14, 1872.

KENT, a village of Portage Co., Ohio, on the Cuyahoga river, eight miles N. E. of Akron; has good water power, and manufactures locks, furniture, carriages, and a fine window-glass made from a white sand-rock found in the vicinity, and has railroad machine-shops. Population 1900, 4,541.

KENT, JACOB FORD, American army officer, born in Pennsylvania, Sept. 14, 1836. In 1856 he was appointed from that state as cadet to the Military Academy; he graduated May 6, 1861, and on the same date entered the regular army as second lieutenant of the Third Infantry, and was made lieutenant July 31 following. In the same year he served in the first Bull Run campaign, and in September, 1862, was taken prisoner, but was exchanged soon after, and served in the Fredericksburg and Chancellorsville campaigns. On Jan. 1, 1863, he was made lieutenant-colonel and assistant inspector-general of volunteers, and was brevetted major for gallant and meritorious services in the battle of Marye's Heights, Va. On January 8, 1864, he was promoted captain, and in the same year was brevetted lieutenant-colonel for gallant services at the battle of Spottsylvania; in October, 1864, was brevetted colonel of the volunteers for faithful services in the field in the campaign before Richmond. From the close of the war till 1877 he served on frontier duty in various departments, and from 1877 to 1885 he served in Montana. In July, 1885, he was made major of the 4th Infantry, and up till 1887 was stationed at Fort Omaha, and in 1887-94 at Spokane, Wash. In 1891 he was made lieutenant-colonel of the 18th Infantry; and on April 25, 1895, colonel of the 24th Infantry, with headquarters at Fort Douglas, Utah. After the war with Spain broke out he was made major-general of volunteers and commander of the First Division of General Shafter's army at Santiago, and distinguished himself at the battles at San Juan, near there, July 1-3, 1898.

KENT, WILLIAM CHARLES MARK, an English editor; born in London, Nov. 3, 1823. From an early age he adopted literature as a profession, and produced a number of volumes of poems, essays, and stories. He was for 25 years editor of *The Sun*, and for seven years (1874-81) editor of the Roman Catholic publication, *The Weekly Register*. He edited the works of Lamb, Burns, Moore, and the first Lord Lytton, and published some theological works, of which *Corona Catholica* is the best known. Among his works are *Dark Ages, by an Oscotian* (1847); *The Gladstone Government, by a Templar* (1869); *The Humour and Pathos of Charles Dickens* (1884); and he contributed the articles on DEAN ALFORD and LORD DALLING to this ENCYCLOPÆDIA.

KENTISH RAG, the local name given to a grayish blue limestone which occurs at Hythe and other places on the coast of Kent, England, in the lower greensand measures; is sometimes sixty to eighty feet thick.

KENT ISLAND, the largest island in Ches-

peake Bay, belonging to Queen Anne County, Maryland, extending from $38^{\circ} 51'$ to $39^{\circ} 3'$ N. lat. It was colonized in 1631 by Claiborne, who here established the first settlement in the state. The island is fifteen miles long, and has a very fertile soil and important oyster-fisheries. Population 1890, 2,230.

KENTON, a city and the capital of Hardin County, northwestern central Ohio, situated in the center of the state, in a farming district, on the Scioto River, and on the Cleveland, Cincinnati, Chicago and St. Louis and the Toledo and Ohio Central railroads, 28 miles E. of Lima. Lumbering and farming are the industries of the surrounding region. Kenton manufactures straw-board, bee-keepers' supplies, has the largest iron-fence factory in the United States, and saw and planing mills. Population 1890, 5,557; 1900, 6,852.

KENTON, SIMON, an American pioneer; born in Fauquier County, Virginia, April 3, 1755. At the age of 16 he had an affray arising from a love affair, and, believing that he had killed his adversary, fled from Virginia to Kentucky, where he ranged the country as a spy against the Indians until 1778, when he was captured by the Indians, but escaped some months afterward, and during the invasion of Kentucky by the British and Indians, led a company and aided in driving out the invaders. In 1782 he again commanded a company, and then, learning that the man he supposed he had killed was still living, visited his old home, but soon afterward re-entered the army. In 1793 he was major of a battalion of Kentucky volunteers; in 1805 became a brigadier-general of Ohio militia, and fought at the battle of the Thames in 1813. In 1824, having lost his vast possessions of land through the invasion of pioneers, he appeared in Frankfort, Kentucky, before the legislature, in tattered garments, petitioning for relief, which was granted, and a pension of \$240 procured for him from Congress. He died in Logan County, Ohio, April 29, 1836.

KENTUCKY had a population of 1,858,635 in 1890, of whom 276,454 lived in the seven cities of

STATE SEAL OF KENTUCKY.

the state, constituting 14.87 per cent of the entire number of inhabitants. The gain for the ten years 1880 to 1890 was 12.73 per cent. The number of people to the square mile was 46.47, a density greater than that of any other of the south-central group of states. The relative proportions of males to females was 942,758 of the former and 915,887 of the latter. The population of the state in 1900 was 2,147,174. The number of negroes in 1890 was 268,071, a decrease of 3,380 since 1880.

Kentucky stood the highest among her group of states in the item of average annual milk-production per cow, the average being 325.08 gallons in Kentucky, as compared with 77.03 gallons in

Louisiana. In the production of hemp Kentucky leads the states, with 23,468 acres devoted to its culture, against 25,054 acres, the entire area in the United States, thus giving the state 92 per cent of the total acreage. The value of the crop for the statistical year 1889 was \$1,102,602, of which amount the farmers of Kentucky received \$1,045,081. The census returns also showed Kentucky to be first in the production of tobacco, over one half of the entire area devoted to its cultivation in the United States being in the states of Kentucky and Virginia, the former showing an increase of 48,467 acres since the census of 1880, the latter showing a decrease of 30,212 acres during the same period. The number of acres devoted to tobacco in 1889 was 274,587, or 39.49 per cent of the entire area, while the yield was 221,880,303 pounds, or 45.44 per cent of the crop of the United States. In addition to the products mentioned, there are raised broom-corn, potatoes, beans, buckwheat, hay, and grass-seeds. The number of farms at the date of the taking of the census was 179,264, the average size 119 acres, and the total area 21,412,229 acres, of which 44.80 per cent was unimproved. The total value of lands, buildings, fences, machinery and implements and live-stock was \$428,170,266. The estimated value of the farm products for the year was \$65,948,485; the number of horses, 401,356; the number of mules, 151,649; neat cattle, 1,066,091; swine, 2,036,746; and sheep, 937,124. The yield of wool was 2,777,533 pounds.

The manufacturing statistics compiled for the decennial census of 1890 show the number of establishments to have been 7,745; the amount of capital invested, \$79,811,980; the number of persons employed, 65,579; to whom \$27,761,746 were paid as wages; and the value of all products, \$126,719,857. The principal industry was distilling, the number of establishments being 126; the capital invested, \$10,966,210; the persons employed, 1,992; and the value of the product, \$15,159,648. The manufacture of tobacco in its different forms yielded a return in excess of \$11,000,000. Flouring and grist-mill products returned \$9,681,259, and foundry and machine-shop products, \$5,565,231. Woolen goods, slaughtering and meat-packing, and lumber and other mill products from logs or bolts, were important industries, as was also leather, tanned and curried, which gave a product valued at \$3,447,570.

The annual production of coal has not varied much, for several years, from 3,000,000 tons, yielding a return of about the same number of dollars. Nearly 10,000 persons are engaged in mining, and the coke industry employs about 2,500.

The raising of fine cattle and horses has been a prominent industry in Kentucky for many years, and in rearing the latter animals the state stands almost alone in the production of thoroughbreds.

The reports of the state officers for 1895 showed a deficit in the treasury of about \$80,000, almost one half of which belonged to the school fund. During the preceding year the deficit had been almost \$200,000 greater than it had been in 1895, and the payment of state expenses was suspended for a time and the treasury closed. The assessed

valuation of all property in the state was nearly \$600,000,000, on which a tax was levied of 47 cents on the \$100. The hard times of 1893, 1894 and 1895, had operated to cause the non-payment of taxes to such an extent as to bring about the financial troubles mentioned.

The returns of the eleventh census show that Kentucky had a good relative standing in the production of the cereals, as is shown by the following table, the percentage given being that of the entire crop of the United States.

PRODUCT.	ACRES.	PER CENT.	RANK.	BUSHEL.	PER CENT.	RANK.
All cereals -----	4,556,098	3.25	9th	98,511,733	2.80	11th
Corn -----	2,960,382	4.11	9th	78,434,847	3.70	8th
Wheat -----	898,694	2.68	12th	10,707,462	2.29	13th
Oats -----	645,316	2.28	13th	8,775,814	1.08	14th
Barley -----	5,776	0.18	24th	165,959	0.21	22d
Rye -----	45,546	2.10	15th	423,847	1.49	13th

The showing above made was not equaled in any item by any state within the south-central group, to which Kentucky belongs, with the single exception of Texas, which stood one number higher in the table showing the order of production in the item of area devoted to corn, and one above in the production of oats.

The National Guard of Kentucky, locally known as the Kentucky State Guards, numbered, in 1895, 1,471 officers and men. The force was organized into three regiments of infantry, no other arm of the service being represented. The annual state appropriation is \$10,000, which is supplemented by a Federal appropriation ranging from \$8,000 to \$12,000, mainly in arms and equipments. State encampments occupying ten days are held annually. The number of persons in the state liable to military duty was given at the beginning of 1896 as 361,137, and the authorized strength of the guard at 3,500.

The Central Asylum for the Insane at Lakeland reported 1,083 inmates in October, 1895. The expenditures for the year were \$169,000. Other institutions for the insane are located at Anchorage, Lexington and Hopkinsville. The Institution for Deaf Mutes at Danville reported 295 pupils in October, 1895, the cost of whose maintenance for the preceding year was \$55,000 for the whites and \$7,591 for the negro department, in which were 40 pupils. The Institution for the Blind at Louisville had, for the year 1895, 104 white and 26 negro pupils. The expenses were \$26,576.

The Institution for Feeble-Minded Children was destroyed in the summer of 1896, in which nearly 100 children at the time were confined. No loss of life resulted, but the building was totally destroyed, and the children, from their condition, were rescued with much difficulty.

The schools of the state number nearly 7,000; the children of school age, 700,000, of whom 115,000 are negroes. The state board of education holds irredeemable state bonds of the value of \$2,312,596, the annual interest on which is paid by the state, and goes to the support of the public schools. The annual expenditures for the maintenance of the

schools of Kentucky are nearly \$2,000,000. Institutions of higher education are many, the colleges numbering 33, the academies about 60, and many schools for instruction in particular branches of learning. Of the colleges, the leading institution is Center College (q.v., in these Supplements), located at Danville. Of the denominational institutions of learning in Kentucky, Columbia Christian College at Columbia, Eminence College at Eminence, South Kentucky College at Hopkinsville, and Kentucky University at Lexington, are all

under the control of the Christian Church. Georgetown College at Georgetown, Liberty College at Glasgow, and Bethel College at Russellville, are controlled by the Baptist Church. The Presbyterian Church controls the Central University at Richmond and Center College at Danville. The Roman Catholic Church has St. Mary's College at St. Mary's, the Methodist Episcopal Church has Union College at Bourbonville, and the Methodist Episcopal South Church has Kentucky Wesleyan College at Winchester. Three non-sectarian institutions are maintained, one at Berea, known as Berea College; one at Bowling Green, known as Ogden College; and Garrard College at Lancaster.

The following table shows the colleges for women in Kentucky, with their location, and the auspices under which they are conducted:

LOCATION.	INSTITUTION.	HOW CONDUCTED.
Bowling Green.	Potter College.	Non-sectarian.
Clinton.	Clinton College.	Baptist.
Danville.	Caldwell College.	Presbyterian.
Glendale.	Lynnland Female College.	Baptist.
Harrodsburg.	Young Ladies' College.	Non-sectarian.
Hopkinsville.	Bethel Female College.	Baptist.
Lexington.	Hamilton Female College.	Christian.
Mittlersburg.	Millersburg Female College.	Methodist Episcopal South.
Nicholasville.	Jessamine Female Institute.	Non-sectarian.
Owensboro.	Owensboro Female College.	Non-sectarian.
Pewee Valley.	Kentucky College for Young Ladies.	
Russellville.	Logan Female College.	Methodist Episcopal South.
Stanford.	Stanford Female College.	Non-sectarian.
Winchester.	Winchester Female College.	Christian.

The church organizations of Kentucky number about 5,500, with 4,700 edifices. All Baptist bodies number about 2,000, the Methodist Episcopal South coming next, with almost 1,000 organizations. Other

denominations of importance are the Disciples of Christ, Negro Baptists, Methodist Episcopal and Cumberland Presbyterians.

STATE ELECTION FOR GOVERNOR (1899). Very keen and bitter was the contest in 1899 for the governorship of Kentucky, the struggle in the Democratic party being the more violent on account of personal hostility to the aspiring candidate, Senator William Goebel, who was long a conspicuous figure in Kentucky politics, and whose career, later on, was ended by a tragic occurrence. Senator Goebel was the author of the State Election law which was obnoxious to many, as were his political methods. In spite of this, he received the nomination for Governor at the Democratic convention held at Louisville, June 24, 1899. Another wing of the party held a convention some two months later at Lexington, which nominated an independent or anti-Goebel ticket. On July 13, the Republican convention met also at Lexington and nominated for Governor, Mr. W. S. Taylor, the attorney-general of the State. The election came off on Nov. 7, the official returns for the two principal candidates being as follows: W. S. Taylor (Rep.), 193,714; Wm. Goebel (Dem.), 191,331. So strong was the rival party feeling and so bitter the opposition to Goebel in the Democratic ranks that the State militia was in attendance at Louisville on the polling day. Advantage was taken of that fact by the defeated Democrats to protest against the election and bring the matter before the Legislature and the courts. Great political tension existed for many weeks after the election, but on Dec. 9, Mr. Taylor was given a certificate guaranteeing his proper return and he assumed the office of Governor. This, however, only added fuel to the fire already burning and quickened Democratic zeal to inquire into the alleged irregularities of the election. While these inquiries were being made and the State was in a continued turmoil owing to the obstructions placed in the path of the seated Governor, Senator Goebel was shot on Jan. 30, 1900, while walking in the capitol grounds on his way to the State House, and died Feb. 3. The assassin, James Howard, was later on in the year found guilty, the jury rendering a unanimous verdict that the death penalty should in his case be imposed. As we write, a new trial has been asked for, on the ground that some of the jurymen were prejudiced against the accused. Henry E. Youtsey, as we write, is also on trial for complicity in Senator Goebel's murder. Kentucky, meanwhile, has succeeded in securing a new Election law, a manifest improvement on the obnoxious Goebel measure.

KENYON COLLEGE, an educational institution for young men, located at Gambier, Ohio. It was started at Worthington, Ohio, in 1824, as a theological seminary of the Protestant Episcopal Church, but was removed to Gambier in 1828, and a college and seminary organized separately. In 1891 the two were united, and a preparatory department was added, all under the name of Kenyon College. The institution has productive property worth \$500,000 and an in-

come, from all sources, of \$18,000, besides being well equipped with buildings and apparatus, and having a library of 30,000 volumes. The student body averages about 180, and there are

"OLD KENYON."—THE COLLEGE DORMITORY.

18 instructors and professors in the faculty. There are also about twelve scholarships.

KEOKUK, a thriving city of Iowa, one of the capitals of Lee County, in a thriving fruit-raising region. The river is crossed at this point by a fine railroad bridge, which connects Keokuk with the towns of Warsaw and Hamilton, Illinois. Keokuk has a Roman Catholic academy, a Lutheran school, and business and medical colleges. The Mississippi is navigable at this point for large steamboats, and the United States government has constructed, at the cost of \$8,000,000, a ship-canal, ten miles long and three hundred feet wide, around the Des Moines Rapids, which extend from Keokuk northward. The city is built on limestone bluffs 150 feet high, and the limestone affords excellent material for building purposes. The manufactures are various, and the business of the town is prospering. It is supplied with electric lights, gas and water, and has a sewer system. Population 1890, 14,101; 1900, 14,641. See also KEOKUK, Vol. XIV, p. 45.

KEOKUK, a chief of the Sacs and Foxes; born on Black River, Illinois, about 1780. He was of the tribe of Sacs, and rose to distinction during the War of 1812. Opposed to the sway of Black Hawk and other chieftains, he sided with the whites, and on several occasions succeeded in quieting his turbulent followers. After the capture of Black Hawk in 1832, Keokuk was recognized formally as the head chief of the Sacs and Foxes. In 1837 he visited Washington, when peace was made between his people and their old-time adversaries, the Sioux. Afterward, his party, in company with Black Hawk, visited the principal cities of the Union. In 1832 the United States government gave the Indians a reservation on Iowa River, and in 1845 they were removed to Kansas. In 1848 he was poisoned by an Indian of the Black Hawk band. He was not a hereditary chief, but attained his eminence by the force of his own powers.

KEOSAUQUA, a village and the capital of Van Buren County, southeastern Iowa, on a loop in the Des Moines River, 40 miles above its mouth, and on the Chicago, Rock Island and Pacific railroad. Grain and live-stock, building-stone and hardwood lumber are the products of

Keosauqua and its vicinity. Population 1890, 831; 1900, 1,117.

KEPHIR, a fermented milk. What *koumiss* is to the inhabitants of southwestern Russia, *kephir* is to those of the northern Caucasus. In its preparation, cow's, sheep's or goat's milk is fermented in leathern bottles with *kephir-grains*. These grains are masses of fungi and bacteria. At a given stage the *kephir-grains* are removed and dried in the sun, when they are ready for another service. On analysis it is concluded that the fermentation of the milk is entirely due to *Saccharomyces Mycoderma*.

KÉRATRY, ÉMILE, COMTE DE, a French soldier and politician; born in Paris, March 20, 1832, of an ancient Breton family, his father being Count Auguste Hilarion Kératry, who died in 1859. Having completed his studies at the lycéums of St. Louis and of Louis-le-Grand, he enlisted as a volunteer, went through the Crimean campaign, and in 1861 engaged in guerrilla warfare in Mexico. In this service he distinguished himself by his bravery and decision, and afterward was appointed officer of ordnance to Marshal Bazaine. The Comte de Kératry was mentioned several times in the "Order of the Day" in Africa and Mexico, but in 1865 retired from the service. At this period he had received the Legion of Honor, and had been decorated with several foreign orders. On his return to France he devoted himself to literary pursuits, and contributed to the *Revue Contemporaine* a remarkable series of articles on the Mexican expedition, in which he severely attacked the government and the conduct of Marshal Bazaine. Soon afterward he became editor of the *Revue Moderne*, in which periodical he continued his accusation. In 1869 he was returned by the electors of Brest to the Corps Législatif, when he associated himself with the new Liberal Tiers Parti. On the establishment of the Government of the National Defense in September, 1870, he was made prefect of police, but in the following month he escaped in a balloon from Paris, then besieged, and proceeded on a diplomatic mission to Madrid, where, soon afterward, he was succeeded by M. Edmond Adam. He was the author of *Le Contre-Guerrilla* (1867); *La Créance Jecker* (1867); *L'Élévation et la Chute de Maximilien* (1867); a work on French events, entitled *Le 4 Septembre et le Gouvernement de la Défense Nationale* (1871); *Armée de Bretagne 1870-71* (1874); *Mourad V, Prince, Sultan, Prisonnier d'État* (1878); and *À Travers le Passé, Souvenirs Militaires* (1887).

KERITE OR **ARTIFICIAL CAOUTCHOUC**, a compound invented by A. C. Day. It is used principally for insulating, and is made by vulcanizing, by means of sulphur, a combination of animal or vegetable oil with India rubber.

KERMADEC, a cluster of four small volcanic islands in the Pacific, 450 miles N.E. of New Zealand, between 29° 10' and 39° 30' S. lat. and 177° 45' and 179° W. lat. The largest is Sunday Island, 20 miles in circumference; it is very rugged and heavily timbered. The soil is very

rich, and fish are plentiful about the coast of all the islands. Area, 15 square miles. Population 1893, 7.

KERMESITE. See **MINERALOGY**, Vol. XVI, p. 396.

KERMESSE OR **KIRMESSE**, a festival of Holland and Belgium, formerly religious, but now secular. All sorts of amusements and outdoor sports are indulged in, and usually it is held out of doors. In order to prevent the degeneracy of the custom and an overcrowding of the ground, Joseph II of Flanders ordered all the festivals to be held on the same day, but the rule disappeared with the Austrain domination.

KERN, a river of Kern County, southern California, rising on Mount Whitney, and flowing south, east and north into Lake Tulare. Length, 210 miles. Its course is through magnificent scenery, especially in its upper part.

KERN, JACQUES CONRAD, a Swiss statesman; born in 1808, near Arenenberg, in the canton of Thurgau, Switzerland. After studying at the gymnasium of Zurich, he proceeded to the university of Basel, to study theology, which he gave up; became a law student, and finished his education in the schools of Berlin, Heidelberg and Paris. From 1837 he performed in his canton the duties of president of the supreme court of judicature, and those of president of the council of education. He was, from 1833, under the old compact as under the new federal constitution, regularly chosen representative of his canton in the Diet or in the National Assembly. In 1838, when France demanded the extradition of Louis Napoleon, he was largely influential, in the Diet, in stirring up the Swiss to refuse the demand. He was active in the preparation of the federal constitution (1848); founded the Polytechnic School of Zurich, and at the conference of the great powers in Paris represented Switzerland. He died in Zurich, April 15, 1888.

KEROWLY. See **KARAULI**, Vol. XIV, p. 4.

KERRVILLE, a town and the capital of Kerr County, southern central Texas, on the Guadalupe River, the terminus of a branch of the San Antonio and Aransas Pass railroad, 89 miles W. of Austin. It is in a cotton, lumber, and stock-raising region, and has a wind-mill factory and flour-mills. Population 1900, 1,423.

KERSEYMERE, a corruption of the word *casimere* (cashmere), sometimes abbreviated to *kersey*, a fine woolen fabric made in England and the United States, intended for men's clothes. In the latter country the cloth is known as *cassimere*. Another form of *kersey* is a coarse twilled fabric made from long wool in the north of England.

KERSHAW, JOSEPH BREVARD, an American soldier; born at Camden, South Carolina, Jan. 5, 1822. He was admitted to the bar in 1843; served in the state senate from 1852 to 1857, and was a member of the secession convention in 1860. When the Civil War broke out he raised a regiment and joined the Confederate army; became a major-general before the close of the war,

and was then imprisoned for several months at Fort Warren. He was engaged in the battles of Bull Run, Antietam, Fredericksburg, Chancellorsville and Chickamauga, and it was his brigade that led Longstreet's charge at Gettysburg, in which he lost half his men. He was president of the state senate (1865-66), judge of the circuit court of the state (1877-93); and at the time of his death was postmaster at Camden. He died at Camden, April 13, 1894.

KERVILER, RENÉ POCARD, a French civil engineer; born at Vannes, France, Nov. 13, 1842; received his education at the École Polytechnique and at the École des Ponts et Chaussées. He was sent with various commissions to England, Holland and Belgium, and then, in succession, to Tarbes, St. Briec and Nantes. In 1874 he was sent to St. Nazaire to construct the Penhouët basin; was made engineer-in-chief and decorated with the cross of the Legion of Honor. Among his writings are a series of papers on the French Academy, its history, leaders and patrons; *Recherches et Notices sur les Députés de la Bretagne aux États Généraux* (1888); *La Pucelle* (1882); and *Répertoire Général de Bibliographie Bretonne*.

KERVYN DE LETTENHOVE, JOSEPH MARIE BRUNO CONSTANTIN, BARON, a Belgian historian; born at St. Michel, near Bruges, Aug. 17, 1817. From an early age he devoted himself to historical studies. He was for many years a member of the Chamber of Representatives. When the Conservatives came into power in July, 1870, he accepted office under Baron d'Anéthan as Minister of the Interior, and retained that post until the resignation of the ministry in December, 1871. He was author of *Histoire de Flandre* (1850); *Étude sur les Chroniques de Froissart*, which was "crowned" by the French Academy in 1856; *Les Huguenots et les Gueux* (1883, 1886); *Marie Stuart, l'Œuvre Puritaine, le Procès, le Supplice* (1889); *Histoire et Chroniques de Flandre* (1879); *Jacques d'Arvelde* (1863); *Le Prince d'Orange* (1867); and *Les Chroniques des Comtes de Flandre* (1849). He likewise edited the works of Chartellain (6 vols.) and *Lettres et Négociations de Philippe de Comines*. He died April 3, 1891.

KETTELER, WILLIAM EMANUEL VON, a German ecclesiast and polemic writer; born at Münster, Westphalia, Dec. 25, 1811. He studied law and entered the civil service of his native city; but, under the influence of the Galitzic circle, he began studying theology and became a priest (1844). In 1850 he became bishop of Mayence. His aim in life was to restore the Catholic Church to the place which it held during the middle ages, and therefore opposed with all his might the establishment of a German empire under the Protestant house of Hohenzollern. He also opposed Bismarck unceasingly, as he believed his policy to be antagonistic to the Roman Catholic Church. Among his writings is *Die Arbeiterfrage und das Christenthum* (1864), besides a large number of pamphlets of a polemic character. He died at Burghausen, Bavaria, July 13, 1877.

KEUKA COLLEGE, a co-educational institution, situated at Keuka, Yates County, New York. It was organized in 1892, under the control of the Free Baptist Church. The nearness of Lake Keuka adds to its natural advantages. With a student body of 150 there is a faculty numbering 12. The income-bearing property amounts to \$75,000, and there is a library of over 2,000 volumes.

KEUKA LAKE, a Y-shaped body of water, mostly in Yates County, western central New York, in a beautiful undulating vine-clad region. It extends from Hammondsport to Penn Yan, about 20 miles long. Its width is about two miles, and it is 200 feet deep. It has a line of steamers on it, and is connected by canal with Seneca Lake, its outlet being at Penn Yan.

KEUPER GROUP. See GEOLOGY, Vol. X, pp. 352, 353.

KEWANEE, a post village of Henry County, northwestern Illinois, on the Chicago, Burlington and Quincy railroad, 132 miles W. of Chicago. It has foundries and machine-shops, several wagon and carriage shops, and manufactories of agricultural implements, soil-pipe, pumps, and of steam-heating apparatus. In the vicinity are inexhaustible beds of bituminous coal. It has good public schools, and a public library containing 6,000 volumes. Population 1890, 4,569; 1900, 8,382.

KEWAUNEE, a village and the capital of Keweenaw County, eastern Wisconsin, on Lake Michigan, at the outlet of Keweenaw River, on the Green Bay, Winona and St. Paul railroad, 26 miles E. of Green Bay. It contains a saw-mill, foundry, flour-mills, a pearl-button factory, machine-shop, furniture factory, and has a large trade in wheat and lumber. Population 1895, 1,529.

KEWEENAW SERIES, in the geology of North America, a group of rocks, forming a sub-classification of the Algonkian or Huronian formation. In its restricted and more intelligible sense it relates only to the alternating sandstone, amygdaloid and conglomerate formation of the western south shore of Lake Superior, but has been extended by some geologists so as to form a corporate part of the Huronian, in a hollow basin of which series lies Lake Superior. The Keweenaw Series proper extends along upper Michigan and Wisconsin, and touches the eastern edge of Minnesota, but does not reach the northern shore of the lake. This sandstone and conglomerate formation contains the famous copper-mines of northern Michigan and numerous quarries of Old Red or Potsdam Sandstone, and, with the superincumbent gravel-deposits, reaches, in places, a thickness of thousands of feet.

KEW GARDENS, London, were first formed as a botanic garden by the Princess Augusta of Saxe-Gotha, dowager Princess of Wales, in 1760. A treasury committee to consider the management was appointed in 1838, and the gardens were transferred to the Commissioners of Woods and Forests in 1840. The Botanic Garden was opened to the public, free, in 1841; the Arboretum, in 1847. The Palmhouse was built

in 1848; the Temperate-house in 1862. There are 248 acres on the grounds, 70 acres of which are in the Botanic Gardens proper, the rest being in the Arboretum. They form the most important botanical establishment in the world.

KEW MAGNETOMETER. See **METEOROL-OGY**, Vol. XVI, p. 161; and **MAGNETISM**, Vol. XV, pp. 239, 240.

KEW OBSERVATORY, Old Deer Park, Richmond, Surrey, England, was built by George III, in preparation for the famous transit of Venus in 1769. The building eventually was handed over to the British Association for the Advancement of Science in 1842, under the title of the Kew Observatory. The connection between the British Association and the Kew Observatory lasted for thirty years, until 1871. Mr. J. P. Gassiot, who was then the chairman of the Kew Committee, made the offer to endow it with a sum of £10,000 if the Royal Society would nominate a Kew committee, who should have entire control over the management of the observatory and over the income from the trust fund, and cause magnetic and meteorological observations to be continued in perpetuity, which offer was accepted. It is subsidized as the central station of the Meteorological Office for the system of self-recording observations, as a place where new instruments intended for other observatories can be tested beforehand, as a school where intending observers can be trained practically, and lastly, as an experimental laboratory, where the efficiency of new designs of meteorological instruments may be tried thoroughly. A largely increased and increasing number of instruments are continuously in progress of verification, suitable fees being charged to the public and the various government offices to defray the cost of the examination. During 1892 an elaborate piece of apparatus, designed by Major Darwin, for the purpose of examining photographic lenses for the public, was added to the verification appliances. See also **OBSERVATORY**, Vol. XVII, p. 710.

KEY. One of the various systems of tones in music, in each of which the numbers have the same relations among themselves, although they are of other absolute pitch than the corresponding numbers of the remaining keys. They are considered with special reference to the relation of the other tones to the tonic or key note. See also **MUSIC**, Vol. XVII, pp. 88, 89, 105.

KEY, SIR ASTLEY COOPER, an English admiral; born in 1821; was educated at the Portsmouth Naval College; entered the navy as lieutenant in 1835; was in constant service, and for gallantry was made commander in 1845 and captain in 1850. He served throughout the Baltic campaign of 1855, in 1857 during the Indian mutiny, and in China in 1858. He was placed in charge of the Naval Ordnance Bureau, and superintended the first attempts in armor-plate manufacture. He was superintendent of the Portsmouth navy-yard, and principal of the Greenwich Naval College in 1873-76. He became an admiral in 1878, and

was first naval lord of the admiralty. He died March 3, 1888, in Maidenhead.

KEY, ERNST AXEL HENRIK, a Swedish pathologist; born in Småland, Sweden, in 1832; was educated as a physician at the University of Lund; later studied at the Seraplinn Hospital, Stockholm, and then with Max Schultze at Bonn, and with Virchow in Berlin. In 1862 he became professor of pathology in Caroline Institute, Stockholm; associate editor of *Medicinskt Arkiv* (1863-68); and editor of *Nordiskt Medicinskt Arkiv* from 1869; and represented his city in the lower house of Parliament in 1882. He contributed to scientific literature, *Studien in der Anatomie des Nervensystems und des Bindegewebes*, for which he was awarded the Montyon gold medal by the French Academy in 1876.

KEY, FRANCIS SCOTT, an American poet; born in Frederick County, Maryland, Aug. 9, 1780. He studied law in the office of his uncle, and practiced law at Frederick City, Maryland, until he became district attorney in Washington, District of Columbia. When the British invaded Washington in 1814, they seized Dr. William Beanes, a planter, as a prisoner, and Key, aided by President Madison, resolved to release him. He went with John S. Skinner, agent for the exchange of prisoners, in a cartelship, to the British general, Ross, who finally consented to Dr. Beanes's release, but detained the party during the attack on Baltimore. From their ship they could see the flag on Fort M'Henry nearly all night by the glare of the battle; but before morning the firing ceased, and they watched most anxiously to ascertain which colors floated on the ramparts in the morning. Key's feelings, when he saw that the stars and stripes had not been hauled down, found expression in the *Star-Spangled Banner*, which gained for him a lasting reputation. It was to be sung to the tune, "Anacreon in Heaven." The verses and tune soon became popular throughout the United States. A collection of Key's poems was published in 1857. James Lick, of California, bequeathed the sum of \$60,000 for a monument to Key. It was erected in Golden Gate Park, San Francisco, in 1887. He died in Baltimore, Maryland, Jan. 11, 1843.

KEYES, ERASMUS DARWIN, an American soldier; born at Brimfield, Massachusetts, May 29, 1810. He was graduated from the United States Military Academy in 1832; served in Charleston harbor during the nullification troubles in 1833; and in 1837-41 was aide to General Winfield Scott. After being made captain he served as instructor of artillery and cavalry at West Point from 1844 to 1848, and afterward served in the field on the northwestern frontier. During the Civil War he fought as brigade-commander in the first battle of Bull Run; commanded the Fourth Corps of the Army of the Potomac under General McClellan; and was engaged actively in the Peninsular campaign, which gained for him the promotion to major-general of volunteers. In 1863 he took part in General Dix's expedition against Richmond. He resigned in 1864. He

then removed to California, where he became president of the Mexican Gold-Mining Company (1867-69) and vice-president of the California Vine Culture Society (1868-72). In 1884 General Keyes published *Fifty Years' Observation of Men and Events*. He died at Nice, France, Oct. 14, 1895, and was buried the following January, with full military honors, at West Point.

KEYPORT, a post town of Monmouth County, central eastern New Jersey, on Raritan Bay, and on the Central Railroad of New Jersey, 25 miles S.S.W. of New York City. Here are flour-mills, a fruit-canning factory, wagon and carriage and sash and blind factories, a clam bouillon factory and a large brick-yard, and an important enterprise of the town is growing oysters, which were introduced from Virginia. It is very popular as a summer resort. Population 1900, 3,413.

KEYSER, a town and the capital of Mineral County, eastern West Virginia, on the Baltimore and Ohio and the West Virginia Central and Pittsburg railroads, 20 miles S.W. of Cumberland, Maryland, and on the North Fork of the Potomac. It has some railroad machine-shops, a roundhouse and manufactories of wagons and lumber, and has considerable trade in grain, wool and cattle. Population 1890, 2,165.

KEYSER, PETER DIRCK, an American surgeon; born in Philadelphia, Feb. 8, 1835; made a study of chemistry in Philadelphia, and went to Europe in 1854, but returned to enter the army in the Civil War. He was forced to resign on account of ill-health during the war, so he went back to Germany, where he was graduated from the University of Jena in 1864. Returning, he entered the army as acting assistant surgeon. In 1865 he resigned and took up private practice in Philadelphia. He was successively surgeon in charge of the Philadelphia Eye and Ear Infirmary (1868); ophthalmic surgeon to the medical department of the German Society of Philadelphia (1870); and a surgeon to the Wills Eye Hospital in Philadelphia (1872); was a member of the Pennsylvania Medical Society, and contributed to various magazines in the United States and Europe on strictly scientific subjects. Among his works are *On the Use of Chloral Hydrate after Operations on the Eye* (1871); *On Congenital Hereditary Dislocation of Both Lenses*; and *Phosphatic Degeneration of the Cornea* (1874).

KEY WEST, a city and port of entry in Florida, the southernmost city of the United States. Among the prominent buildings are a city-hall, county court-house, custom-house, government barracks, marine hospital, United States court-house; and Fort Taylor, a casemated pentagonal brick structure, forms the principal fortification of the island. The most important business is the making of cigars. As the climate of Key West is remarkably equable and free from the extremes of cold and heat, Key West has of recent years become a famous winter resort, especially for consumptive patients. "Key West" is a mispronunciation of the Spanish name of the island, *Cayo Hueso*, meaning Bone Key. Population

1890, 18,080; 1900, 17,114. See also KEY WEST, Vol. XIV, pp. 55, 56.

KHABUR, an affluent of the Euphrates. See MESOPOTAMIA, Vol. XVI, p. 48.

KHĀIBAR PASS, a pass over the Suláiman Mountains, forming part of the great northern military route between India and Afghanistan. It begins a little west of Pesháwa, in lat. 34° N., where the Punjab state railway stops, and runs up to the northwest, through the mountains at their juncture with the Safid Koh Range, and ends at Dhaka fort, opposite Lalpura, in the valley of the Kabul. The pass is about 33 miles long, and varies in width from 10 feet, in a very few places, to 450. The summit is 1,970 feet above Dhaka.

KHALID, BEN AL-WALID, a Moslem general; born in Mecca, in 582. He was in command of the Koreish cavalry at the battle of Ohod, when Mohammed was defeated; but being converted to the faith in 629, he served under the Caliphs from that time. He led the Moslem forces in northwestern Arabia, and won the battle of Yermouk, which caused Heraclius to abandon Syria in 636, and captured Mecca in 635. He was disliked by the Caliph Omar, and passed his last years in disgrace at Enusa, where he died in 642. See also ARABIA, Vol. II, p. 257.

KHALKAS. See MONGOLS, Vol. XVI, p. 744.

KHALLIKAN. See IBN-KHALLIKAN, Vol. XII, p. 609.

KHARAY. See KARAK, in these Supplements.

KHAYAM. See OMAR KHAYAM, Vol. XVII, p. 771.

KHEDIVE, title of the Viceroy of Egypt. It was granted in 1866 to Ismail Pasha by the Turkish government, and Aug. 14, 1867, it was made hereditary, in consideration of which the annual tribute of Egypt was raised from £376,000 to £720,000. Since Great Britain came into control in 1882, the title of Khedive has been of only nominal importance.

KHORSABAD, an ancient village of Asiatic Turkey. Among the ruins here, discovered in 1843, were found the first historical cuneiform inscriptions of ancient Assyria. See also ARCHITECTURE, Vol. II, p. 399; and MADRAS, Vol. XV, p. 185.

KIAU-CHAU, a port, town, and district on the east coast of the Chinese province of Shan-tung, which were seized by Germany in Nov. 1897, and in the following March were by treaty transferred to Germany on a 99 years' lease. In April, 1898, the district was declared a protectorate of the German empire, and its administration entrusted to the navy department, a naval officer being placed at its head with the title of governor. The area of the protectorate is about 200 square miles, exclusive of the bay on which the port is situated, and it has a population of about 60,000. The garrison consists of marines and marine artillery, about 1,500 in all. Extensive coal mines, about 100 miles inland, at Wiehsin and Pashan, are about to be worked with German capital, by agreement with China, and concessions have also been granted for the construction of railways in the district.

KIANG-SI OR KEANG-SE, a province of CHINA (q.v.), Vol. V, pp. 635, 636.

KIANG-SU OR KEANG-SOO, a province of CHINA (q.v.), Vol. V, p. 635.

KICKAPOO INDIANS, a tribe of the Algonquin family of North American Indians, which were first found by French and English pioneers inhabiting the Ohio Valley and northward into Wisconsin and Michigan. They were first met by the Jesuit explorers on the Wisconsin River, but later, in 1763, were found in Indiana by the English. They were engaged in constant warfare with the Americans, and took part in the War of 1812. Treaties were signed at the close of that, and the Kickapoos moved westward and southward. At one time the majority of the tribe engaged in a marauding expedition into Texas and Mexico, but were brought back by the United States government and settled in Kansas and Indian Territory. In 1895 the Kickapoos in the United States numbered 502, of whom 231 were on a reservation in Nemaha County, Kansas, and 271 in eastern Oklahoma.

KICKING-HORSE PASS, a pass in the Rocky Mountains in lat. $51^{\circ} 26' N.$, through which the Canadian Pacific railroad runs. The scenery is very beautiful. Altitude, 5,296 feet.

KIDD, BENJAMIN, an English sociological writer; born in London in 1859; employed in the British civil service, having been for some years in charge of a statistical department at Somerset House. Practically nothing is known to the world concerning Mr. Kidd's life, although he is said to have contributed articles to the *Nineteenth Century*, *Cornhill* and other English reviews prior to the appearance of his book *Social Evolution* (1894).

This work created a sensation, not only among lay readers, but among theologians and scientists. It deals with social phenomena, and bears especially upon the problem of the intellectual and moral development of mankind, and the relation of biological science thereto. Admitting the truth of the doctrine of natural selection, it not merely makes the recent theories of Professor August Weismann the sole exponent of that doctrine, but it expands Weismannism to the degree of converting it into an active champion of the cause of supernatural religion.

In adopting Weismann's main contention, that acquired characters are non-transmissible in heredity and that variations are produced entirely through primordial determinant germ-cells, the book takes violent issue with the Darwinian view—now held by Mr. Herbert Spencer and others—that variations are produced by the transmission of acquired faculties arising through contact of the individual with the conditions of the external world. Mr. Kidd assumes that the older Darwinian view excludes the possibility of teleological explanations, and that Weismann's theory admits of them. Mr. Kidd is gifted with a vigorous and attractive style; and in assuming, as his predominant theme, that religion is the prime factor in human development, his methods

seemed so comprehensible to the uncritical reader, and he struck so responsive chords among many people of divergent classes, that his book had a warm reception. Reviewers and scientific critics attacked his theories as unsound and his deductions as absurd. They declared the work to be not only a pretentious piece of reasoning, but, in its entirety, positively incoherent. But the work supplied so great a want among those who felt alarm over the spreading materialistic implications of the teachings of modern biological science, that for every word of adverse criticism a host of writers arose in its defense. Unprejudiced and competent thinkers regard the work as unscientific and of no permanent value except, possibly, in stimulating the desire for deeper research. In 1898 Mr. Kidd published *The Control of the Tropics*.

KIDD, WILLIAM, a Scotch pirate, commonly known as CAPTAIN KIDD; born, probably, at Greenock, and is supposed to have been the son of a Covenanted minister, who died in 1679. The lad went early to sea, saw much hard service privateering against the French, and gained a high reputation for stubborn courage, and in 1691 a reward of £150 from the council of New York City. A ship of thirty guns was fitted out by a private company in London for suppression of piracy in the Indian Ocean and given to Kidd, who was furnished with the usual letters of marque. In January, 1697, he reached Madagascar, the chief rendezvous of the pirates, but ere long disquieting reports reached England that Captain Kidd was playing the game of pirate himself. After a two-years' cruise he returned to the West Indies, and a few months later had the temerity to go to Boston without securing himself by a safe-conduct. In spite of the half promises that had been made him, he was arrested and sent to England, where he was tried for piracy and the murder of one of his men. Of the latter charge he was formally found guilty and hanged at Execution Dock, London, May 24, 1701, protesting his innocence to the last. The trial was unfair, and it is at least doubtful if he was guilty of the crimes ascribed to him.

KIDNEY. See NUTRITION, Vol. XVII, p. 683.

KIDNEY, DISEASES OF. See PATHOLOGY, Vol. XVIII, pp. 387-389.

KIDNEY, OPERATIONS ON. See SURGERY, AMERICAN, in these Supplements.

KIDO, TAKAYOSHI, a Japanese statesman; born in the province of Choshu, Japan, about 1833; was one of the revolutionary party in his province in 1868, was instrumental in organizing the imperial army; and was a member of the Privy Council after peace had been restored. In 1872 he visited Europe and America as a member of the imperial embassy, but returned to become Minister of State; held an important office in the imperial household; and again became a member of the Cabinet, in 1875. He died June, 1881.

KIDRON OR CEDRON. See JERUSALEM, Vol. XIII, p. 636.

KIEKIE (*Freyinetia Banksii*), a climbing shrub of the family *Pandanacea*, or screw-pines. It yields an edible fruit said to be the finest indigenous

to New Zealand. It is found in the northern part of that country.

KIELLAND, ALEXANDER LANGE, a Norwegian novelist; born in Stavanger, Norway, Feb. 18, 1849. He was educated at the University of Christiania, and was admitted to the bar in 1872, though he never entered upon the practice of his profession. Instead, he purchased some brick-works near Stavanger, and managed the business connected with their running until 1881. He made several extended trips through Europe; in 1889 became editor of the daily paper, Stavanger *Avis*; and in 1891 burgomaster of Stavanger. He published *Novelletter* (1879); *Nye Novelletter* (1880); *Garman og Worsø* (1880); *Else* (1881); *Skipper Worsø* (1882); *Sne* (1886); *Jakob* (1891). A great many of his novels are connected by the introduction of characters appearing in them all. He also wrote a number of shorter dramas and farces, but none of them have been particularly successful.

KIEPERT, HEINRICH, a German geographer; born in Berlin, July 31, 1818. After studying geography as a specialty he explored Asia Minor in 1841-42, and became director of the geographical institute at Weimar, in 1845. After 1852 he delivered numerous lectures in Berlin; in 1859 was made professor in the university of that city; and in 1865 was appointed to a position in the statistical bureau there. His most important publications are *Atlas von Hellas*; *Historisch-geographischer Atlas der Alten Welt*, which passed through numerous editions; and *Neuer Hand-Atlas der Erde*. He also wrote *Lehrbuch der Alten Geographie* (1878); and *Travels in Asia Minor*.

KIESELGUHR. See DYNAMITE, Vol. VII, p. 583; and INFUSORIAL EARTH, in these Supplements.

KILAUEA, one of the largest volcanoes in the world. See HAWAIIAN ISLANDS, Vol. XI, p. 531.

KILBOURN OR KILBOURN CITY, a post village of Columbia County, Wisconsin, on Wisconsin River, 108 miles N.W. of Milwaukee. It is at the foot of the noted "Dalles of the Wisconsin," and is a pleasant summer resort. It is the center of the hop-trade of the Northwest, and it manufactures doors, sash and blinds, flour and other articles. Population, 1000, 1,134.

KILLEN, WILLIAM DOOL, an Irish educator and writer; born in Ireland, April 5, 1806. He engaged in the ministry from 1829 to 1842, when he became professor of church history and pastoral theology in Belfast Presbyterian College; in 1869 became president of the same institution; and in 1881 principal of the theological faculty of Ireland. He published *Plea of Presbytery* (1840); *The Old Catholic Church Traced to 755* (1871); *The Ecclesiastical History of Ireland from the Earliest Period to the Present Times* (1875); and *The Framework of the Church* (1890); was also one of the authors of *Presbyterianism Defended* (1839).

KILLER, the popular name of the genus *Orca*, in the family of dolphins (*Delphinidae*). They are very ferocious, and often attack and kill the whalebone whales. There are many species, but *O. gladiator* is the best known.

KILLIECRANKIE, a pass in northern Perth-

shire, on the River Garry, in a beautiful wooded region, 15 miles N.N.W. of Dunkeld. Here, on the 27th of July, 1689, Graham of Claverhouse, Viscount Dundee, was killed, while his troops totally defeated those of General Mackay, commander of the forces of William III. The Highlanders were discouraged, however, by the loss of their leader, and the insurrection was speedily put down.

KILLINGTON, a mountain-peak in Sherburne Township, Rutland County, Vermont, 7½ miles E. of Rutland. Its elevation is 4,380 feet, making it the third highest mountain in the State, and the view from its top is picturesque to a degree seldom seen outside of Switzerland.

KILMAINHAM TREATY. See HOME RULE, in these Supplements.

KILWA OR QUILOA, a seaport of German East Africa, acquired by Germany by purchase from the Sultan of Zanzibar in 1890. It is situated in lat. 8° 58' S., 150 miles S. of Zanzibar City. It is a regular coaling-station for the steamers of the German East Africa Company. Population 1893, about 7,000. See also ZANZIBAR, Vol. XXIV, p. 768.

KIMBERLEY, the chief town and capital of Griqualand West, in Cape Colony. It is situated close to the frontier of the late Orange Free State, 647 miles N. E. of Capetown, by rail. The climate is healthy, but hot in summer, and the death-rate is high, on account of the deaths of the diamond-miners, mostly natives. The town is supplied with water-works and electric lights, and has a number of handsome public buildings, including a town-hall, postoffice, high court, public library and botanical library. The great diamond mines here have all been brought under the control of the huge concern known as the De Beers Consolidated Company. In the mines controlled by this organization is found by far the greater part of the diamond output of the world. Their estimated yield per working day before the war was in value about ten thousand pounds sterling, and the owners used to pay out over five million dollars a year in wages.

When the war between Great Britain and the Transvaal broke out (Oct. 10, 1899), Kimberley was at once invested by the Boers. The British and Colonial troops in the town consisted of a detachment of the Loyal North Lancashire battalion, a battery of garrison artillery with some old 7-pounder muzzle-loaders, and a considerable number of volunteers raised and armed by the De Beers Mining Co. The English commander was Colonel (now Major-General) George Kekewich, with whom was shut up in the besieged town the Hon. Mr. Cecil Rhodes, who raised a regiment from his own purse—the Kimberley Light Horse. By the 20th of Oct. (1899), the town was completely invested by the Boers and the long and trying siege began.

The incidents of the siege, which lasted 123 days, were such as Ladysmith and Mafeking had experience of—the lively excitement of bombardment and assault, sortie and sniping, the battling daily against disease, the dodging of flying shell, with ever increasing anxiety over the scarcity of food, yet all borne uncomplainingly and with no thought of surrender. With General Roberts'

advance into the Orange Free State, the prospect finally brightened for the plucky defenders of Kimberley. The hope of relief rose high when it was known that a column of 10,000 men, under General French, was setting out from the Orange River on the 10th of Feb. (1900), to push its way northward, across the Riet and the Modder Rivers, towards the diamond city. A further happy omen was the British entry into and occupation of Jacobsdal, and the anticipated capture of Cronje's army, which followed some twelve days after the relief of Kimberley. Succor came to the latter on Feb. 15, General French entering Kimberley late in the afternoon of that day. European population 1891, 28,718. See also KIMBERLEY, Vol. XIV, p. 77.

KIMBERLEY, JOHN WODEHOUSE, EARL OF, an English statesman; born Jan. 7, 1826. He succeeded his grandfather as Baron Wodehouse (1846); was Under-Secretary for Foreign Affairs (1852-56 and 1859-61); ambassador to Russia (1856); special minister with regard to the Schleswig-Holstein question (1863); Lord-Lieutenant of Ireland (1864-66), during which time he was raised to the earldom of Kimberley; Lord of the Privy Seal (1868); Secretary of State for the Colonies (1870-74), and again in 1880; in 1882-85, Secretary of State for India; held the same position in 1886, and again in 1892, being also Lord-President of the Council; and in 1894 he became Secretary of State for Foreign Affairs, which office he retained till the fall of the Rosebery Cabinet in 1895.

KINCHINJINGA MOUNTAIN. See HIMALAYA, Vol. XI, p. 825.

KINDERGARTEN. For the origin and history of the kindergarten system of training children and the manual-teaching system, see KINDERGARTEN, Vol. XIV, p. 79. The spread of the system in the United States has been rapid and general. In all of the larger cities and in many of the towns, training-schools have been established for preparing teachers for primary school-work. In some cities the actual methods are carried in the primary grades of the public schools. The introduction of the system is in no small way responsible for the interest in manual training which has resulted in the establishment of numerous industrial institutes. In a commercial way the system has developed establishments for the manufacture of the apparatus used. Prominent among the advocates of the kindergarten system are Dr. Felix Adler, of New York City, and Elizabeth Palmer Peabody, who established the *Kindergarten Messenger*. The National Educational Association has a department devoted to the discussion of kindergarten methods. Especially has the system been successful in teaching the blind. Recognition has been given the kindergarten methods in many of the countries of South America.

KINETICS and KINEMATICS. See PHYSICAL SCIENCE, Vol. XIX, p. 2; and MECHANICS, Vol. XV, pp. 678-702.

KINETOGRAPH, an instrument for recording the motions of bodies, to be reproduced to the eye

by means of the kinetoscope (q.v.). The kinetograph bears the same relation to the kinetoscope as the recording diaphragm of the phonograph bears to the reproducing diaphragm. The human eye is capable of detecting and separating a maximum of about forty distinct impressions per second of time, and if more than forty are presented before the retina in a second of time, the eye will blend them into one continuous impression or view. The kinetograph is in part a photographic camera so constructed, with attachments and devices invented by Thomas A. Edison, that it records forty-six distinct and separate views of moving objects or scenes during each second of time. In other words, the kinetograph takes forty-six separate and distinct photographs of moving objects every second of exposure. These photographs are recorded on a long film, which is finished substantially as all photographs are finished, and is thus prepared for reproduction and exhibition by means of the kinetoscope. The mechanism has both a scientific and a popular interest.

KINETO-PHONOGRAPH. This name is applied to the combination of Thomas A. Edison's inventions known separately as the phono-kinetograph, phono-kinetoscope, kinetograph and kinetoscope. As arranged for use, a very contracted theater stage is set up, and towards it the kinetographic apparatus is directed to catch the continuous action of the players, while the phonographic portion of the apparatus simultaneously records the sounds they utter, or that come from the musical instruments accompanying. The actors have to be placed under a very strong light, and their utterances must be directed toward the phonograph, to secure good results. The task of causing the phonograph and kinetograph to act in exact unison was one of the most difficult features of the invention, and is accomplished by a most intricate and complicated mechanism. The photographic pictures are produced on a sensitized strip of celluloid, an inch and a half wide, inside of a drum. The celluloid strip is perforated to enable the teeth of a locking-device to hold it steady for nine tenths of the forty-sixth part of a second, which period is allowed for exposure and taking the photograph. Notwithstanding that the film has only the remaining one-tenth of the forty-sixth part of a second in which to make its travel for the next picture, yet the speed of travel maintained by the strip is 26 miles an hour. When the strip is used for exhibition, its great length is coiled away in a most ingenious manner in a case of suitable size. The perfected combination of these devices was completed in 1895, W. K. L. Dickson being associated with Mr. Edison in the work.

KINETOSCOPE, a companion invention to the kinetograph, by Thomas Edison, 1894. The photographic views taken by the kinetograph in rapid succession are exhibited in the same order by the kinetoscope, a mechanical device, operated by electricity, so constructed as to run the views at a speed of about forty-six a second. The views pass over a series of rollers which hold them steady. The kinetoscope is, for purposes of commercial exhibi-

tion, placed in a cabinet, in the top of which is a small window, covered with clear glass. The observer of the views looks down through this window, and the film passes before his eyes with such rapidity that he beholds practically one continuous picture. The apparatus is a cabinet about four feet high by two feet wide and one foot nine inches deep, and it contains a small electric motor. Among the pictures presented by the kinetoscope are the successive steps of a dancer and features of a stage production.

KING, CHARLES, an American soldier and author; born in Albany, New York, Oct. 12, 1844; graduated from West Point (1866); served in garrison duty (1866-69); at the Military Academy (1869-71); frontier duty (1874-79). He was made captain in May of 1879, and retired in June, on account of wounds received in line of duty. He was inspector-general of the Wisconsin National Guard and colonel of the Fourth Regiment (1882-89), and then became commander of cadets at the Michigan Military Academy. He wrote *The Colonel's Daughter* (1882); *Famous and Decisive Battles* (1884); *Marion's Faith* (1885); *Captain Blake* (1891); *Cadet Days* (1894); *Trooper Ross* (1895); *From School to Battlefield* (1898); and many shorter stories.

KING, CLARENCE, an American geologist; born in Newport, Rhode Island, Jan. 6, 1842. He graduated at Sheffield Scientific School (1862), and was connected with the geological survey of California (1863-66). In 1867 he was placed in charge of the United States geological survey of the fortieth parallel. In 1878 he was made the first director of the United States Geological Survey, but resigned in 1881, and afterward engaged in special investigations. *Systematic Geology*, published by the government, was written by him (1878); also *Mountaineering in the Sierras* (1871); and various articles in scientific journals in the United States and Europe. He was elected a member of the National Academy in 1876.

KING, RUFUS, an American statesman; born at Scarborough, Maine, March 24, 1755; graduated at Harvard College in 1777. He studied law and began practice in Newbury, Massachusetts, in 1780; became a member of the legislature in 1782, and was sent by it as a delegate to the Continental Congress at Trenton in 1784, and introduced a measure for the prohibition of slavery in the territories of the Northwest; was a member of the Federal Constitutional Convention; and was afterward instrumental in securing the ratification of the constitution by Massachusetts. He served in the United States Senate (1798-96), where his advocacy of the ratification of the Jay treaty with England won the admiration of Washington, who offered him the Secretaryship of State and appointed him Minister to England. This post he held until 1803, when he settled on a farm in Long Island. But in 1813 he re-entered public life, becoming United States Senator and serving till 1825, when he again became Minister to England. His health failing, he resigned in 1826. He was always opposed to slavery, and fought against it throughout his life; also opposed the second war with England, but gave it his

support after hostilities commenced. He died at Jamaica, Long Island, April 29, 1827.

KING, THOMAS STARR, an American clergyman; born in New York City, Dec. 17, 1824. Having first served as a clerk in a store, in 1840 he was made an assistant teacher in the Bunker Hill grammar-school, and in 1842 became principal of the West grammar-school of Medford, Massachusetts. In 1845 he began to preach, and in 1846 was called to a church in Charlestown. In 1848 he became pastor of the Hollis Street Unitarian Church, Boston, and held this post for 11 years. In 1860 he accepted a call to San Francisco, California, remaining there until his death. It was largely, if not wholly, due to his patriotic efforts that California remained loyal to the Union, and that the United States Sanitary Commission secured the generous sums of money which enabled it to carry on its work during the war. Mr. King was the author of *The White Hills: their Legend, Landscape and Poetry* (1859); *Patriotism and other Papers* (1864); and numerous printed sermons. He died March 4, 1864.

KING, WILLIAM RUFUS, an American statesman; born in Sampson County, North Carolina, April 7, 1786. In 1806 he was admitted to the North Carolina bar, and in the same year became a member of the state legislature. He was re-elected in 1808, and in 1809 was sent to Congress, where he remained until 1816, when he was made secretary of legation at Naples and afterward at St. Petersburg, holding the position till 1818. He then removed to Dallas County, Alabama, and on the adoption of the state constitution became a United States Senator. He served until 1844, when he was appointed minister to France. In this capacity he paved the way for the annexation of Texas without the intervention of foreign powers. In 1848 he again became United States Senator, and in 1852 was chosen Vice-President of the United States on the ticket with Franklin Pierce, taking the oath in Havana, but was never able to enter on the duties of the office. Died in Dallas Co., Ala., April 18, 1853.

KING AT ARMS. See HERALDRY, Vol. XI, 687.

KING-CRAB. See CRUSTACEA, Vol. VI, p. 662.

KING-FISH OR OPAH. See YELLOW-TAIL, Vol. XXIV, p. 738.

KING-FISHER. See Vol. XIV, pp. 81, 82.

KINGLAKE, ALEXANDER WILLIAM, an English historian; born at Wilton House, near Taunton, Somersetshire, Aug. 5, 1809. The family was in affluent circumstances, and his mother, a friend of the younger Pitt, encouraged the boy in out-door sports and Homeric study. His academic training came through Eton and Trinity College, Cambridge, where he took his bachelor's degree, in 1832. Five years later he was called to the bar at Lincoln's Inn, and he gained considerable chancery practice, though he was independent of professional work. While a law student he traveled in Syria, and wrote an account of his adventures, his fastidious taste demanding nine years of recasting and reflection before he gave it to the public in 1844. Then he guaranteed the publisher against loss, although *Eothen*, with its deft descriptive touch and per-

sistent geniality and delicate sense of what is vital or picturesque, is one of the best books ever written concerning the East. In 1845 he witnessed the relentless campaign of the French against Abd-el-Kader, in Algeria; in 1854 he was with his friend Lord Raglan in the Crimea, as a student of the military art; in 1857 he sat in Parliament for Bridgewater, but a feeble voice prevented his making an impression commensurate with his abilities. He held his seat for eleven years. In politics he was a liberal, and had in detestation the tyrannies of King Bomba in Naples and the usurpations of Napoleon III, especially his annexation of Nice and Savoy to France, in 1860. On the death of Lord Raglan, his widow delivered his papers into Kinglake's hands, and he set about writing *The Invasion of the Crimea*, of which the first volume appeared in 1863 and the eighth and last volume came out twenty-four years later. This was intended to be his great monument, and the book has in its vividness some of the charm of *Eothen*. The field was left to him, but the Crimean war was not an heroic one, and the knightliest affection could not make a hero of Raglan. The prejudices of the author were noble ones, both in his likes and dislikes, but they disqualified him for impartiality. The criticism of Napoleon III was so severe that the sale of the work was prohibited in France during the empire. Died in London, Jan. 2, 1891.

KINGMAN, a city and the capital of Kingman County, southern central Kansas, on the Ninnescah River, and the Hutchinson and Southern, the Missouri Pacific and the Wichita and Western railroads, 45 miles W. of Wichita. It has abundant water-power, a large planing and lathe mill, a plow and agricultural-implement factory, and a large fire-extinguisher factory. It is the shipping-point for considerable live-stock and grain. Population 1890, 2,390; 1900, 1,785.

KINGO, THOMAS. See DENMARK, Vol. VII, p. 90.

KINGSBOROUGH, EDWARD KING, VISCOUNT, an Irish statesman and author; born in Cork, Nov. 16, 1795. From 1820 to 1826 he represented Cork in Parliament, and then devoted himself to his great work, *The Antiquities of Mexico, comprising Facsimiles of Ancient Mexican Paintings and Hieroglyphics, together with the Monuments of New Spain by M. Dupaix, with their respective Scales of Measurement, and accompanying Descriptions, the whole illustrated with many valuable inedited MSS.* The first of nine volumes was published in 1831, and the eighth and ninth after his death, which occurred in Dublin, Ireland, resulting from a fever contracted in a debtors' prison, Feb. 27, 1837.

KING'S BENCH, same as **QUEEN'S BENCH**. See BENCH, Vol. III, p. 556; RECORDS, Vol. XX, p. 311.

KING'S OR QUEEN'S COUNSEL are certain barristers-at-law, in England and Ireland, who have been appointed by letters-patent. The office is entirely honorary, but it gives a right of pre-audience in all the courts, according to the date of appointment. The appointment practically belongs to the Lord Chancellor. See also BARRISTER, Vol. III, p. 394.

KING'S DAUGHTERS, THE ORDER OF THE, a

Christian sisterhood of service composed of many small circles of women united in one great organization, now numbering more than 150,000 members. It is a Christian but unsectarian order, and its members may be found in all churches and in almost all nations. It originated in New York City, in 1886, and has spread over nearly every state in the Union, having its representatives in Canada, England, France, Italy, India, Australia, New Zealand and other countries. At first it was intended to limit local branches to ten members, but this was found impracticable and was given up. Its members are bound individually and collectively to serve the needy and the suffering, to consider the poor and to be helpful in good work. Each individual circle may choose its own field of labor, but cannot escape the obligation of service. The badge is a small Maltese cross of silver, engraved with the initials I.H.N. ("In His Name"), often worn with a knot of purple ribbon. The order is an incorporated society, of which this little cross is the seal.

KING'S EVIL. See SCROFULA, Vol. XXI, p. 554.

KINGSLEY, HENRY, an English author, brother of Rev. Charles Kingsley; born at Holne, Devonshire, England, in 1830. After graduating at Oxford, he went to Australia, where he remained five years. In 1858 he returned to England and remained until he became war correspondent for his own paper, the *Daily Review*, in the Franco-Prussian War. He wrote *Recollections of Geoffrey Hamlyn* (1859); *Ravenshoe* (1861); *Austin Elliot* (1863); *The Hillyars and the Burtous* (1865); and other works. He died May 24, 1876. His daughter, Mary H., a distinguished traveller, scientist, and author, died at Simonstown, South Africa, June 3, 1900.

KING-SNAKE, the common name of a snake, known to naturalists as *Ophiobolus getulus*, which the negroes of the southern United States believe to be a ruler over other serpents, and to even destroy the deadly rattlesnake by constriction. It is a beautiful snake, usually black with a series of white rings, hence sometimes known as chain-snake. The color is highly variable, and many varieties have been recognized. The so-called milk-snake is one variety. The king-snake is not venomous.

KING'S RIVER, a stream of Humboldt County, northwestern Nevada, rising in Malheur County, Oregon, near the state boundary, and flowing generally southwest, disappearing about sixty miles northeast of Winnemucca. Its valley contains about seventy-five thousand acres of good grazing-ground. It abounds in trout. Length, about two hundred miles.

KINGSTON, capital of JAMAICA, q.v., Vol. XIII, p. 550.

KINGSTON, a city of southeastern New York, and capital of Ulster County. The city includes the former villages of Kingston, Rondout and Wilbur. It is on the West Shore, the Ulster and Delaware and the Walkill Valley railroads. It is also near the northeast terminus (Eddyville) of the Delaware and Hudson canal, which connects it with the coal region of Pennsylvania. Large quantities of coal are brought here by this canal and reshipped on the Hudson. At Kingston many steamboats are owned, which are

engaged in the river traffic. It has regular steam-boat connection with New York, Albany and many intermediate stations. Kingston is the center of a large ice industry, and does an immense business in making hydraulic cement. It also ships great quantities of bluestone, a metamorphic Devonian sandstone, and an excellent material for flagging. It has good educational advantages and a good-sized public library. Population 1890, 21,261; 1900, 24,535. See KINGSTON, Vol. XIV, p. 89.

KINGSTON, a borough of Luzerne County, northeastern Pennsylvania, on the Delaware, Lackawanna and Western and the Lehigh Valley railroads, in the anthracite coal region, and on the north branch of the Susquehanna, opposite Wilkesbarre, with which it is connected by two bridges and an electric street-railway. An imposing monument here erected commemorates the massacre of Wyoming. It is the seat of Wyoming Seminary, a Methodist co-educational institution with 25 instructors and 550 pupils. Population 1900, 3,846.

KING VULTURE. See VULTURE, Vol. XXIV, p. 302.

KINKAJOU. See MAMMALIA, Vol. XV, p. 441.

KINKEL, JOHANN GOTTFRIED, a German poet; born at Oberkassel, Aug. 11, 1815; was educated for the ministry at Bonn, and preached until 1848, when he became involved in the revolutionary movement and was sentenced to imprisonment for twenty years; through the aid of Carl Schurz escaped and went to America in 1851, but removed to England in a short time, and became professor of German language and literature, first at Hyde Park College, and later at Bedford College. In 1866 he became professor of art history at the Technical Institute of Zurich. He wrote the following poems: *Gedichte* (1843); *Otto der Schütz* (1846); *Nimrod* (1857); and in prose, *Geschichte der Bildenden Künste bei den Christlichen Völkern* (1845). He died Nov. 13, 1882.

KINMUNDY, a city of Marion County, southern central Illinois, 229 miles S. of Chicago, on the Illinois Central and the Chicago, Paducah and Memphis railroads. Brick is manufactured here, and farming, especially fruit-raising, and coal-mining are the chief industries of the neighborhood. Population 1890, 1,045; 1900, 1,221.

KINNIKINICK, a native name applied to several plants, whose leaves were used by the Indians for smoking with or without tobacco. The name has come to be especially applied to *Arctostaphylos Uva-ursi*, the common bearberry, an ericaceous plant, and to *Cornus sericea*, the common silky dogwood.

KINSTON, a town and the capital of Lenoir County, central eastern North Carolina, on the Neuse River (navigable), and on the Atlantic Coast Line and the Atlantic and North Carolina railroads, 30 miles W.N.W. of Newbern. It has manufactories of carriages and plows, and is a shipping-port for cotton. It is in an agricultural region, and has lumber-mills, turpentine distilleries, and carriage and plow factories. Population 1890, 1,726; 1900, 4,106.

KINTYRE OR **CANTYRE**, a peninsula of Argyleshire, Scotland, between the Atlantic and the Firth of Clyde, 42 miles long, and $4\frac{1}{2}$ to $11\frac{1}{2}$ miles broad. At the north end it connects with the

mainland by the isthmus of Tarbert. The surface is diversified by a ridge of low, moorish hills, with many lochs. Coal is found near Campbelton. A lighthouse, 297 feet above sea-level, stands on the Mull of Kintyre, which is overhung by Ben-na-Lice (1405 feet), and is 13 miles distant from Ireland. Kintyre contains numerous ruins of ancient architecture.

KIOSK (Turkish), a small open summer-house or ornamental pavilion used in the East and imitated in the parks and gardens of the West. It consists of a dome or canopy resting on four or more detached columns inclosing an open space. The name is also applied to small shops for the sale of papers in French towns.

KIOWAS, a tribe of North American Indians, formerly living from the Platte River southwestward to the Rio Grande, but now confined to a reservation in the southwest part of Indian Territory. They are exceedingly intractable and hard to civilize. In 1895 the Kiowas numbered 1,037. See also INDIANS, Vol. XII, p. 832.

KIP, WILLIAM INGRAHAM, an American Protestant-Episcopal bishop; born in New York City, Oct. 3, 1811. He graduated at Yale, and in 1835 took orders, and was called to St. Peter's Church, Morristown, New Jersey. He then served as assistant at Grace Church, New York City, and in 1838 became rector of St. Paul's at Albany. In 1853 he was made missionary bishop of California, and four years later bishop. He was author of *The Lenten Fast* (1843); *The Double Witness of the Church* (1844); *The Christmas Holidays in Rome* (1845); *Early Jesuit Missions in America* (1846); *Early Conflicts of Christianity* (1850); *The Catacombs of Rome* (1854); *Unnoticed Things of Scripture* (1868); *The Olden Times in New York* (1872); and *The Church of the Apostles* (1877). He died in San Francisco, April 7, 1893.

KIPLING, RUDYARD, an Anglo-Indian author whose virile pen has enshrined the virtues and detailed the failings of the English soldier of the present day, was born in Bombay, India, in 1865. His father, JOHN LOCKWOOD KIPLING, was for many years the head of the Mayo School of Industrial Art at Lahore, and also curator of the Government Museum there. A scholarly, artistic man, his *Beast and Man in India* brought him recognition and fame. Like many another "Baba Sahib," his son, the future laureate of the barrack-room was sent home for his education. If his *Baa, Baa, Black Sheep* be autobiographical, the lot of the keenly-sensitive Anglo-Indian child, always precocious and used to the worship of a score of retainers, was cast in far from pleasant places, in a preparatory school at Southport in Lancashire. It was a fight for existence with young barbarians, in which caste was forgotten and force alone prevailed. After some years at school

RUDYARD KIPLING.

at Westward Ho, in Devonshire, he went out to India in 1880 as sub-editor of *The Lahore Civil and Military Gazette*. Occasional glimpses of his experiences are to be seen in his *In and Out of India*, *The City of the Dreadful Night*, and that masterly short story, *The Man who Would be King*. When others fled to the hills in the heated term, Kipling, amid printer's ink and perspiration, "ran" the paper and filled up a column occasionally with some terse graphic prose. His vacations were spent with Strickland, of the Indian police, whom he has portrayed as an investigator of native character in out-of-the-way places; among the thousand and one smells and dialects of the bazar, and in the depths of the Indian forest, whence sprang later his Mowgli, blood-brother of every beast in the *rukh*.

His genius for doing things in novel fashion showed itself in his first bid for public fame. Collecting his ballads in book-form and in the colored cover peculiar to an Indian Departmental document, he was his own publisher, and reaped a substantial profit from the venture. Official India, wherein, as he sagely remarked, the game of lawn-tennis with the seventh commandment was far from infrequent, had in its midst a new force to reckon with. Living and real were the Bronckhorsts, the Gadsbys, the Mrs. Reivers, the Mrs. Hauksbees and the Venus Annodomini of his pen. More than one Abner had fallen in the van of a hill expedition.

His *Departmental Ditties* (1887) and *Plain Tales from the Hills* (1888) were read from Cabul to Calcutta, and soon traveled across the ocean for English Grub Street first to cavil at, then to admire, and for American publishers to reprint, provoking parodies and imitations all over the land. Then *Soldiers Three* and *Barrack-Room Ballads* limned the red-coated Alexanders at 25 cents a day as neither soldier nor sailor had been depicted before, and won for Kipling the faint praise of the critic and the homage of every English-speaking soldier. He had done for the "Widow's Redcoats" what Captain Charles King had done for the "Boys in Blue." The civilian knew the army regulations better than the adjutant. The man in mufti, who felt the pulse of a battalion with keener diagnosis than the doctor or the martinet sergeant-major, and to whom the slang of the cantonment and the incidents of active service were as every-day matters, became the laureate of England's soldiery at a single bound. Marion Crawford alone of all earlier novelists had evoked interest in things Indian. To critics, the empire was a gigantic Nazareth, whence nothing but dry bones could come. Yet here was a spectacled boy reporter of an up-country newspaper, who had set the critics agog with terse phrases pregnant with word painting. To use his own graphic words, "There was a great silence amid the howling of the jackals" when "over the bastions of Fort Amara burst the pitiless day." *Mine Own People, In Black and White*, studies of fat and fearsome *babus*, lithe Pathans and lean hillmen, and a few more short stories, preceded his return to England, in 1889, to see "the only perfect, living green in the world" of his father's land, and to sniff, a little dubiously, the incense offered up in his honor by the daily press.

Then came *The Light that Failed*, a gem whose pathos overshadowed all other merits. Next, in a literary partnership and close friendship, *The Naulakha*, by Wolcott Balestier and Kipling, wherein Balestier's tracery of western frontier life stood in the shade of Kipling's daring treatment of things Indian, appeared in the pages of *The Century* magazine, and hardly satisfied those who had hoped for greater things. *Many Inventions* went back to the East for the scenery and subject-matter of many of its short stories, and the same crisp sentences and brilliant word-pictures were again to be seen. Verse in the periodicals came at intervals, grandly patriotic, such as *The Flag of England*, a lyric worthy of a Dibdin or a Macaulay; of it the Winds of the World sing:

"The dead dumb fog hath wrapped it—the frozen dews
have kissed—
The naked stars have seen it, a fellow-star in the mist.
What is the Flag of England? Ye have but my breath
to dare,
Ye have but my waves to conquer. Go forth, for it is
there!"

or pathetic and tender, as his reply to James Whitcomb Riley's gift of a book:

"Your trail lies to the Westward,
Mine back to mine own place.
There is water between our lodges—
I have not seen your face;
But I have read your verses
And I can guess the rest,
For in the hearts of children
There is no East or West."

There were also brave sea-ballads, such as *The Bolivar* and *The Camperdown*, that epic of the old Scotch engineer, *McAndrews' Hymn*, a noble piece of sustained and strenuous verse, and *The Seven Seas*, a grand interpretation of colonial patriotism.

Marrying the sister of his dead friend Balestier, to whose memory a book and a set of his best verses were inscribed, daring verses indeed, with a far from orthodox description of the great Beyond, where—

"Cup to lip in fellowship, they gave him welcome high,
And made him place at the banquet-board, the Strong
Men ranged thereby,
Who had done his work, and held his peace, and had no
fear to die.
"Beyond the loom of the last lone star through open
darkness hurled,
Further than rebel comet dared or hiving star-swarm
swirled,
Sits he with such as praise our God for that they served
his world."

Kipling settled with his bride in the sylvan glades of Brattleboro, Vermont, responding liberally to the demand for short stories and felicitous verse. Later, and in his happiest vein, came the two *Jungle Books*, illustrated by his father's able pen, wherein, after the fashion of Æsop the past-master, the very beasts of the forest talked again. The doings of Bagheera the Panther, the gambols of the Bandar-log, with much lore of Gray Brother the Wolf, Kaa the Python, and Hathi the Silent, in their exploits with Mowgli, their blood-brother, idol of the Seonee pack, were the manliest, most wholesome matters children had read for a century. There was a depth of knowledge of woodcraft, and a subtle ability to describe the moist *rukh* and its myriad denizens, which more than interested grizzled forest officers, who had

grown gray, like Müller, in the depths of India, far from the habitations of men. In all was the solid, terse Anglo-Saxon prose evident, the pen-pictures being the more vivid for their picturesqueness of phrase and virility of style. Kipling had done for India what scores had tried and failed to do. Its essence lived in his pages. His last novel, *Captains Courageous* (1897), dealt with the Gloucester fishermen and their lives on the Grand Banks. Written from close personal study of the scene and the people, it was American in its characters, and in its plot seafaring and adventurous. In the same year appeared his fine poem, *Recessional*; and in 1898 *The Day's Work*, a volume of short stories.

KIPSCHAK, same as *Golden Horde*. See *MONGOLS*, Vol. XVI, p. 746.

KIRATARJUNIYA, the name of one of the celebrated poems of Sanskrit literature. See *SANSKRIT*, Vol. XXI, p. 284.

KIRCHENTAG, an influential association composed of the clergy and laity of the Lutheran, German Reformed, United Evangelical, and Moravian churches in Germany. Its object is to promote the interests of religion, without regard to denominational differences. It holds an annual meeting, the place being changed every year. The first meeting took place in 1848, at Wittenberg, in the church to the doors of which Luther affixed his theses. Its deliberations have a marked influence upon the development of religious thought in Germany.

KIRCHHOFF, CHARLES WILLIAM HENRY, an American mining engineer; born in San Francisco, March 28, 1854. He received his education at the Royal School of Mines, in Clausthal, Germany, 1874; returned to the United States, and became chemist and assistant superintendent of lead-refining works in Philadelphia. He was also connected with several technical magazines in New York, being associate editor of the *Metallurgical Review* (1877); *The Iron Age* (1877-82 and 1886-90); managing editor of *Engineering and Mining Journal* (1882-86); and of *The Iron Age* after 1890. He was special superintendent of the United States geological survey for the collection of lead, copper, and sulphur statistics from 1882, and special agent for the census of 1890 in collecting statistics for lead, copper, and zinc mining and smelting.

KIRCHHOFF, GUSTAV ROBERT, a German physicist; born at Königsberg, March 12, 1824. After studying mathematics and natural sciences in the University of Königsberg, he lectured in Berlin on mathematical physics in 1848, and in Breslau on experimental physics in 1850. In 1854 he was made professor of natural philosophy at Heidelberg, which position he occupied till 1874, when he became professor of natural philosophy in Berlin University. He made researches on electricity, heat, and the tension of vapors, which attracted much attention. But his fame as a physicist is chiefly based on his discovery of "spectrum analysis," which he developed in connection with Bunsen. In 1870 he received the Prussian Order of Merit. Among Kirchhoff's publications are *Untersuchungen über das Sonnenspectrum und die Spectren der Chemi-*

schen Elemente (1861); and *Vorlesungen über Analytische Mechanik* (1874). He died Oct. 17, 1887. See also *SPECTROSCOPY*, Vol. XXII, p. 373.

KIRCHHOFF, JOHANN WILHELM ADOLF, a German Hellenist and epigraphist; born in Berlin, Jan. 6, 1826; was educated in Berlin, and became professor ordinarius at the University. He was editor-in-chief of the *Corpus Inscriptionum Atticarum*, to which he contributed a volume; he also wrote *Umbrische Sprachdenkmäler* in connection with Aufrecht (1851); *Studien zur Geschichte des Griechischen Alphabets* (1887); and *Ueber die Entstehungszeit des Herodotischen Geschichtswerkes* (1878). His researches regarding the Homeric poems are of great importance to the student of Hellenic literature.

KIRK, SIR JOHN, a British naturalist; born at Arbirlot, Scotland, in 1833. He graduated M.D. in 1854, and early distinguished himself in botany and other departments of natural history. He served on the medical staff during the Crimean War, and for six years as medical officer and naturalist to Livingstone's second exploring expedition to the Zambesi River. In 1866 he was appointed acting surgeon to the political agency at Zanzibar. He was promoted to be vice-consul at the same place in 1873, and he accompanied the sultan of Zanzibar on his visit to England in 1875. Dr. Kirk materially aided the progress of geographical discovery in East Africa; but his great achievement was the almost complete suppression of the slave trade in the greater part of eastern Africa. In 1875 he was appointed consul in the Comoro Islands; agent and consul-general at Zanzibar in 1880; and in 1890 a Knight Commander of the Bath.

KIRK, JOHN FOSTER, an American historian; born at Fredericton, New Brunswick, March 22, 1824; came to the United States at the age of 18, and from 1847 to 1859 acted as secretary to Prescott, the historian. His publications include contributions to the *North American Review* and the *Atlantic Monthly* and a three-volume history of *Charles the Bold* (1863-68). For fourteen years, from 1871 to 1885, he edited *Lippincott's Magazine*, and then became lecturer on European history in the University of Pennsylvania. He edited the complete works of William H. Prescott (1870-74).—His wife, ELLEN WARNER OLNEY, an authoress, was born in Southington, Connecticut, Nov. 6, 1842; author of *Love in Idleness* (1876); *A Lesson in Love* (1881); *The Story of Margaret Kent*, under the name "Henry Hayes" (1886); and *Sons and Daughters* (1887).

KIRKBRIDE, THOMAS STORY, an American physician; born in Morrisville, Bucks County, Pennsylvania, July 31, 1809; received his medical education at the University of Pennsylvania. In 1832 he was made resident physician of the Friends' Asylum for the Insane at Frankfort, Pennsylvania, and from 1833 to 1835 held a similar position in the Pennsylvania Hospital for the Insane, Philadelphia, from 1840 till his death remaining its superintendent. He was an authority on mental alienations, and published various important works on the care of the insane, including *The Construction, Organiza-*

tion and General Management of Hospitals for the Insane (1854); and *Appeal for the Insane* (1854). He was the first in America to place the sexes in separate institutions; was one of the founders of the Association of Superintendents of Institutions for the Insane, and was for eight years president. He died Dec. 17, 1883.

KIRKDALE CAVE, a cave near Pickering, Yorkshire, England, 28 miles W. of Scarborough; discovered in 1821. Its length is 245 feet, but in it there are only two or three places where a man can stand erect. The remains of many tertiary mammals have been discovered in it. The fossil bones are contained in a deposit of mud on the floor of the cave, covered by stalagmites formed by the water dropping from the roof. See also CAVES, Vol. V, p. 267.

KIRKE OR KERTK, SIR DAVID, an English adventurer; born in Deippe, France, 1596, of English parentage. During the Huguenot troubles he went to England; secured vessels there under royal letters of marque, and set out with his two brothers against the French colonies in Canada, besieging Quebec ineffectually. During a subsequent expedition he again laid siege to Quebec, compelling Champlain to surrender the city to him in 1629, though it was returned to France in 1632. At the same time Cape Breton was captured, but afterward ceded to France. He was knighted in 1633, and, with others, received a grant of Newfoundland, of which he was governor for nearly twenty years. Cromwell dispossessed him, but he regained part of his property from Claypole (1653). He died about 1655.

KIRKE, EDMUND. See GILMORE, JAMES ROBERTS, in these Supplements.

KIRKLAND, CAROLINE MATILDA STANSBURY, an American authoress; born in New York City, Jan. 12, 1801. She married William Kirkland, the author, in 1827, and in 1842 established a girls' boarding-school in New York City. Later she became the editor of the *Union Magazine*, which in 1848 was removed to Philadelphia and published as *Sartain's Magazine*. She wrote, among other publications, *A New Home; Who'll Follow?* (1839); *Western Clearings and Essay on the Life and Writings of Spenser* (1846); *Garden Walks With the Poets* (1854); *Memoirs of Washington* (1857); *Personal Memoirs of George Washington* (1858); and *The Destiny of Our Country* (1864). She died in New York, April 6, 1864, having succumbed to overwork induced by efforts in behalf of the great Sanitary Fair of that year.

KIRKLAND, JAMES HAMPTON, an American educator; born in Spartanburg, South Carolina, Sept. 9, 1859; educated at Wofford College, subsequently filling the positions of Latin and Greek tutor and Greek and German professor in that institution; studied in Germany from 1883 to 1886, where he received the degree of Ph.D. Returning to America, he was appointed professor of Latin in Vanderbilt University, becoming chancellor in 1893. In 1885 he published a critique of an Anglo-Saxon poem, *Die Hollenfarht Christi*, and in 1893 edited the *Satires and Epistles of Horace*.

KIRKLAND, JOSEPH, an American author, son of Caroline M. S. Kirkland; born at Geneva, New York, in 1830. He enlisted for the war in the Twelfth Illinois Regiment, served with it in the Army of the Potomac and came out a major. Afterward he studied law and was admitted to the bar, but latterly engaged in literature and became noted for his stories of Western life. Among these are *Zury, the Meanest Man in Spring County* (1887); *The McVeys* (1888), graphic stories of pioneer life in Illinois; *The Captain of Company K*; *The Story of Chicago*; and *History of the Chicago Massacre of 1812*. He died in Chicago, April 29, 1894.

KIRKLAND, SAMUEL, an American clergyman; born in Norwich, Connecticut, Dec. 1, 1741. He received a collegiate degree from Princeton; was ordained to the Congregational ministry in 1766, and commissioned Indian missionary of the Missionary Society, previously having spent 18 months among the Six Nations, acquiring a knowledge of the Mohawk and Seneca tongues, and laboring for upwards of forty years among the various tribes. During the Revolutionary War he became brigade chaplain to General John Sullivan, and was for a time chaplain to the Continental forces at Fort Schuyler and at Stockbridge, Massachusetts. In the early part of the struggle, his good offices among the Six Nations were largely instrumental in securing the neutrality of these tribes, as is attested by a letter of Washington addressed to the Continental Congress in 1775. When peace was declared he resumed his civilizing labors among the Indians. In 1793 he established Hamilton College for the education of American and Indian youth, and founded the town of Kirkland, on land given him by the government. He died Feb. 28, 1808, in Clinton, New York.

KIRKMAN, MARSHALL MONROE, an American author; born in Illinois, July 10, 1842; entered the services of the Chicago and North-Western railroad in 1856, and rose to vice-president and comptroller. He published various works on railways; among them, *Railway Expenditures* (1877); *Railway Disbursements* (1876); *The Baggage, Parcel and Mail Traffic of Railways* (1881); *The Maintenance of Railways* (1886); and *Railway Rates and Government Control* (1892).

KIRKSVILLE, a city and the capital of Adair County, northeastern Missouri, six miles E. of Chariton River, on the Quincy, Omaha and Kansas City and the Wabash railroads, 67 miles W.S.W. of Keokuk, Iowa. The county is well supplied with coal and wood, and has very fertile farming-lands. The village has manufactories of hubs and spokes, woolens, cheese, furniture and plows. The North Missouri State Normal School is located here. Population 1890, 3,510; 1900, 5,966.

KIRKWOOD, a village of St. Louis County, eastern Missouri, on the Missouri Pacific railroad, seven miles W. of St. Louis. It is in a truck-gardening region and has a cartridge-belt factory. Population 1890, 1,777; 1900, 2,825.

KIRKWOOD, DANIEL, an American astronomer and educator; born in Bladensburg, Prince George Co., Md., Sept., 1814. In 1843 he was made principal

of Lancaster (Pennsylvania) High School, and in 1848 of Pottsville Academy. In 1851 he became professor of mathematics in, and in 1854 president of, Delaware College; in 1856 he was made professor of mathematics in Indiana University, in 1866 of Jefferson College, Pennsylvania, and in 1867 he resumed his professorship at Indiana. In his most important work, *The Nebular Hypothesis and the Approximate Commensurability of the Planetary Periods*, he applied the Laplace theory to explain the hiatus in the ring of Saturn and the gaps in the zone of the minor planets. He wrote, also, *Meteoric Astronomy* (1867); *Comets and Meteors* (1873); and *The Asteroids* (1887). He died at Riverside, Cal., June 11, 1895.

KIRKWOOD, SAMUEL JORDAN, an American statesman, cousin of the preceding; born in Harford Co., Md., Dec. 20, 1813; received but little education, and was employed as a drug clerk (1827-34); removed to Ohio (1835), and having studied law, was called to the bar in 1843; he practiced his new profession until 1855, when he went to Iowa. In the next year he served in the Iowa state senate, and in 1859 was elected governor. Re-elected in 1861, he became known as one of the great "War Governors," and by his energy in raising troops, Iowa was enabled to fill her quota without resorting to the draft. His prudent management saved his state \$500,000 out of the funds appropriated for defense bonds. In 1866 he was elected United States Senator, in 1875 was for a third time governor of Iowa, and in 1876 was re-elected to the Senate. He resigned in 1881, and from thence till April, 1882, was Secretary of the Interior in Garfield's cabinet. Died in Iowa City, Sept. 1, 1894.

KIRMAN OR KERMAN, the capital of Kirman province, Persia, 225 miles N. by E. of Bander Abbas, its port on the Persian Gulf, in a plain surrounded by mountains; is enclosed by a mud wall, and has a citadel; is the great trade centre between the Persian Gulf and northern Persia and central Asia; has many fine bazars, and manufactures shawls, cotton carpets, silk goods, and matchlocks; has been frequently sacked and destroyed by invaders, the last time in 1794, by Agha Mohammed Khan. Population about 45,000.

KIRMESS. See KERMESE, these Supplements.

KIRN, a town in Rhenish Prussia, on the Nahe river, 40 miles S. of Coblenz; manufactures woolens and fine leather. Population 1895, 5,638.

KIRRIEMUIR, a market town in Forfarshire, Scotland, near Prosen Water, 5 miles N.W. of Forfar; has handsome churches, schools, a trades' hall, and a bank; manufactures brown linen, sheeting, and dowlas. Near by is Inverquharity castle. The town is the "Thrums" of J. M. Barrie. Pop. 1891, 4,179.

KIRSANOF, a town in Tambof government, Russia, 60 miles E. of Tambof; has a large trade in grain, hides, and cattle. Population 7,193.

KIRTHAL, a town in Meerut district, Northwest Provinces, India, 32 miles N.W. of Meerut. Population 1881, 5,500.

KIRTLAND, JARED POTTER, American physician and naturalist, born in Wallingford, Conn., Nov. 10, 1793. He obtained his early education at Wallingford and Cheshire, Conn., becoming a student in

botany and fruit and flower culture. In 1811-13 he was a medical student at Edinburgh, but in 1813, on account of the war with Britain, entered the medical department at Yale, where he graduated in 1815. In 1815-23 he practiced his profession in Connecticut, and in 1823 removed to Ohio. In 1828 he was elected to the legislature, and served three terms. In 1845 he was one of the founders, and the first and only president, of the Cleveland Academy of Science, which in 1865 became the Kirtland Society of Natural History. He was also one of the founders of Cleveland Medical College, in which, up till 1864, he was professor of the theory and practice of medicine. He was also president of the Ohio Medical Society. During the war he was examining surgeon of recruits at Columbus and Cleveland, and gave his salary to the bounty fund and to the Soldiers' Aid Society of northern Ohio. His chief discovery in natural history was that of the sexual differences in the naiades, showing that the male and female can be distinguished by the forms of the shells as well as by their internal anatomy. Died in Cleveland, Dec. 10, 1877.

KIRUMBO, a Madagascar bird, *Leptosomus discolor*, the only surviving member of the family *Leptosomidae*. The male is glossy green above, and gray beneath and on the sides of the head and round the neck; the female has blackish and reddish-brown spots and bars. The birds live in wooded land, in small flocks, and have the habit of tumbling in the air from a great height, like the rollers (*Coracias*).

KIRWIN, a city in Phillips Co., Kansas, on the north fork of the Solomon river, 15 miles S.E. of Phillipsburg; has a U. S. land office, 2 hotels, 2 newspaper offices, banks, elevators, and flour mills. Population 1890, 689; 1900, 586.

KISHANGARH, a walled town, the capital of the native state of Kishangarh, Rajputana, India, 18 miles N.E. of Ajmir. Population 1891, 15,457.

KISHANOWADA, a seaport town in Hondu Island, Japan, 50 miles S.S.W. of Kyoto. Population 1887, 12,879.

KISHON, a torrent of central Palestine, rising near Mount Tabor, in lat. 32° 30' N., long. 35° 30' E. It flows northwest and empties into the Bay of Acre, just north of Mount Carmel. It was the scene of the defeat of Sisera (Judg. iv) and of the destruction of the prophets of Baal by Elijah (1 Kings, xviii, 40). The modern name is Nahr-el-Mukatta, *i. e.* "the river of slaughter."

KISHORGANJ, a town in Maimansingh district, Dacca division, Bengal, India, 50 miles N.N.E. of Dacca. Population 1891, 13,988.

KIS-KÖRÖS, a town in Pest-Pilis-Solt-Kis-Kun Co., Hungary, 25 miles W. by S. of Felegyhaza; produces good wine. Population 1890, 7,878.

KISLINGBURY, FREDERICK FOSTER, an American army officer and Arctic explorer; born at Ilesley, near Windsor, England, Dec. 25, 1847. When he was quite young his parents brought him to America, and settled in Rochester, N. Y. In 1863 he enlisted in a cavalry regiment and served for two years, till the end of the Civil War, after which he was chief clerk of the Department of the Lakes, at Detroit. A few years later he was given command of a band of scouts to fight the Indians; and still later served on

the plains as second lieutenant of the 11th Infantry. In 1881-84 he was second officer of the Greely Arctic expedition, and died of starvation at Cape Sabine, Ellesmere Land, June 1, 1884, being one of the last members of that ill-fated expedition who succumbed. His body was brought home and buried at Mount Hope cemetery, Rochester. He was a Knight of Pythias, and in Rochester a new lodge was founded in honor of his memory.

KISMAYU, a seaport in British East Africa, near the mouth of the Juba river; has an excellent harbor, with good anchorage. Population about 1,000.

KISMET (Turkish, *quismet*; Persian, *quismat*; "lot," or "fate," or "destiny"), an Oriental word meaning man's fate or destiny, or lot in life, or any event or episode in it; the fulfillment of destiny.

KISS, AUGUST, a German sculptor; born at Pless, Prussian Silesia, Germany, Oct. 11, 1802; educated first at the Royal Foundries at Gleiwitz, later with the eminent sculptor Rauch (q. v. Vol. XX). After producing some creditable bas-reliefs, groups, and other decorations for Schinkel's famous Charlottenhof fountains he gave the measure of his talent in his group *The Amazon and the Panther* (1839), which created such enthusiasm that it was cast in bronze by public subscription. It is now on the steps of the Berlin Museum. A plaster cast of it took the first prize in the London exhibition in 1851, and was bought by an American, and exhibited in New York in 1853. Among his best-known works are an equestrian statue of Frederick the Great, at Breslau; two statues, one equestrian and colossal, of Frederick William III, at Königsberg; a *St. Michael and the Dragon*, presented to Frederick William IV; and a colossal statue of St. George, now in the court of the palace in Berlin. Kiss left a strong and wholesome mark on the development of modern German sculpture. He died in Berlin, March 24, 1865.

KISS, JOSEPH, an Hungarian poet, born at Temesvár, in 1843. Since 1890 he has been editor of *The Week*, a literary paper. His poems have the note of modernity, with a strain of melancholy. Among the most notable are *A Song of the Sewing Machine* (1884), a eulogy on woman and a glorification of work; and *A Grave* (his mother's). A fourth edition of his *Poetical Works* appeared in 1890; and *New Poems* in 1891.

KISSA, a volcanic island, one of the Banda Islands, Malay archipelago, Dutch East Indies, N. E. of Timor; 20 miles in circumference; is low, sandy, and rocky, and enclosed by a coral reef. Population about 10,000.

KISSAR, a five-stringed lyre used by the Abyssinians and other people of northern Africa; it is similar to an instrument represented as being played by captives in Assyrian bas-reliefs.

KISSIMMEE, a city, the capital of Osceola Co., Fla., 70 miles E. N. E. of Tampa, in an orange-growing district; early vegetables for northern markets are raised; has sugar-refineries and rice-mills. Population 1890, 1,086; 1900, 1,132.

KIS-TELEK, a town in Csongrad Co., Hungary, 18 miles N. by W. of Szegedin. Pop. 1890, 7,459.

KIS-UJSZÁLLÁS, a town in Jasz-Nagy-Kun-Szolnok Co., Hungary, 45 miles W. S. W. of Debreczen. Population 1890, 12,527.

KIS-VÁRDA, a town of Szabolcs Co., Hungary, 54 miles N. N. E. of Debreczen. Pop. 1890, 6,458.

KITAH, a town in Bokhara, central Asia, on the Kashka river, 38 miles S. of Samarkand. Population about 15,000.

KITAIBELIA, a genus of plants of the order *Malvacea*, tribe *Malveæ*, subtribe *Malopeæ*, distinguished from *Malope* by having the style stigmatic at the apex, and from other genera by its 6 to 9 bracts united at the base. It has only one species, *K. vitifolia*, the vine-leaved Kitaibel, a native of Hungary, along the Danube, where its leaves are used as a vulnerary. It is a rough, hairy, perennial herb, two or three feet high, clammy above, with five-lobed leaves and whitish flowers an inch and a half across. It was named after Dr. Paul Kitaibel, of Budapest.

KITCHEN CABINET, a coterie of political advisers of President Jackson, who were said to influence his policy more than his cabinet did. The chief members were Francis P. Blair, editor of the *Washington Globe*, the organ of the Democratic party from 1829 to 1845; General Duff Green, editor of the *Washington United States Telegraph*, another organ of the administration; Isaac Hill, editor of the *New Hampshire Patriot*; Amos Kendall, of Kentucky, fourth auditor of the Treasury; and Major William B. Lewis, of Nashville, Tenn., second auditor of the Treasury. "They were men," says Mr. Schouler, in his *History of the United States*, vol. iii., p. 495, "with whom he could smoke and converse at random, without the constraint of a council and clashing minds." It was called "Kitchen" because separate from the cabinet proper, and lacking in public dignity and authority.

KITCHENER of Khartum. Horatio Herbert Kitchener, first Baron of Khartum (created 1898), and since 1892 Sirdar of the Egyptian army, was born in 1850. He is the eldest son of the late Lieutenant-Colonel Kitchener, and was educated at the Royal Military Academy, Woolwich, England. He entered the British army in 1871, and three years later was employed in the Palestine and Cyprus surveys. In 1882, on his release from this duty, he served as a major of cavalry in the Egyptian army, accompanied the Nile Expedition in 1884, and became governor of Suakin in 1886. For his bravery in the action of Handub in 1888, when he led the Egyptian troops against Osman Digna, he was made aide-de-camp to the Queen; and in the subsequent fighting in the Sudan he was mentioned in despatches and made a Companion of the Bath. From 1888 till 1892 he held the rank of adjutant-general in the Khedival army, and in the latter year was appointed Sirdar. After the taking of Dongola, in 1896, he was made a K. C. B., and in

HORATIO H. KITCHENER.

the subsequent effort to "smash the Mahdi's forces" in the Sudan and recover the territory for Egypt and civilization, he won honors and fame. The Conservative government of Lord Salisbury having decided to regain Khartum, which was lost when General Gordon fell, General Kitchener was instructed to organize a strong and effective force, including a few British troops and some 20,000 Egyptian and Sudanese soldiery, and to proceed against the Dervishes under the Khalifa. At this period the Egyptian frontier did not extend beyond Wady Halfa, so there was much to do to organize and push on the new expedition, both by the Nile and over the deserts. The reconquest of the Sudan began March 19, 1896, and before the end of September the Dervishes had been defeated at Ferket, Suarda occupied, the battle of Hafir won, and the Sirdar's army had entered Dongola. About a year later Abu Hamed was captured and Berber was occupied by friendly tribes. In October, 1897, the railway from Halfa to Abu Hamed was completed, and the gunboats of the expedition engaged the enemy's forts at Metemmeh. In March, 1898, Shendy was captured; and on April 8, 1898, the Dervishes were completely defeated at Nakileh, on the Atbara, and Mahmud, the Khalifa's right-hand man, was taken prisoner. By August, 1898, the advance was within 30 miles of the Khalifa's capital, Omdurman, opposite the site of Khartum. It included British, Sudanese, and Egyptian infantry and cavalry, a camel corps, and some mounted infantry, with strong batteries of Maxim guns, howltzers, and 40-pounders; the total number being about 25,000. Opposed to the Sirdar was a force of fanatical Dervishes, numbering fully 50,000, which had taken up position near Omdurman. On September 2, 1898, this force was descried in the desert northwest of the town, drawn up in five divisions, with a wing thrown back, its spears and swords glistening in the early morning sunshine. With magnificent courage it at once advanced to attack the brigades of the Sirdar, only to be routed or driven back, and mowed down by the steady rifle fire of the infantry, and by the Maxim guns and the shells fired from the British gunboats on the river. The slaughter was frightful, as the onset was a determined one and the attacks were madly repeated by the various portions of the Khalifa's army. The Dervish loss is supposed to have exceeded 11,000 killed, 16,000 wounded, and 4,000 prisoners. The Khalifa escaped from the battlefield with a small following, while the Omdurman forts were silenced and the town was occupied.

For achieving the victory, General Kitchener was awarded a peerage, as Baron Kitchener of Khartum and of Aspell, in the English county of Suffolk; and on his return to England in October, 1898, he was given an enthusiastic reception and presented with the freedom of the City of London and a sword. While in England Lord Kitchener was instrumental in raising a fund of half a million dollars to found and endow a Gordon Memorial College at Khartum for the instruction of Egyptian and Sudanese youth. In Jan., 1899, he was appointed Governor-General of the Sudan.

From this post General Kitchener was withdrawn, towards the close of the year 1899, to

accompany Lord Roberts as his chief of staff in the Boer war. In the operations against the Boers he has had the duty of organizing and conducting the military transport service in South Africa.

KITCHEN-MIDDENS OR SHELL-HEAPS, prehistoric mounds of shells and refuse. See ANTHROPOLOGY, Vol. II, p. 116; and ANDAMAN ISLANDS, Vol. II, p. 11.

KITCHIN, GEORGE WILLIAM, D. D., an English clergyman and historian; born at Naughton Rectory, Suffolk, Dec. 7, 1827; Dean of Winchester, 1883-94; Dean of Durham since 1894. He wrote *History of France* (3 vols., 1873-77); *Life of Pope Pius II* (1881); *Winchester* (1890), etc.

KITE, a bird of prey. See Vol. XIV, pp. 103-04.

KITES AND KITE-FLYING. Kite-flying, in the minds of the majority of persons, is but an innocent sport for the amusement of children. In recent years the art has come into skillful use as a means of solving certain scientific problems. Benjamin Franklin's famous kite, with which he won from the skies some of the secrets of electricity, is recorded in history. When the Niagara suspension-bridge was in course of construction, after the towers had been built, the problem of stretching the first wire of the cables was solved by the aid of a kite, which carried a line across the river, and this line, in turn, was used to draw over the first wire. Since 1880 experiments have been performed repeatedly to devise methods for taking meteorological observations by means of self-recording instruments carried to the upper air strata by kites. Among those who have developed the kite as an aid to science are W. A. Eddy, at Bayonne, New Jersey; Hargrave of Australia; Dr. A. B. Johnson, of New York city; J. Woodbridge Davis; and Alexander McAdie of Blue Hills, Massachusetts. The kite used generally in experiments, of which those of W. A. Eddy are representative, is not the traditional triangular kite with a tail, but is a convex-surface contrivance, which flies without a tail, and of which the construction is the result of much study of every detail. Two sticks of some light wood are crossed at a point 18 per cent below the top of the one which is to be the upright; the sticks are tied, not nailed; the horizontal stick is bent back in a bow shape, and fastened by a cord attached to the ends; the centre of this cord must be at a distance from the crossing-point of the two sticks equal to one-tenth of the length of the cross-stick; a fine wire is passed around the whole, in notches at each end of the two sticks; a light paper or cloth is then stretched over the framework and pasted at the edges around the wire; the lower portion of the paper must be loose, so that the two parts below the cross-stick will be concave and the upper portion above the cross-piece convex; cords are then attached at the crossing-point and at the lower end of the vertical stick; these cords are joined and so arranged that when the kite is in the air the main cord will make an angle of 70° with the earth. Kites of this kind can be flown to great heights, and in tandems of from six to eight planes, upon one main cord. Another kind of kite, invented by Hargrave, consists of an oblong box open at both ends, constructed of very

light material, and elevated by the suction of the wind. Tandems of the latter kind of kites have a strong pulling-power, in one recorded instance lifting a man from the ground to a height of twelve feet. Kites of both kinds will fly in any wind. Owing to the large lifting-power, automatic instruments can be sent up and observations taken. Valuable meteorological investigations have been made, and by means of such kites weather prognostications are made regularly by Mr. Eddy. On Oct. 8, 1896, at the Blue Hills Observatory, by means of a tandem of seven Eddy and two Hargrave kites, a self-recording meteorograph, run by clockwork, was sent up 9,385 feet, requiring over three miles of wire. Accurate observations were taken at this the highest recorded altitude then reached by a kite. The pull varied from 20 pounds at the start to 95 pounds at the highest point. Another use of the kite is in photographing large extents of country by means of a camera carried up by the kite and regulated from the ground. Views of parts of New York City have been secured in this way. The kite-buoy is used on the Atlantic Coast. A kite of the first kind described is attached to a buoy so arranged with a keel that it will travel through but not leave the water when dragged by the kite. This is used by wrecked vessels for sending messages or lines ashore. A third kind, known as the "aérophile," has been designed more recently. The frame resembles an umbrella, is made of metal, and, like the umbrella, will fold. The covering is cloth, and a tail is attached, which consists of several ribbons, with pockets at their extremities. In these pockets, weights can be placed to regulate the kite's ascension in accordance with the force of the wind. It has large buoyancy, but thus far is hardly more than a scientific toy. As improvements are made in the kite and kite-flying apparatus it will be made to play an important part in scientific work. See AERONAUTICS, in these Supplements.

KIT-FOX (*Vulpes velox*), a small reddish-gray fox which lives in burrows on the prairies of the western United States. It ranges from Oregon to Missouri. The name was given by Lewis and Clark. It often is called burrowing-fox and swift-fox, but the latter designation is a misnomer, for the animal is not rapid in its movements. The nearest relative of this fox is *V. corsac*, which inhabits the plains of Asia.

KITTANNING, a borough and the capital of Armstrong County, western central Pennsylvania, on the Allegheny River, 43 miles above Pittsburg, and on the Allegheny Valley railroad. It contains a rolling-mill, oil-refineries, woolen-mill, blast-furnace, and a pottery. It is the site of a college, an academy, a school of telegraphy and typewriting and other institutions of learning. It is in a coal and iron mining region and has an abundance of natural gas. Population 1890, 3,095; 1900, 3,902.

KITTATING MOUNTAINS, a range in northern New Jersey, running through Sussex and Warren counties. The Delaware River runs parallel with them, from three to five miles to the west. The ridge is characterized by its even outline, there being very few peaks. They do not exceed 2,400 feet in height. The Delaware Water Gap, which divides them from

the Blue Ridge in Pennsylvania, is a beautiful spot. They are composed of rocks of Silurian formation, mostly Medina sandstone and Oneida conglomerate.

KITTIWAKE. See GULL, Vol. XI, p. 274.

KIU-KIANG, a walled city and treaty port of Kiangsi province, eastern China, on the Yang-tse-Kiang, 445 miles W. of Shanghai and 480 miles N.N.E. of Canton. Its foreign trade amounts annually to about \$12,500,000, of which nearly two thirds represent local exports. The principal exports are china-ware, grass-cloth, hemp, paper, rice, tobacco and tea. It is surrounded by a wall six miles in length. Population 1874, 35,000; official estimate of 1898, 55,000.

KIUSHIU OR KYUSHU, the most southerly of the three principal islands of Japan. It is separated from Corea by the Straits of Corea, and from Honshiu Island by the Strait of Shikoku. Its area is 13,767 square miles; including the smaller adjacent islands, 16,840; entire population, 1898, 6,357,551.

KIZIL-IRMAK OR HALYS RIVER. See ASIA MINOR, Vol. II, p. 707.

KLACZKO, JULIEN, a Jewish author; born at Wilna, Lithuania, Nov. 6, 1828. After receiving at the Königsberg University his Ph.D. in 1846, he became one of the writers for the *Revue des Deux Mondes* in Paris. In 1869 Count von Beust, Chancellor of Austria, called him to a position in the Council of State, which he resigned in 1870 on account of ill health. His most noted work is *Les Deux Chanceliers*, a bitter attack upon Bismarck and Gortschakoff, which created a great sensation. He also published *La Poésie Polonoise au XIXe Siècle* (1862); *Correspondence of the Polish Poet, Mickiewicz* (1861); and *Causeries Florentines* (1880), crowned by the French Academy. He was elected a corresponding member of the French Institute.

KLAPKA, GYÖRGY, a Hungarian soldier and patriot; born at Temesvar, April 7, 1820. In 1842 he entered the Imperial Life-Guards of Austria, and in 1847 he became an officer in one of the frontier regiments. In 1848 he joined the Hungarian revolutionary army, where he distinguished himself so much that he was placed at the head of an army corps in 1849. Under Görgei he contributed to several victories over the Austrian troops, most particularly at Komorn, where his efforts opened the way to Vienna. He was called to Debreczin by Kossuth and made Minister of War, taking sides with the people against the ultra-aristocratic Hungarian party. He sustained valiantly the siege of Komorn, until the defection of Görgei rendered his efforts useless. However, Marshal Haynau, the besieger, was forced to consent to a free withdrawal of the besieged, with flags floating and the honors of war. He took refuge in England, and during the Franco-Austrian war endeavored to operate a diversion in favor of Hungary. In 1866 he raised a Hungarian legion to fight against Austria, but in vain. When Austro-Hungary was reconstructed in 1867, he was permitted to return to his native land, where he was elected a Deputy and helped in reorganizing the army. In 1877 he was called to Constantinople with a view to reorganizing the Ottoman army against the Russians. Having succumbed

to local intrigues, he was obliged to give up his plans and return home. He published *Memoirs of the War of Independence in Hungary*; *The National War in Hungary and Transylvania*; and *The War in the East* (1855). Died in Budapest, May 17, 1892.

KLAPROTH, MARTIN HEINRICH, a German chemist; born at Wernigerode, Saxony, Dec. 1, 1743; began life as an apothecary's apprentice and clerk, employing his leisure in acquiring a thorough knowledge of chemistry, and publishing a number of valuable analyses; made professor of chemistry at the Berlin School of Artillery in 1787 and at the University in 1789. He discovered the metals zirconium, titanium, and uranium. His method of analysis assisted greatly the proper classification of minerals. An enthusiastic believer in the theories of Lavoisier (q. v.), he was made a corresponding member of the French Institute. He edited a *Chemical Dictionary* (5 vols., 1807-10), wrote a *Chemical Manual*, and contributed a number of papers to the *Denkschriften* of the Berlin Academy. He was the father of HEINRICH JULIUS VON KLAPROTH, the Orientalist (q. v.). Died in Berlin, Jan. 1, 1817.

KLEBS, ERWIN K., a German physician and educator; born at Königsberg, Prussia, Feb. 6, 1834; studied successively at the universities of Würzburg, Jena, and Berlin, where in 1861 he became assistant to Virchow at the Pathological Institute; professor of pathological anatomy at the Bern University in 1866; surgeon in the Prussian army in 1870-71; but at the close of the war returned to Switzerland to care for the typhus-stricken soldiers of Bourbaki's army, who had taken refuge in that country. He became well known for his studies on diphtheria, smallpox, and gunshot wounds. He was successively professor at the Würzburg, Prague, and Zurich universities. He wrote *Handbuch der pathologischen Anatomie* (1867-78); *Beiträge zur pathologischen Anatomie der Schusswunden* (1872); *Studien über die Verbreitung des Kretinismus in Oesterreich* (1877), *Ueber die Umgestaltung der Medizinal-Anschauungen in den letzten drei Jahrzehnten* (1877).

KLEIST, EWALD CHRISTIAN VON, a German soldier and poet; born at Zeblin, Pomerania, March 7, 1715. After a course of classical studies he entered the Danish army in 1736, and later joined the Prussian army under Frederick the Great. His close intercourse with Gleim, Nicolai, and Lessing (q. v.) excited his poetic talents, and his reputation soon spread through Germany. In 1756 he published an edition of his collected poems. Among these, *Der Frühling* (*Spring*) is considered his best, though obviously inspired by Thomson's *Seasons*. A few months before his death at Frankfort-on-the-Oder, Aug. 24, 1759, from a wound received at the battle of Kunersdorf on Aug. 12, he published a volume on military tactics.

KLEIST, HEINRICH BERNT WILHELM VON, a German poet and playwright; born at Frankfort-on-the-Oder, Oct. 18, 1777. When a young man he served in the army against Napoleon, and afterward was employed in the civil service. He was taken prisoner by French troops, and kept in France for

a year (1805-06). He committed suicide at Wannensee, near Potsdam, Nov. 21, 1811. He wrote the following dramas: *Die Familie Schroffenstein* (1803); *Penthesilea* (1808); *Käthchen von Heilbronn* (1810); *Der Zerbrochene Krug* (1811); *Der Prinz von Homburg* (1821); and *Die Hermannschlacht* (1821). Among his novels the best undoubtedly is *Michael Kohlhaas*.

KLENZE, LEO VON, a German architect; born at Hildesheim in 1784. After studying his profession in Berlin, he traveled extensively in Italy and France; became court architect to King Jerome of Westphalia, Napoleon's brother (1812); and Bavarian court architect in 1815, and settled at Munich. There he built the Glyptothek, the Pinakothek, the Odeon, and an extension to the Royal Palace, monuments of lasting beauty; also the Walhalla at Ratisbon, and the Imperial Museum, St. Petersburg, and was invited by King Otho of Greece, a Bavarian prince, to visit Athens and improve its public buildings. His great merit was his tenacious fidelity to the great principles of classical art at a time when a general upheaval seemed to overturn all the old principles. He was a member of nearly all the art academies in Europe. Died at Munich, Jan. 27, 1864.

KLEPTOMANIA. See CRIME, Vol. VI, p. 584.

KLICPERA, VÁCLAV KLIMENT, a Bohemian playwright; born at Chlumec, Bohemia, Nov. 23, 1793; graduated in philosophy and medicine from the Prague University, but devoted himself to teaching and literature; professor at the gymnasium of Králové Hradec in 1819; president of the Prague Academic Gymnasium in 1851. He wrote a large number of novels and dramas of very unequal worth. His best dramatic efforts are *The Wonderful Hat*; *The Four-Cornered R.*; and *The Liar and his Family*. His historical tragedy, *Sobeslav*, is his best serious work. Died in Prague, Sept. 15, 1859.

KLIEFOTH, THEODOR FRIEDRICH DETLEV, a German Lutheran divine; born at Körchow, Mecklenburg, Jan. 18, 1810; studied theology in Rostock and Berlin; is considered a high authority on Lutheran liturgies; occupied after 1850 the high office of superior consistorial counselor for Mecklenburg-Schwerin. He wrote his exhaustive *Liturgische Abhandlungen* (8 vols., 1859-69); *Eschatology* (1885); a *History of Dogmas*; and commentaries on several prophets and on Revelation.

KLIKITAT INDIANS, a small tribe of Indians belonging to the family of Shahaptian Indians, who once occupied a large tract of country along the Columbia river; to the same family belongs the tribe of the Nez-Percés. It is known that the Klikitat tribe forded the Columbia between 1820 and 1830, and, crossing the Willamette valley, overran the Umpqua valley, Oregon. But they were soon compelled by the Chinook Indians to retire to their own country, on the other side of the Cascade Mountains. In 1866 they were found—hardly over 100 in number—in the prairie country at the foot of Mount Hood, Wash., between Vancouver and The Dalles.

KLINGER, FRIEDRICH MAXIMILIAN VON, a German soldier, novelist, and playwright; born at

Frankfort-on-the-Main, Feb. 17, 1753; educated at the University of Giessen; entered the Austrian army in 1778; passed to the Russian service in 1780, where he rose to the rank of lieutenant-general in 1811. Early in life he found himself under the literary influence of Goethe; his first drama, *Sturm und Drang* (1776), is descriptive of the new literary era founded by Goethe and Herder. His best-known novels are *Faust's Life, Deeds, and Journey to Hell* (1791), and *The Worldling and the Poet* (1798). He also wrote *Reflections and Thoughts on Various Subjects of the World and Literature* (3 vols., 1802-05). Died at Dorpat, Feb. 25, 1831.

KLONDIKE (a corruption of the Indian name, "Thron-diuck," that is, "river with plenty of fish"), a river and gold-bearing region in Yukon district, Canada. The river is about 150 miles long, and flows into the Yukon from the east at about 64° 5' N. lat., six miles above old Fort Reliance, now in ruins. Its source is in a high range of mountains, which forms the water-parting between its basin and that of the Stewart river, to the south. An island divides its mouth into two channels, each about 150 feet wide and four or five feet deep. The stream is clear and shallow, and very swift, with numerous rapids, which make it difficult of navigation for canoes. Its waters afford excellent salmon fishing, and the work of catching and drying the fish is a profitable industry for the Indians. Among its affluents coming in from the south are Bonanza Creek, Bear Creek, Hunker Creek, Too-Much-Gold Creek, and All-Gold Creek, on all of which gold has been discovered. Indian River flows into the Yukon from the east about 30 miles above the Klondike, its chief affluents being Quartz, Dominion, and Sulphur Creeks, on all of which also gold has been discovered. Still further south is Henderson Creek, another gold-bearing stream, which enters the Yukon from the east about 15 miles above Indian River. Indian River and Henderson Creek, though not a part of the Klondike river system, may be considered as belonging to the Klondike district.

GOLD MINING. The first discoveries of gold in paying quantities in the Klondike district were made in August, 1896, by two men, named Henderson and George W. Cormack. These discoveries were made on an affluent of the Klondike to which Cormack gave the name of Bonanza Creek. On Nov. 3, 1896, a rich strike was made on this creek, the first pan (two shovelfulls) yielding 35 cents, and the next seven pans averaging \$3.35 each. From this strike dates the Klondike "boom." Other strikes were made, and by October, 1897, Bonanza Creek had been staked out for a distance of 20 miles from its mouth. In September, 1896, strikes were made on Eldorado Creek (an affluent of Bonanza) and on Hunker Creek, an affluent of the Klondike. By the first week in June, 1897, when the season's work closed, gold to an estimated value of from \$2,000,000 to \$4,000,000 had been taken out by about 600 men; and by the end of the summer, in September, 1897, the amount had been increased by another \$1,000,000. The highest price paid for the purchase of a single claim was \$55,000. The output for the following season, 1897-98, was estimated at \$9,000,000, as follows:

Eldorado, \$4,000,000; Bonanza, \$3,000,000; Hunker and Bear, \$1,000,000; Dominion, Sulphur, and all other creeks, \$1,000,000. This estimate of \$9,000,000, however, is probably \$2,000,000 below the actual output. It is expected that the output for the season of 1898-99 will be double that of 1897-98. By many of the miners Eldorado Creek is considered to be the richest placer district ever worked in the world. From its mouth to claim 38, four miles up the river, every claim has proved to be uniformly rich, not one being worth less than \$200,000, and some being worth a good deal more. And according to results yielded in the latter part of 1898, Dominion Creek (an affluent of Indian River) promises to turn out as rich as, if not richer than, Eldorado Creek. Paying diggings have also been discovered on Henderson Creek. During the winter of 1897-98, also, some rich strikes were made on an island in the Yukon, about 10 miles above Dawson, to which the name of Monte Cristo was given. As high as \$8 was found in a single pan. This discovery caused a good deal of excitement, and all the islands in the Yukon for from 15 to 20 miles above and below Dawson were speedily staked. Outside of and some 400 miles to the south of the Klondike district another gold-bearing region has been discovered in northwest Canada, in the neighborhood of Lake Atlin, a sheet of water about 50 miles long and three or four miles wide, lying partly in British Columbia and partly in Yukon district, and between Lake Tagish, on the west, and Lake Teslin, on the east. This region is nearer and more accessible than the Klondike, and there will probably be a rush to it during the present season (1899). In the fall of 1898 an active volcano, in full eruption, about 14,000 feet high, was discovered in the Atlin district.

Under the Canadian mining regulations claims in the Klondike district are limited to 250 feet along the general course of a stream. The discoverer is allowed to locate two claims, or 500 feet. Every alternate ten claims are reserved to the government; that is, when a claim is located, the discoverer's and nine other adjoining claims are open for registration, then the next ten claims are reserved to the government. A prospector can locate but one claim in a district, and he must certify under oath that he has found gold in paying quantities. This gives a fair chance to all, as it prevents speculators from taking up claims before they have been properly prospected, and for the mere purpose of selling again. A royalty of ten per cent is collected on the gross annual output of each claim, \$2,500 being first deducted from the gross annual output. The gold commissioner's fees are: miner's license, \$10; location notice, \$15; transfer, \$2; mortgage, \$2; partnership agreement, \$5.

The method of placer mining in the Klondike district is usually as follows: The ground throughout the Klondike has a covering of moss to a depth of from 12 to 18 inches, beneath which there is a deposit of decayed vegetation called by the miners "muck," which varies from 2 to 30 feet in depth. This "muck" is frozen solid from its surface just beneath the covering of moss down to the frozen gravel, which is generally struck at a depth of 10 or 15 feet, though sometimes not till a depth of 25 or

30 feet is reached. It is in this gravel that the gold is found. The summer heat has no effect on the layer of frozen earth or "muck," until the moss is removed. This layer of moss is therefore stripped off, and the miner, with a pick, sinks a shaft, about 6 feet long by 3 or 4 feet wide, through the frozen earth till he reaches the gravel. This frozen gravel is so hard that it turns the point of the best pick in five minutes. The miner therefore thaws out the gravel by "burning"; that is, he builds a fire at the bottom of the shaft, and when the gravel is thawed out to the depth of about 2 feet, he shovels it out and, with a windlass, hoists it to the surface, where the gold can be washed out. This process of thawing and shoveling out the gravel is called "drifting," and it can be continued downward till bed rock is reached. This work is best done in winter, because in summer the flow of water into the shaft prevents work at the bottom. Shallow claims, where a shaft is not necessary, can be worked in summer by sluicing. When placer mining by hand labor has been exhausted, it is probable that the Klondike will, for many years, yield profitable results from mining by hydraulic machinery.

POPULATION AND TOWNS. News of the great strikes in the Klondike quickly spread, and miners at once flocked in from other districts, including about 800 or 900 from Circle City, Alaska, till by April 1, 1897, the population in the Klondike numbered about 1,500; and during the season of 1897 about 4,000 more came in. During the season of 1898, from April to September, about 40,000 entered the district, many of whom, however, left before or at the end of the season. Dawson, the chief town of the district, is situated on the east bank of the Yukon, just north of the mouth of the Klondike river. It was located as a town site about Sept. 1, 1896, by Joseph Ladue (the author of *Klondike Facts*), of the firm of Harper & Ladue, owners of a saw-mill at Sixty Mile; and within six months from that date about 500 log-houses had been built, including residences, stores, hotels, restaurants, and saloons. In August, 1897, the population was about 3,000, but by October 1 the number had been reduced to about 2,000. In September, 1898, the population had grown to about 20,000. At that date the town had 4 churches, 2 banks, a saw-mill, an opera house, a variety theatre and dance hall called the Pavilion, and 2 newspaper offices, from one of which the *Yukon Midnight Sun*, the first newspaper in Dawson, made its first appearance on June 11, 1898, and from the other of which the *Klondike Nugget* appeared five days later; the price of each paper being 50 cents a copy. The main street has a solid line of four or five blocks of substantial structures, many of which cost from \$20,000 to \$30,000 each. Dawson is the headquarters of the Canadian Northwest mounted police. Land on the main street, in the central part of the town, sells for from \$500 to \$1,000 a foot frontage; residence lots of 50x60 feet fetch from \$100 to \$2,000 each, according to location. A business lot on the second street from the river sold in May, 1898, for \$10,000. A log cabin rents for \$200 a month. In the summer of 1897, another town, called The Forks, sprang up on the north side of Bonanza Creek,

opposite the mouth of the Eldorado. Fort Cudahy, Fort Constantine, and Forty Mile are other towns or posts, all being situated on the Yukon, at the mouth of Forty Mile Creek, 53 miles below Dawson. On the route from Skagway, at the head of Lynn Canal, to Dawson, there are villages or posts, with Canadian post offices, having a fortnightly service, at Bennett, Tagish House, White Horse Rapids, Lebarge, Hootalinqua, Big Salmon, Little Salmon, and Sixty Mile.

On April 26, 1899, Dawson City was almost entirely destroyed by fire. It has since been in some measure rebuilt. The administration of the Yukon Territory, which dates from July, 1898, when the Canadian government organized it and appointed William Ogilvie as first commissioner, is still primitive and inefficient. This will no doubt henceforth be improved as the Ottawa government obtains a larger return from royalties and miners' certificates. The amount it received for the year ending June 30, 1899, in the way of revenues from the district, was in the neighborhood of one million dollars, exclusive of customs levies. This amount it is claimed to have disbursed in administration expenditure, including the expenses in maintaining the militia force (the Northwest Mounted Police), in disbursements on the postal and customs service, and on public works. The value of the gold yield in the Yukon district for the year 1898 was, in round figures, \$10,000,000; in 1899 the yield was \$16,000,000. The local gold commissioner representing the Canadian government is (1900) E. C. Senkler. Geological experts, reporting for government on the probable productive area of the Yukon gold fields, state that the Klondike gold district, as at present known, covers an area of 1,000 square miles. This area, it is explained, refers to the district traversed by the gold-bearing creeks, and not to the actual area of pay gravels. At present the bulk of the gold yield is derived from the Eldorado and Bonanza creeks.

For particulars as to climate, routes, outfit, postal service, etc., see ALASKA, *ante*, pp. 111*b*-111*d*.

KLOPP, ONNO, a German historian; born in Leer, Hanover, Oct. 9, 1822; taught in the Osnabrück Gymnasium in 1845-58. His historical works attracted the attention of King George V of Hanover, who attached him to his person in 1865. When the blind sovereign was driven out of his kingdom after the defeat of his troops by the Prussians at Langensalza in 1866, Klopp followed him into exile. He joined the Roman Catholic Church in 1874, and settled near Vienna, giving his time to historical researches and writings. He wrote *Geschichte Ostfriesland* (3 vols., 1854-58); *König Friedrich II von Preussen und die Deutsche Nation* (1867); *Tilly im 30 jährigen Krieg* (1861); *Der Fall des Hauses Stuart* (14 vols., 1875-87); *König Georg V* (1878); *The Thirty Years' War to the Death of Gustavus Adolphus* (1891).

KLOPSCH, LOUIS, M. A., Ph. D., journalist, and proprietor of the *Christian Herald*, New York, was born in Germany, March 26, 1852. His father, a physician, who had actively participated in the revolution of 1848, came in 1854 with his family to the United States and settled in New York city. Here Klopsch attended the public schools. In 1890, after

a journalistic experience of twenty years, he purchased the *Christian Herald* and engaged Rev. T. DeWitt Talmage as its editor. Introducing secular enterprise into religious journalism, he achieved a success unprecedented in that particular field. Since 1893, with the aid of his paper, he has raised and distributed in international charities the sum of one million dollars. In recognition of his relief operations in connection with the Russian famine of 1892, he was received by the present Tsar of Russia and royally entertained by the municipalities of St. Petersburg and Moscow. In 1898 the English and Indian governments officially united in special thanks for his services in behalf of famine-stricken India, when he sent a cargo of corn by the relief steamship *Everett* and money aggregating over \$400,000. In the same year President McKinley appointed him one of the three United States commissioners charged with the relief of the reconcentrados in Cuba. His work in Armenia, Constantinople, and elsewhere has also contributed to make him notable as an international philanthropist.

KLUAHNE, a lake in Yukon district, Canada, 50 miles long by about 6 miles wide; its outlet, the Klaant river, flows into the White River.

KNAPP, JACOB HERMANN, German ophthalmologist; born in Dauborn, Prussia, March 17, 1832; educated in Germany, France, and England; graduated in medicine at Giessen, in Hesse-Darmstadt, in 1854; professor of ophthalmology at the University of Heidelberg, 1860-68. In 1868 he settled in New York, and in 1869 founded the New York Ophthalmic and Aural Institute, of which he has since been surgeon. In 1869, also, he founded the *Archives of Ophthalmology and Otolaryngology*, a monthly. Since then he has filled various important professional positions in New York. He has written *Intraocular Tumors* (1868); *Cocaine and Its Use in Ophthalmic and General Surgery* (1885); *Fermentation, Putrefaction, and Suppuration* (1886); *Cataract Extraction without Iridectomy* (1887); *One Thousand Successive Cases of Cataract Extraction without Iridectomy* (1887).

KNAPP, SAMUEL LORENZO, an American author; born in Newburyport, Mass., Jan. 19, 1783. He wrote *Travels in North America, by Ali Bey* (1818); *Biographical Sketches of Eminent Lawyers, Statesmen, and Men of Letters* (1821); *Memoirs of General Lafayette* (1824); *The Genius of Freemasonry* (1828); *Discourse on the Life and Character of De Witt Clinton* (1828); *Lectures on American Literature* (1829); *American Biography* (1833); *History of the United States* (1834), etc. Died in Hopkinton, Mass., July 8, 1838.

KNAUS, LUDWIG, a German genre painter; born at Wiesbaden, Oct. 10, 1829; entered the Düsseldorf School of the Fine Arts, where he studied under Sohn and Schadow; went to Paris, and, except one year spent in Italy, lived there for eight years, perfecting himself in the technical part of his art by close study of modern French masters. His *Promenade* was honored with a place in the Luxembourg in 1855. His next important pictures were *The Golden Wedding* (1858) and *The Christening* (1859). In 1860 he returned to Wiesbaden, but in 1861 went to Berlin, and in 1866 to Düsseldorf, whence, in 1874, he returned to Berlin, to fill an important post in the Academy.

His *Children's Festival* (1869) is in the National Gallery, Berlin. Others of his works are *Funeral in a Hessian Village* (1871); *His Excellency Traveling*; *The Village Musician*; *The Inn* (1876); *The Refractory Model* (1877); *Solomon's Wisdom* (1878); and *A Peep Behind the Scenes* (1880); the last of which created a great deal of interest in Düsseldorf. Several of his best works are owned in America, among them *Priest and Poacher*. Other good examples were sold at high prices at the Wolfe and Latham sales in New York. His *Holy Family, Peace*, and *None but the Cats* are in the Metropolitan Museum, New York; and *Mud Pies* (1873) is in the Walters Gallery, Baltimore.

KNEELAND, SAMUEL, naturalist and educator; born in Boston, Mass., Aug. 1, 1821. During the Civil War he was a surgeon in the Union army, and in 1866 was mustered out with the brevet rank of lieutenant-colonel. In 1867-78 he was instructor or professor in the Massachusetts Institute of Technology, and later devoted himself to travel, literature, and lecturing. He wrote *Science and Mechanism* (1854); *The Wonders of the Yosemite Valley and of California* (1871); *An American in Iceland* (1876); a work on the Philippines entitled *The Land of Hemp and Sugar*; and *Volcanoes and Earthquakes* (1888). Died in 1888.

KNIAZHININ, IAKOV BORISOVICH, dramatist; born in Pskov, Russia, Oct. 3, 1743. Though influenced by, if not adapted from, the tragedies of Voltaire, Corneille, and Racine, his plays met with great success in Russia, especially his patriotic tragedies *Roslav* (1784) and *Vadim Novgorodskii* (1789). The latter was published in 1793 after his death, but on account of its liberal utterances brought its publishers much trouble. His best comedies are *The Boaster* and *The Queer One*. Died Jan. 14, 1791.

KNIGHT, DANIEL RIDGEWAY, an American painter; born in Philadelphia about 1845. In 1872 he went to Paris and studied at the École des Beaux Arts and under Gleyre, and in 1876 under Meissonier, and has since lived almost entirely in France. To the Paris Salon he sent *The Fugitives* (1873); *French Washerwomen* (1875); and *Harvesters' Repast* (1876); and to the National Academy, New York, *The Veteran* (1870); *Othello in the House of Brabantio* (1871); *The Antiquary, The Old Bean*, and *Dividing the Profits* (1873); *Strolling in the Garden* (1874); *Market Place at Poissy* and *Harvest Scene* (1877); and *Pot au Feu* (1878). Other works are *The Vintage in France* (1877); *After Breakfast* (1878); *A Halt* (1880). *Dowerless* (1883); *Un Deuil* (1883); *Chatterboxes* (1885); and *In October* (1887). His studio is now (1899) in Poissy.

KNIGHT, EDWARD HENRY, Anglo-American mechanic; born in London, June 1, 1824. In 1845 he came to the United States, and after 1863 was in the Patent Office, Washington, where, in 1871, he founded the *Official Gazette of the United States Patent Office*. He was juror at the Philadelphia (1876), Paris (1878), and Atlanta (1881) exhibitions; and in 1878 was U. S. commissioner at Paris, where he was made chevalier of the Legion of Honor. He published *Library of Poetry and Song* (1870; rev. ed., 1876); and *Practical Dictionary of Mechanics* (4 vols., 1877-84). Died in Bellefontaine, Ohio, Jan. 22, 1883. His brain weighed 64 ounces, one of the heaviest on record.

KNIGHT, RICHARD PAYNE, an English antiquarian and author; born in Herefordshire in 1750. From an early age he took great interest in the study of ancient art and literature, and on inheriting his grandfather's great wealth he devoted himself to researches and purchases in his favorite field of work. In his extensive travels he amassed a vast collection of ancient coins, bronzes, statuary, and other objects relating to the Greek and Roman religions. His *Account of the Remains of the Worship of Priapus* (1786; New York, 1874) caused some scandal, but was finally accepted as an authority on the topic. He was an M. P. and a trustee of the British Museum, to which he bequeathed his magnificent collection, valued at £50,000. He wrote several pamphlets tending to prove that Homer's poems are the works of one man; also *An Analytical Inquiry into the Principles of Taste* (1805). Died in London, April 24, 1824.

KNIGHT, THOMAS ANDREW, an English biologist and horticulturist, brother of the preceding; born at Wormsley Grange, Herefordshire, Oct. 10, 1758. He contributed greatly to the progress of these branches of science in England. Elected a fellow of the Royal Society, in some of his papers inserted in the *Transactions* he almost reached Darwin's radical conclusions. He published several monographs on fruit-culture, and after his death his remarkable *Physiological and Horticultural Papers* were collected in book-form. He died in London, May 11, 1838.

KNIGHT, WILLIAM ANGUS, a Scotch philosopher and educator; born at Mordington, Scotland, Feb. 22, 1836; graduated from the University of Edinburgh; appointed professor of philosophy in the University of St. Andrews in 1876. His teachings exerted a strong and wholesome influence upon his pupils. He has published *Poems from the Dawn of English Literature to 1609* (1863); *Colloquia Peripatetica* (5th ed. 1879); *Philosophical Classics for English Readers* (15 vols., 1880-90); *The Philosophy of the Beautiful* (2 vols., 1891-93); *University Extension Manuals* (18 vols., 1891-94); *Aspects of Theism* (1894); *The Christian Ethics* (1894); *Works of William Wordsworth and Dorothy Wordsworth* (12 vols., 1896-97); *Nugæ Viatoris* (1897).

KNIGHTSTOWN, a village of Henry Co., Ind., on Blue River, 34 miles E. of Indianapolis; has an academy, a Soldiers' and Sailors' Orphans' Home, abundant water power, natural gas, electric lights, machine-shops, mills, foundries, and tile, lumber, pump, and paper factories. Population 1900, 1,942.

KNIGHTSVILLE, a village of Clay Co., Ind., 2 miles E. of Brazil, in the centre of the block-coal

region of the state; is a shipping-point for freight between Indianapolis and St. Louis; and has extensive blast-furnaces and rolling-mills, and the works of the Indiana Coal and Iron Co. Population 1890, 1,148; 1900, 1,171.

KNIPPERDOLLING, BERNHARD, a German religious fanatic; one of the leaders of the Anabaptist sect that ruled over Münster, Westphalia, in 1532-35. He was burgomaster of the city, but after its capture by Count Waldeck, June 24, 1535, was, with John of Leyden, put to death with horrible tortures, Jan. 23, 1536. See also ANABAPTISTS, Vol. I, p. 786.

KNORRING, ERIK OSKAR VON, traveler and writer; born in Sweden in 1822; when quite young entered upon a successful literary career; after 1884 editor and publisher of the periodical *Läsning i Hemmet* (*Home Reading*); published a number of novels, tales, and sketches; also *Reminiscences of the Danish Campaign of 1849, by a Swedish Volunteer* (1864); and *Two Months in Egypt* (1873).

KNOT OR GRAYBACK. See KNOT, Vol. XIV, p. 129; SANDPIPER, Vol. XXI, p. 260.

KNOTT, JAMES PROCTOR, an American statesman; born in Lebanon, Ky., Aug. 29, 1830; in 1846 began to study law; elected to the state legislature in 1858, and in 1859 appointed, and in 1860 elected, state attorney-general. In 1861, for refusing to take an ironclad Union oath, he was imprisoned and disbarred, and his office was declared vacant. In 1866 he was elected to Congress, and obtained his seat with some difficulty; was re-elected in 1868 (during which Congress he made his famous "Duluth" speech), and again in 1874, and served from 1875 to March, 1883, in which year he was elected governor of Kentucky. He was afterward an unsuccessful candidate for the United States Senate.

KNOWLEDGE. See METAPHYSIC, Vol. XVI, pp. 82-98; COMTE, Vol. VI, pp. 234-36; LOCKE, Vol. XIV, pp. 760-62.

KNOWLES, JAMES, an architect and litterateur; born in England in 1831; educated as an architect at University College, London, in his father's office, and in Italy; is a fellow of the Royal Institute of British Architects. Among his best artistic efforts are Aldworth (Tennyson's Surrey residence); Kensington House, London; Albert Mansions, in Victoria street; the Public Gardens and Fountains, Leicester; and several London churches. In 1870-77 he edited *The Contemporary Review*, which was made the organ of the Metaphysical Society, which he had originated in 1869, with forty members chosen from leading-British speculative thinkers. In 1877 he founded *The Nineteenth Century*. He compiled (from Sir Thomas Mallory) *The Story of King Arthur* (1860).

KNOW-NOTHINGS. See *American Party* under UNITED STATES, Vol. XXIII, p. 770.

KNOX, HENRY, an American soldier and patriot; born in Boston, Mass., July 25, 1750. When 18 years of age evinced a love of military affairs by joining an independent company of grenadiers, of which he was chosen commander. In 1770 he became a bookseller, but his patriotic and military ardor soon led him to espouse the cause of the colonies by joining the army investing Boston. During the winter of 1775-76 he distinguished himself by the success-

ful issue of a hazardous project, by which fifty-five pieces of ordnance and a large quantity of ammunition were transferred from Lake George and the forts near the Canadian frontier to Washington's army, his services being rewarded by Congress with the commission of brigadier-general of artillery.

GENERAL HENRY KNOX.

He took an active part in the battles of Bunker Hill, Trenton, Brandywine, Germantown and Monmouth, and during the siege of Yorktown rendered efficient service, enjoying the distinction of Washington's special confidence and esteem. In 1775 he was appointed Secretary of War, being reappointed under Washington's first administration, and executing the duties of the office with remarkable tact and energy. In 1794 he withdrew from official life, and retired, poor, but highly honored, to a homestead on the Penobscot, in Maine. His services to his country, however, had been too eminent to permit long obscurity, and he was repeatedly chosen to the Maine legislature and to the council of state. He died at Thomaston, Maine, Oct. 25, 1806.—His wife, Lucy, daughter of the secretary of Massachusetts province, was remarkable for her personal beauty and amiable character, no less than for her intellectual power. She became an intimate in Washington's household, having followed her husband's fortunes in the field, and endearing herself to the soldiery by her courage during the trying scenes at Valley Forge. In matters of ceremony and official courtesy her judgment was in constant demand by Mrs. Washington, and even in affairs of state her counsel was not infrequently sought by the commander-in-chief.

KNOX, JOHN JAY, an American financier; born in Knoxboro, Oneida County, New York, March 19, 1828; was graduated from Hamilton College (1849), and immediately entered the banking business, his father, John J., having been a noted New York state banker, a general in the militia, and for thirty years chairman of the board of trustees of Hamilton College. He did business as a private banker at St. Paul, Minnesota, from 1857 to 1862.

JOHN J. KNOX.

A pamphlet on national banks, written in the latter year, attracted the attention of Secretary Chase, who appointed him chief of the mint and coinage correspondence of the Treasury (1866); deputy comptroller of currency (1867); comptroller of the currency (1872). His report on the mint service was one of the efficient causes of the Coinage Act of 1873.

He assisted in the work of the resumption of specie payment (1879); abandoned the comptrollership for the presidency of the National Bank of the Republic, New York City (1884); wrote *A History of the Various Issues of Paper Money by the United States Government* (1884; rev. ed. 1887). He died in New York City, Feb. 9, 1892.

KNOX, THOMAS WALLACE, an American traveler, journalist, and author; born in Pembroke, New Hampshire, June 26, 1835. After teaching school for a few months, he visited the gold-fields of Colorado in 1860, but enlisted as soon as the Civil War broke out. After two campaigns he retired with a lieutenant-colonel's brevet, to join the field-staff of a New York daily. Later, he crossed Siberia with a telegraph-laying expedition, making 3,600 miles on sledges and 1,500 miles on wheels, and publishing his impressions under the title of *Overland Through Asia*. He wrote a number of books for boys, which proved very successful, being mainly based upon his own traveling experiences. He wrote, also, a *Life of Henry Ward Beecher*; *Lives of Blaine and Logan*; *Decisive Battles Since Waterloo*; and a *History of the Republican Party*; etc. He died in New York City, Jan. 6, 1896.

KNOX COLLEGE, a non-sectarian, co-educational institution, situated at Galesburg, Illinois; founded in 1837; organized in 1841; first class graduated in 1846. From then until 1895 1,135 graduates received their diplomas from the institution. In 1895 there were 31 professors and instructors, 688 students, and 8,000 volumes in the college library. The productive endowments amounted to \$175,000, the total revenue to \$13,000 per annum, and the value of buildings and equipment was set down at \$325,000.

KNOX COLLEGE, a theological training institution located at Toronto, Ontario, in connection with the Canadian Presbyterian Church. The present site of the college, which was founded in 1846, is a commanding position on Spadina Avenue, in the Ontario capital, on which a handsome edifice was erected in 1875. The college has numerous lecture-rooms, and the residence has accommodation for 75 students. There is also a fine library and convocation hall. The theological course extends over three sessions, and there is at the disposal of the authorities a number of valuable prizes and scholarships. The college, which is affiliated with Toronto University, is governed by a board of management, appointed annually by the General Assembly of the church. The senate consists of the principal, the professors and lecturers of the college, and a number of gentlemen, clerical and lay, appointed by the General Assembly.

KNOXVILLE, a city of Knox County, north-western central Illinois, 50 miles W.N.W. of Peoria, on the Chicago, Burlington and Quincy railroad. It is the seat of the Illinois Protestant Episcopal diocesan school for girls, and of a Swedish college. Coal-mining and manufacturing are carried on, there are eight paving-brick yards, and carriages, plows, wagons, flour, and woolen goods are produced. Population 1890, 1,728; 1900, 1,857.

KNOXVILLE, a city and the capital of Marion

County, Iowa, situated 40 miles S.E. of Des Moines, on the Chicago, Burlington and Quincy and the Chicago, Rock Island and Pacific railroads. It is in an agricultural and coal-mining region, and good building-stone and timber are also found here. It has an iron foundry, steam-mills, washer and woolen factories. It is the seat of the Iowa Home for Adult Blind, and is supplied with electric lights and city water. Population 1900, 3,131.

KNOXVILLE, a city of Tennessee, the capital of Knox County. It lies on the north bank of Holston River, at the head of steam-navigation, and on the Knoxville, Cumberland Gap and Louisville, the Knoxville and Augusta, the Marietta and North Georgia and the Southern railroads. The leading manufactures are machinery, car-wheels, nails, flour, cotton and woolen goods, leather, furniture, soap, stoves, lumber and wooden-ware. Knoxville is the seat of the University of Tennessee and the State Agricultural College; also of the Tennessee School for Deaf Mutes, the East Tennessee Asylum for the Insane and the Austin Industrial School for Colored Pupils. It was occupied during the Civil War by Burnside, with a Federal force of 12,000 men, in November, 1863. He was besieged and assaulted by Longstreet, who had pursued him hither, without success, on the 17th and 29th of the month, when the Confederates lost heavily. The siege, however, continued, and Sherman was sent to Burnside's assistance, but he was detained by the battle of Chattanooga and did not arrive till December 4th. A short battle ensued, Longstreet was compelled to retire and raised the siege. Population 1890, 22,535; 1900, 32,637. See also KNOXVILLE, Vol. XIV, p. 134.

KNYPHAUSEN, BARON WILLIAM VON, a German soldier; born in Lützberg, Germany, Nov. 4, 1716. He entered the Prussian army in 1734, and became a general officer in the army of Frederick the Great. In 1776 he fought against the Americans as second in command of the corps of Hessians hired by England. He took part in the battles of Long Island, White Plains, Fort Washington, Brandywine and Monmouth. While in command at New York he made raids into New Jersey and New England, sacking the village of Connecticut Farms and burning Springfield. He was finally placed in full command of the Hessians, and occupied the city of New York in 1780. He returned to Europe in 1782, having lost an eye and gained little military reputation. The remainder of his life was passed as governor of the Castle of Cassel, Hesse. He died in Cassel, Dec. 7, 1800.

KOALA, COALA, AUSTRALIAN BEAR, NATIVE SLOTH (*Phascolarctos cinereus*), a marsupial found only in eastern Australia, resembling the *Phalangeridae* in general character, but having much larger molar teeth, and the toes of the fore feet disposed in two opposite groups—a peculiarity of structure unique among quadrupeds. The tail is quite rudimentary, and the shape of the animal not unlike that of a bear. The female carries her young on her back for some time after they leave her pouch.

KOBE, a foreign settlement, suburb of HIOGO; q.v., Vol. XI, p. 851.

KOBELL, FRANZ VON, a German mineralogist

and poet; born at Munich, July 19, 1803. In 1834 he became professor of mineralogy at the University of Munich, where he had been assistant professor for eight years, and from 1850 to 1860 he wrote his *Characteristics of Minerals*; he was intensely fond of open-air life, and mingled a great deal with the peasants and foresters. He published *Hochdeutsche Gedichte*, a book of poems. Many of his dialect poems were widely circulated in Germany. His work *Die Urzeit der Erde* (*The Primitive Times of the Earth*) blends erudition with an intense poetic feeling. He died in Munich, Nov. 11, 1882.

KOBO-DAISHI OR KUKAI, priest. See JAPAN, Vol. XIII, p. 581.

KOBOLD, in German fairy-tales, a kind of elf, described as a little old man or woman, oddly dressed in miner's clothes, and fond of hoarding precious metals and gems. They were said to be friendly to mankind, generally choosing some particular habitation, in which they endeavored to render all kinds of services without being discovered.

KOCH, KARL HEINRICH EMMANUEL, a German naturalist; born at Weimar, June 6, 1809. Studied at the universities of Würzburg and Jena, in 1836 undertook a scientific journey to southern Russia; in 1843-44 visited Armenia, Kurdistan, Transcaucasia and the Crimea, where he collected materials for books entitled *Wanderings in the East* (1846-47) and *The Crimea and Odessa* (1853). He published, also, an excellent map of the Caucasian Isthmus and Armenia. In 1836 he was appointed extraordinary professor of Botany at Jena, and in 1848 at Berlin. His chief work is his *Dendrologie* (1869-72). He died in Berlin, May 27, 1879.

KOCH, ROBERT, a German bacteriologist; born at Klausthal, Hanover, Dec. 11, 1843; received his M.D. degree from Göttingen; practiced as a physician in a village near Hanover, and later in Rackwitz and Wollstein. While there his name came before the public in 1880, as an expert in connection with the famous Speichert poisoning case. The conviction of the prisoner was entirely owing to the medical testimony of Dr. Koch, which attracted such attention that he was summoned

DR. KOCH.

to Berlin and appointed a member of the Sanitary Commission and a professor of the School of Medicine. In 1882 he made the discovery that tuberculous diseases are due to the existence of bacilli, and announced a specific germ, which he called the bacillus tuberculosis. Thenceforth he devoted his entire efforts to finding some rival microbe or chemical antidote powerful enough to neutralize the operations of the tuberculous bacilli. In 1883 he was placed at the head of the medical commission dispatched by the German government to Egypt and India for the purpose of making researches into the causes and prevention of cholera. While at Calcutta he suc-

ceeded in discovering, in the water of a cistern, the comma-like microbe of cholera Asiatica, for which, until now, no one has succeeded in discovering an antidote. On his return to Germany he was rewarded by the government, for his researches, with an honorarium of 100,000 marks, the rank of Privy Councilor and the rectorship of the Imperial Institute of Hygiene.

In September, 1890, Dr. Koch startled the world by the announcement that he had discovered a remedy which would destroy the bacillus tuberculosis and expel it from the human system without injuring the tissues in which the germ resides. After the hopes of the unfortunate victims of tuberculosis had been excited to the point of hysteria, and when thousands of patients were crowding Berlin to test the new substance, it was recognized that the remedy was generally worse than the disease. The procedure was finally abandoned, and Dr. Koch resumed his researches. The matter of his "lymph" is still *sub judice*, as true consumption takes six years to run its course, and by 1897 the injections of lymph made in 1890-91 may prove to have realized absolute cures in slow, chronic cases. His works include *Zur Ätiologie des Milzbrandes* (1876); *Untersuchungen über die Ätiologie der Wundinfektions-Krankheiten* (1878); *Ueber die Milzbrandimpfung* (1882); *Was Wissen und Können Unsere Aerzte?* (1885); and *Weitere Mittheilungen über ein Heilmittel gegen Tuberculose* (1890).

KOEL, a town of India. See ALIGARH, Vol. I, p. 576.

KOEPPEL, WLADIMIR PETER, a Russo-German meteorologist; born in St. Petersburg, Russia, Sept. 25, 1846; educated there, and at Heidelberg and Leipsic, receiving the degree of Ph.D.; assistant in the Central Physical Observatory, St. Petersburg, (1872-73), meteorologist at the Deutsche Seewarte, at Hamburg (1875), and for many years editor of the *Deutsche Meteorologische Zeitschrift*. He made many ascents in free and captive balloons for scientific purposes. He wrote for the *Repertorium für Meteorologie* (1869-74), for *Die Annalen der Hydrographie und Maritimen Meteorologie*, and for *Das Archiv der Seewarte*.

KOH-I-NOOR. See DIAMOND, Vol. VII, p. 166.

KOHLER, ULRICH, a German specialist in Greek epigraphy; born in Germany in 1838; had spent several years in Athens as secretary of the German Archæological Institute, when he published his famous work on Attic inscriptions; appointed professor of Greek history at the Berlin University in 1888.

KOHL-RABI. See AGRICULTURE, Vol. I, p. 370; and HORTICULTURE, Vol. XII, p. 284.

KOHLRAUSCH, FRIEDRICH, a German physicist; born at Rinteln, Germany, in 1840. He was the son of RUDOLF KOHLRAUSCH, a distinguished professor of physics at the Cassel Polytechnicum; studied at Marburg and Erlangen; received his Ph.D. from Göttingen in 1863; after filling instructorships at Göttingen and Frankfort-on-the-Main he was successively professor of physics at Zurich (1870-71), Darmstadt (1871-75) and Würzburg (1877-88). He succeeded Kundt as director of the Strasburg

Physical Laboratory in 1888, and was the author of an excellent *Manual of Physical Laboratory Practice (Leitfaden der Praktischen Physik)* (1879), translated into English, French, Russian and Hungarian.

—His brother, WILHELM FRIEDRICH, born at Marburg in 1855, received his Ph.D. from Würzburg; an electrician of reputation, he became successively professor of theoretical physics at Strasburg in 1883 and professor of electricity at the Royal Engineering School at Hanover in 1884.

KOH-SABAP, same as CHANTIBURI. See SIAM, Vol. XXI, p. 852.

KOKOMO, a city and capital of Howard County, northern central Indiana, on the Wild Cat River, 54 miles N. of Indianapolis, and on the Pittsburg, Cincinnati, Chicago and St. Louis, the Toledo, St. Louis and Kansas City and the Lake Erie and Western railroads. It is in an agricultural, stock-raising and lumbering region, and manufactures hubs and spokes, doors, furniture, flour, plate-glass, bits, stoves and ranges, sashes and blinds and woolen goods. It has banks, churches, high schools and several weekly newspapers. Population 1890, 8,261; 1900, 10,609.

KOKO-NOR OR KUKU-NOR ("Blue Sea"), a lake of Tsing-Hai province, in the western Chinese Empire, north of Tibet, crossed by lat. 37° N., long. 100° E. It receives the drainage of a large, broad valley, but has no outlet, and its waters, in which fishes abound, are very salt and bitter. Length, 65 miles; breadth, 18 to 40; altitude, 10,700.

KOLA, the most northern town of European Russia. It is situated on the peninsula of Kola, is the capital of Russian Finland, and has a capacious harbor. Population, 770. The peninsula of Kola is a dreary expanse of forests and lakes, but has several ranges of mountains, one of which, the Umbdek Mountains, on the east side of Lake Imandra, rises to 3,300 feet.

KOLA-NUT. See NUT, Vol. XVII, p. 664.

KOLAR, JOSEF JIRI, a Bohemian actor and playwright; born in Prague, Bohemia, Feb. 9, 1812, where he studied philosophy at the university. He made a very successful *début* on the stage in 1837, and soon became the star tragedian of the Bohemian theater, appearing in the chief Shakespearean rôles. He translated or adapted a number of plays by Shakespeare, Schiller, Goethe, and wrote many tragedies: *Monica* (1846); *Zizkova Smrt* (1850); *Magelsna* (1851); *Primator* (1883); *Kralovna Barbara* (1884); *Mistr Geronym* (1886); and comedies: *The Veterans* (1868); *The Ants* (1870); *The Three Pharaohs* (1871). Six volumes of his novels were published between 1854 and 1861.

KOLLAR, JAN, a Bohemian poet; born at Mossove, Hungary, July 29, 1793. In 1819 he became pastor of a Slavic Protestant congregation at Budapest, and in 1849 he was made professor of Slavic archæology in the University of Vienna. He wrote poems in the Czech language, which very powerfully influenced the spirit of his race toward an ultimate unification of all nations of Slav blood. In a treatise, *Ueber die Literarische Wechselstigkeit Zwischen den Stämmen und Mundarten Sla-*

vischer Nationen, he advocates the use of a common Slavic literary language. His best-known poem is a lyrico-epic of 643 sonnets, entitled *Slavy Dcera* (*Slava's Daughter*). It had, and has yet, an extraordinary hold upon all Slavs from St. Petersburg to Prague. He died in Vienna, Jan. 29, 1852.

KÖLLIKER, RUDOLPH ALBRECHT VON, a Swiss physiologist and educator; born at Zurich, Switzerland, July 6, 1817; received his Ph.D. from Zurich (1841), and his M.D. from Heidelberg (1842); studied also in Bonn and Berlin. He soon entered upon the microscopic investigations which made him famous. In 1849 he became professor of anatomy at Würzburg, and assisted in founding a medico-physical society there. His works on histology and physiology are acknowledged as standards, and have been translated into most European languages. Among the more important of them are a treatise on microscopic anatomy, including its application to special organs, the results, amounting to a revolution in physiological standards, entitled *Handbuch der Gewebelehre des Menschen* (1852); *Icones Histologicae* (1864); and many monographs on his discoveries and systems of study.

KOLOSSES, same as THLINKEETS. See INDIANS, Vol. XII, p. 826.

KOLTSOV, ALEXEI VASILIVITCH, a Russian poet; born at Voronezh, Russia, Oct. 26, 1809, of humble parentage; at 16, educated only in the rudiments of village-school learning, he tried his hand at writing poetry; a bookseller gave him a book on prosody, and permission to read the works of the poets in his shop. In 1831 he visited Moscow, and in 1835 published his first volume of poems, which made him famous in a year; his visit to St. Petersburg in 1836 was a triumph. His complete poems, 124 in number, are short and rough, but filled with the pathetic melancholy peculiar to the Russian peasant. He has been called the "Burns of Russia." He died Nov. 12, 1842.

KOLTZOFF—MASSALSKY, HELENIA GHIKA, best known as "Princess Dora d'Istria," her literary pseudonym, a Roumanian writer; born in Bucharest, Wallachia, Jan. 22, 1829. She was a member of the famous Ghika family of Wallachia. She began to write at an early age, and by her German translation of the *Iliad* of Homer had attracted attention, when she was married to Prince Koltzoff-Massalsky, and went with him to the Russian court. She left him, however, and, thrown upon her own resources, again began to write. Among the best of her productions are *The Swiss Confederation* (1856); *The Women of the Orient* (1860); *Women, by a Woman* (1866); and a *Pilgrimage to the Tomb of Dante* (1865). She died in Florence, Italy, Nov. 22, 1888.

KONIG, HEINRICH JOSEPH, a German novelist;

born in Fulda, Germany, March 19, 1790; entered the civil service of Hesse, but devoted much of his time to writing historical novels, which were quite successful and showed much honesty of purpose and careful research; his best effort is undoubtedly his *William Shakespeare* (1850), surrounding the Bard of Avon with the graceful details of a poetical romance. Among his many books may be mentioned *Die Hohe Braut* (1833); *Die Klubbisten in Mainz* (1847); *König Jerome's Karneval* (1855). He died in Wiesbaden, in 1869.

KÖNIGSTEIN, a town of Saxony, Germany, 17 miles E.S.E. of Dresden, near the left bank of the Elbe. It is noted for its fortress, built on a precipitous rock 450 feet high and 1,180 feet above sea-level—one of the few strongholds of Europe which have never been taken. It has been the place of storage of royal treasures during war. It is used now as a state prison. Population 1890, 4,000.

KONRAD VON WÜRZBURG, a German poet of the thirteenth century; said to have been born at Würzburg, Bavaria; author of several poems of only average merit, among them *Engelhardt*; *Otto mit dem Bart*; *Der Welt Sohn*; *Der Schwanenritter*; *Der Trojanische Krieg* (60,000 verses, unfinished); and *Alexius*. He died in Basel, Switzerland, Aug. 31, 1287.

KONKAN, region of BOMBAY. See Vol. IV, pp. 21, 22.

KOODOO. See ANTELOPE, Vol. II, p. 101.

KOORNHERT, RICHARD, a sixteenth-century Protestant theologian. See ARMINIUS, Vol. II, pp. 551, 552.

KOOTENAY, a river of Kootenay District, British Columbia, rising near lat. 51° 20' N., long. 116° 15' W., and flowing south into Montana, then turning and flowing back through Idaho into British Columbia, where it joins the Columbia River. Its upper course is very irregular and rock-bound; from Bonner's Ferry, Idaho, to Kootenay Lake, it is navigable for any sort of craft, but after it leaves the lake it soon becomes too full of rapids and falls for transportation purposes. The district is rich in silver deposits.

KOOTENAY, KOOTENAI, KITUNAHAU OR COOTENAI INDIANS, an American Indian tribe, counting about one thousand members at the last census (1890), and forming a distinct linguistic stock; they resemble more the Indians east of the Rocky Mountains than those of lower Oregon; they are found nowadays only in Montana and British Columbia. They are peaceable, and have added agriculture to their old pursuits as fishermen and hunters. The Upper Kootenays are nominally Christians; the Lower Kootenays pray and sacrifice to the sun.

KOPPARBERG, a province of central Sweden. See Vol. XXII, pp. 739-741.

KOPTOS, an ancient town of Upper Egypt, on the east bank of the Nile, in lat. 26° N. It was destroyed by Diocletian for having taken part in a war against him. Part of its walls still remain, and it has inscriptions going back to the sixth dynasty. It was of importance as a commercial center, being the western terminus of the caravan route from

Arabia and the East. It had gold-mines, which added to its prosperity.

KORAIS OR KORAY, ADOMANTIOS, a Greek patriot and scholar; born in Smyrna, Asia Minor, April 27, 1748. After following a commercial life in Amsterdam, to please his family, he visited Montpellier, France, in 1782, to study medicine and natural history, and in 1788 settled in Paris. His efforts were directed toward resurrecting patriotism in Greece, by means of modern Greek literature, at the same time raising the pride of his compatriots by reminding them of their glorious ancestors. Thus, his editions of Heliodorus, Hippocrates, Xenophon, Plato and Epictetus were the worthy precursors of his *Atacta, ou Mélanges sur la Littérature Grecque Moderne* (1826-35). There is an Athenian edition of his works, collected and published in 1881-87. He died in Paris, April 6, 1833.

KORA-WOOD OR COCYS-WOOD, a wood of the Indian tree, *Lepidostachys Roxburghii*. It is imported in logs of six or eight inches in diameter, having the heart-wood of a deep brown color and very hard. It is much used in the manufacture of musical instruments.

KOREA. See **COREA**, in these Supplements.

KOROLENKO, VLADIMIR GALAKTIANOVICH, a Russian author; born in Zhitomir, Russia, July 15, 1853; when studying in the University of Moscow his liberal ideas caused trouble, and finally he was exiled to eastern Siberia in 1879; returning in 1885, he settled at Nizhni-Novgorod. His writings are of a popular nature, and nearly all works of fiction. Several were translated into English. He wrote *The Vagrant* (1888); *The Blind Musician* and *In Two Moods* (1890-91); *The Master's Dream*; *Sokolnets*; *In Bad Society*; *The Forest Murmurs*.

KORTING, GUSTAV, a German philologist, born in Dresden, Saxony, June 25, 1845; was professor of Romance languages and English philology, first at Münster in 1876; then at Kiel in 1893; one of Diez's prominent pupils; founder, with Koschwitz, of the *Zeitschrift für Neufranzösische Sprache und Literatur* (1879); and *Französische Studien* (1880). Among his works of importance are *Geschichte der Literatur Italiens im Zeitalter der Renaissance* (3 vols., 1878-82); *Encyclopädie und Methodologie der Romanischen Philologie* (3 vols., 1884-86); *Grundriss der Geschichte der Englischen Literatur* (1887); *Encyclopadia der Englischen Philologie* (1887); *Lateinisch-Romanisches Wörterbuch* (1891).—His brother, **HEINRICH KARL OTTO**, also a philologist and a professor of the Romance languages at the University of Leipsic; born in Leipsic, March 15, 1859. He wrote *Geschichte des Französischen Romans im XVII Jahrhundert* (2 vols., 1885-87), a work greatly esteemed, even in France. He died in Leipsic, July 19, 1890.

KOSCHWITZ, EDUARD, a German philologist; born at Breslau, Oct. 7, 1851; private tutor at Strasburg in 1877; professor of the Romance languages and literature at Greifswald in 1894. Wrote *Les Plus Anciens Monuments de la Langue Française* (1879; 4th ed., 1886); *Grammatik der Neufranzösische Schriftsprache—XVI-XIX Jahrhundert* (1889).

KOSCIUSKO, a town and the capital of Attala County, central Mississippi, on Yockanockany Creek,

and on the Illinois Central railroad, 65 miles N.E. of Jackson. Its chief industry is raising cotton, and flour and lumber milling. Population 1900, 2,078.

KOSSUTH, LOUIS, a Hungarian patriot; born at Monok, Hungary, April 27, 1806. In 1832 he commenced his political career at the Diet of Presburg as the proxy of a member of the Upper House. Afterward he published a lithographed Liberal paper at Pesth, but the government prohibited its issue. Kossuth was arrested in 1837, tried for high treason and condemned to four years' imprisonment for the stand he took in regard to the illegal arrest of six patriots. He was released

LOUIS KOSSUTH.

after 18 months' confinement because the Liberals in the Diet refused to grant supplies to the government unless he were set free. In 1841 he founded the *Pesté Hirlap*, a newspaper which met with great success, both politically and financially. In 1847, elected to the Diet, he soon became its leader. On the dissolution of the ministry in September, 1848, he became the head of the Committee of National Defense. For the events of the revolutionary war of 1848-49 the reader is referred to the article on **HUNGARY**. In 1849, Kossuth, who had been Dictator of Hungary, fled to Turkey, where he was made a prisoner. In 1851 he was liberated, and sailed to England, and afterward to the United States, where he met with a most enthusiastic reception. In 1852 he returned to England, residing there until the Italian war of 1859 broke out. After that he resided at Turin, devoting his time to scientific researches from that year until his death. Many of his speeches were published in the *Europäische Bibliothek* in 1860-70; in 1880 he published a portion of his memoirs in Hungarian, English, German and French, under the title of *Souvenirs et Écrits de mon Exil, période de la Guerre d'Italie*. He died in Turin, Italy, March 20, 1894. See Vol. III, p. 137; and Vol. XII, p. 371.

KOSTOMAROV, NIKOLAI IVANOVICH. See **RUSSIA**, Vol. XXI, p. 108.

KOUMISS. See **MILK**, Vol. XVI, pp. 305, 306.

KOVALEVSKŪ OR KOWALEVSKY, EGOR PETROVICH, a Russian traveler and statesman; born in the government of Kharkov, Russia, in 1811; traveled in Siberia, Montenegro, Upper Egypt (1847), to investigate gold deposits for Viceroy Mehemet Ali Pasha; opened a new caravan road to and from China, through Mongolia, finally concluding a favorable treaty of commerce with China in 1851; appointed chief of the Asiatic Department at the Russian Ministry of Foreign Affairs in 1856; organized several explorations into Khorassan, Kashgar, etc.; wrote several volumes relating to his travels, and a *History of the Crimean War*. He died Oct. 2, 1868.

KOXINGA, a Chinese buccaneer. See CHINA, Vol. V, p. 650.

KOZLOV, IVAN I. See RUSSIA, Vol. XXI, p. 107.

KRAKATOA, a volcano. See SUNDA ISLANDS, Vol. XXII, p. 653.

KRANTZ, JEAN BAPTISTE SÉBASTIEN, a French civil engineer and statesman; born at Arches, France, Jan. 17, 1817; graduated from the Polytechnic School in 1838, and from the School of Roads and Bridges in 1840; was promoted to be Chief Engineer of Roads and Bridges in 1864; assisted in the designing of the buildings of the Paris Exposition in 1867; distinguished himself during the siege of Paris in 1870-71; elected to the National Assembly in 1871; one of the leaders of the Moderate Republicans and a steady opponent of any monarchical restoration; elected a life Senator in 1875; Commissioner-General of the Paris Exposition in 1878, his work was indorsed by all exhibitors; retired as Inspector-General of Roads and Bridges and a grand officer of the Legion of Honor in 1878.—His cousin, JULES FRANÇOIS EMILE, a French admiral; born Dec. 29, 1821; was three times Minister of Marine (1877, 1888 and 1890), and attained the rank of vice-admiral.

KRAPOTKINE, PRINCE. See KROPOTKIN, in these Supplements.

KRASINSKI, ZYGMUNT NAPOLEON, COUNT, a Polish poet. See POLAND, Vol. XIX, p. 304.

KRASNOHORSKA, ELISKA, pseudonym for JINDRISKA PECHORA of HENRIETTA PECH, a Bohemian poetess. See SLAVS, Vol. XXII, p. 152.

KRASNOVODSK, a town and fortress and naval station of Russia on Krasnovodsk Bay; an important starting-point for scientific and military expeditions bound for central Asia. The bay extends from the southeastern shore of the Caspian Sea westward along the fortieth parallel of latitude for seventy miles. It is protected by a long tongue of land, and decreases in width from thirty to five miles as it runs inland.

KRASZEWSKI, JOZEF IGNACY (1812-87), a Polish author. See POLAND, Vol. XIX, p. 305.

KREMER, ALFRED VON, an Austrian scholar and statesman, born in Vienna, Austria, May 13, 1828; studied law as well as the Eastern languages at the university of that city. His knowledge of Arabic and Coptic procured him the appointment of first dragoman to the Austrian consulate in Egypt in 1852; consul at Cairo in 1859, and consul at Galatz in 1862, at Beyrut in 1870; made a councilor of the empire in 1872; commissioner on the Egyptian state debt in 1876; Austrian Minister of Commerce in 1880-81. His published works include *Egypt, the Country and People* (1863); *The Leading Ideas of Islam* (1868); and *The Kulturgeschichte des Orients unter den Kalifen* (1875-77).

KREMLIN, a huge crenelated inclosure in Moscow, comprising a city of public buildings, palaces, churches, gardens, etc. See Moscow, Vol. XVI, p. 856.

KRESTOVSKII, VSEVOLOD VLADIMIROVICH, a Russian historian and novelist; born in the government of Kiev, Russia, Feb. 11, 1840; leaving the St.

Petersburg University before graduating, in 1868 he entered the army, and in 1874 wrote a history of his regiment, which caused him to be transferred to the Imperial Guard, and to be made staff historian at the outbreak of the Russo-Prussian War in 1877. As a fiction-writer of secondary merit, but of much imagination and force, he acquired great popularity after the publication of *The Slums of St. Petersburg* (1867), a realistic tale of the great sufferings of the lower classes in the capital. Among his best efforts are *Not the First, not the Last* (1859); *Krovavyy Puf* (1867); and two novels dealing with Russian Jewdom, *Egyptian Darkness* and *Tamara Bendavid*. Several of his stories have been translated into French and German. *The Hetaira of Jerusalem* is considered his best short poem. His campaign history was published as *Twenty Months in the Active Army* (1879). Died in Warsaw, Feb. 1895.

KRISHNA. See SANSKRIT, Vol. XXI, p. 285; and BRAHMANISM, Vol. IV, pp. 208-210.

KRIZHANICH, YURI, seventeenth-century author. See RUSSIA, Vol. XXI, p. 105.

KROHN, WILLIAM O., an American psychologist; born at Galion, Ohio, in 1868; entered sophomore class, Western College, Toledo, Iowa, in January, 1885; received the degree of A.B. in 1887; went to Yale for post-graduate work in philosophy and psychology; received the degree of Ph.D. from Yale in 1889, and was made professor of philosophy in Western Reserve University, Cleveland, Ohio; resigned in 1891 to visit the psychological laboratories of the German universities; took up special work at Clark University under the direction of G. Stanley Hall in March, 1892, holding a senior fellowship in that institution; was elected to the chair of psychology, University of Illinois, September, 1892. He published *Practical Lessons in Psychology*; editor child-study department of *Intelligence and Interstate School Review*; translated from the German, Preyer's *Directions for Mothers Keeping a Record of a Child's Development*; and is classed among the modern educators who are endeavoring to transfer the basis of pedagogic science from the empirical to the psychological.

KROPOTKIN, PETR ALEXEIEVITCH, PRINCE, a Russian geographer and refugee, was born Dec. 9, 1842, in Moscow; entered the St. Petersburg Military School, and at twenty was commissioned lieutenant; for the sake of adventure obtained service in a Cossack regiment of the Amur, and spent five years in eastern Siberia; at first on the staff of the governor of Transbaikalia and then as attaché for Cossack Affairs to the governor-general of eastern Siberia; made explorations in Amur and northern Manchuria; promoted captain in 1865; returned in 1867 to St. Petersburg and studied mathematics for four years in the University, acting also as secretary to the section on physical geography of the Geographical Society; in 1871 was sent to examine the glaciers of Finland and Sweden; published accounts of his explorations in the *Mémoires* of the Geographical Society, from which he received a gold medal for his Siberian contributions.

In 1872 Prince Kropotkin visited Belgium and became a member of the International Society, ren-

dering himself conspicuous by the ardor of his anarchical opinions. He returned to St. Petersburg, and in 1874 was imprisoned in the castle of St. Peter and St. Paul on account of his activity in promoting nihilist organizations. Transferred to the prison of the military hospital, he escaped in 1876 and fled to England. The next year he took charge of the Jura branch of the International in Switzerland, and founded in Geneva *La Révolte*, a nihilist journal, soon after transferred to Paris. At the instigation of the Russian government he was refused Swiss asylum, for defending the assassination of Czar Alexander II. At Thonon, in Upper Savoy, and in England, where he found refuge, he continued to propagate his revolutionary views. In 1883 he was arrested at Thonon, taken to Lyons, France, convicted of sedition, and sentenced to six years' imprisonment; but in 1886, at the solicitation of Victor Hugo and some English scientists, President Grévy released him, and dismissed him across the border, when he took up his residence in London.

Kropotkin collaborated with his friend Elisée Réclus on the *Géographie Universelle*, especially contributing the parts relating to Russia. Many of his papers in *La Révolte* found wide circulation in Europe as pamphlets, and he published in English *In Russian and French Prisons* (1887), and in French *À la Recherche du Pain* (1892), in the interests of nihilism. He contributed to this ENCYCLOPÆDIA many articles on Russian geography and chief cities, of which the more remarkable for original work are SIBERIA, SYR DARIA, TRANSBAIKALIA and TURKESTAN.

KRÜGER, STEPHANUS JOHANNES PAULUS, a Boer statesman, familiarly known as "Oom Paul" (Uncle Paul), and president of the late So. African Republic. He was born in the Cclesberg district of the Cape Colony, a British subject, Oct. 25, 1825. He was of Boer parentage, and at the age of 10 years accompanied his parents and six thousand other Boers in the Great Trek across the Vaal River, inaugurated by the Boers rather than emancipate their slaves.

S. J. P. KRÜGER.

It was a great exodus, a seeking of a promised land among the lions and the natives, neither of whom were pleasantly disposed to the newcomers. But the Boers made room. They shot the lions and served the natives in the same manner, or enslaved them. When Krüger was only 12 years old, he stood behind the wagon-laager on Battle Hill and saw the Zulu crescent surge up the hill almost to the muzzles of the Boer rifles. There was great psalm-singing over the deliverance. At the age of 13 he was present at the great fight on the Blood River, where, after a solemn dedication-service, the Boers fell on the Zulus and slaughtered ten for every Dutchman whom Dingaan had ambushed and massacred.

In 1845 at the age of 16, he had become a field-

cornet, and the next year saw him a full-fledged filibuster, besieging Durban for twenty-six days in the Boers' futile attempt to obtain a sea-gate for their land. He was concerned in the Sand River Convention and in the raid on Livingstone's mission station at Sechelle, and bore no inconsiderable part in the Potchefstroom rebellion of 1857. In 1857 he carried the flag of truce in the Lydenburg rebellion, and on the banks of the Rhenoster River played exactly the same part as Dr. Jameson did in 1896. Then he became a British officer, holding a membership of the executive council until November, 1877, when he was dismissed upon "a serious charge of misrepresentation of money-matters not very creditable to him." Thereafter he became a strong patriot, agitated for independence, and in 1884 made a pilgrimage to Europe to obtain greater freedom for the Transvaal. In 1883 he was elected president of the South African Republic, and reëlected in 1888 and 1893, and at once set on foot intrigues with Germany and made repeated attempts to obtain a foothold and outlet upon the coast. He was reëlected in 1898.

His position was snug from a financial point of view, a salary of eight thousand pounds and "coffee money" being attached to the office of President, with unlimited possibilities for obtaining pecuniary favors in return for his executive acts. A heavy-built, elderly man, whose movements indicate the great muscular force that has once been his, with a strong, square, sagacious face; with grave, troubled eyes that are usually closed in meditation but which ever and anon suddenly open and fasten upon his visitor with a look of intense penetration; clean-shaven, save for a fringe of gray beard around the iron jaw; with coarse, long, straight gray hair—that is what meets the gaze when the "Staats President" of the South African Republic rises to greet a stranger in the presidential mansion at Pretoria. He dwells in simple, patriarchal fashion in the bosom of a large family, and but for the trooper of the Staats Artillerie mounting guard at the doorway, the official residence of the president could not be distinguished from that of any other well-to-do burgher in the capital of the Transvaal.

President Krüger possesses, with much native ability, many of the better characteristics of the Boers. Inveterate hater of the English, knowing their lust for his land, surrounded by a corrupt ring of capitalists and denying the franchise to all who disagree with him, Paul Krüger is a picturesque anomaly of the nineteenth century. Clever though tricky as a diplomat, his anti-British feelings at length led to his own and his country's undoing. When the Bloemfontein conference, which took place early in June, 1899, came to nothing, and when subsequent negotiations with the British government ended also in failure, Mr. Krüger delivered himself of an ultimatum (Oct. 9th), which, as Great Britain could not discuss, led to war. The Transvaal Boers, joined by their fellow burghers of the Orange Free State, invaded Natal, Cape Colony, and Bechuanaland, and for a time gave the English all they could do to hold their own, even when General Buller arrived with the first

army corps. It was not until the English had met with serious reverses, which brought upon the scene Lord Roberts with large reinforcements, that the tide of battle turned, and the Boer republics were in turn invaded, and the capitals of both Dutch States were captured and occupied. Bloemfontein was entered by the British March 13th; the Vaal was crossed May 25th; Johannesburg was occupied May 31st; and Pretoria fell June 5th, 1900, Mr. Krüger and his burghers escaping to the eastward. With the British flag floating over the capitals of the two Boer republics and the Presidents of both States seeking safety in flight, Boer independence received a crushing blow. The spirits of the Dutch burghers were, however, not yet broken, for the war continued throughout the summer (winter in South Africa), the British columns having much to do ere the Boer power finally collapsed with the flight of Mr. Krüger, early in September, to Lourenço Marques, the Portuguese seaport on Delagoa Bay. Here Mr. Krüger embarked for Holland on a Netherland's warship, and Lord Roberts meanwhile issued a proclamation reincorporating the Transvaal with the other possessions of the British crown. Thus practically ended a long and bitter struggle on the Boers' part for independence, which Mr. Krüger's misguided ambitions and the menacing attitude of his republic towards aliens in the Transvaal had made impossible. Britain, as we write (Oct. 1900), is still confronted, however, with the arduous, and it may be serious, work of pacification throughout the vast areas of the disaffected Dutch colonies. British occupation of the countries will necessarily, for a time, be under military administration; and, though independence is again impossible, a large and early measure of self-government is within practical reach of the Boers. For Mr. Krüger's exile, it is impossible not to feel sympathy, as well as pity for a man who sees the object of his life, for which he has striven so long and so obstinately, slip forever from his grasp. As a prominent journal has remarked: "He has waged a hopeless fight against those great principles of justice and equal dealing and constitutional right which English arms have now asserted in his dominions."

As the old Dopper President and his people could not brook the hunger and thirst for progress which characterized the alien Uitlander in the Transvaal, and from which they had in the past repeatedly ran away, one can readily understand how passionate was their love of isolation and how eagerly they sought to stem the advancing tide of modern civilization as it surged inland over their country. And yet if they could not estop the incoming rush, or with silent dignity submit to be submerged by the new forces which the discovery of gold flung in upon them, they were shrewd enough to exact a price for the unsettling intrusion, and clever at playing the Englishman's game of fighting for the retention of power and dominancy. In choosing to do this, rather than yield an iota of his despotic power, President Krüger recklessly gambled with high stakes and risked everything in

the hazard of war. "Never has England," writes a London journalist, "been defied by a more singular foe than this rugged Boer, who throve on England's military carelessness, traded on her generosity, plotted against her in every chancellery of Europe, and hated her with that most persistent and indiscriminating zeal which a man usually reserves for a personal rather than for a national foe. It is well for her and for South Africa that his stupid despotism is over, and that the cross tyranny which we know as Krügerism can vex the British colonist no more." And yet there is so much that is pathetic in the fall of Mr. Krüger, and so regretful in the lot of his brave burghers, whose republic and that of their neighboring kin he used as dice in diplomacy and war, that no one with a sense of chivalry would wish to dwell either on his own or his country's mistakes. He who created the State and built it must in an especial degree feel deep chagrin at its loss. And yet the issues of the war are but the punishment for his own misrule and many corrupt acts. His country will in the future, we doubt not, be the better off without him. By his flight, he has relieved the British of a great embarrassment; now there is every prospect that the Transvaal will have assured peace, and with peace a new and prosperous era of moral and material development. In his passing from the scene, so also has passed the dream of a Dutch republic from Capetown to the Zambesi. "In the history of South Africa," writes the author of *The Transvaal from Within*, "the figure of the grim old President will loom large and striking—picturesque, as the figure of one who by his character and will made and held his people; magnificent, as one who in the face of the blackest future never wavered from his aim or faltered in his effort; who, with a courage that seemed, and still seems, fatuous, but which may well be called heroic, stood up against the might of the greatest empire in the world. And," continues Mr. Fitzpatrick, "it may be pathetic, too, as one whose limitations were great, one whose training and associations—whose very successes—had narrowed, and embittered and hardened him; as one who, when the greatness of success was his to take and to hold, turned his back on the supreme opportunity, and used his strength and qualities to fight against the spirit of progress, and all that the enlightenment of the age pronounces to be fitting and necessary to good government and a healthy State."

G. M. A.

KRUNG-KRAO OR AYUTHIA. See SIAM, Vol. XXI, p. 852.

KRUPP, ALFRED, a German gun manufacturer; born at Essen, in Westphalia, April 26, 1812. When he was 14 years of age his father, FRIEDRICH, the discoverer of the art of making cast-steel, died, leaving a small forge and shop for the support of his family. In 1848 the shop, employing only two workmen, was taken charge of by Alfred, who rapidly increased its output until he discovered a method of casting steel in large masses, and in 1851 sent to the London Exhibition a block of steel weighing 4,500 pounds, and in

1873 cast steel in one mass weighing 53 tons. Besides rails, tires, wheels, engines, and all kinds

ALFRED KRUPP.

of cast-steel work he also manufactured the large steel guns with which the Germans did such terrible execution when they besieged Paris. These guns are all "built up" by shrinking steel hoops over a central steel tube. There is a single layer of hoops around the tube for guns below nine-inch caliber, while those above this size have two layers of hoops in the after part. Some twenty years ago the Krupp steel guns began to be bought in large numbers by all the European powers; a gun of 135 tons was cast for the Russian Government in 1890, and one of 124 tons was sent over to the Columbian Exposition in 1893. Krupp had to extend his works time and again to fill the pressing orders, so that now over 20,000 workmen are employed in them. They include the foundries and shops at Essen, extending over 1,000 acres; the coal-mines at Essen and Bochum; several iron-mines in Germany and Spain; a series of smelting-furnaces; and some branch works at Nerdweid and Layn. In 1864 Krupp declined the letters of nobility offered him by the King of Prussia. One of the wealthiest men in Germany, he did a great deal for the welfare of employees and their families. But he jealously kept some of his processes secret. A commission appointed some years ago by the United States government to study his system of making large castings for steel guns, tried in vain to get Krupp's permission to enter his works, only workmen being admitted to his great foundries. His son Alfred succeeded him; the concern, however—by far the greatest of its kind in the world—is owned by a corporation. He died July 14, 1887.

KÜCHENMEISTER, GOTLOB FRIEDRICH HEINRICH, a German scientist; born in Buchheim, Saxony, Jan. 22, 1821; received his M.D. from Leipsic, 1846; concentrated his attention upon the study of entozoa and the metamorphoses of intestinal worms, his most important work on the subject *On the Animal and Vegetable Parasites of the Human Body* (1855), having gone through several editions and been translated into English; from 1862 to 1865 he edited the *Zeitschrift des Norddeutschen Chirurgen Vereins*; and in 1874-75 the *Allgemeine Zeitschrift für Epidemiologie*. His main theories are found discussed in PARASITISM, Vol. XVIII, p. 263, and TAPE WORMS, Vol. XXIII, p. 55.

KÜCKEN, FRIEDRICH WILHELM, a German musician; born at Bleckede, Hanover, Nov. 16, 1810. He first studied music at Schwerin under Lürss (his brother-in-law) and Aron, and his songs attracted the attention of the Grand Duke of

Mecklenburg; he pursued his studies, especially counterpoint, with Birnbach, in Berlin, and produced there his first opera, *Die Flucht nach der Schweiz*, which was a success (1839). At Vienna, where he went to study under Sechter (1841), he enjoyed considerable popularity. In 1843 he went to Paris, where he composed the opera *Le Prétendant*, and wrote the music for several of Heine's *Lieder*. From 1851 to 1861 he was chapel-master to the King of Württemberg. Some of his compositions were gathered in *Les Echos de l'Allemagne* and *Friedenshymne*. His lasting reputation is due to his extremely melodious songs, among which *Das Sternelein!* and *O Weine Nicht!* may be considered works of great beauty. He died at Schwerin, in 1882.

KUENEN, ABRAHAM, a Dutch theologian; born at Haarlem, Holland, Sept. 16, 1828; successively student, private tutor, and in 1855 professor of theology at Leyden; a thorough student of the Old Testament. In his book entitled *Historico-critical Investigation of the Origin and Collection of the Books of the Old Covenant* (2d ed. 1885-93), he introduced into the study of the old books much skeptical research, and was severely criticised for doing so. He wrote also *Worship of Israel till the Overthrow of the Jewish State* (1874-75), *Prophets and Prophecy in Israel* (1877); and *National Religions and Universal Religions* (1882). He edited the *Theologisch Tydschrift* from 1867 until his death, which occurred in Leyden, Dec. 10, 1891.

KUFA, a ruined town of Mesopotamia, Asiatic Turkey, on the east coast of Bahri Nedgiff Lake, in lat. 32° N. The Arabic characters called Cufic received their name from this place. It was the seat of Arabic learning for a long time. When, at the end of the eighth century, the residency was removed to Bagdad, the town soon sank into ruins.

KUGLER, FRANZ THEODOR, a German art-critic; born at Stettin, Germany, Jan. 19, 1808; he devoted himself early to the study of the history of art, and spent several years in Italy collecting information for his great work, *Handbook of the History of Painting from the Age of Constantine to the Present Time*, two volumes, published in 1837 and immediately translated into the leading European languages. In 1833 he had been appointed professor in the fine arts at the Berlin University. No less valuable and popular are his *Handbook to the History of Art* (2 vols., 1841-42), and his *Description of the Art Treasures in Berlin and Potsdam*. His novels and his *History of Frederick the Great* are not considered up to the average of his other works. He began (with Lübke, q.v.) a *History of Architecture*. He died in Berlin, March 18, 1858.

KUHN, FRANZ FELIX ADALBERT, a German philologist and educator; born at Königsberg, Prussia, November 19, 1812. After studying philology at the Berlin University, he became successively teacher at the Cologne Gymnasium in 1841 professor in 1856, and rector emeritus of the Berlin University. He may be said to have

inaugurated the new science of comparative mythology, when he endeavored to trace the formative factors of various religious myths through linguistic phenomena. He edited *Zeitschrift für Vergleichende Sprachforschung*, and wrote *Ueber Entwicklungsstufen der Mythenbildung* (1874). He died in Berlin, May 5, 1881.

KÜHNER, RAPHAEL, a German philologist; born in Gotha, Germany, March 22, 1802. After studying philology at Göttingen, he became a teacher in the Lyceum at Hanover, in 1825, and devoted himself chiefly to the Greek language and to Cicero. His *Ausführliche Grammatik der Griechischen Sprache* (3d ed., 1893) arranges the syntax of that language on scientific principles, and marks a new epoch in the teaching of Greek. His *Elementary Greek Grammar* and his *Elementary Grammar of the Latin Language* passed through numerous editions and translations in Germany, England and America, but are now somewhat out of date. In 1879, his son published his father's *Ausführliche Grammatik der Lateinischen Sprache*, in two volumes, a work of deep erudition. He died in Hanover, April 16, 1878.

KU-KLUX-KLAN. A secret political association formed in the southern states of the United States shortly after the termination of the Civil War, for the purpose of preventing freedmen from voting, and nullifying the rules set down in the reconstruction acts. It is supposed that the order was organized in 1867, under various names, "Invisible Empire," "White League," etc. The supreme head was called "The Grand Wizard"; the head of a state, a "Grand Dragon"; the head of a congressional district, a "Grand Titan"; the head of a county, a "Grand Giant"; and, finally, local lodges were ruled by a "Cyclops," the members being called "ghouls." They roamed about at night, wrapped up in dreadful garbs that soon made them the terror of the superstitious negroes. From mere intimidation, the Ku-Klux-Klan advanced to brutality and murder, and practiced their cruelty on the whites who happened to disagree with them, as well as on the negroes. The outrages became so frequent and so fearful that congress appointed a joint committee of investigation in March, 1871, and finally enacted the "force bill" of April 20, 1871, which contained such stringent and effective measures that the Ku-Klux-Klans soon were disbanded for good.

KULJA, a province of the Chinese Empire, central Asia, between 80° and 83° W. long. The soil is fertile, and gold, silver, copper, lead and coal are found. It has a population of about 80,000, scattered mostly along the banks of the Ili. Area, 23,000. Before the Dzurgarion rebellion it had 2,000 inhabitants. The town of Kulja, on the banks of the Ili, had, before the rebellion, a population of 75,000. Now it is but a heap of ruins. See also KULDJA, Vol. XIV, p. 154.

KULLBERG, KARL ANDERS, a Swedish author; born in Sweden, in 1813; graduated in law from the Upsala University, and after sitting on

the bench of the Swedish supreme court, resigned to give his whole time to literature. He wrote poems—*Leopold* (1830) and others—historical novels and studies: *The Cousins* (1846), *Carl Gustav Wrangel* (1843), *Gustavus III and His Court* (1838-39), and a drama, *Svenskarne i Neapel* (1836). He edited *Freja*, a periodical (1836-44). His style is pleasing, and his narratives based on fairly trustworthy facts. He died in 1857.

KULTURKAMPF. See GERMANY, Vol. X, pp. 506, et seq.

KUMAMOTO, a city of southern Japan, situated on the west side of Kiushiu on the Shira River. It is a fortified town, and the capital of the præfecture of Kumamoto. Its fortress, built of enormous stones, withstood all efforts of the Satsuma insurgents to take it. It is the most populous city of this island, the center of the Higo rice trade, and an important military and educational center. It is difficult to reach, however, for the river is only navigable for small steamers, and is malarial. In 1889 it suffered from a severe earthquake. Pop. 1898, 61,463.

KUMQUOT, the native name of *Citrus japonica*, a member of the family *Rutaceæ*, the "golden orange," native to China and Japan. It is a low shrub, rarely of man's height, and bears a delicious fruit, slightly more than an inch in diameter. It has been introduced into Florida.

KUN-DUZ, district, town and river. See AFGHANISTAN, Vol. I, pp. 241, 242.

KUNG-CHIN-WANG, known as PRINCE KUNG, a Chinese statesman; born in 1830. Being Emperor Hin-Fung's brother, he was in 1861, when Hin-Fung died, made one of the regents, as the new emperor, Tung-Che, was then only seven years old. For the suppression of the Taiping rebellion, which occurred while he was a regent, he availed himself largely of the assistance of foreigners. In 1866, and again in 1869, Prince Kung went on special embassies to Europe and America. When, in 1874, he concluded peace with Japan after the Formosan troubles, he was accused of having yielded too much to foreign influence, and was condemned to death. But on the next day an imperial decree restored him to his former high office. In the difficulties with France in 1883-84, ending with the treaty of Tien-tsin, Prince Kung's conduct gave his enemies another opportunity to drive him from power. This prince was noted for his steady endeavors to introduce the ideas, methods and inventions of modern European civilization into China, and would have succeeded in so doing, in spite of many hindrances and a powerful inimical clique, had he understood better the proper methods to be used to reach such radical results. His political adversary, Viceroy Li Hung-Chang, had a clearer comprehension of the ways and means by which China can be gradually brought to adopt modern progress, and his influence through the Empress dowager was all-powerful. When General Grant visited China, Prince Kung entertained him royally. At the close of 1894 he was appointed by the emperor to arrange with

Japan terms of settlement of the war then raging. After Kung's short period of imperial favor, Li Hung-Chang was again called forward, and closed the negotiations with Japan, thus superseding Kung. Died in Peking, May 29, 1898.

KUNIGUNDE, SAINT, daughter of Count Siegfried of Luxemburg and wife of Duke Henry of Bavaria, who was crowned king of the Germans in 1002, and emperor in 1014. According to a legend, when accused of infidelity she vindicated her chastity by walking barefoot over hot plowshares and coming out of the ordeal unhurt. After her husband's death, in 1024, she retired into the convent of Kaufungen, near Cassel, which she had founded, and there she died, March 3, 1040. Pope Innocent III canonized her in 1200.

KURBSKII, ALEXANDER, a Russian soldier and author. See *RUSSIA*, Vol. XXI, pp. 104, 105.

KURDISH LANGUAGE. See *KURDISTAN*, Vol. XIV, pp. 157, 158; and *PERSIA*, Vol. XVIII, p. 655.

KURIA MURIA ISLANDS, a group of five rocky islands off the S.E. coast of Arabia, in lat. $17^{\circ} 3' N.$ and long. $56^{\circ} E.$ the only inhabited one of which supports from twenty to thirty fishermen. They were ceded to England in 1854. Guano of inferior quality is obtained from them, and they form a landing-place for the Red Sea telegraph-cable.

KURISCHE-HAFF, one of the three larger lakes or lagoons of northern Germany. See *GERMANY*, Vol. X, pp. 447-450.

KURNOOL, KARNUL OR CARNOUL, the chief town of a district of the same name in the presidency of Madras, southern India, on a rocky spit of land, at the junction of the Hindre and the Tungabhadri rivers, in lat. $15^{\circ} 50' N.$ and long. $78^{\circ} 5' E.$ The district itself contains about 7,470 square miles. It has been liable to endemic fever since the construction of the Kurnool Canal, connecting the Tungabhadri at this point with the Pennar. This canal is 189 miles long, and was built for the purposes of irrigation and navigation. Population of district, 956,068; of the town, in 1891, 24,400.

KURO SIWO OR JAPAN CURRENT. See *PACIFIC OCEAN*, Vol. XVIII, p. 118.

KUSATSU, a village and famous summer resort of central Japan, in Shiga Ken, 25 miles N. by E. of Kyoto. It is the coolest resort in the country, is free from mosquitoes and is especially noted for its hot springs, which range in temperature from 113° to $130^{\circ} F.$, and are very valuable for rheumatic and similar complaints. They contain sulphur, alum, sulphate of copper, arsenic and borax. Its altitude is 3,800 feet. Population, 5,000.

KUSI, a considerable tributary of the Ganges. See *BHAGALPUR*, Vol. III, p. 626.

KUSKOKWIM, a river of Alaska, the second in size in the territory, rising on the western side of the Alaskan Mountains, in long. $148^{\circ} W.$, and flowing through a very irregular and rock-bound

channel to Kuskokwim Bay, in Bering Sea. It is over 500 miles in length, and is navigable for about 300.

KÜSTENLAND OR LITTORALE, a crown land of Austria, consisting of the principality of Goritz and Gradisca, the margravate of Istria, and the town of Trieste with its territory. It lies between the crown land of Carniola on the northeast and the Gulf of Venice on the southwest. The surface is mountainous, and the chief rivers are the Isonzo and the Quieto. The soil is in general fruitful, and wine is made extensively. In the mountainous districts in the north and northeast the breeding of cattle is the chief industry. Commerce is carried on at the various seaports. Area, 3,084 square miles. Population 1890, 695,384.

KUTUSOFF, MICHAEL LAURIONOVITSCH GOLENITSCH, Prince of Smolensk; a Russian soldier; born in 1745; a cadet in 1761, his brilliant military conduct had made him a major-general in 1784; commanded under Suwaroff in the brilliant capture of Ismail; lieutenant-general in 1791; ambassador to Constantinople in 1796; in the campaign of 1805 against Napoleon, which ended in the latter's victory at Austerlitz, he defeated Marshal Mortier at Dürrenstein; general-in-chief of the Russian army at the time of Napoleon's Moscow campaign, he was beaten at Borodino, but, undaunted, he incessantly renewed his attacks against the French, who were weakened by hunger and cold, and suffered heavy losses at his hands in the battle of Jaroslavatz, Krasnoë and Smolensk; made a prince and a field-marshal as his reward. He died of malignant fever while pursuing the invaders across the frontier in Prussian Silesia, April 28, 1813.

KUTZTOWN, a borough of Berks County, southeastern Pennsylvania; on the Philadelphia and Reading railroad, 16 miles N.E. of Reading. It is in an iron and limestone region, has the Keystone State Normal School, and manufactures castings, carriages and shoes. Population 1890, 1,595; 1900, 1,328.

KWANG-CHOW FOO, same as *CANTON*, Vol. V, p. 37.

KWANGSO, province. See *CHINA*, Vol. V, p. 640.

KWANG-SU, "Succession of Glory," the name of the ex-emperor of China; born in 1871; reigned 1875-98; and resigned in 1898. See *CHINA*, Vol. V, pp. 652-53.

KWANGTUNG, province. See *CHINA*, Vol. V, p. 639.

KWEICHOW, province of *CHINA*, q.v., Vol. V, p. 640.

KWIKHPAK, one of the northern delta-arms of the Yukon, Alaska. It is 52 miles long, and is broad and shallow. The Russians gave this name also to the whole river.

KYLE, JAMES HENDERSON, United States Senator from South Dakota, a clergyman; born in Centerville, Ohio, in 1854. He graduated from Oberlin (Ohio) College in 1878, and studied theology in the Western Theological Seminary, Allegheny, Pennsylvania. He was for three years a

teacher of mechanical and civil engineering in Pittsburg, Pennsylvania, and studied law; pastor of a church in Salt Lake City, Utah, four years, and an officer of the Utah Commission; a pastor in Ipswich, South Dakota, and Aberdeen, South Dakota; financial agent of the Congregational college at Yankton, South Dakota. In politics he believed in the principles of the Farmers' Alliance, and was elected a state senator in 1890. In 1891 he was elected by the state legislature to the United States Senate as an independent, to succeed Gideon C. Moody, and re-elected in 1897.

KYRIE ELEISON, "Lord have mercy," the

only form of prayer used in the mass of the Roman Catholic Church which has never been translated into Latin out of the Greek of the early church service. In the ordinary of the mass it immediately follows the introit and precedes the *Gloria in Excelsis*. In the Church of England and in the Protestant Episcopal church-service it is embodied in the "lesser litany" or short petition that follows each of the commandments, "Lord have mercy upon us, and incline our hearts to keep this law."

KYUSHU. See KIUSHU, in these Supplements.

L

LAALAND—LABOR DAY IN AMERICA

LAALAND OR LOLLAND, a Danish island in the Baltic, at the southern entrance to the Great Belt, 36 miles long by 9 to 15 broad. The surface is remarkably flat, and malarial fever is epidemic in its marshy parts, but the soil is exceedingly fruitful. Products: corn, hemp, hops, apples and timber. Forests of beech and oak cover upward of fifty square miles. Area, 1,444 square miles. Population 1890, 65,550. The capital is Maribo, and the largest town Nakskov, with a good harbor and considerable trade. With the exception of this place it is difficult of access on account of surrounding shallows.

LABAT, JEAN BAPTISTE, a French missionary and author; born in Paris, in 1663. After teaching for a few years he took charge of a parish in the Island of Martinique, West Indies, from 1694 to 1696. Having joined the Dominicans, he traveled extensively, until his return to Europe in 1705, when he visited Italy and finally settled in Paris. His *Nouveau Voyage aux Îles de l'Amérique* (1724) had several editions, and was translated into Dutch and German. He edited Marchais's *Voyage en Guinée, Îles Voisines et Cayenne*. He died in Paris, Jan. 6, 1738.

LA BÉDOLLIÈRE, EMILE GIGAULT DE, a French journalist and historian; born at Amiens, France, May 24, 1812; graduated from the École des Chartes, and the same year published his *Vie Politique du Marquis de LaFayette* (1833). He became a regular contributor to the liberal daily, *Le Siècle*, and founded *Le National* in 1839. Among his works are *Beautés des Victoires et des Conquêtes des Français* (2d ed., 2 vols., 1847); *Histoire des Mœurs et de la Vie Privée des Français* (3 vols., 1847); *Histoire de Paris* (1864); *Histoire Complète de la Guerre d'Allemagne et d'Italie* (1866); *Histoire de la Guerre de 1870-71* (1872). He wrote a few books for children, one of which, in the style of a nursery-rhyme, has been translated and imitated extensively. It is called *Histoire de la Mère Michel et de son Chat* (1851). He died in Paris, April 23, 1883.

LABEL. See TRADE-MARKS, Vol. XXIII, p. 499; and FORGERY, Vol. IX, p. 414.

LABIALIZATION. See SPEECH-SOUNDS, Vol. XXII, pp. 383, 384.

LABIALS, in ancient dialects. See HIEROGLYPHICS, Vol. XI, p. 797.

LABIATÆ, a very large family of dicotyledonous plants, mostly natives of temperate climates. They are herbaceous or shrubby, and have four-angled stems and opposite leaves which abound in volatile oil. The flowers are often in cymes or heads, or in whorls, or sometimes solitary. Some are used in medicine. Mint, rosemary, lavender, sage, etc., are examples of this family.

LABICHE, EUGÈNE MARIN, a French playwright; born in Paris, May 5, 1815. He was educated at the Collège Bourbon, and studied law, but finally devoted himself entirely to literature. His first dramatic piece was the popular farce, *M. de Coyllin* (1838), which was followed during the next forty years by a series of over a hundred comedies, farces and vaudevilles. He collaborated with Gondinet, Delacour, E. Legouvé, Augier and other dramatists. Labiche was elected to the French Academy in November, 1880. His productions are distinguished by a mastery of stage technique, great drollery of plot and situations, a keen knowledge of human nature, crisp and sparkling dialogue, and a lambent humor that is often caustic but never unkind. A great many of his plays have been adapted for the English and American stage, and have been acted in every civilized language. Among them are *Le Chapeau de Paille d'Italie* (1851); *Le Voyage de M. Perrichon* (1860); *Les Petits Oiseaux* (1862); *L'Homme qui Manque le Coche* (1865); *Doit-on le Dire* (1873). His plays have been collected in a complete edition of ten volumes. He died in Paris, Jan. 23, 1888.

LABLACHE, LUIGI, an Italian singer; born in Naples, Dec. 6, 1794. His first engagement as a basso singer was at the San Carlo Theatre, at Naples, in 1812. He afterward sang with much success at Palermo, Milan (1817), when his reputation began to be known all over Europe; at Rome, Turin and Vienna; in the last-named city a medal was struck in his honor. From 1830 to 1857 he sang alternately in Paris and London, making occasional visits to St. Petersburg and Naples. His voice, a deep bass, has rarely been equaled, either in volume or quality; and his acting, particularly in the characters of Figaro, Don Bartolo, Don Pasquale, Leporello, etc., was almost as remarkable. His dignity in the stately parts was equalled by his spontaneous and rich humor in the gay rôles of his repertory. He died in Naples, Jan. 23, 1858.

LA BOÉTIE, ETIENNE DE, a French writer and philosopher; born in Sarlat, France, Nov. 1, 1530. He was not 20 years old when he wrote his strong pamphlet entitled *Contre-un*, or a *Discours sur la Servitude Volontaire*, which was published in 1575. He sat in the Parliament of Bordeaux during the last ten years of his life. He was a personal friend of Montaigne, who wrote about him most feelingly. See MONTAIGNE, Vol. XVI, p. 768. He died near Bordeaux, Aug. 18, 1563.

LABOR DAY IN AMERICA, a legal holiday for workmen, which first began to be celebrated by a few states in 1887. It falls on the first Monday in September. In Europe, May 1st is usually celebrated as a labor festival, and in some coun-

tries socialistic disturbances have led governments to forbid the usual demonstrations. See also HOLIDAYS, in these Supplements.

LABOR, WOMEN. See INDUSTRIAL CONDITION OF WOMEN, in these Supplements.

LABORDE, ALEXANDER LOUIS JOSEPH, COMTE DE, a French soldier and archæologist; born in Paris, Sept. 15, 1774. After serving for some years in the Austrian army, he went to Spain in 1800 to explore that country. He described his experiences in a work entitled *Voyage Pittoresque et Historique en Espagne* (1807-18). He filled several civil offices under Napoleon; was elected a deputy in 1822, and sat in the ranks of the opposition to the Bourbons; took part in the revolution of 1830; was rewarded by being appointed by King Louis-Philippe a brigadier-general of the National Guard, and later prefect of Paris. He wrote a second book on Spain, and also *Les Monuments de la France Classés Chronologiquement* (1815-36). He died in Paris, Oct. 24, 1842.

LABORDE, LEON EMMANUEL SIMON JOSEPH, COMTE DE, a French archæologist, son of the preceding; born in Paris, in 1807. He was educated at Paris and Göttingen. He traveled extensively through the East, and published an account of his visit to Arabia in his *Voyage en Orient*. For some time he held diplomatic positions. In 1846 he published *Les Anciens Monuments de Paris*. He was curator of the middle ages and renaissance collections at the Louvre Museum for some years, and after 1857 director of the archives of the empire. He died in Paris, in 1869.

*LABOR ORGANIZATIONS, so far as their social and industrial influence is concerned, belong for the United States, to this century. Various clubs, societies and local associations existed at times during the eighteenth century. With the extension of the factory system, labor societies became more frequent, and especially under the reform movements from 1825 to 1850 labor organizations received a new impetus. Since 1825 their growth and progress have been interesting and their development rapid, almost every industry in the country being involved.

A labor organization *per se* is any association of wage-workers or salary-receivers, having for its direct purpose the improvement of the condition of its members through educational work, the increase of compensation and the shortening of hours. Such associations usually take up a great variety of topics belonging to the general, social and economic conditions in which they are placed. The older form of organization came under the general title of "trades union." The underlying principle of individual associations like trades unions is that men who think alike should act together; so a trades union, primarily, is an organization which takes an active and earnest interest in the welfare of its own individual members, and secondarily, of the members of all unions of persons of like occupation, a trades union being composed of the members of a single trade, like the hatters or glass-blowers. Such unions do not, as a rule, undertake to extend their influence to all classes of workers.

* Copyright, 1897, by The Werner Company.

Among the most noted trades unions now in existence is the International Typographical Union, representing nearly every state and territory, and tracing its origin to 1850. This is the oldest existing American trades union. The hatters were organized in 1854, under the name of the National Trade Association of Hat Finishers of the United States of America. Out of this grew, in 1868, another order, which took the name of the Silk and Fur Hat Finishers' Trade Association of the United States of America. The Iron Molders' Union of North America was founded in 1859. The Brotherhood of Locomotive Engineers dates from 1863, the Cigarmakers' National Union from 1864, the Bricklayers and Masons' International Union from 1865, the Order of Railway Conductors from 1868, the United States Wool Hat Finishers' Association from 1869, the Brotherhood of Locomotive Firemen from the same year, the National Union of Horseshoers of the United States from 1875, the Amalgamated Association of Iron and Steel Workers from 1876, the Granite Cutters' National Union of the United States from 1877, the Brotherhood of Carpenters and Joiners from 1881, the Railroad Brakemen from 1884, the Journeymen Bakers' National Union from 1886. There are many other national trades unions in the country, but those enumerated are the leading ones, and many of them have weekly newspapers of more or less influence.

Besides the national unions named and others of a national character, there are many state and local trades unions, numbering 539 in all, according to the latest information obtainable. These unions exist in nearly every state and territory in the country, the exceptions being Arizona, Delaware, Idaho, Mississippi, Nevada, New Mexico, North Carolina, Oklahoma, South Carolina, South Dakota, Utah, Virginia and Wyoming. The states having the largest number are California, 6; Colorado, 10; Connecticut, 12; Illinois, 46; Indiana, 27; Iowa, 7; Kansas, 10; Kentucky, 9; Louisiana, 6; Maine, 6; Maryland, 6; Massachusetts, 58; Michigan, 51; Minnesota, 9; Missouri, 34; Montana, 6; Nebraska, 9; New Jersey, 8; New York, 58; Ohio, 71; Pennsylvania, 23; Rhode Island, 8; Wisconsin, 27. Each union has its own government as to strikes, dealings with members, and, in fact, all its own regulations.

After some years of experience as to individual organizations there began to grow a strong desire among the unions for some form of federation. This desire was stimulated by the existence of the order of Knights of Labor, organized in Philadelphia in 1869, which will be described later; but prior to this there was an attempt to organize a national union or federation which should comprehend all the various trades unions, national and international, existing in the United States, and the first of such attempts was made in 1866, at Baltimore, when the representatives of the trades unions of New York and Baltimore sent out a call for a national labor congress, which congress met August 20th of the same year, and consisted of one hundred delegates, representing about sixty open and secret organizations. A second convention was held in Chicago the next year (1867). These movements were instituted with

the view of following in the footsteps of the trades-union congresses of England, the local bodies connected with which were not permitted to discuss politics. The necessity arose for having some central body where questions of a political nature, and especially bearing upon national legislation in favor of the working class, could be discussed freely.

The National Labor Union held two conventions in 1868, and it met again in Chicago, in 1869. A meeting was also held in 1870 at Boston, one in 1871 at Philadelphia, and one in 1872 at Columbus, Ohio. The National Labor Union did not meet again, however; yet from it was projected the present American Federation of Labor, which grew more directly out of the industrial congress at Rochester in April, 1874, and a convention, in the same month, of a secret organization known as the Sovereigns of Industry. The Industrial Brotherhood of the United States, a secret order, was represented in this Rochester congress. This latter order had other ideas as to labor organization than the trades unions; thus there was an antagonism in the convention, and the movement ended at Rochester. Other attempts, largely political, were made in 1875 and 1876, and still further attempts at federation were made in the years prior to 1881, when the Federation of Organized Trades and Labor Unions of the United States and Canada was created. This great organization, afterward known as the American Federation of Labor, grew out of a joint call of the Knights of Industry and the Amalgamated Labor Union, the desire being to organize a secret order to supplant, if possible, the growing order of Knights of Labor. The joint call referred to resulted in a convention at Terre Haute, Aug. 2, 1881, but the secret organization sought for was not effected, as the chief element in the convention was trades union in its character and opposed to increasing the number of labor societies then existing; yet another call was made and a second convention held, in Pittsburg, Nov. 19, 1881. This convention represented 262,000 workmen, who sent to it 107 delegates, and in their permanent organization they adopted the name and style of the Federation of Organized Trades and Labor Unions of the United States and Canada.

The American Federation of Labor, as now known, was organized Dec. 8, 1886, at Columbus, Ohio, but it dates its birth from the convention at Pittsburg in November, 1881. At that convention the demand was made for eight hours as a day's work and for the national and state incorporation of trades unions, and the convention favored obligatory education of all children and the prohibition of their employment under the age of 14. It also favored the enactment of uniform apprentice laws, and opposed bitterly all contract convict labor and the truck system for payment of wages. It asked that laws giving to workmen a first lien on property upon which their labor had been expended be enacted; it insisted upon the abrogation of all so-called conspiracy laws; urged the establishment of a national bureau of labor statistics and the prohibition of the importation of foreign labor; opposed government

contracts on public work; and favored the adoption by states of an employers' liability act.

The American Federation of Labor, of course, represents the trades-union element of the United States. It is not a secret order, nor does it claim the individual allegiance of members, for its membership is made up of national and international trades unions or societies represented in it. It is a democratic and representative organization in every sense, being a federation of the leading trades unions of the country. With the exception of the various railroad brotherhoods, the principal labor unions of the country are affiliated with it. It has about 7,000 orders represented in it, and a membership of over 650,000. It undertakes to encourage the formation of local trades and labor unions, and invites the closest federation of all such associations. Its federation is of various orders having dissimilar methods, not only in organization, but in work, and having no common constitution or laws, although the federation has a constitution for the general government of the representative body.

At the convention held in Cleveland, Ohio, Nov. 21, 1882, the American Federation of Labor issued a manifesto opposing political action, on the assumption that it had been organized as a purely industrial body. The manifesto issued at that time is important, and is as follows:

"We favor this federation because it is the most natural and assimilative form of bringing the trades and labor unions together. It preserves the industrial autonomy and distinctive character of each trade and labor union, and, without doing violence to their faith or traditions, blends them all in one harmonious whole—a 'federation of trades and labor unions.' Such a body looks to the organization of the working classes as workers and not as 'soldiers' (in the present depreciatory sense) or politicians. It makes the qualities of a man as a worker the only test of fitness, and sets up no political or religious test of membership. It strives for the unification of all labor, not by straining at an enforced union of diverse thought and widely separated methods; not by prescribing a uniform plan of organization, regardless of their experience or interests; not by antagonizing or destroying existing organizations, but by preserving all that is integral or good in them and by widening their scope so that each, without destroying their individual character, may act together in all that concerns them. The open trades unions, national and international, can and ought to work side by side with the Knights of Labor, and this would be the case were it not for men, either over-zealous or ambitious, who busy themselves in attempting the destruction of existing unions to serve their own whims and mad iconoclasm. This should cease, and each should understand its proper place and work in that sphere; and if they desire to come under one head, or affiliate their affairs, then let all trades and labor societies, secret or public, be represented in the Federation of Trades and Labor Unions."

The headquarters of the American Federation of Labor in 1896 was at Indianapolis, Indiana. The president was Samuel Gompers, and the secretary Augustus McCraith. The *American Federationist* is the official organ of the federation.

The Knights of Labor are organized on a principle widely at variance with that underlying the organization of the trades unions and the American Federation of Labor. The basis of the organization of the Knights of Labor ignores vocation and seeks the unification of all individual or separate interests

in the interests of the whole. This is an exceedingly broad basis, and follows the attempt of the International, organized in London in the autumn of 1864, to associate workmen wherever manufacturing had gained any foothold. The International had some standing in the United States. Its broad foundation had an influence in such future organizations, but its practices were not American, and the attempt of organized labor on its broad basis practically failed. But the second great attempt to utilize the society basis for the basis of labor organization resulted in the Noble Order of Knights of Labor, which was born Thanksgiving day, 1869, in the city of Philadelphia. This order resulted from the efforts of Uriah S. Stephens, who had associated with him six garment-cutters. The garment-cutters of Philadelphia had been organized as a trades union, but had failed in their attempts to increase the rate of wage in their trade. The dissatisfaction growing out of this disappointment resulted in the disbanding of the Garment-Cutters' Union, and Mr. Stephens, who had foreseen such result, prepared the outlines of a plan which should include in an organization all branches of honorable toil. Stephens was a man of great force of character, a thoroughly trained mechanic, a lover of books, and possessed a strong feeling in favor of secret organizations, having been for many years a member of the Masonic order. It was probably through the experience gained in Masonry that he brought into the ritual of the new order many of the features of speculative Masonry, certainly so far as forms and ceremonies were concerned. He also introduced obligations in the nature of oaths, taken upon the Bible with all solemnity. The members were sworn to the strictest secrecy. Even the name of the order was not divulged for a long time, stars being used in the place of the name *Knights of Labor* and in circulars, meetings, conversation, etc., the members referred to the order as "Five Stars." Originally the ritual contained many classical expressions taken from the Greek, showing the scholarly attainments of the founder of the order. At a meeting held Dec. 28, 1869, the name *Knights of Labor* was adopted, and the ritual adopted at the same time contains the following instructions, which have been given to every person ever admitted to the order:

"Labor is noble and holy. To defend it from degradation, to divest it of the evils to body, mind and estate which ignorance and greed have imposed, to rescue the toiler from the grasp of the selfish, is a work worthy of the noblest and best of our race. In all the multifarious branches of trade, capital has its combinations; and whether intended or not, they crush the manly hopes of labor and trample poor humanity in the dust. We mean no conflict with legitimate enterprise, no antagonism to necessary capital; but men, in their haste and greed, blinded by self-interests, overlook the interests of others, and sometimes violate the rights of those they deem helpless. We mean to uphold the dignity of labor, to affirm the nobility of all who earn their bread by the sweat of their brows. We mean to create a healthy public opinion on the subject of labor (the only creator of values), and the justice of its receiving a full, just share of the values or capital it has created. We shall, with all our strength, support laws made to harmonize the interests of labor and capital, and also those laws which tend to lighten the exhaustiveness of toil. To pause in his toil, to devote to his

own interests [*sic*], to gather a knowledge of the world's commerce, to unite, combine and co-operate in the great army of peace and industry, to nourish and cherish, build and develop the temple he lives in, is the highest and noblest duty of man to himself, to his fellow-man and to his Creator."

Under the original formation, physicians could not become members, because professional confidence might force the societies' secrets into unfriendly ears; but this rule was repealed at Detroit, in 1881. Politicians were excluded, but men engaged in political work are not now excluded for the cause originally assigned. Lawyers were and still are excluded from membership. Rum-sellers, being non-productive of articles of use, are not included in those who can become members.

The close secrecy adopted in the beginning of the order prevented its growth, but now the degrees, which were worked somewhat after the Masonic methods, are not known, there being no degrees in the sense of secret organizations. Strict secrecy was abolished at Detroit in 1881, and the name and objects of the order made public.

The Knights of Labor as an organization consist of local assemblies, which may be organized anywhere under proper rules established by the higher assemblies; district assemblies, which are composed of delegates from local assemblies; there may also be state and national trade assemblies; then there is the general assembly, which is composed of representatives chosen by the state, national, trade and district assemblies. Each has its constitution. The general assembly has full and final jurisdiction, and is the highest tribunal of the order. At the meetings of the general assembly, which take place every year, there is usually more or less discussion as to some modification or proposed modification of the constitution. At the time of the abandonment of the secrecy of the workings of the order, which took place, as stated, in 1881, when the oath-bound obligations were abolished and a simple pledge took its place, the Knights of Labor were working upon a declaration of principles adopted at the general assembly, at Reading, Pennsylvania, in January, 1878. Articles have been added from time to time, until the present declaration of principles was adopted. It is too long to be reproduced in full here, but in the main it declares the purpose of the order to be to make industrial moral worth, not wealth, the true standard of individual and national greatness, and to secure to the workers the full enjoyment of the wealth they create. The order demands the establishment of bureaus of labor statistics, the reservation of public lands as a heritage of the people, the incorporation of trades unions and all labor organizations, the prohibition of employment of children under 15 years of age, and of all convict labor, a graduated income tax, and various other important demands along the lines of other labor organizations.

At one time the organization is said to have had nearly one million members. Through various influences the membership has been reduced, although since its foundation about 275 district assemblies, 23 state assemblies and over 1,300 local assemblies have been organized. It is quite impossible to give

the membership at present, but it is supposed to be in the vicinity of 200,000. The order has been extended to Canada, British America, France, Belgium, Great Britain and Australia. It is represented now in every state and territory of the Union, with the exception of Alaska, Arizona and Wyoming. It is exceptionally strong in New York, Massachusetts, and in the Southern and Western states.

The headquarters of the Knights of Labor are at Washington, District of Columbia. James R. Sovereign is the General Master Workman of the General Assembly, and John W. Hayes the general secretary-treasurer. *The Journal of the Knights of Labor* is the official organ of the order.

Following the lines of the Knights of Labor, in some respects, is the American Railway Union, for it has sought to bring into one order a large body of employees. This union was organized in Chicago, June 20, 1893, and I am authorized to say that it is composed of 391 local unions, with a membership, in round numbers, of 120,000. *The Railway Times* is the official paper of the union, published semi-monthly. Eugene V. Debs is the president, the headquarters of the union being at Terre Haute, Indiana.

The American Railway Union differs widely from the Knights of Labor and American Federation of Labor so far as its integral elements are concerned, although it affiliates in some cases with the former. It was created for the protection of members in all matters relating to wages and their rights as employees, and affirms that railway employees are entitled to a voice in fixing wages and in determining the conditions of employment. It is composed of a general union, consisting of representatives of the local unions, which local unions are instituted under the jurisdiction of the general union, and it is the policy of the general union not to declare strikes of its own motion, but to refer such matters to the particular class affected.

The Independent Order of Knights of Labor is a new organization of a national character. Its declaration of principles is identical with that of the Knights of Labor. It was organized at Columbus, Ohio, Feb. 14, 1895. Its constitution is similar to that of the Knights of Labor, except that it eliminates such parts as give general officers great power, and otherwise restricts the possibilities of general officers in directing the affairs of the order. Its friends claim that it has made steady progress, not only in organizing new assemblies, but in reorganizing old ones and in assimilating local and district assemblies of the old order. It takes a progressive stand on social and economic subjects, and seeks to dispel the ignorance that exists in the mind of the workingman, and attempts to cultivate his reasoning powers. Its membership cannot be ascertained. The headquarters of the order are at Tiffin, Ohio. William B. Wilson is the general master workman, his address being Blossburg, Pennsylvania, and Charles R. Martin the general secretary-treasurer, Tiffin, Ohio.

There are very many local orders, societies and associations not connected with any of the large orders described. From the best estimate that I can

make, the total membership of all labor organizations of all kinds reaches at least 1,400,000. They have all been influential in the development of industrial conditions and in securing legislation which relates to labor; in general, it may be said that strikes and matters relating to strikes are referred to local organizations in all the great national orders. None of them countenance riots, violence, intimidations, etc., yet they do not provide for the discipline of members when guilty of these things.

For fuller information relating to labor organizations, details of their growth, demands, doctrines, etc., see *The Labor Movement: The Problem of To-Day*, edited by George E. McNeill (Boston, 1887); *The Story of Manual Labor*, by John Cameron Simonds (Chicago, 1886); *Thirty Years of Labor*, by T. V. Powderly (Columbus, Ohio); *The Labor Movement in America*, by Richard T. Ely, Ph.D. (New York, 1886); also the following works by the writer: *An Historical Sketch of the Knights of Labor*, published in *Quarterly Journal of Economics* for January, 1887; *The Amalgamated Association of Iron and Steel Workers*, published in *Quarterly Journal of Economics* for July, 1893; *Industrial Evolution of the United States* (Meadville, Pennsylvania, 1895).

CARROLL D. WRIGHT.

LABOR PARTIES. As far back as 1825, when the establishment of manufactures, the building of turnpikes and canals, the growth of population, the rise of great cities and the rush of emigrants from Europe led to the appearance in this country of a laboring class, efforts were made to bring the workingmen into politics. Now and again, from that time down to the war, labor questions were agitated in the states and labor conventions held. But it was not till the country entered on that extraordinary career of industrial growth which began with the Civil War, that labor questions assumed national importance.

In 1865 the first national labor congress was held, at Louisville, Kentucky, at which some twenty-five delegates were present. In 1866 a second congress met, at Baltimore, a third at Chicago in 1867, and a fourth at New York in 1868, to which came women-suffragists and labor-reform agitators. The next was held at Philadelphia, in 1869, when it was decided to hold a great national labor congress at Cincinnati on Aug. 15, 1870. The platform there adopted is too long to quote, but among its demands were lower rates of interest; a repeal of the national banking act; the withdrawal of national banknotes and the issue of paper currency "based on the wealth of the nation," and a legal tender for all debts public and private, and convertible into United States bonds bearing three per cent interest; eight-hour laws; exclusion of the Chinese; no land-grants to corporations; and the immediate formation of a "National Labor-Reform Party."

The idea of a new party was heartily approved, and from the National Labor Congress of 1871,

which met at St. Louis, came a formal call for a national nominating convention.

LABOR-REFORM PARTY. The convention thus called was held at Columbus, Ohio, Feb. 21, 1872, and nominated David Davis and Joel Parker. Each declined, and at a second convention or conference, at Philadelphia, August 22d, Charles O'Connor was nominated for president, but no one for vice-president.

With 1873 came the panic, and the country entered on a period of business depression, hard times and steady reduction of wages. Low wages bred discontent, which was fomented by the work of every sort of communistic and socialistic society in the country, till, in 1877, it took shape in the greatest strike in the history of labor. As probably every workingman was a voter, a desperate effort was now made by the socialists and politicians to use the prevailing discontent for political purposes. In Louisville a Workingman's Party was organized at once, and several members of the Kentucky legislature were elected by it. The platform demanded an eight-hour law, courts of arbitration, lower taxes and compulsory education. In Ohio a workingman's state ticket was put in the field. In New York the Bread-Winners' League issued a call for an independent labor party, and demanded that the government control the railroads and that greenbacks be issued in place of bank-notes.

At Baltimore a convention formed "The Labor Party of the United States." At St. Louis "The United Workingman's Party" already existed.

So far, little effort had been made toward a national party, but in 1878 the first step was taken by the union of the labor-reform parties in such states as Massachusetts and Pennsylvania (September, 1877) with the Greenback party and by the calling of a national convention of these two at Toledo, Ohio, on Feb. 22, 1878, when

THE NATIONAL PARTY, or, as it was commonly called, "The Greenback-Labor Party," was founded.

The platform, of course, consisted of two parts: That furnished by the Greenbackers called for—1. Withdrawal of all currency issued by state and national banks and corporations. 2. That coin should not be paid for the principal or interest of the national debt, unless specifically promised. 3. That the only currency should be paper issued by the government on the faith of the nation and convertible into bonds bearing 3.65 per cent interest, and be a full legal tender for all dues, debts and taxes.

The part furnished by the labor-reform element demanded—4. That government bonds should be taxed. 5. No land grants to corporations. 6. Reduction of the hours of labor. 7. National and State labor bureaus. 8. Abolition of the contract prison-labor system. 9. Exclusion of the Chinese.

At the election of 1878 the National party polled 1,000,365 votes in 37 states, as against 187,095 votes in 15 states in 1877 and 82,640 votes in 24 states in 1876, and elected 14 Con-

gressmen. Its greatest growth was in California, Iowa, Maine, Massachusetts, New York, Pennsylvania, West Virginia, Georgia and Missouri.

Encouraged by this success, a national convention was called to meet at Chicago, where, June 9-10, 1880, James B. Weaver of Iowa and B. J. Chambers of Texas were nominated. The platform was that of 1878, with the addition of a few new demands for an eight-hour labor law, the sanitary inspection of factories, workshops and tenements.

But the prosperity of the party was on the decline; the popular vote polled was but 306,867, and the number of Congressmen elected but eight. Of these, four came from Missouri, two from Maine, and one each from New York and Texas.

In 1884 the party nominated Benjamin F. Butler of Massachusetts and Absalom W. West of Mississippi, and polled but 133,825 votes in 30 states, and practically went out of existence.

UNION-LABOR PARTY. This party was formed at Cincinnati on Washington's Birthday, 1887, at a convention of delegates representing such organizations as the Knights of Labor, the Agricultural Wheelers, the Corn-Growers, Farmers' Alliance, Homesteadery, Grangers and Greenbackers. It was opposed to land monopoly in every form; it demanded the public ownership of telegraphs and railroads; it called for a currency issued by the government directly to the people without the intervention of banks, and loaned on landed security at a low rate of interest; for the free coinage of gold and silver; the immediate payment of the bonded debt; a graduated income tax; the exclusion of the Chinese; the election of United States Senators by popular vote, and the extension of the franchise to women.

Thus formed, and on this platform, the Union-Labor party (made up chiefly of the old Greenback-Labor men) entered the campaign of 1887 with state tickets in Ohio, Arkansas and Missouri. The vote polled was so encouraging that in the autumn of 1888 there were Union-Labor tickets in nearly all the Western states, and a Presidential ticket nominated at Cincinnati in May, 1888, by a national convention of 274 delegates from 25 states. The candidates were Alson J. Streeter of Illinois and Charles E. Cunningham of Alabama.

UNITED-LABOR PARTY. Side by side with the Union-Labor party grew up another, which sprang directly from the Henry George movement in New York City in 1886, and after supporting him for Secretary of State in 1887, called a national convention, to meet at Cincinnati and nominate a Presidential ticket. The delegates, ninety-nine in number, assembled May 16, 1888, nominated Robert H. Cowdery of Illinois for President and William H. T. Wakefield of Kansas for Vice-President, and drew up a platform. The chief features of it were declarations against land monopoly, and in favor of taxing land according to its value and not its area; a circulating medium

issued by the government without the intervention of banks; government control of railroads and telegraphs; less hours of labor; sanitary inspection of tenements, shops and mines; the Australian ballot; and a reduction of the cost of legal proceedings.

An effort to join these two labor parties was a failure, and each was absorbed in 1890 by the People's Party.

SOCIALISTIC-LABOR PARTY. The Socialistic-labor party held its national convention at New York City in August, 1892, and nominated Simon Wing of Mississippi and Charles H. Matchet of New York. The platform consisted of two parts:

I. *Social Demands.* 1. Less hours of labor. 2. Government ownership of railroads and telegraphs. 3. Municipal ownership of gas, ferries, electric plants and street railways. 4. The United States to have sole right to issue money. 5. No patents; inventions to be remunerated by the nation. 6. Repeal of pauper, tramp and conspiracy laws. 7. Equal wages for men and women. II. *Political Demands.* 1. Abolish the Presidency, Vice-Presidency and Senate, the House of Representatives to elect an executive board. 2. Direct vote; secret ballot; equal suffrage for men and women, black and white.

At the election the party polled 21,191 votes, namely, Connecticut, 329; Massachusetts, 676; New Jersey, 1,337; New York, 17,965; Pennsylvania, 898.

J. B. McMASTER.

LABOUCHERE, HENRY, an English journalist and politician; born in 1831. He was educated at

HENRY LABOUCHERE.

Eton; entered the diplomatic service in 1854, through the influence of his uncle, the late Lord Taunton; and was successively attaché at Washington, Munich, Stockholm, Frankfurt, St. Petersburg, Dresden and Constantinople; was elected a member of Parliament for Windsor in 1865-66; for Middlesex in 1867-68, and for Northampton since 1880, with Charles Bradlaugh for his co-member. Mr. Labouchere was rated as an advanced Gladstonian Liberal, with strong independent tendencies; so in Lord Rosebery's ministry and after it he must be classed as an advanced radical. His opposition to the very existence of the House of Lords manifested itself on all possible occasions. He edited and owned *Truth*, a society paper of very general influence, and was part proprietor of the *Daily News*.

LABOULAYE, EDOUARD RENÉ LÉFEBVRE DE, a French author, born in Paris, France, Jan. 18, 1811; began life as a type-founder; at 28 he published *History of Landed Property in Europe*, which attracted great attention, and was crowned by the Institute. In 1842 he was admitted to

the Paris bar, and in 1849 became professor of comparative legislation in the College of France. During the empire, his opposition to the despotic methods of Napoleon III was moderate in form but untiring in act. He never ceased presenting to his audiences the United States constitutions as models for a future French republic, and during the Civil War took openly the side of the Union against the secessionists. In 1871 he was elected to the National Assembly for the department of the Seine; in 1875 he became a life-Senator, and in 1876 was made administrator of the College of France and shortly afterward resumed the lectures that had made him so popular under the Second Empire. Among his works are *Political History of the United States* (1855); *The United States and France* (1862); and *Memoirs of Franklin* (1866). His *Paris en Amérique* (1863) is a clever plea in favor of American customs, under cover of a humoristic fiction. The sons of Laboulaye gave the library and manuscript lectures of their father at the College of France to Johns Hopkins University. He died in Versailles, May 25, 1883.

LABOURDONNAIS, BERTRAND FRANÇOIS MAHE DE, a French sailor and colonial governor; born in St. Malo, France, Feb. 11, 1699; he entered the royal navy early, and reached the rank of captain in 1723; after serving some time in the Portuguese navy he was appointed governor of the French islands of Isle de France (Mauritius) and Bourbon (now La Réunion), and developed greatly the prosperity of these colonies. During one of the Franco-English wars he bombarded Madras, in 1746, and levied a contribution on the East India Company of £540,000. The jealousy of Duplein, the governor-general, caused him to be dismissed from the service and imprisoned in the Bastille for three years. Finally he was acquitted, in 1751, and later his widow was pensioned. He is mentioned with much praise in Bernardin de St. Pierre's admirable prose-poem, *Paul et Virginie*. He died Sept. 9, 1753.

LABRADOR, a dependency of Newfoundland, and under the administrative supervision of the governor of that island. The latest official reports place the area at about 56,000 square miles, and the population at 4,211. Included in the population of Labrador were 609 Indians. The statistics of trade and productions are reported in connection with those of Newfoundland. See also **LABRADOR**, Vol. XIV, p. 175.

LABRADORITE. See **MINERALOGY**, Vol. XVI, p. 420.

LABYRINTHODONTA. See **AMPHIBIA**, Vol. I, pp. 761-62.

LACEBARK-TREE (*Lagetta lintearia*), a tree of the family *Thymelæaceæ*, a native of the West Indies. The inner bark of the tree has the appearance of coarse lace, and is used in weaving.

LACERTIDÆ. See **LIZARD**, Vol. XIV, pp. 732-734.

LACERTILIA. See **REPTILES**, Vol. XX, p. 439, et seq.

LA CHAISE, FRANÇOIS D'AIX DE, a French

Jesuit; born in the Château d'Aix, France, Aug. 25, 1624. He entered the order of Jesuits, and by the influence of Father Coton, his uncle, rapidly rose to the office of Provincial; appointed confessor of Louis XIV, he closed his eyes to the court-scandals, but incited the persecution of Protestants, being mainly instrumental in the revocation of the Edict of Nantes in 1685, and causing trouble to all adherents of the Gallican Church. He was given by the king fine grounds in the eastern suburbs of Paris, whereon he built himself a summer residence. These gardens have since been turned into into the handsomest of Parisian cemeteries, and named after Pere La Chaise. He died in Paris, Jan. 20, 1709. See also FRANCE, Vol. IX, p. 579.

LACHES, a law term signifying negligence, or remissness in asserting or enforcing a right. Where a remedy is discretionary, and not compulsory, laches on the part of the person seeking to enforce the remedy will prejudice and sometimes defeat his case. In courts of equity the maxim is, "Equity aids the vigilant, but not the indolent." Laches is only excused if the party is laboring under a legal disability, as insanity, coverture (a *feme covert*, or married woman, has no right to sue in her own name), infancy (if the party had not attained legal majority), imprisonment and the like. No laches can be imputed to a state.

LACHESIS. See SNAKES, Vol. XXII, p. 199.

LACHINE, a town of Hocheloga County, Quebec, Canada, situated on a railroad, eight miles above Montreal, and connected by a bridge with Caughnawaga. A ship canal eight and one half miles long extends hence to Montreal harbor, to avoid the Lachine Rapids of the St. Lawrence. It is a favorite summer residence, and a place of resort for pleasure parties during the winter. A steamer shoots the rapids daily, and the trip is very popular among tourists. See ST. LAWRENCE, Vol. XXI, p. 181.

LACHLAN, a river of New South Wales, Australia, rising in King County. It flows west, and joins the Muerrenabidgee, a tributary of the Murray, in lat. 34° 25' S., long. 144° 4' E. Length, 700 miles. Navigable in rainy season for light-draught boats.

LACHRYMAL APPARATUS. See ANATOMY, Vol. I, p. 891; DISEASES OF, see OPHTHALMOLOGY, Vol. XVII, p. 786.

LACKAWANNA OR LACKAWANNOCK, a river of northeastern Pennsylvania, rising in Susquehanna County, flowing southwest and entering the Susquehanna at Pittston. Its basin is a very productive coal region, whence one half the anthracite coal of the United States is obtained. It is 40 miles in length. Scranton and Carbon-dale, important mining towns, are the largest on the river.

LACKMUS. See LITMUS, Vol. XIV, p. 703.

LA CLEDE, PIERRE LIGNESTE, a French explorer; born at Bion, France, in 1724. The company over which he ruled had obtained in 1762 from Governor d'Abbadie the exclusive right to

trade with the Indians on the Missouri River. His lieutenant, Auguste Chouteau, chose the present site of St. Louis for a trading-post, and, having fortified it, gathered there the stores of the company, Feb. 15, 1764—practically the date of the founding of St. Louis. It was named by La Clede, a month later, in honor of King Louis XV. He died on the Mississippi River at the mouth of the Arkansas, June 20, 1778.

LACON, a city and the capital of Marshall County, northern central Illinois, on the Illinois River, and on a branch of the Chicago and Alton railroad. It is a grain shipping point, contains a distillery, a shawl, woolen and flour mills, and a canning-factory. The Illinois River is navigable here for steamboats. It is supplied with electricity and city water. Population 1900, 1,601.

LACONIA, a town, and the capital of Belknap County, New Hampshire, on Lake Winnisquam and the Boston and Maine railroad. It has manufacturing of hosiery, flannel, yarn, etc. Population 1890, 6,143; 1900, 8,042.

LACRETELLE, PIERRE LOUIS, a French author; born in Metz, France, in 1751. When 27 years old he left Nancy, where he was practicing law, to enter the Paris bar; there he was in frequent intercourse with La Harpe, Malesherbes and their literary coterie. He took part in the revolution as a moderate, and barely escaped the guillotine. He confined his labors to his profession and to literature, except under the Restoration, when the newspapers he wrote for were suppressed for their persistent opposition to all reactionary measures. His *Portraits et Tableaux, Études sur la Révolution Française*, and *Mes Soirées à Malesherbes*, give trustworthy pictures of the troubled times in which he lived. He died Sept. 5, 1824.

LACROIX, PAUL, a French writer, better known by his pen-name of "Le Bibliophile Jacob"; born in Paris, Feb. 27, 1806; was educated at the College Bourbon; while still at school he began to prepare editions of the old French classics. It was in the field of historical research, however, that he won reputation as a writer. His books on history and on bibliography treat in attractive fashion of the habits, manners, customs, costumes, arts, sciences, and intellectual condition of France from the middle ages down to the nineteenth century. From 1855 Lacroix was custodian of the Arsenal library of Paris. He was a decided liberal in his principles, and a personal friend of the stubborn adversaries of the Second Empire, Victor Hugo, Charras, Louis Blanc, etc. He died in Paris, Oct. 16, 1884.

LA CROSSE, a city and the capital of La-Crosse County, southwestern central Wisconsin. It is a great lumber center; a great many logs are floated down the Black River and here converted into lumber. Four railways center here, the Chicago, Burlington and Northern, the Chicago, Milwaukee and St. Paul, the Chicago and Northwestern and the Green Bay, Winona and St. Paul. The city stands on a sandy tract, and is spread over a large area. Large quantities of grain

and other farm products are shipped by rail and river. La Crosse has many manufactories, mostly those of wooden articles. Invested in them is an aggregate capital of \$11,000,000. Their annual product averages \$10,000,000 in value. The city contains 50 churches, public halls, opera-houses, a public library containing over fifteen thousand volumes, and electric lights and street-railways. The population in 1890 was 25,221; 1900, 28,895. See also LA CROSSE, Vol. XIV, p. 195.

LACTEALS. See ANATOMY, Vol. I, pp. 906, 907.

LACTOMETER. See ADULTERATION, Vol. I, p. 168.

LACTUCARIUM. See NARCOTICS, Vol. XVII, p. 231.

LA CYGNE, a post village of Linn County, central eastern Kansas, 52 miles S. of Kansas City, on the Osage River, and on the Kansas City, Fort Scott and Memphis railroad. It has superior water-power, and manufactures considerable lumber. It is surrounded by a fruit-growing and stock-raising region, and has valuable coal and building-stone in its vicinity. Population 1890, 1,135; 1900, 1,037.

LADANUM or LOBDONUM, resinous exudation from the "Rose of Sharon" (*cistus cretica laurifolius*, and *lodiniferous*). This is the myrrh of the Hebrews. It has been used as a perfume throughout historic times, and is still an article of commerce in Turkey. See also INCENSE, Vol. XII, p. 718.

LADD, GEORGE TRUMBULL, an American educator; born in Painesville, Ohio, Jan. 19, 1842; graduated at Western Reserve College in 1864 and Andover Seminary in 1869. Served as pastor of Congregational churches in Edinburgh, Ohio, and Milwaukee, Wisconsin, until 1879, when he was appointed professor of intellectual and moral philosophy in Bowdoin, and lecturer at Andover Seminary. In 1881 he was called to the chair of philosophy in Yale. He wrote *Principles of Church Polity* (1881); *Doctrine of Sacred Scripture* (1883); and *Elements of Physiological Psychology* (1887).

LADIN, dialect. See ENGADINE, Vol. VIII, pp. 213, 214.

LADISLAUS, King of Naples, surnamed "The Liberal and the Victorious"; was born about 1375, and in 1387, under the regency of his mother, succeeded his father Charles III; was driven from the city in July of that year by his rival to the throne, Louis II of Anjou, who was supported by Pope Clement; was reinstated by Otto of Brunswick a few weeks later; repulsed two invasions made by Pope Urban VI, in 1388; was crowned at Gaeta, May 29, 1390, by a legate of the new Pope, Boniface IX; a candidate for the Hungarian throne, and crowned in 1403, but soon withdrew his claims thereto; attempted to besiege Rome in August, 1405, for which he was excommunicated and deprived of his kingdom by the Pope, June 18, 1406; again made an attack on Rome, in 1406, and finally took the city by surprise and plundered it, June 8, 1413. During

his career he was also a claimant to the throne of Provence and a candidate for the imperial crown of Germany. He was probably the first of the modern Italian rulers who entertained the project of united Italy. He died in Naples, Aug. 16, 1414.

LADISLAUS, the name of seven kings of HUNGARY; q.v. Vol. XII, pp. 367-69.

LADISLAUS OR WLADYSLAW, the name of two kings of POLAND; q.v. Vol. XIX, p. 289.

LADRONES OR MARIANA ISLANDS. See Vol. XIV, pp. 199-200; and GUAM, in these Supplements.

LADY-BIRD. See COLEOPTERA, Vol. VI, 128, 134.

LADY FRANKLIN BAY, an inlet into the coast between Grant Land and Grinnel Land, and between lat. 80° and 81° N., opening into Robeson Channel. It was the station of the unfortunate United States Signal Service expedition of 1881-1883.

LADY'S MANTLE, a name given to *Alchemilla*, an Old World genus of herbaceous plants of the family *Rosaceæ*. The common lady's mantle (*A. vulgaris*), abundant throughout Great Britain and cultivated in the United States, has a bitterish, astringent taste. Formerly it was used in medicine as an astringent.

LADY'S SLIPPER, an orchid of the genus *Cypripedium*. The corolla has a large inflated lip, thought to resemble a slipper. In America the most conspicuous wild lady's slippers are the larger yellow *C. pubescens*; the smaller yellow *C. parviflorum*; the showy *C. spectabile*; and the stemless *C. acaule*. The roots of the first yield an officinal remedy, regarded as a nervous stimulant and anti-spasmodic. See Vol. XVII, p. 818.

LADYSMITH, SIEGE OF. Ladysmith is an inland town of Natal, noted for its 118 days' siege by the Boers in Britain's war (1889-1900) with the late South African republics. The town is situated on a plain, commanded by high hills, and watered by the Klip River. It is distant about 190 miles from Port Durban and 119 miles from Pietermaritzburg, the capital of the Colony. To understand how Ladysmith came into prominence in the struggle here related, it may be well first to recite, briefly, the opening incidents in the conflict between Briton and Boer. When the war broke out (Oct. 10, 1899), a small British force was stationed at Newcastle, to the northward of Ladysmith, near the passes in the Drakensburg mountains where the northern wedge-shaped portion of the Natal Colony impinges upon the Transvaal. From Newcastle the British withdrew on Oct. 13, to escape being taken in the rear by the Boer troops that in large force had invaded northern Natal, seizing Laing's Nek and the ill-omened region for the British of Majuba Hill and the Ingogo. The small retreating British force was under General Sir W. Penn Symons, who awaited reinforcements from England and the East Indies. Just before these arrived and General Sir George White took command, the English gave battle (Oct. 20) to the Boers at Dundee, 35 miles from Ladysmith and connected with it by railway. Though Dundee was won by the British, it cost them dear, especially in the storming of Talana

Hill, for they were now opposed by the large burgher levies under Generals Joubert, Meyer, and Kock. As General Symons had fallen at Dundee, General Yule took command. Being, however, hard-pressed and short of ammunition, and hoping also to receive reinforcements, now being brought northward from the coast by Sir George White, General Yule decided to fall back upon Ladysmith. Meanwhile, General French, in command of another British column, including the 5th Lancers and the Imperial Light Horse, had beaten a large force of the Boers plying heavy guns at Elands-laagte; while Sir George White, who had now arrived at Ladysmith, had had an action with the enemy at Rietfontein, with the view of enabling General Yule to get back to the British railway and supply base near the Klip River. The British, having suffered heavy losses, and the varied columns being wearied with hard marching and counter-marching, all concentrated at Ladysmith. As the whole of Natal was now menaced in force by the burgher levies, General White elected to hold Ladysmith with his entire command, to prevent further invasion southward of the Colony. This command consisted of about 11,000 men, including 2,400 troopers, with 48 guns. Against this force and to invest the place, the Boers brought up an army some 20,000 strong, and proceeded to cut off all railway and telegraphic communication with the town. Now ensued the 118 days' exciting siege, with all its attendant horrors, the results of bombardment, deaths from casualties, enteric fever, and other sicknesses, and towards the end lack of food and exhausted hospital stores, and ammunition reduced to fifty rounds. To add to the drawbacks of the situation, the beleaguered garrison lost by death and capture in a sortie in the early days of the siege some 2,000 comrades. Of the remaining 9,000 troops, two-thirds of whom ere the siege was raised had passed through the hospital, 600 were killed or wounded, 350 died from diseases, while all were emaciated and enfeebled. In addition to these casualties, the citizens of the town suffered a loss of 120 of their number in killed or wounded. Towards the close of Feb. (1900), relief at length came in the welcomed approach of General Buller's army corps, which had had much hard fighting and had met with many serious reverses in relieving Natal of the Boer forces and in enabling the Earl of Dundonald, with his cavalry division, to enter Ladysmith on the evening of Feb. 28, amid the acclaims of the besieged and the rejoicings of the entire British nation.

Some critics, since the relief of the place, have taken Sir George White to task for his decision to shut himself and his troops in Ladysmith and for attempting to defend so vulnerable and exposed a town. The criticism, from a military point of view, is not to be found fault with; yet it must be remembered that Ladysmith had hitherto been a garrison town and base of supplies, and to Sir George White it no doubt appeared a weakness to give the place up to be looted by the Boers. In addition to the more advanced towns in the colony from which the British had withdrawn; while re-

lief, if he thought of the necessity of that at all, and of a prolonged siege, would surely, he might imagine, be quickly forthcoming. The loss of *morale* in deserting the place and seeking safety further south, was no doubt the matter that weighed with him, besides consideration for the British colonists and loyal Dutch in Natal, who were naturally alarmed at the menace of invasion. The natural barrier of defence, it may be admitted, is the rugged valley of the Tugela River, to the rear of Ladysmith, from the hills overlooking which the Boers held General Buller so long and tightly while Ladysmith famished. At the same time, as we have hinted, desertion of the town would have entailed a moral loss and lowered British prestige; while the defence of the place, as it turned out, has added a glowing chapter to the annals of British military history and shown the world how undauntedly the British soldier can fight and endure, however hard and even intolerable his environment. What that environment was in Ladysmith during the siege, the war correspondents have with telling effect related. In dealing with the dramatic hours of the afternoon of Feb. 28, when the relieving column entered Ladysmith, one of these correspondents, Mr. Richard Harding Davis, has sketched for us "the pitiful contrast which the two forces presented. The men of the garrison were in clean khaki, pipe-clayed and brushed and polished, but their tunics hung on them as loosely as the flag around its pole, the skin on their cheek-bones was as tight and as yellow as the belly of a drum, their teeth protruded through parched, cracked lips, and hunger, fever, and suffering stared from out their eyes. They were so ill and so feeble that the mere exercise of standing was too severe for their endurance, and many of them collapsed, falling back to the sidewalk, rising to salute only the first troop of each succeeding regiment of the relieving force." For months, it will be remembered, the garrison had been reduced to a diet of horse flesh, with the occasional luxury of a small dish of corn-starch, with bluing in it, originally intended for washing clothes!

G. M. A.

LAEKEN, a suburb of Brussels, Belgium.

LA FARGE, JOHN, an American artist; born in New York City, March 31, 1835; a pupil of Couture, in Paris, and of William Hunt, in New York. He was first a draughtsman on wood, then a painter of flowers, landscapes and portraits, and afterward became noted as a decorator of church interiors and a mural painter on Biblical themes. He was elected a National Academician in 1869, was awarded a first-class medal at the Paris Exposition of 1889 for his stained-glass exhibit, besides being made a Knight of the Legion of Honor. Among his finest efforts are decorative paintings in Trinity Church, Boston, and St. Thomas Church and the Church of the Ascension, New York, and the battle-window (stained glass) in Memorial Hall, Harvard.

LAFAYETTE, a town and the capital of Chambers County, central eastern Alabama, situated 67 miles N. E. of Montgomery, on the Central railroad of Georgia. It has a good cotton

trade, and contains Lafayette College for women, churches, hotels, and a newspaper office. It has a large cotton trade, and also a general trade with a large cotton-raising and grazing region. Population 1890, 1,369; 1900, 1,629.

LAFAYETTE, a city and the capital of Tippecanoe County, western central Indiana, 63 miles N.W. of Indianapolis. It is on the Cleveland, Cincinnati, Chicago and St. Louis, the Lake Erie and Western, the Louisville, New Albany and Chicago and the Wabash railroads, and on the Wabash and Erie canal. It is supplied with natural gas led from Tipton County, with electric lights and street-railways, and a regular fire department. Population 1900, 18,116. See LAFAYETTE, Vol. XIV, p. 201.

LAFAYETTE, a town and the capital of Lafayette Parish, central southern Louisiana, on the Vermillion Bayou, and on the Southern Pacific railroad, 30 miles S.W. of Baton Rouge. It is in a cotton-growing region, sugar-cane and corn being also largely produced. Mt. Carmel Convent, an institution with over 150 students and 10 instructors, is situated here. Population 1900, 3,314.

LAFAYETTE, FORT. See NEW YORK CITY, Vol. XVII, p. 459.

LA FAYETTE, MARIE MADELEINE PIOCHE DE LA VERGNE, COMTESSE DE, a French novelist; born at Le Havre, France, 1634. She married at 21, Count de LaFayette, who brought her to Paris and introduced her to the cultured coterie that made its headquarters at the Hotel de Rambouillet, and from which Cardinal Richelieu was to recruit the founders of the Académie Française. She devoted much time to writing fiction, and, thanks to her masters, Ménage, Segrais, etc., she escaped the affected, stilted style that preceded the sober diction of the reign of Louis XIV. Her novel *La Princesse de Clèves* (1678) is remarkably fine and true to life, her short stories *Md'lle de Montpensier* (1662) and *La Comtesse de Tende* (1680) not being esteemed so highly by modern critics. Her *Histoire de Madame Henriette d'Angleterre* and her *Mémoires de la Cour de France pour les Années 1688-89* are considered documents of real value. The mutual attachment that lasted so long between her and the Duc de la Rochefoucauld (author of the *Maximes*) is also a matter of history. She died in Paris, in 1693.

PARDEE HALL, LAFAYETTE COLLEGE.

LAFAYETTE COLLEGE, an American institution for the education of men, situated at Easton, Pennsylvania; opened in 1832, though char-

tered by the state six years earlier; controlled by the Presbyterian Church. In 1895 it had 28 instructors, 301 students, and 25,000 volumes in its library. Besides the regular curriculum in the liberal arts, instruction and degrees are given in the sciences, and in civil and electrical engineering. With the presidency of Dr. William C. Cattell (1863-83), it began to develop on new and stronger lines, a technical school, fully equipped, being added to it through the generosity of Mr. Ario Pardee. The grounds extend over 40 acres and the buildings number 27. The value of the assets is said to exceed \$1,000,000; the productive funds in 1895 amounted to \$302,000 and the annual income was \$36,000.

LAFITTE, JACQUES, a French banker and financier; born of humble parents, at Bayonne, Oct. 24, 1767. He left his home in 1787, walked to Paris, and in the following year was employed as bookkeeper in the banking-house of Perregaux; was soon admitted to the firm, and in 1809 succeeded to the business. He became a regent of the Bank of France in the same year; in 1813, a member of the Tribune of Commerce; in 1814, president of the Chamber of Commerce and governor of the Bank of France. During the stormy years that followed, his honesty and liberality did much toward averting financial disasters. He was respected and his services made use of by all parties. He was banker for Louis XVIII, and also for Napoleon during the Hundred Days, discharging both trusts with perfect honesty. In 1816 Lafitte was elected to the Chamber of Deputies, and in 1830 secured the election of Louis Philippe and averted a revolution by reconciling Lafayette with the latter. He became premier and Minister of Finance in the new Cabinet, but resigned in 1831, his liberal sentiments not permitting him to retain office longer. His banking-house failed in the financial panic of the next year, but out of his private fortune of 50,000,000 francs he was enabled to pay all liabilities, and with 8,000,000 francs remaining to start a new house. He was re-elected to the Chamber in 1843. He died May 26, 1844.

LAFITTE, JEAN AND PIERRE, two American buccaneers, born in France about 1780. The brothers went to New Orleans and set up a blacksmith shop, but left this occupation to engage in privateering expeditions against the Spanish mercantile traffic in the Gulf under commissions from the French, and later from the Republic of Colombia. They made their headquarters on the island of Grande Terre, about 35 miles west of the mouth of the Mississippi, selling their booty by auction to the merchants of New Orleans. It was very probable that they did not confine depredations to the commerce of the enemies of the governments which employed them, but in fact were mere pirates. In 1814 Jean Lafitte was offered a commission and a pardon for past offenses if he would enter the service of the British in the siege of New Orleans, Pierre Lafitte being in prison in that city on the charge of piracy. He, however, rejected the offer, and tendered

his services to the United States on the same terms. The offer was rejected by Governor Claiborne, of New Orleans, and an expedition fitted out against him and his brother who had escaped from jail, which destroyed their stronghold and carried off the greater part of their booty. Upon his arrival in New Orleans, General Jackson received another offer from the brothers, procured their pardon, and took them into his service. After the war they removed to Central America, where it was believed that they continued their old free-booting occupation. Jean Lafitte died about 1826, on the coast of Yucatan. A *Historical Sketch of Pierre and Jean Lafitte* was contributed to the *American Magazine of History*, October and November, 1883, by Charles Gayarré.

LAFOURCHE, a bayou of southern Louisiana, leaving the Mississippi near Donaldsonville, and flowing southeast to the Gulf of Mexico. Length, 150 miles; navigable for 100 miles from its mouth. It is bordered by great cotton and sugar-cane plantations.

LAFUENTE, MODESTO, a Spanish historian and critic; born at Rabanel de los Caballeros, May 1, 1806. He studied at Leon and Santiago de Compostela; became professor at Astorga in 1830; in 1838 went to Madrid and entered journalism. He published numerous critical essays, and his great work, *Historia de España*. He died Oct. 5, 1866.

LAGARDE, PAUL ANTON, a German theologian and orientalist; born in Berlin, Dec. 2, 1827. He graduated at Berlin and Halle; studied for two years in Paris and London; was professor successively in the Werder Gymnasium in Berlin, in the Polytechnic Institute in the same city, in the gymnasium at Cologne, and again in the Werder Gymnasium. In 1869 he became professor of oriental languages at Göttingen. He published, among other works, *Reliquiæ Juris Ecclesiastici Antiquissimæ* (1856); *Constitutiones Apostolorum Græcæ* (1862); *The Programme of the Prussian Conservative Party* (1884); *Upon Certain Berlin Theologians* (1890); and several critical works on the Old Testament.

LAGERSTRÆMIA, a genus of plants of the family *Lythraceæ*, distinguished by winged seeds, and containing some of the noblest trees of tropical forests. *Lagerstræmia Flos-reginæ*, or queen's flower, is the jarul of India, a magnificent tree with red wood, much used for boat-building.

LAGOA DOS PATOS, the largest lake of Brazil, situated in the extreme southern state of the country. It is 144 miles long, and 41 in extreme breadth, and runs parallel with the Atlantic, from which it is only separated by a long, low range of sand-dunes and swamps. Its outlet is at the southern end, and is called the Rio Grande do Sul. The lake as a rule is shallow, but has a channel for ships of heavy draught. The tide is felt at its lower end, but very little salt water enters the lake proper. Its principal tributary is the Jacuhy.

LAGO MAGGIORE. See MAGGIORE, Vol. XV, p. 198.

LAGOMYIDÆ. See MAMMALIA, Vol. XV, p. 421.

LAGOON, a species of lake formed by the overflow of the sea or of rivers, or by the infiltration of their water; hence lagoons are sometimes divided into fluvial and marine. In some cases they are dried up in summer, in others they preserve throughout the whole year the character of stagnant, marshy pools, and in others the sea reunites them to itself in winter, but is separated from them in summer by a bar of sand or shingle. See LAKE, Vol. XIV, p. 217.

LAGOS, a city in the state of Jalisco, central Mexico, on a tributary of the Verde River, and on the Mexican Central railroad, 225 miles N.W. of Mexico. It is notable for its annual winter fair, and its extensive iron-ore deposits and opal mines. Population, 13,500.

LAGOSTOMINÆ, a subfamily of *Chinchillidæ*, whose only known species, the viscacha (*Lagostomus trichodactylus*), is a characteristic rodent of the pampas of South America. It is distinguished by a rat-like form, but with a bushy tail, the lip cleft, the fore feet four-toed and the hind feet three-toed.

LAGOTIS or LAGIDIUM, a genus of rodents of the family *Chinchillidæ*, inhabiting the Andes of Chili, Bolivia and Peru. They have long ears, long, bushy tail, and are about the size of a hare. They are often called the "rabbit-squirrel" and chinchas. They resemble the chinchillas in appearance and in habits.

LA GRANDE, a city of Union County, north-eastern Oregon; on two branches of the Oregon Railway and Navigation Company railroad, 39 miles N. of Baker City. It is in the Grande Ronde valley, a rich lumbering, farming and mining region, and ships large amounts of lumber, live-stock and grain; has several mills, and a roundhouse and repair-shops of the railroad. It has electric lights and water-works. Population 1890, 2,583; 1900, 2,991.

LAGRANGE, a city and the capital of Troup County, central western Georgia, 65 miles S.W. of Atlanta; on the Atlanta and West Point and the Georgia Southern and Florida railroads. It contains a furniture factory, banks, churches, two colleges for young women, and two other collegiate institutions for both whites and negroes. It has manufactories of flour, cotton-seed oil, guano, carriages, plows and castings. Population 1890, 3,090; 1900, 4,274.

LAGRANGE, a town, and the capital of LaGrange County, northwestern Indiana, 42 miles W.N.W. of Fort Wayne, on the Grand Rapids and Indiana railroad. It has high and normal schools, churches, pump, bee-hive, butter-tub and carriage factories, and saw, planing and flour mills. Population 1900, 1,703.

LAGRANGE, a city of Lewis County, north-eastern Missouri, on the Mississippi River, 175 miles N. of St. Louis. It has considerable river trade, very large rolling-mills for turning out railroad iron, flour and planing mills, tobacco factories, and is the seat of LaGrange College, a

Baptist institution chartered in 1859. This college has six instructors and over 200 students. Population 1890, 1,250; 1900, 1,507.

LAGRANGE, a city and the capital of Fayette County, southeastern central Texas, on the east bank of the Colorado River, on the Missouri, Kansas and Texas and the Southern Pacific railroads; thirty miles N.E. of Columbus. Steamboats can ascend the river to the place. It contains cotton mills and compresses, an oil-mill, carriage and wagon shops, and a large trade in corn. Population 1890, 1,626; 1900, 2,392.

LA GUAIRA. See GUAYRA, Vol. XI, p. 242.

LA HARPE, FRÉDÉRIC CÉSAR, a Swiss patriot; born at Rolle, Vaud, in 1754; studied at Tübingen, and became tutor to a young Russian nobleman; later, to the grandsons of Catherine II of Russia, Alexander, afterward emperor, and Constantine. In 1793 he was pensioned and returned to Switzerland. He took part in the revolution in his native canton, resulting in the calling in of the French troops, and the proclamation of the Lemanic Republic, which after the establishment of the Helvetic Republic was incorporated in it as the canton of Leman. He was a member of the Swiss Directory, 1798-1800, and was given the honorary title of general by Emperor Alexander of Russia, his former pupil. He died March 30, 1838. See also SWITZERLAND, Vol. XXII, p. 743.

LA HARPE, JEAN FRANÇOIS, a French critic and poet; born in Paris, Nov. 20, 1739. He began his literary career by the publication of poems entitled *Heroïdes* (1759); in 1768 became literary critic on the *Mercure de France*; elected to the Academy in 1776; in 1786 made professor of literature in the Lycée. He is best known for his series of lectures given in that institution on the *History of Literature, Ancient and Modern*, which was published in sixteen volumes (1799-1805). La Harpe was a zealous supporter of the revolution. In philosophy he was first a follower of Voltaire, but later became converted to Catholicism. He died Feb. 11, 1803.

LAHÖNTAN LAKE. See UNITED STATES, Vol. XXIII, pp. 794, 795.

LAISSEZ FAIRE THEORY. See GOVERNMENT, Vol. XI, p. 17; and POLITICAL ECONOMY, Vol. XIX, pp. 360-400.

LA JUNTA, a village and the capital of Otero county, southeastern Colorado, on the Arkansas River and on the Atchison, Topeka and Santa Fé railroad, at the junction of two of its lines, 65 miles E. of Pueblo. Its industry is farming and stock-raising. Pop. 1890, 1,439; 1900, 2,513.

LAKE CHARLES, a town and the capital of Calcasieu parish, southwestern Louisiana, on the Calcasieu River and on the Southern Pacific Company railroad and the Lake Charles and Leesville, and the Kansas City, Watkins and Gulf railroads; surrounded by a large orange-growing and lumbering district. It has saw, shingle and wood-working mills, car-shops, a sugar-refinery and an ice factory; and it is supplied with water-works and electric lights. Pop. 1890, 3,442; 1900, 6,680.

LAKE CITY, a town and the capital of Co-

lumbia County, northeastern Florida, surrounded by beautiful lakes containing excellent fish. It is on the Florida Central and Peninsular, the Gainesville and Gulf, the Savannah, Florida and Western and the Silver Springs, Ocala and Gulf railroads. It is the seat of the State Agricultural College and a Peabody school, and is a winter resort for invalids. It is in the Sea Island cotton district, and has a large trade in fruit, vegetables, lumber, turpentine and phosphates. Population 1890, 2,020; 1900, 4,013.

LAKE CITY, a town of Calhoun County, western central Iowa, on the Chicago and North-western railroad, 35 miles S.W. of Fort Dodge. It is in a corn, wheat and oat raising district, and dairying and cattle-raising are important industries. It has repair-shops of the railroad. Population 1890, 1,160; 1900, 2,703.

LAKE CITY, a town of Missaukee County, northwestern south Michigan, on a pretty inland lake, and on the Grand Rapids and Indiana railroad, 98 miles N. E. of Muskegon. It is in a farming and lumbering district, and has saw and shingle mills. Population 1900, 816.

LAKE CITY, a city of Lake county, southeastern Minnesota, on beautiful Lake Pepin, an enlargement of the Mississippi, and on the Chicago, Milwaukee and St. Paul railroad, 52 miles S. E. of St. Paul. It is a wheat market, and has manufactories of flour, plows, lumber and wagons, and has foundries, machine-shops and steam-elevators. It has a public library, and is quite popular as a summer resort. It occupies a picturesque site on a small plain between the lake and the bluffs. Population 1890, 2,128; 1900, 2,744.

LAKE DISTRICT OF ENGLAND, THE. See CUMBERLAND, Vol. VI, p. 699.

LAKE FOREST, a city of Lake County, northeastern Illinois, 28 miles N.W. of Chicago, on Lake Michigan, and on the Chicago and North-Western railroad. It contains Lake Forest University, Ferry Hall Seminary, a boys' academy, churches and elegant residences. It is spread along the lake for three miles, on beautiful high bluffs, and is one of the most picturesque places in the state. Population 1890, 1,203; 1900, 2,215.

LAKE FOREST UNIVERSITY, a co-educational institution, located partly in Lake Forest, Illinois, and partly in Chicago. It was founded in 1857 by a number of Chicago Presbyterians, under the name of Lind University. This was changed to Lake Forest University in 1865. In 1896 there were six distinct departments: the academy for boys, the college (co-educational), and Ferry Hall Seminary for girls, all located in Lake Forest; the three professional schools, Rush Medical, united with the University since 1887, Chicago College of Law since 1889, and Chicago College of Dental Surgery since 1887, all located in Chicago. The academy is a preparatory school; Ferry Hall is preparatory, but also has a two-years course, like the first two, in college. The college is organized upon the elective plan, a certain number of credits, including three years' work in elective subjects, being required for

graduation. The school owns, aside from its campus and equipment, income-bearing property to the amount of \$500,000, which, together with all sources of income, nets about \$85,000 a year. There were in 1898, in all departments, 1,393 students and 121 instructors, and the library had 16,000 volumes. The campus in Lake Forest includes 75 acres of land, and there are 15 buildings on it. President (1899), James G. K. McClure, D.D.

LAKE GENEVA, a city of Walworth County, southeastern Wisconsin, situated on a lake from which it takes its name, and on the Chicago and Northwestern railroad, 45 miles S.W. of Milwaukee. It has flour and feed mills, a postoffice fixture factory, and has a large trade in pork and wool. It has popularity as a summer resort. Population 1890, 2,297; 1900, 2,585.

LAKE MÅLAR, one of the largest lakes in Sweden, studded with upward of twelve hundred islands, mostly well wooded. Its east end is close by Stockholm, where its waters empty into the Baltic Sea. The shores are adorned with castles, country-seats and villas, including the royal palaces of Drottningholm and Gripesholm. See **SWEDE**N, Vol. XXII, pp. 736, 737.

LAKE OF THE THOUSAND ISLANDS, an expansion of the St. Lawrence, extending down the river for about forty miles from Lake Ontario. It contains the group called the Thousand Islands, some fifteen hundred rocky islets, belonging partly to Canada and partly to Jefferson County, New York, the largest, Wolf Island, measuring 21 miles by 7. These islands are very popular summer resorts. See **ST. LAWRENCE**, Vol. XXI, p. 1800.

LAKE OF THE WOODS, a large irregular lake in northern Minnesota and Canada, about sixty miles in diameter. It has several large wooded islands and numerous small ones. Its largest tributary is Rainy Lake River, which flows in from the east. Its outlet is Winnipeg River, which discharges its waters into Winnipeg Lake. Altitude 1,060 feet.

LAKEPORT, a village and the capital of Lake county, northwestern central California; situated on the west shore of Clear Lake, amidst very beautiful scenery, one hundred miles N. of San Francisco. It is in a fruit-raising region, and has medicinal springs and quicksilver mines. Some gold and silver are mined. Its picturesque situation makes it a popular tourists' resort. Population 1900 726.

LAKEPORT, a village of Belknap County, central New Hampshire, on Long Bay, at the outlet of Lake Winnepisaukee, on the Boston and Maine railroad, two miles N. of Laconia. It derives water-power from the lake outlet, and has a foundry, machine-shop, and manufactories of hosiery, woolen goods and needles. Population 1890, 2,715.

LAKES, in coloring. See **PIGMENT**, Vol. XIX, pp. 87, 88.

LAKE VALLEY MINES. See **SILVER AND SILVER MINING**, in these Supplements.

LAKEWOOD, a town of Ocean County, central eastern New Jersey, on the south branch of the Metedecong River, and on the Central railroad of New Jersey, twenty miles S.S.W. of Long Branch. Lumbering and the manufacture of charcoal, iron

from native ore, and farming are the principal industries. Lately, Lakewood has obtained popularity as a health and winter resort. It is situated in a large pine forest studded with many pretty lakes. It has four large hotels, electric lights, and the Lakewood Preparatory Academy. Population township (1900), 3,094.

LALLEMAND, CHARLES FRANÇOIS ANTOINE, a French general; born in Metz, June 23, 1774. He entered the army in 1792; served in Egypt, Spain and Russia; in 1811 was made baron and brigadier-general; upon Napoleon's return from Elba, lieutenant-general and member of the House of Peers. He was chosen by Napoleon to conduct negotiations for his surrender to Captain Maitland, and he afterward requested permission to follow the deposed emperor to St. Helena, but was refused and imprisoned at Malta by the British authorities; subsequently was released, and went to the United States with the intention of founding a colony for imperialist refugees in Alabama. The scheme proved a failure, and another attempt was made in Texas, which was frustrated by the Mexican authorities, who drove the colonists out of the country. In 1823 he took part in the Spanish war, and then went to France, where his military and political honors were restored him, and he took his seat in the Chamber of Peers. Afterward, for two years he was governor of Corsica. Lallemand was a legatee of Bonaparte's for 100,000 francs, but being at the time under the sentence of death by a French court, the bequest was refused him. He died in Paris, March 9, 1839.

LAMAR, a town and the capital of Barton County, southwestern Missouri, on Muddy Spring River, and on the Missouri Pacific and the Kansas City, Fort Scott and Memphis railroads, 60 miles W.N.W. of Springfield. It is in a fertile and productive agricultural region, where coal and timber are plentiful; has manufactories of flour, brooms, cigars and wagons, and has large nurseries. Population 1890, 2,860; 1900, 2,737.

LAMAR, LUCIUS QUINTUS CININNATUS, an American statesman; born in Putnam County, Georgia, Sept. 1, 1825; graduated at Emory College; studied law, and in 1847 was admitted to the Georgia bar; in 1849 became adjunct professor of mathematics in the University of Mississippi, but resigned the following year. He then returned to the practice of law in Covington, Georgia, and in 1853 was chosen to the state legislature. In 1854

LUCIUS Q. C. LAMAR.

he settled in Mississippi, and from 1857 to 1860 was a member of Congress. During the Civil War he fought with the Confederate army, was the representative of the Confederacy in Europe for securing financial aid and government recognition, and attained the rank of colonel. In 1866 he became professor of political economy in the University of

Mississippi, and in 1872 was again elected to Congress. In 1874 he was re-elected, and in 1877 became a United States Senator. During President Cleveland's first term he was Secretary of the Interior, and in December, 1887, became an associate justice of the United States supreme court. He died at Macon, Georgia, Jan. 23, 1893.

LAMARCKIANISM. See LAMARCK, Vol. XIV, pp. 231, 232; EVOLUTION, Vol. VIII, pp. 748-750; HEREDITY, and NEO-LAMARCKIANISM, in these Supplements.

LA MARMORA, ALBERT, COUNT DE, a brother of Alfonso, an Italian soldier and naturalist; born in Turin, in 1789; was educated at Fontainebleau, France, and served under Napoleon I. In 1821 he took part in the uprising in Piedmont, and in consequence was banished to the Island of Sardinia, where he remained nine years. He spent the time of his exile in a thorough study of the physical features of the island, especially its geology. The results of his investigations were published under the title *Travels in Sardinia*, the first volume of which was published in 1826, the third and last in 1857. In 1831 he was recalled by King Carlo Alberto, and was afterward sent back to Sardinia as royal commissioner to effect the reconciliation of the Separatist party. He died in 1863.

LA MARMORA, ALFONSO FERRERO, MARQUIS DE, an Italian general and statesman; born in Turin, Nov. 17, 1804. He was educated at the military academy at Turin; entered the Sardinian army in 1823 with the rank of lieutenant of artillery; subsequently visited almost every country in Europe for the purpose of military study, and became known as a zealous reformer of the army. He was decorated for distinguished services in the national war of 1848, and promoted general of brigade. In 1849 he entered the Sardinian Cabinet as Minister of War, withdrawing in 1855 to assume command of the Sardinian troops in the Crimea. At the close of the war he was invested with the Order of the Bath and the Grand Cross of the Legion of Honor, and re-entered the ministry in his former capacity. He took part in the war of 1859, by which Lombardy was acquired by Italy; was appointed commander-in-chief of the Italian army in 1861; and became Prime Minister in 1864. He was minister to Paris in 1867, and was governor of Rome in 1870-71. After 1873 he lived in retirement. His *Life* has been written by Massari. He died Jan. 5, 1878.

LAMB, MARTHA JOANNA READE NASH, an American authoress; born in Plainfield, Massachusetts, Aug. 13, 1829. She began writing at an early age, and in 1852 married Charles A. Lamb, and moved to Chicago. She was there the founder of the Home for the Friendless and the Half-orphan Asylum. In 1866 she moved to New York, and devoted all her attention to literature. In 1883 she became the editor of the *Magazine of American History*. Her best work is *The History of the City of New York* (2 vols., 1877-81), besides which she has written numerous historical sketches, novels and shorter stories, among which are *Spicy*, a novel (1873); *Play School Stories* (1874); *The Christmas Owl* (1881);

Wall Street in History (1883). She died Jan. 2, 1893, in New York City.

LAMBAYEQUE, a department of northwestern Peru, bordering on the ocean, the western Cordillera and the departments of Piura and Libertad. The coast part is low and rather arid, but the valleys are fertile and produce sugar-cane, tobacco, cotton and rice. The principal river is the Lambayeque, on which is the capital, Lambayeque, with a population of 8,000. Population of department in 1896, 124,091; area, 4,613 square miles.

LAMBERTVILLE, a city and railroad junction of Hunterdon County, northwestern New Jersey, on the Delaware River and on the Pennsylvania railroad, 14 miles above Trenton. It has excellent water-power, running cotton, paper, twine and spoke mills, and also a rubber and shoe factory, foundry, and railroad construction and repair shops. It has electric and gas lights. Population 1890, 4,142; 1900, 4,637.

LAMBIN, DENYS, a French bibliographer and editor; born at Montreuil, Vaud, Switzerland, in 1520. He was the lifelong friend of Cardinal Tournon, and accompanied the latter to Rome in 1549, remaining until 1560. During this time he made a critical study of the manuscripts of classical authors in the Vatican library. In 1561 he became professor of Greek and Latin in the University of Paris. He published editions of Cicero, Horace, Lucretius and Plautus, which are of great value to modern editors. He died in Paris, in 1572. His death is said to have been caused by a fit of apoplexy brought on by the sight of the horrors of the St. Bartholomew massacre.

LAMBINET, EMILE, a French landscape-painter, born in Versailles, France, Jan. 13, 1815; a pupil of Horace Vernet; was awarded medals in the salons of 1843, 1853 and 1857, and was given the decoration of the Legion of Honor in 1867. His paintings were remarkable for pearly gray tones, their atmospheres and a soft perspective. He died in Bougival, Jan. 1, 1878.

LAMELLIBRANCHIA. See MOLLUSCA, Vol. XVI, pp. 684-695.

LAMELLIROSTRES, an order of birds, arranged by Cuvier, including the "ducks" (*Anatidae*) and the flamingoes (*Phanicopteridae*). The name refers to the lamellæ in the beak or rostrum. The group is almost equivalent to the modern group *anserines*, and without the flamingoes corresponds to the group *chenomorpha*.

LAMÉTH, the name of three brothers who served in the American Revolutionary War, and afterward distinguished themselves as soldiers and statesmen during and after the French Revolution. ALEXANDRE THEODORE VICTOR; born in Paris, Oct. 28, 1760. He served in America on the staff of Count Rochambeau, and was made colonel in 1785. In 1789 he was elected to the Second Estate, the *Noblesse*, of the States General, but resigned to take a seat with the Third Estate. In the following year he was elected president of the National Assembly. His policy during the Revolution was the establishment of a constitutional monarchy, and he consequently found himself continually opposed by Mira-

beau, Robespierre and the Jacobins. When the war with Austria broke out he joined the army and served as field-marshal, but was accused by the National Assembly, obliged to flee, and finally was captured by the Austrians, who kept him prisoner for three years. After Napoleon came into power Lameth was prefect in several departments. Louis XVIII appointed him lieutenant-general in 1814, and afterward he was elected to the Chamber of Deputies, where he served four sessions as leader of the opposition. He wrote *History of the Constituent Assembly* (2 vols., 1828-29). He died in Paris, March 19, 1829.—CHARLES MALO FRANÇOIS, born in Paris, Oct. 5, 1757. He served in the American war on the staff of Rochambeau; was wounded at Yorktown; was promoted to rank of colonel. Returning to France, he was chosen to the National Assembly, and became its president in 1791. His policy was that of his brother Alexandre. He also joined the army, in 1792, served as field-marshal, and was obliged to flee from the army and take refuge at Hamburg. From 1809 to 1814 he served under Napoleon, attaining the rank of lieutenant-general. After Napoleon's fall he lived in retirement until 1829, when he was elected deputy to the Chamber. In the following year he took part in the revolution which deposed Charles X. He died in Paris, Dec. 28, 1832.—THEODORE, born in Paris, June 24, 1756. He also served in America; was deputy to the National Assembly in 1791-92, and was obliged to flee. He published his *Observations* in 1843. He died Oct. 19, 1854.

LAMIAN WAR. See GREECE, Vol. XI, p. 107.

LAMINARIA, a genus of the family *Laminariaceae*, a group of the brown seaweeds. The leathery plant's body consists of a root-like lower part which serves to attach it, a stem-like part and a large terminal leaf-like expansion. In *L. digitata* the broad leaf is usually torn palmately by the waves into a number of strips; *L. saccharina* contains a large quantity of sugar, and is sometimes used in the preparation of a syrup. The latter species is also employed in surgery to distend apertures and passages, the cell-walls swelling up very much with the absorption of water. The large laminarias, where abundant, are also used in the production of iodine and soda.

LAMINITIS. See FOUNDER, in these Supplements.

LAMMAS DAY, the first day of August, the festival of the grain harvest, was originally one of the four great annual pagan festivals in ancient Britain. When Christianity was introduced into the country, this celebration, like many other heathen customs, was modified and adopted by the church. The day was celebrated by bringing a loaf, representing the first-fruits of the harvest, to the church, and hence was given the name *hlaf-mass*, which later was contracted to lammas. It was also customary for each family to give the Pope on Lammas day a penny, which was called Peter's penny. Lammas lands were lands tilled by individual occupiers until harvest or Lammas-time, and then thrown open as common pasture.

LAMMERMUIR HILLS. See HADDINGTON, Vol. XI, p. 361.

LAMNIDÆ. See ICHTHYOLOGY, Vol. XII, p. 685.

LAMONT, DANIEL SCOTT, an American statesman; born at Courtlandville, New York, Feb. 9, 1851. He was educated at McGranville Academy and Union College. Early in life he entered upon a newspaper career. In a short time he formed the acquaintance of political leaders of the Democratic party in New York. When President Cleveland entered upon his first term in 1885, Mr. Lamont became his private secretary, and exhibited tact and personal qualifications of a high order. In 1893 he accepted the portfolio of the war department in President Cleveland's second administration.

DANIEL SCOTT LAMONT.

LAMOTTE, ANTOINE HOUDART, a French critic and author; born in Paris, Jan. 17, 1672. He was educated at a Jesuit college; began his literary career as a playwright, and was elected to the Academy in 1710. Two years later he became blind. Lamotte published a poetical translation of the *Iliad*, in which he abridged and altered the original to suit his own taste, which caused a controversy with Mme. Dacier (q.v., Vol. VI, p. 759). He also published *L'Europe Gallante*, a ballet (1697); *Inès de Castro*, a tragedy (1723); and several volumes of essays, farces, etc. He died Dec. 26, 1731, in Paris.

LAMPASAS, a city and the capital of Lampasas County, central Texas, 63 miles N.N.W. of Austin, on the Gulf, Colorado and Santa Fé railroad, and on the Sulphur fork of the Lampasas River. It is the center of a large cotton and live-stock raising region; it has flour-mills, a creamery and ice factory. The sulphur springs here are visited by many invalids. Population 1890, 2,408; 1900, 2,107.

LAMPRIIDIUS, ÆLIUS, an ancient biographer. See AUGUSTAN HISTORY, Vol. III, p. 74.

LAMP-SHELL, a name sometimes applied to the brachiopod shells in general, but particularly to the shell of *Terebratulina* and its allies, because of the resemblance to an ancient lamp. Certain mollusk shells are used as lamps. In Shetland the shell of a species of *Fusus* is used for this purpose.

LANARK, a post village of Carroll County, northwestern Illinois, on the Chicago, Milwaukee and St. Paul railroad, 20 miles S.W. of Freeport. It contains a flour-mill, elevators and warehouses, a grain-separator factory, vinegar-works and a woolen factory. Population 1890, 1,295; 1900, 1,306.

LANCASTER, a village and the capital of Garrard County, central Kentucky, 32 miles S. of Lexington, on the Louisville and Nashville railroad. It is the commercial center of a grain and live-stock raising region. It has a tobacco factory, a wheat-fan factory and a high school. Population 1900, 1,640.

LANCASTER, a town and the capital of Coos County, northern New Hampshire, on the Connecti-

cut River, and on the Boston and Maine and the Maine Central railroads, 88 miles N. of Concord. It has a paper-mill and several starch and saw mills, hotels, churches, a public library and an academy, and is a popular summer resort. Population 1890, 5,373; 1900, 3,190.

LANCASTER, a city and the capital of Fairfield County, southern central Ohio, on the Cincinnati and Muskingum and the Columbus, Hocking Valley and Toledo railroads, on the Hocking River and the Hocking canal. It has a state reform farm for boys. It is supplied with natural gas from the vicinity. Population 1890, 7,775; 1900, 8,991. See LANCASTER, Vol. XIV, p. 255.

LANCASTER, a city and the capital of Lancaster County, southeastern Pennsylvania, near Conestoga Creek, on the Pennsylvania, the Philadelphia and Reading and the Cornwall railroads, 35 miles E.S.E. of Harrisburg. Its principal agricultural product is wheat, and tobacco is also raised in the vicinity. Limestone is quarried. Lancaster is an active manufacturing town. Over 500 establishments reported in 1890; their capital aggregated \$7,400,000, and their annual product averages \$10,300,000 in value. Among these establishments are several cotton-mills, breweries, tanneries, potteries, paper-mills and machine-shops, several iron-foundries and blast-furnaces. It is the oldest inland town in the state. Franklin and Marshal College (q.v., in these Supplements) is situated here. While the British were occupying Philadelphia in 1777, the Continental Congress met at Lancaster. Pop. 1890, 32,011; 1900, 41,459. See also LANCASTER, Vol. XIV, p. 255.

LANCASTER, a town and the capital of Lancaster County, central northern South Carolina, 50 miles N. of Columbia, on the Wateree River, and on the Cheraw and Chester and the Ohio River and Charleston railroads. It is in an agricultural region. Population 1890, 1,094; 1900, 1,477.

LANCASTER, a city and the capital of Grant County, southwestern Wisconsin, 20 miles N. of Dubuque, situated in a fine grain-producing and lead-ore region, on a branch of the Chicago and North-Western railroad. It contains a sash and door factory, machine-shops, carriage factories, a creamery, an excelsior factory and woolen and flour mills. Population 1890, 1,543; 1900, 2,403.

LANCASTER SOUND, a passage of the north polar regions connecting Baffin Bay with Barrow Strait, and extending from long. 78° to 88° W., between North Devon and Cockburn islands. It was discovered by Baffin in 1616.

LANCET-FISHES, the common name of fishes of the family *Acanthuridae*, which have lance-shaped spines on the tail. Sometimes the name is applied to certain fishes on account of the shape of their teeth. See ACANTHURIDÆ, in these Supplements.

LANCET-WINDOW. See ARCHITECTURE, Vol. II, p. 427.

LANCIANI, RODOLFO AMADEO, an Italian archæologist; born in Rome, Jan. 1, 1847. He was educated at the University of Rome; in 1877 received the appointment of director of excavations from the Italian government, and in the following year was made professor of Roman topography in the Uni-

versity of Rome. He published works on the archæology of Rome to the number of three hundred, among which are *Ancient Rome in the Light of Recent Discoveries* (1888); *Pagan and Christian Rome* (1892); and began a work, *Forma urbis Romæ*, in eight parts, the first of which was published in 1893.

LAND COMMISSION. See HOME RULE, in these Supplements.

LANDER, FREDERICK WILLIAM, an American engineer and soldier; born in Salem, Massachusetts, Dec. 17, 1821. He studied engineering at the military academy in Norwich, Vermont; practiced in Massachusetts, and afterward was employed by the government in making surveys in the West to determine the practicability of a transcontinental railroad. He also laid out the overland wagon route to the Pacific, in all making five transcontinental surveys. When the Civil War broke out in 1861, he served on the staff of General McClellan as engineer, and was promoted to the rank of brigadier-general of volunteers on May 17, 1861. He was wounded later in the year, but returned to active service in January, 1862. He died of congestion of the brain on the 2d of the following March.

LAND LEAGUE. See HOME RULE, in these Supplements.

LAND-RAIL OR CORN-CRAKE. See CRAKE, Vol. VI, p. 542; and RAIL, Vol. XX, p. 222.

LANDS, PUBLIC. See UNITED STATES, Vol. XXIII, pp. 822, 823.

LANDSCAPE-GARDENING, the art of giving a picturesque appearance to a plat of ground by modifying its physical features, its pools, streams, slopes, etc., or by constructing such artificially by making an artistic disposition upon it of trees, shrubs, lawns and garden-beds, and by introducing artificial structures, such as statues, monuments, bridges and roads, or otherwise changing the plat so that it will present a pleasing aspect. There can be no specific rules laid down for the arrangement of grounds, this depending almost entirely on the original condition of the piece of land in question, its use, the climate, and innumerable other conditions. The general rule usually observed in modern landscape-gardening, however, is, that art shall but assist nature, and itself be as unobtrusive as possible.

There has probably never existed a civilized nation which did not give some attention to beautifying its public and private grounds, but landscape-gardening, cannot be said to have become an art until the seventeenth century, when a great deal of attention was given by the Italian nobles to the improvement of the grounds around their villas, and a definite style of landscape-gardening, since called the Italian style, was developed. The chief characteristic of this style was its conventionality. Walks, trees, garden-plats, streams and terraces were all laid out with geometrical regularity. A good example of Italian gardening is the garden on the Isola Bella. A barren rock, in 1671, by Vitaliano Borromeo was converted into a paradise of fertility and luxury by bringing earth from the banks of the Lago Maggiore to one of the Borromeo Islands. (See BORROMEO ISLANDS, Vol. IV, p. 64.) He built ten terraces on arches, one above the other, to the top

of the island Isola Bella, on which the palace stands. These terraces he covered with fine exotic and native flowering plants, and with groves of bay, lemon and orange trees interspersing statuary in rich abundance. The Italian style of gardening made its way with some rapidity over Europe with the revival of art. But it was altered by the French and Dutch to accord better with the character of their climates and more level countries.

Gardening was brought to a high degree of perfection in Holland. The wealth acquired by the Dutch merchants and seafarers enabled them to indulge in fine country residences and luxurious gardens. They imported flowering plants, seeds and bulbs from the foreign countries they visited. The cultivated Dutch flowers, the tulip, anemone, hyacinth, narcissus, etc., are all Oriental, and came to them mostly from Constantinople in the sixteenth century. Bulbous flowers were cultivated extensively in Holland because the climate and soil of that country are singularly favorable for their growth. The Dutch and the French landscape-gardening are characterized by symmetry and an abundance of ornaments. But the gardens of Holland are more confined than the French, more often covered with frivolous ornaments, and generally intersected with still waters. As a specimen of the Dutch style of the seventeenth century, the gardens and palace at Loo during the time of William III may be taken.

FRENCH gardening revived with André Le Nôtre, who lived at the time of Louis XIV. He delighted in long clipped alleys, triumphal arches, richly decorated parterres, fountains and cascades, with grotesque ornaments, a profusion of statues and therms, and many deep grottos. All these wonders, springing up in a desert-like open country, dazzled and enchanted the beholders, and caused the king to make him director of the royal gardens, to create him a knight, and to commission him to improve also the gardens of the Tuileries, the Champs Elysées, Trianon, Neudon, St. Cloud, Chantilly and the celebrated Terrace of St. Germain. England, Sweden and all Europe adopted Le Nôtre's style. The gardens of Versailles are the grand effort of Le Nôtre and the model of excellence in the geometrical school of landscape-gardening.

The modern ENGLISH style of landscape-gardening was created by Bridgeman and Kent. William Kent vindicated the natural style against the artificial, and rejected entirely the mathematical symmetry of ground-plan then in vogue for laying out gardens. (See KENT, Vol. XIV, p. 40.) "Nature, not art, must be the model of the landscape-gardener," he said. The straight lines and stiff terraces of the ancient style were succeeded by flowing lines and wide, smooth lawns and slopes; the formal avenues and geometrical clumps in which trees had been arranged were succeeded by pleasing curves and an irregularity of grouping that relieved the eye and beautified the scene. The gardens and pleasure-grounds of Doublat, at Epinal, have the reputation of being the finest specimen of English gardening in France. Their great merits depend more on the natural beauties of the situation and of the sur-

rounding scenery than on the exercise of any style of art. They consist of a rocky hill rising abruptly from the town of Epinal to the height of four hundred feet, and stretching away to the east for a mile, in the form of a narrow ridge, gradually declining till it terminates in the valley of the Moselle.

The gardening of GERMANY, as compared with that of Great Britain, is, on the whole, inferior in the splendor of its productions; but it is nevertheless pursued in Germany with greater ardor in proportion to the wealth of the inhabitants. If there are no gardens in Germany in the natural style equal to the Parks of Great Britain, it is not for want of skill on the part of the Germans in laying them out tastefully, but attributable more to the severity of their winters, the scarcity of good gravel for walks, and the economy more generally practiced in their country. Yet there are good botanic and pleasure gardens at Munich, Carlsruhe, Berlin and elsewhere. The French style has prevailed in Germany from the earliest period. An excellent example is the park surrounding the palace at Carlsruhe. The whole place is a natural forest of pines and oaks, pierced with thirty-two avenues, radiating from the center of the grounds where stands the palace.

In AMERICA the art of landscape-gardening has as yet made rather slow progress. But the increase of wealth since the close of our Civil War, and the accompanying development of the artistic taste in painting, sculpture and allied branches, have given an impetus to the art which promises to bring its products very soon to the level with the best works in Europe. Some cemeteries, and the public parks of our cities, have up to this time been the main fields for its exercise. The climate and other conditions of America will modify the art to some extent. There is reason to expect, from the laying out of the Central Park, and of the several other parks in the cities of New York, Brooklyn, Philadelphia, Chicago, etc., that the natural English style, with its gentle flowing lines, will ultimately predominate over the stiff, geometrical Dutch and French styles of landscape-gardening in America.

LANDSEER, the name of a family of English artists. JOHN, an engraver; born in Lincoln in 1761; in 1807 elected associate engraver to the Royal Academy; in 1806 delivered lectures on *Engraving* before the Royal Institution and in 1823 on *Engraved Hieroglyphics*; author of *Sabaan Researches* (1823) and a *Catalogue of the Earliest Pictures in the National Gallery*. He engraved illustrations for Mackin's *Bible* (1793) and for Boyer's *History of England* (1793), and also made engravings after Turner, Rubens, Rembrandt and others. He died in London, Feb. 29, 1852.—CHARLES, son of the above, a painter; born in 1799; studied art under his father and Haydon and entered the schools of the Royal Academy at 16; elected associate of the Academy in 1837, academician in 1845, and in 1851 was appointed keeper. Among his paintings, which are largely on historical subjects, are *The Sacking of Basing House* (1836); *Cromwell at the House of Sir Walter Stewart* (1867); *Surrender of Arundel Castle* (1870); *A Langum Fishercvoman*, *Tenby* (1876). He died July 22, 1879. For his

more noted brother, SIR EDWIN, see LANDSEER, EDWIN, Vol. XIV, pp. 280, 281.—Another brother, THOMAS, an engraver, was born in London in 1795. He was elected associate of the Academy in 1868. He reproduced several of his brother Edwin's pictures; among them, *Doubtful Crumbs*, and also *The Horse Fair* and *Denizens of the Forest*, after Rosa Bonheur, which gave him a great reputation. He also did some original work in oils, *A Deluge of Rain*, *Lion-Hunting* and others. He was the author of the *Life of William Bewick* (1871). He died Jan. 20, 1880.

LANDSTURM. See GERMANY, Vol. X, p. 467; and ARMY, Vol. II, p. 604.

LAND SURVEYS IN THE UNITED STATES. See UNITED STATES, in these Supplements.

LANE, JAMES HENRY, an American politician; born in Lawrenceburg, Indiana, June 22, 1814. In 1840 he was admitted to the bar, and in 1846 enlisted in an Indiana regiment, of which he was made colonel. At the battle of Buena Vista he commanded a brigade. In 1848 he was elected lieutenant-governor of Indiana. From 1853 to 1855 he was a representative in Congress, having been chosen as a Democrat. There he voted for the repeal of the Missouri compromise. After moving to Kansas in 1855, he took an active part in the formation of the state government, and became a leader of the free state party. As such, he presided over both the Topeka and the Leavenworth constitutional conventions. In 1858 he shot a neighbor dead, in a quarrel about a well. He was tried for murder, but acquitted of the charge. When Kansas was admitted as a state of the Union, Lane was elected United States Senator. He served on the committees of Indian affairs and agriculture. During the Civil War he was for a time brigadier-general of volunteers. In 1865 he was re-elected for the United States Senate, but in the midsummer of the following year, when on his way home, he had an attack of paralysis, affecting his sanity, and committed suicide at Leavenworth, July 1, 1866.

LANE, JOSEPH, an American soldier and statesman; born in Buncombe County, North Carolina, Dec. 14, 1801. He moved to Warwick County, Indiana, in 1816, and became a clerk in a mercantile house. In 1822 he was elected to the state legislature, which office he held until 1846, when he enlisted in a regiment of volunteers. He was commissioned colonel and afterward brigadier, and served throughout the Mexican War, gaining the brevet of major-general. He was appointed governor of Oregon in 1848, and was its delegate to Congress in 1851-57. When Oregon was admitted in 1859 he was elected to the Senate, serving until 1861. In 1860 he was nominated for Vice-President on the ticket with Breckinridge, and after his defeat took no more part in politics, and passed the rest of his life in obscurity and poverty, dying April 19, 1881, in Oregon.

LANE-POOLE, STANLEY, an English Orientalist and author; born in London, Dec. 18, 1854. He was educated under the direction of his great-uncle, E. W. LANE, the Orientalist (q.v., Vol.

XIV, p. 282), and graduated at Corpus Christi, Oxford, in 1878. His first important work was a *Catalogue of the Oriental Coins in the British Museum* (8 vols., 1875-83), to which he added a *Catalogue of Indian Coins* (3 vols., 1884-92); *Additions to the Oriental Collection* (2 vols., 1890); and a *Catalogue of Arabic Glass Weights* (1891). After the death of his great-uncle, Lane-Poole took up his *Arabic Lexicon*, and brought out volumes 6, 7 and 8 (1877-93). He also wrote a *Life of E. W. Lane* (1877). Among other works he published *Life of Stratford Canning* (1888); *Social Life in Egypt* (1883); and *The Life of Sir Harry Parkes*, with F. V. Dickens (1894), and contributed to this ENCYCLOPÆDIA the article on WYCLIFFE. In all, he published about 60 volumes.

LANESBORO, a town of Fillmore County, southeastern Minnesota, 28 miles S.W. of Winona, on the south branch of the Root River, and on the Chicago, Milwaukee and St. Paul railroad. It contains a newspaper-office, churches, a bank, a high school and a flour-mill, oatmeal-mill, creamery, flax-fiber mill and wagon-works. Population 1900, 1,102.

LANFRANCO OR LANFRANC, GIOVANNI, an Italian artist; born in Parma in 1581. He studied under the Carracci, whose work his earlier pictures resemble strongly. He worked in Rome for the Farnese and Borghese families, and after the death of the Carracci, returned to his native city, whereupon his work took on a more individual style. Among his best-known paintings are *St. Andrea Avellino* at Rome; fresco paintings on the cupola of St. Andrea della Valle in Rome; on the cupola of the Church of Jesus at Rome; and the *Dead Christ* at Bologna. He died in Rome in 1647.

LANG, ANDREW, a British writer; born at Selkirk, Scotland, March 31, 1844, and educated

at Edinburgh Academy, St. Andrews University and Balliol College, Oxford, where he graduated first-class in classics. In 1868 he was elected fellow of Merton College, Oxford, and in 1888 was appointed Gifford lecturer on natural religion at St. Andrew's University. His *Ballades in Blue China* (1881)

brought him into prominent notice, and his subsequent works, especially *Helen of Troy*, *Rhymes à la Mode*, and *Custom, Ritual and Myth*, increased his reputation. He was joint translator with Professor Butcher of the *Odyssey*, and with Mr. Myers and Mr. Leaf of the *Iliad*. His recent works include *The Gold of Fairnilee*, *Lost Leaders* and *Prince Prigio*. He also edited the *Blue Fairy-Tale Book* and the *Red Fairy-Tale Book*. In 1890 he wrote, in collaboration with Rider Haggard, *The World's Desire*. In 1891 he wrote *Essays in Little*; in 1894 *A History of St. Andrews* and *Ban et Arrière Ban*, a

ANDREW LANG.

volume of verse; in 1895 *A Monk of Fife, My Own Fairy-Book*, and edited *The Red True Story-Book*; and in 1898 published *The Making of Religion*. He also annotated the Border Edition of the *Waverley Novels*, and wrote the department, *At the Sign of the Ship*, in *Longmans' Magazine*.

LANGDON, JOHN, an American statesman; born at Portsmouth, New Hampshire, June 25, 1741. He engaged in mercantile business in his native city till 1774, when he secured the ordnance stores of Fort William and Mary in Portsmouth harbor for the colonists. In 1775 he was elected to the Continental Congress, and in 1776 he became a navy agent. In 1777, while he was speaker of the New Hampshire assembly, and means were needed for equipping General Stark's brigade, Langdon gave all his money, pledged his silver plate and subscribed the proceeds for that purpose. He commanded a company in the brigade and took part in the battles of Bennington and Stillwater. In 1779 he presided in the New Hampshire convention, and in 1787 he was a delegate to the convention at Philadelphia which framed the Constitution of the United States. In 1788 he became governor of New Hampshire and in the next year he was elected United States Senator, holding office till 1801, when he was chosen president of the Senate. From 1805 till 1812, with the exception of one year, he was governor of New Hampshire. He died in Portsmouth, Sept. 18, 1819.

LANGENDIJK, PIETER, a Dutch poet and playwright; born at Haarlem, July 25, 1683. His father died while the boy was a child, and his mother moved to The Hague, and supported herself and him by keeping a shop. He became a designer of damask, moved to Amsterdam and went to work at this occupation in a linen factory. Here appeared his first comedies: *Don Quixote* (1711); *The Braggart* (1712); and *The Mutual Marriage Deception* (1712). In 1715 he published *Krelis Louwen* and the *Mathematicians*, and in 1720 *Arlequijn Actionist*. In 1722 he returned to Haarlem, and for about twenty years nothing appeared from his pen. Among his later plays are *Xantippe*, which, it is said, was suggested by his own unfortunate matrimonial venture; *Papirius*; and *A Mirror of Our Merchants*, which was left incomplete. Although, to a certain extent, under the domination of French taste, Langendijk's comedies possess considerable originality and vigor, and some of them are acted still on the Dutch stage. His collected works were published in 1760. He died in 1756.

LANGÉVIN, SIR HECTOR LOUIS, a Canadian statesman; born in Quebec, Aug. 26, 1826. After studying law, he was admitted to the Canadian bar in 1850, and became queen's counsel in 1864. For one term he was mayor of Quebec, but for several terms he served as representative in the Dominion Parliament. From 1864 till 1865 he was solicitor-general for Lower Canada, and from 1865 till 1867 he was Postmaster-General. After the union of the provinces he became Secretary of State for Canada, which portfolio he retained

until he was appointed Minister of Public Works in 1869. In 1878 he became Postmaster-General again and in 1879 again Minister of Public Works. He was a Conservative in politics. In 1891 he was forced to give up his office on account of frauds discovered in his department, although his own honesty was not doubted. He wrote *Le Canada, Ses Institutions, and Droit Administratif, ou Manuel des Paroisses et Fabriques*; also *Report on British Columbia* (1872), having been appointed by the government to visit the country and acquire information concerning it.

LANGHAM, SIMON, an English ecclesiastic; born at Langham, in Rutlandshire, about 1310. He entered the clergy in 1335; became abbot of Westminster in 1349; bishop of Ely in 1362; was Chancellor of England (1363-66); archbishop of Canterbury in 1367. He resigned the archbishopric in the following year, and went to the papal court at Avignon. He was made cardinal bishop in 1373, and again appointed to the see of Canterbury; but his appointment was not confirmed by the pope. He is best known for his removal, while primate, of Wycliffe from the wardenship of Canterbury Hall, Oxford. See WYCLIFFE, Vol. XXIV, p. 708. He died July 22, 1376.

LANGLES, LOUIS MATHIEU, a French Orientalist; born at Perenne, Haute-Loire, Aug. 23, 1763. He studied Oriental languages, and in 1795 was chosen professor of Persian in the School of Oriental Languages, founded in Paris in that year by the French government. He translated into French *The Political and Military Institutions of Tamerlane, Written by Himself, in Mongol* (1787); edited Amyot's *Manchu-French Dictionary* (1789-90); and was the founder of the Geographical Society of Paris. He died in Paris, Jan. 28, 1824.

LANGLEY, SAMUEL PIERPONT, an American astronomer and physicist; born in Roxbury, Massachusetts, Aug. 22, 1834. He was educated at the Boston Latin School, and became a civil engineer, but spent a great deal of his time in the study of astronomy. In 1865 he was appointed assistant at the Harvard Observatory, and shortly afterward professor of mathematics in the United States Naval Academy at Annapolis. In 1867 he received the appointment of professor of astronomy at the Western University of Pennsylvania, with charge of the observatory at Allegheny City. At this time the total equipment of the observatory consisted of a 13-inch equatorial telescope, and Professor Langley, in order to raise funds for procuring more apparatus, originated the system, still in vogue, of supplying railroads with electric time-signals. Since then the scheme has been taken up by many of the observatories of the country. In 1869 and 1870 he accompanied the parties sent by the United States government to Oakland, Kentucky, and to Xeres, Spain, respectively, to observe the total eclipses which occurred in those years. In the latter year he began the study of solar phenomena, in which subject he became a recognized authority, and proved, among

other theories, that the effect of a sun-spot on the temperature of the terrestrial atmosphere is appreciable. Finding the thermopile, in the course of his investigations, not sensitive enough for his purpose, Professor Langley invented the bolometer, by which he was able to measure the slightest changes in temperature. In 1878 he observed a total eclipse of the sun from Pike's Peak, Colorado, and spent the winter of 1878-79 in the study of that body from Mount Ætna, Sicily. In 1881 he organized a party under the auspices of the United States Signal Service to ascend Mount Whitney, and in 1885 gave the results of his investigations in the absorption of solar heat by the earth's atmosphere, before the Royal Society in London. Two years later he was chosen secretary of the Smithsonian Institution. Among Professor Langley's honors may be mentioned the Rumford medal from the Royal Society of London in 1887; membership in the National Academy of Sciences; in 1886 the presidency of the American Association for the Advancement of Science, and memberships in other learned societies, domestic and foreign. He also interested himself in the subject of aëronautics (q.v., in these Supplements), and devised a flying-machine. Among his published works are *The New Astronomy*, which first appeared in the *Century Magazine* (1884-86); *Experiments in Aërodynamics* (1891); and *The Internal Work of the Wind* (1894).

LANGLOIS, VICTOR, a French Orientalist; born at Dieppe, March 20, 1829. He studied Oriental languages and traveled in Asia in 1852-53, as the result of which he published *Travels in Cilicia and in the Mountains of Taurus*. His other works are *Mount Athos and Its Monasteries* (1867), and *Collections of Ancient and Modern Historians of Armenia*, which was left incomplete at the time of his death, May 14, 1869.

LANGSTON, JOHN MERCER, an American lawyer and educator; born in Louisa County, Virginia, Dec. 14, 1829. By birth he was a mulatto slave, but was emancipated in childhood. He studied theology at Oberlin, graduating in 1853, and afterward studied law. From 1854 till 1869 he practiced law in Ohio. In 1869 he was made professor of law in Howard University, Washington. In 1873 he became dean of the faculty of the law department of the university. From 1875 to 1885 Langston was United States minister and consul-general in Haiti. After his return he was appointed president of the normal and collegiate institute in Petersburg. He wrote a volume of selected addresses, entitled *Freedom and Citizenship* (1883), and published many papers on political, biographical, literary and scientific subjects.

LANGTRY, EMELIE CHARLOTTE LILLIE, an English actress, the daughter of the Rev. W. C. le Breton, dean of Jersey; born at St. Hélier's, on the island of Jersey, in 1852. She was celebrated for her beauty, being known as the "Jersey Lily," and in 1874 was married to Edward Langtry of Belfast. Her husband's means having become diminished, she determined to go on the stage,

and made her first appearance, Dec. 15, 1881, at the Haymarket Theatre, London, in *She Stoops to Conquer*. After that she continued acting in London in different plays, and in 1882, 1886 and 1895 made tours in America. Among her rôles are Rosalind in *As You Like It*, Juliana in the *Honeymoon*, and Lady Teazle in *The School for Scandal*. Her success as an actress was perhaps not due so much to her histrionic powers as to the curiosity of her audiences to see her.

LANIER, SIDNEY, an American poet; was born Feb. 3, 1842, in Macon, Georgia. He was the son of a lawyer, and was graduated at Oglethorpe College, Midway, in his native state, when 18 years of age. Enlisting in the Confederate army upon the capture of Fort Sumter, he served in the battles about Richmond, in the signal service at Petersburg, in North Carolina, and in 1864 was captured while in command of a blockade-runner, suffering an imprisonment of five months at Point Lookout, Florida. At the close of the war he was, for a time, a clerk in Montgomery, Alabama; in 1867 he taught a Southern academy; the next year he joined his father, at Macon, in the practice of law. He composed the cantata sung in 1876 at the opening of the Centennial Exhibition in Philadelphia; the next year he was lecturing on English literature in Baltimore; in 1879 he was appointed lecturer on this subject in the Johns Hopkins University. Two years later, while camping in western North Carolina, he died of consumption, Sept. 7, 1881. The hard circumstances of wretched health and penury were borne by Lanier with pathetic patience, and a sensitive disposition, with the fastidious taste of high ideals, repressed his spontaneity. His first love was music, to which he thought himself more of a devotee than to verse. In *Science of English Verse* (1880) he published his theory of versification and created the expectation that he might produce a new type of song. His poems were collected after his death by his wife, to which Dr. W. H. Ward prefixed a discerning memorial. They are full of changing color, high ethical thought, melody, finely wrought work, but too passionless. His other books are *Florida* (1876); *The Boy's Froissart* (1878); *The Boy's King Arthur* (1880); and two posthumous books, *The Boy's Percy* and a critical work on *The English Novel and Its Development* (1881).

SIDNEY LANIER.

LANKESTER, EDWIN, an English physician; born at Melton, Leicestershire, April 23, 1814. After studying medicine at University College, London, and at Heidelberg, where he graduated in 1839, he became lecturer in St. George's School of Medicine; in 1850 professor at New College, London; and in 1866 editor of *The Journal of Social Science*. He published *Vegetable Physiology*;

School Manual of Health; and other medical works for popular use. He died Oct. 30, 1874.

LANKESTER, EDWIN RAY, an English zoölogist, son of Edwin Lankester; born in London, May 15, 1847. After being educated at Christ Church, Oxford, he became lecturer in Exeter College, Oxford, in 1872, and professor of zoölogy and comparative anatomy in University College, London, in 1874. Besides his work as editor of the *Quarterly Journal of Microscopical Science* and as secretary of the British Association for the Advancement of Science, Professor Lankester published *Fossil Fishes of the Old Red Sandstone*; *Comparative Longevity*; and *Developmental History of the Mollusca* (1875), besides contributing the articles on MOLLUSCA, PROTOZOA, VERTEBRATA and ZOÖLOGY, in this ENCYCLOPÆDIA. He was prominent in the defense of vivisection.

LANMAN, CHARLES, an American author; born in Monroe Michigan, June 14, 1819. For ten years he held a clerkship in a New York mercantile house, and in 1845 became editor of the Monroe (Michigan) *Gazette*. In 1846 was on the staff of the *Cincinnati Chronicle*; in 1847 on the New York *Express*. Two years later he was appointed librarian of the War Department, and in 1850 became private secretary of Daniel Webster; in 1866 librarian of Congress, and from 1871 to 1882 secretary of the Japanese legation. During this time and until his death he devoted much labor to literary work. Among his books are *Essays for Summer Hours* (1842); *A Summer in the Wilderness* (1847); *A Tour to the River Saguenay* (1848), in which he made this region known to the general public; *Private Life of Daniel Webster* (1852); *The Japanese in America* (1872); *Hazardous Personalities* (1886); and a *Dictionary of Congress*, which has gone through several editions. Mr. Lanman was also an artist, being elected associate to the National Academy in 1846. He exhibited *Brookside and Homestead* (1881), *Frontier Home* (1884), and other pictures. He died in Washington, District of Columbia, March 4, 1895.

LANMAN, CHARLES ROCKWELL, an American philologist, born at Norwich Town, Connecticut, July 8, 1850; was educated at Yale, graduating in 1871, and afterward taking a post-graduate course under Professor Whitney; studied in Berlin, Tübingen and Leipsic; appointed instructor at Johns Hopkins, and in 1880 professor of Sanskrit at Harvard. He published *On Noun Inflection in the Vedas* (1880); *Sanskrit Reader* (1881); and, as secretary of the American Philological Society, edited its *Proceedings and Transactions* (1879-81).

LANPO OR DIHONG, a river of Tibet. See TIBET, Vol. XXIII, p. 341; and DIHONG, in these Supplements.

LANSLOWNE, HENRY CHARLES KEITH PETTY-FITZMAURICE, MARQUISOF, the fifth of the title, an English statesman and diplomat; born Jan 14, 1845; educated at Eton and Balliol College, Oxford; succeeded his father in the marquise (1866); held the offices of Lord of the Treasury (1868-72); Under-Secretary of War (1872-74), Under-Secretary for India (1880); Governor-General of Canada

(1883-88); Governor-General of India (1888-93); and Secretary of War (1895).

LANSLOWNE, HENRY PETTY-FITZMAURICE. See PITT, Vol. XIX, p. 148, note.

L'ANSE, a village, and the capital of Boraga County, northwestern Michigan, at the head of the Keweenaw Bay, on the Duluth, South Shore and Atlantic railroad. It has quarries of slate and brown sandstone, beside plumbago deposits, and ships iron-ore, fish and lumber. Population 1895, 957.

LANSING, a city of Allamakee County, northeastern Iowa, on the Mississippi River, 81 miles N. of Dubuque, on the Chicago, Milwaukee and St. Paul railroad. It has a furniture factory, wagon-works, flour-mill and implement factory. It is the trade center of a large grain-raising region. Population 1900, 1,438.

LANSING, the capital of Michigan, situated in the southern part of the state, on the Detroit, Lansing and Northern, the Michigan Central, the Chicago and Grand Trunk and the Lake Shore and Michigan Southern railroads. The State Agricultural College had, in 1896, 31 instructors, 402 pupils, and has 20,000 volumes in its library. It is in a fertile and populous region, with abundant timber and coal. Its manufactures include agricultural implements, stoves, sleds, carriages, wagons, wheelbarrows, pressed stone, condensed milk, flour, knit-goods, machinery and steam-engines. It is provided with public parks, electric lights and street-railways, and with water-works owned by the city. Population 1890, 13,102; 1900, 16,485. See also LANSING, Vol. XIV, p. 290.

LANSINGBURG, a village in Rensselaer County, central eastern New York. (See LANSINGBURG, Vol. XIV, p. 291). It is connected with Troy by an electric railway, and with Waterford and Cohoes by bridges across the Hudson. Collars, cuffs and shirts are the most important products of the manufactories here next to those mentioned in the article to which reference is made. Population 1890, 10,550; 1900, 12,595.

LANTANA, a tropical or subtropical genus of mostly shrubby plants, of the family *Verbenacea*, with fragrant leaves and flowers. The species are extensively cultivated and much crossed, some of the more common ones being *L. Camara*, from tropical America, with deep yellow flowers; *L. mixta*, from Brazil, with flowers white at first, changing to yellow and red; *L. nivea*, from Brazil, with unchanging white flowers; *L. involucrata*, of the West Indies, with lilac-purple flowers; and *L. Sellowiana* of Brazil, with reddish-purple flowers.

LANTERN. See ARCHITECTURE, Vol. II, p. 467.

LANZAROTE. See CANARY ISLANDS, Vol. IV, p. 800.

LAOMEDON, a legendary king of Troy. See TROAD, Vol. XXIII, p. 583.

LA PAZ, the principal town and seaport, and the capital of Baja (or Lower) California, on La Paz Bay. It is situated in a small but verdant well irrigated plain, between the bay and the

mountains, in lat. 24° 10' N. It is the seat of trade for the mines of Triunfo, 40 miles to the south. There are important pearl-fisheries in the bay. Population, 6,000.

LAPEER, a city and the capital of Lapeer County, southeastern Michigan, 64 miles N.N.W. of Detroit. It has large flour and lumber mills, carriage factories, foundries and machine-shops, and is a shipping-point for shingles and pine lumber. Population 1900, 3,297.

LAPHAM, INCREASE ALLEN, an American naturalist, and founder of the United States Weather Bureau; born in Palmyra, New York, March 7, 1811. He was first a stone-cutter, then worked on several canals as a civil engineer. In 1836 he settled at Milwaukee, Wisconsin, where he was made register of claims. He prepared an herbarium of some 8,000 specimens of plants found in Wisconsin, and a catalogue of shells. He studied especially the grasses of Wisconsin; then the geology of that state, and lastly the fluctuations in the level of Lake Michigan, in which he detected the influence of "a slight lunar tide." In 1873 he became state geologist. Besides numerous contributions to scientific periodicals he was the author of *Wisconsin: Its Geography, Topography, History, Geology and Mineralogy; a Geological Map of Wisconsin; and Antiquities of Wisconsin*. The last-named work was published by the Smithsonian Institution in 1855. For some time Dr. Lapham had been interested in the study of meteorology, and with the aid of Dr. Asa Horr of Dubuque, Iowa, and of Professor Abbé of Cincinnati, had been able to predict storms several hours before they reached Milwaukee. In 1869 he sent a memorial to Congress suggesting the practicability and the value of predicting storms on the Great Lakes by use of the telegraph. The result was the passage of a bill, Feb. 9, 1870, authorizing the Secretary of War to institute a system of signals on the lakes and sea-coast, which finally developed into the Weather Bureau. At first, stations were started in 24 places, the results of observation being telegraphed to Washington. Dr. Lapham was offered a position at the head of the bureau, but declined because his Quaker principles would not allow him to enter a military service. He acted, however, as assistant in Chicago for some time. He died at Oconomowoc, Wisconsin, Sept. 14, 1875.

LA PLATA, the capital of the Argentine province of Buenos Ayres, founded in 1884, after Buenos Ayres City, from which it is 24 miles to the S.E., had been made the federal capital. The new city was rapidly built, with wide streets that are now mostly paved; the central portion is lighted with electric light, the rest with kerosene lamps. The only buildings of note are the handsome capitol and other offices of the government, an observatory, several chapels and a fine railway station. The city has a college, and several miles away, a hospital and an asylum for the insane. Among the manufactories already established is one of cotton and woolen tissues. A canal nearly 5 miles long and deep enough for

vessels of 21 feet draft connects a harbor which has been constructed at La Plata with a large outer harbor at Ensenada, on the La Plata River. See also PLATE, THE RIVER, Vol. XIX, pp. 187-189. Population 1895, 45,410.

LA PLATA, UNITED PROVINCE OF See ARGENTINE REPUBLIC, Vol. II, p. 487.

LAPORTE, a city of northwestern Indiana, and the capital of LaPorte County. It is situated on the Chicago and West Michigan, the Lake Erie and Western, and the Lake Shore and Michigan Southern railroads. The city has numerous educational and charitable institutions, a public library, electric lights and Holly water-works. Population 1900, 7,113. See also LA PORTE, Vol. XIV, p. 308.

LAPORTE CITY, a town of Black Hawk County, northeastern central Iowa, on Wolf Creek, 1 mile from Cedar River and 16 miles S.E. of Waterloo, on the Burlington, Cedar Rapids and Northern railroad. Flour, wagons, carriages and other articles are manufactured here, and grain and other farm produce is shipped. Population 1890, 1,052; 1900, 1,419.

LARA, a state of VENEZUELA; q.v., Vol. XXIV, p. 140.

LARAMIE, a city and the capital of Albany County, southeastern Wyoming, situated in the midst of Laramie Plains, 7,122 feet above sea-level, and 57 miles by the Union Pacific railroad from Cheyenne. From the Black Hills a number of irrigation canals run down through the city, supplying it with cold clear water. Situated here are the State University, State Agricultural College, state penitentiary and the state fish-hatchery. It has a public library and railroad machine-shops, rolling-mills, flour-mills, soda-reduction plant, stone-quarries and glass and soap factories. The first female jury ever impaneled served here. Population 1890, 6,388; 1900, 8,207.

LARAMIE, a river which rises in the Medicine Bow Range, Larimer County, northern Colorado, flows generally northeast through southeastern Wyoming and enters the North Fork of the Platte at Fort Laramie, after a course of about two hundred miles. It is much used for floating lumber from the mountains.

LARAMIE MOUNTAINS, a range of Colorado and Wyoming, but mostly in Wyoming. These mountains extend southward in a curve, bounding Laramie Plains on the northeast and east. Laramie Peak, in Albany County, Wyoming, is their highest point. Their composition is a nucleus of red syenite, with margins of fossiliferous formation, Carboniferous, Triassic, Jurassic, Cretaceous and occasional lignite Tertiary.

LARCENY. See THEFT, Vol. XXIII, p. 232.

LARCOM, LUCY, an American poetess; born in Beverly, Massachusetts, in 1826. When she was 12 years old her father died, and her mother established a factory boarding-house in Lowell. After spending about three years at school she became a factory-hand in a cotton-mill. During that time she contributed to the *Lowell Offering* a series of parables. At

the age of 20 she went to Illinois, where for three years she studied in Monticello Female Seminary. On her return to Massachusetts she was employed six years in the Norton Female Seminary, and later taught classes in the Boston schools. Acquaintance with the poet Whittier ripened into friendship which has become famous in literary circles. She was for a time editor of *Our Young Folks*, a Boston magazine. Her publications are *Ships in the Mist* (Boston, 1859); *Poems* (1868); *An Idyl of Work* (1875); *Childhood Songs* (1877); *Wild Roses of Cape Ann, and Other Poems* (1880). She died in Boston, Mass., April 15, 1893.

LUCY LARCOM.

LAREDO, a city and the capital of Webb County, southern Texas, on the Rio Grande, 78 miles W.S.W. of San Diego, on the Mexican National and the International and Great Northern railroads. It is connected with Nuevo Laredo, on the opposite bank of the river, by two steel bridges. It is in the Rio Grande coal region, and has an important trade with Mexico, its exports averaging \$12,000,000 annually; it is the shipping-point of the largest wool region of the state, and ships large quantities of brick to New Mexico and southwestern Texas. Iron, lead, zinc and copper are also products of the vicinity. Population 1890, 11,319; 1900, 13,429.

LARIDÆ. See GULL, Vol. XI, p. 274.

LARIVEY, PIERRE. See DRAMA, Vol. VII, p. 423.

LARKSPUR (*Delphinium*). See HORTICULTURE, Vol. XII, pp. 249, 251, 255.

LARNAKA. See CYPRUS, Vol. VI, p. 748.

LARNED, a city and the capital of Pawnee County, southwestern central Kansas, on the Arkansas and Pawnee rivers, 20 miles above Great Bend, and on the Atchison, Topeka and Santa Fé railroad. It is surrounded by a fertile farming and stock-raising region, where building-stone, potter's-clay and ochre are found. It has a foundry, machine-shops and flour-mills. Population 1890, 1,861; 1900, 1,583.

LA ROCHE or LAROCHE, MARIA SOPHIE GUTERMAN, a German authoress; born at Kaufbeuren, Bavaria, Dec. 6, 1731. She wrote novels somewhat after the style of the English novelist Richardson. Among them are *Fräulein Sternheim*; *Melusinens Sommerlieder*; and *Rosalien's Briefe*. She is better known, however, on account of her connection with the German literary men of the day. Wieland is said to have fallen in love with her, and Goethe with her daughter, Maximilliane. After her marriage with La Roche, her house at Ehrenbreitstein became a favorite resort for literary men and women. Her daughter was the mother of Bettina von Arnim and

Clemens Brentano. She died at Offenbach, Hesse, Feb. 18, 1807.

LA ROCHEFOUCAULD-LIANCOURT, FRANÇOIS ALEXANDRE FRÉDÉRIC DE, a French philanthropist; born Jan. 11, 1747, in Paris. He was president of the National Assembly in 1789; was forced to leave the country in 1792, and lived in England and America until 1799. He was created peer in 1814. Among other philanthropic institutions, he established a school for the education of poor soldiers' children on his estate at Liancourt, which developed into the School of Arts and Trades of Châlons. He also introduced vaccination into France, and established the first savings bank in the country. He was the author of *Travels in the United States of America* (1798). He died March 27, 1827.

LAROMIGUIÈRE, PIERRE, a French philosopher; born in Guienne, Nov. 3, 1756. He was elected professor of philosophy in the College of Toulouse in 1784; professor in the Lycée of Louis XIV in 1795; at the University of Paris in 1811. His principal work is *Lessons in Philosophy* (1815-18). He accepted and taught, with some modifications, the philosophy of Locke and Condillac, leaving "a fair and pure renown." He died in Paris, Aug. 12, 1837.

LAROUSSE, PIERRE, a French publisher; born at Toucy, in Yonne, Oct. 23, 1817. After teaching for some years, he commenced, in 1851, the publication of school books, many of which he prepared himself. The principal work he undertook was the *Dictionnaire Universel du XIXe Siècle*, for which he commenced to engage contributors in 1863. The exhaustive labor connected with the undertaking hastened his death, which occurred when the dictionary was only half finished. It was completed in sixteen volumes by his widow, and proved a great success. He died Jan. 3, 1875.

LARRA, JOSÉ MARIANO, pseudonym "Figaro." See SPAIN, Vol. XXII, p. 361.

LARVA. See MORPHOLOGY, Vol. XVI, p. 837.

LARVALIA. See VERTEBRATA, Vol. XXIV, p. 186.

LARYNGITIS. See THROAT DISEASES, Vol. XXIII, pp. 319, 320.

LARYNGOSCOPE. See VOICE, Vol. XXIV, p. 276.

LASALLE, a city of Lasalle County, northeastern Illinois. It is the western terminus of the Illinois canal, which extends to Chicago, and is on the Illinois Central, the Chicago, Rock Island and Pacific, the Chicago, Burlington and Quincy, and the Lasalle and Bureau County railroads. Lasalle is engaged in the manufacture of glass and hydraulic cement, in the mining of bituminous coal, and in the smelting and rolling of zinc. The town is lighted with gas and electricity, and has electric railroads. Population 1900, 10,446. See also LA SALLE, Vol. XIV, p. 316.

LAS GUASIMAS. See GUASIMAS, LAS, in these Supplements.

LASKER, EDUARD, a German statesman; born at Jarocin, Posen, Oct. 14, 1829, of Hebrew parentage. After studying law at Berlin and in England, he became, in 1856, an assessor in the city court of Berlin. In the Prussian Chamber of Deputies, to

which he was elected in 1865, he assisted in founding the National Liberal party, and aided Bismarck in measures tending to the unification of Germany, but in the Reichstag, of which he became a member in 1865, he opposed Bismarck's measures in regard to government control of the railroads, and showed himself a determined advocate of free trade when the Chancellor adopted the protective policy. The struggle for leadership between Lasker and Bismarck became bitter and personal, and in 1880 Lasker led the secession from the National Liberal party. In 1883, Lasker made a visit to his brother in Texas, and while returning, he died suddenly in New York City, Jan. 5, 1884. The United States House of Representatives passed resolutions of regard and transmitted them to Germany by the United States government, but Prince Bismarck returned them, as containing improper reflections on the internal affairs of the German Empire. Lasker was the author of *On the Constitutional History of Prussia* (1875) and the *Means and Aims of the Development of Culture* (1881). His *Life* was written by A. Wolff (1884).

LAS PALMAS. See CANARY ISLANDS, Vol. IV, p. 799.

LASSEN PEAK. See CALIFORNIA, Vol. IV, p. 700.

LAS VEGAS, a city and the capital of San Miguel County, northeastern New Mexico, on the Pecos River, 45 miles E. of Santa Fé, and on the Atchison, Topeka and Santa Fé railroad. It is situated in a grazing and mining region, and has large wool interests. It has gas and electric lights, an electric street-railway and a state normal school. The Las Vegas Hot Springs, northwest of this village at the mouth of the picturesque Gallinas Cañon, are famed for their curative powers in various complaints. They are 22 in number, and average 130° F. in temperature. They resemble the Carlsbad water, but are more dilute, the principal constituents being carbonate and sulphate of sodium. Population 1890, 2,385; 1900, 2,552.

LATERAL-LINE ORGAN. See SENSE-ORGANS, in these Supplements.

LATERAN, a Roman palace. The name is also given to a church, St. John Lateran, which was built by Constantine in the palace of the same name. The original basilica was destroyed by an earthquake in A.D. 896. It was rebuilt, but was destroyed by fire in 1308 and again in 1360, and has been many times remodeled. (See also ROME, Vol. XX, p. 835).

LATERAN COUNCILS, ecclesiastical councils, so called because held in the Church of St. John Lateran (San Giovanni, in Laterano). See COUNCIL, Vol. VI, pp. 511, 512.

LATES, a genus of perch-like fishes, inhabiting the rivers Nile and Ganges. *L. niloticus*, or Nile perch, attains a length of three feet, and is the largest fish in the river. The Ganges species is *L. nobilis*. Both are excellent food-fishes.

LATEX. See *Lactiferous Vessels*, under BOTANY, Vol. IV, p. 87.

LATHAM, ROBERT GORDON, an English philologist and ethnologist; born at Billingsborough, Lincolnshire, March 24, 1812. He was educated at

Eton and Cambridge, studied medicine and became assistant physician in the Middlesex Hospital. Then he traveled in Norway and studied the Scandinavian idioms. In 1841 he was made professor of English literature in University College, London. He published numerous works on philology and ethnology; among them, *Norway and the Norwegians* (1840); *Treatise on the English Language* (1841); *Natural History of the Varieties of Man* (1850); *Man and His Migrations* (1851); *Descriptive Ethnology* (1851); *The Nationalities of Europe* (1863); and a series of English grammars. Mr. Latham was the originator of the theory that the first home of the Aryan race was in Europe, not Asia. He died March 9, 1888.

LATHAM, JOHN, an English ornithologist; born at Eltham, near London, June 27, 1740. He studied medicine, and began to practice at Dartford. He was one of the founders of the Linnæan Society and of the Royal Society. See ORNITHOLOGY, Vol. XVIII, p. 6. He died Feb. 4, 1837.

LATHES, RECENT. See MACHINE-TOOLS, in these Supplements.

LATHROP, GEORGE PARSONS, an American author and editor; born in Honolulu, Aug. 25, 1851; was educated in Germany, and married, in 1871, Rose

Hawthorne, the second daughter of Nathaniel Hawthorne. Mr. Lathrop was assistant editor of the *Atlantic Monthly* from 1875 to 1877, and afterward edited the *Boston Courier* from 1877 to 1879. He wrote *Rose and Rooftree*, poems (1875); *Afterglow*, a novel, and *A Study of Hawthorne* (1876); *An Echo of Passion* (1882); *Newport* (1884); *Dreams and Days* (1892); with his wife, *A Story of Courage* (1894); and edited Nathaniel Hawthorne's works. Died in New York city, April 19, 1898.

LATHROP, ROSE HAWTHORNE, an American authoress, the youngest child of Nathaniel Hawthorne; born in Lenox, Massachusetts, May 20, 1851. Most of her childhood was spent in Europe, where she studied painting. In 1871 she married George Parsons Lathrop, and afterward wrote stories and poems for the magazines. She published *Along the Shore*, a volume of poems, in 1888, and together with her husband, a *Story of Courage*, in 1894.

LATICIFEROUS TUBES. See HISTOLOGY Vol. XII, p. 16.

LATILIDÆ, a family of fishes of the suborder *Acanthopteri*, distinguished by certain characteristics, such as subjugular ventral fins, with a spine and five branching rays and by an excess of columnar vertebrae, and truncated snout. There are but few species, one of which, belonging to *Caulolatilus*, is prized as food.

LATINI, BRUNETTO. See ENCYCLOPÆDIA, Vol. VIII, pp. 192, 193.

LATINS OR LATINI. See LATIUM, Vol. XIV, p. 343; and ITALY, Vol. XIII, p. 445.

GEORGE PARSONS LATHROP.

LATIN UNION. See MONEY, Vol. XVI, p. 732, note 3.

LATINUS, a king of Latium, according to common tradition son of Faunus and the nymph Marica, according to Hesoid, son of Ulysses and Circe. He was the father of Lavinia, whom he gave in marriage to Æneas. There are various traditions about his parentage and history, according to one of which he became Jupiter Latiaris after his death.

LATITUDE AND LONGITUDE. See GEOGRAPHY, Vol. X, p. 198.

LATITUDINARIANS, in church history, a name applied by contemporaries to a school of theologians within the English Church in the latter half of the seventeenth century, analogous to what is known today as the Broad Church party. They strove to unite the dissenters with the church by insisting only on those doctrines which were held by both and requiring merely submission to, not acceptance of, the thirty-nine Articles of the Church. The school was represented by a succession of well-known divines, among which were Burnet, Tillotson, Chillingworth, Cudworth, More and Gale, who attempted to construct a philosophy of religion at once free and conservative, in which the rights of faith and the claims of speculative intellect each should have free scope.

LATROBE, a post borough of Westmoreland County, southwestern Pennsylvania, 41 miles E. of Pittsburg, on the Loyalhanna Creek, at the junction of the Pennsylvania and the Ligonier Valley railroads. It contains St. Xavier's Convent and St. Vincent's College, has large coke, coal and steel industries, and manufactories of paper, bricks, mowers, and reapers, brewery products, flour and machinery. Population 1890, 3,589; 1900, 4,614.

LATROBE, BENJAMIN HENRY, an English-American architect; born in Yorkshire, England, May 1, 1764. After being educated in a Moravian seminary in Saxony and at the University of Leipsic, he served in the Prussian army as a cornet of hussars, and was wounded twice. Having resigned his commission, he returned to England, became an architect, and in 1789 was made surveyor of the public offices in London. In 1796 he moved to the United States; he was engineer of the James River and Appomattox canal; built the penitentiary in Richmond, the Bank of Pennsylvania in Philadelphia, the Schuylkill water-works, which supply Philadelphia with water, the Roman Catholic cathedral in Baltimore, etc. He completed the capitol at Washington in 1811, and after it was burned by the British in 1814 he was called to rebuild it. In 1812 he became interested with Fulton in steamboating on the western waters, and built the *Buffalo* at Pittsburg, the fourth steamer that descended the Ohio River. He was engaged in erecting water-works for the city of New Orleans at the time of his death, which occurred Sept. 3, 1820. See ARCHITECTURE, in these Supplements.

LATROBE, BENJAMIN HENRY, an American engineer, son of the preceding; born in Philadelphia, Dec. 19, 1807. After studying law, and becoming a barrister, he abandoned the profession and became an engineer of the Baltimore and Ohio railroad. In 1842 he became the chief engineer of the road, and

as such completed it from Harper's Ferry across the Alleghanies to Wheeling. He also built other roads, was consulting engineer of the Hoosac tunnel, and one of the advisory board to whom John A. Roebling submitted his plans of the Brooklyn bridge. He died in Baltimore, Oct. 19, 1878.

LATTER-DAY SAINTS, CHURCH OF JESUS CHRIST, OF, more generally known as Mormons. The history, organization and doctrines of this religious sect are given in Vol. XVI, pp. 825-828, up to a time prior to the legislation by Congress that drove them from their practice of polygamy. It has been a misfortune of the Mormons, as must be the case with any society that avowedly countenances a moral scheme at variance with the standards of civilization, that they are, for the most part, described by unfriendly pens. They claim that they are not justly represented. Their religion, however fantastic or superstitious it may be regarded by outside observers, has been to them a genuine aspiration for righteousness, and it is not credible that scores of thousands of people could live together in peaceful industry upon a general basis of sensuality. They have been a frugal, simple people for the most part, observing order and justice among themselves, turning a forbidding wilderness into a garden and founding a prosperous state equipped with the institutions of civilization.

Attention has been turned so exclusively upon their system of plural marriages, that it seems to many as if polygamy were the household system observed. This is far from having been the case. Carroll D. Wright, in his report to Congress in 1889 on the subject of *Marriage and Divorce*, says of the Latter-Day Saints:

"Unfortunately the statistics of church marriage, whether single or plural, for time or for eternity, cannot be presented. Every effort was made to obtain them, but without success. The assistant historian and recorder averred that he could not give an approximation which would be of any service. It is nevertheless a mistake to suppose that even a majority of the Mormon population of Utah are, openly at least, polygamists. This class of persons has been disfranchised by Congress, and the returns from the last territorial election seem to indicate that their number is not as large as has been generally supposed." So slight was the hold of plural marriages, that the courts were able to eradicate them with no great opposition from the people. There were physical and economical impediments to the general practice of polygamy. In Utah the males number 53 to each 47 females of the people, a condition of things fatal to a common observance of polygamy. Nor were the mass of the young men rich enough to contemplate a step that would make domestic expense burdensome.

But there were also ecclesiastical checks upon the practice. If a man contemplated taking a wife or wives to be added to his first living spouse, he was obliged by rule to apply to the president of the church, whose duty it was then to "inquire what the will of the Lord" in the matter was, for it was, and still is, held that God makes continual revelations to his people. If the oracle were favorable,

the applicant must first attempt to gain the consent of his living wife, although he might proceed, in case of her contumacy, to espouse the second woman of his choice. At the marriage ceremony it was the duty of his first wife to present the second bride to him, somewhat after the example of Sarah or Rachel and Leah. Clearly, the frequency of plural wives was determined by the president of the church, whose power was very great, and not by the caprice of the parties proposing the contract. Defenders of the system maintained that the Old Testament approved and the New Testament nowhere forbade the practice. They also alleged a mystical argument for it, founded upon the redemption of mankind.

In Mormonism two marriages were recognized—one temporal or for this life, the other eternal and spiritual. In the former case the contracting persons were merely joined and death wrought their divorce; in the latter they were sealed and the relationship had no end. The second covenant was of a most solemn nature, for which ecclesiastical sanction based on the alleged distinct approval of God was requisite. A sealed marriage carried with it especial privileges. A woman could be sealed to only one man, and he might be a deceased person. If a sealed widow married again, that relation was temporary, and the fruit of the marriage was reckoned to the eternal or deceased husband. A man might espouse, either for life or for eternity, as many as he could persuade into the relationship, provided the sanction of the church were obtained.

To understand the position of the Mormon people upon this subject, it is necessary to note that they were taught a doctrine of the pre-existence of souls. All souls destined to exist on the earth were the issue in heaven of the Father-God and some eternal consort. In that state they did not come to full development, and in order that they might do so it was necessary that they should become incarnate on the earth, and these souls await the marriage of God's children on the earth, that they may be assigned bodies to animate and inhabit. It is a high duty of the saints to supply tabernacles of the flesh to receive these divine procreations of God; hence "marriage was a duty, polygamy a virtue." The spirits who opposed this divine scheme under their leader, Satan, were driven out of heaven and denied all place for an earthly incarnation, and therefore for part in the resurrection. The earth was created for the probation of saints redeemed by Christ, seeing that the "fall of man" was inevitable. Those who are saved "shall come forth in the first resurrection; and if it be after the first resurrection, in the next resurrection; and shall inherit thrones, kingdoms, principalities and powers, dominions, all heights and depths."* They are the blessed to whom it is granted to give birth to the bodies of God-created souls, to rear them in this world for immortality and sovereignty in the eternal and redeemed kingdom of the Lord on a transformed earth.

This doctrine conferred great honor and sanctity upon maternity, and explains the desire of many a

Mormon woman to bear children, and especially to bear them to those apostles, priests or dignitaries who were the recognized recipients of God's revelations. It must be borne in mind, too, that the practice of polygamy was no private caprice, but a privilege solemnly conferred by the church upon those whom the Divine Spirit indicated as worthy of the earthly fatherhood of God's children. No doubt the doctrine was open to various abuses, but the people, and especially the women, took it seriously enough, finding in the sealed covenant an exaltation of function for time and eternity denied them in temporal marriage.

But polygamy is now swept away, and the evidence goes to show that it has been done sincerely and thoroughly. In September, 1890, President Woodruff formally announced that the church no longer taught the doctrine of plural marriages, and acquiesced in the law of the United States concerning polygamy, and this declaration was subsequently confirmed in a church conference. The announcement ended a protracted contest, for so complete was the conformity to the law of the polygamists in putting away their excess of wives, that on Jan. 4, 1893, President Harrison, by proclamation, granted amnesty to those who had not violated the law since Nov. 1, 1890; while in September, 1894, President Cleveland extended the same clemency to all who had been convicted of polygamy, on the condition of their promise to obey the law. Still further, by joint resolution of Congress, in October, 1893, the property which had been escheated by previous law, and was in litigation in the courts, was restored to the church.

These pacific results had not been easily attained. The legislation of 1862 in Congress, forbidding polygamy, remained ineffective for twenty years. Then the House of Representatives refused to seat the delegate from Utah on the ground of his plural marriage, and admitted in his place a monogamist. In 1882 the "Edmunds Bill" became a law, punishing, with fine of \$300 and imprisonment for six months, the offense of having more than one living wife or of cohabiting with more than one woman. It was rigorously enforced against Mormons after its constitutionality had been decreed by the supreme court, and it is said that 1,100 were convicted of polygamy and sent to prison, while others fled to hiding-places. In 1887 another and more drastic act of Congress was passed, and the Attorney-General was directed to bring suit to escheat the property held by the church in violation of the law of 1862, and for the confiscation of the charters of the church and all over \$50,000 held in trust. The Perpetual Emigration Fund Company, the especial agent of Mormon propagandism, was stripped of its possessions, and provision was made for turning over these escheated funds to public schools in the territory. A "test oath" was also imposed to prevent polygamists from exercising the electoral franchise or serving on a jury. These confiscating laws were resisted in the courts until terminated in 1893 by Congress, as related above.

In 1887 those Mormons who opposed polygamy held a constitutional convention in Salt Lake City

* See *Doctrines and Covenants of the Church of Jesus Christ of Latter-Day Saints* (Salt Lake City, 1886).

to frame a fundamental law for the state of Utah, but Congress did not accept its proposals. Ultimately these were incorporated, for the most part, in the constitution made by the convention called under the "Enabling Act" of 1894, and under which Utah was admitted to the Union, Jan. 4, 1896. This instrument provides for the suppression of polygamy, for complete religious toleration, and for a system of public schools free from sectarian control; and these provisions are not to be revoked by Utah without the consent of the United States.

On the 6th of April, 1893, the great temple at Salt Lake City was dedicated, forty years after its corner-stones were laid. It is a building 186½ feet long and 99 feet in width, having three towers at each end, of which the east-central one reaches 222½ feet and is surmounted by a gold-plated bronze figure of the angel Maroni who revealed the hiding-place of the tablets of the Book of Mormon. The interior rooms are symbolical, and are used for the ceremonies of the church. The temple is lighted by electricity, and is said to have cost about twelve million dollars. It is of gray granite.

DOCTRINE. The Mormon representation of their own tenets is as follows: "We believe in God, the Eternal Father, and in his Son, Jesus Christ, and in the Holy Ghost. We believe that men will be punished for their own sins, and not for Adam's transgression. We believe that through the atonement of Christ all mankind may be saved by obedience to the laws and ordinances of the Gospel. We believe that these ordinances are, (1) faith in the Lord Jesus Christ; (2) repentance; (3) baptism by immersion for remission of sins; (4) laying on of hands for the gift of the Holy Ghost. We believe that a man must be called of God by 'prophecy and by the laying on of hands,' by those who are in authority, to preach the Gospel and administer in the ordinances thereof. We believe in the same organization that existed in the primitive church, viz., apostles, prophets, pastors, teachers, evangelists, etc. We believe in the gifts of tongues, prophecy, revelation, visions, healings, interpretation of tongues, etc. We believe the Bible to be the word of God, as far as it is translated correctly; we also believe the Book of Mormon to be the word of God. We believe all that God has revealed, all that He does now reveal, and we believe that He will yet reveal many great and important things pertaining to the kingdom of God. We believe in the literal gathering of Israel and in the restoration of the ten tribes; that Zion will be built upon this continent; that Christ will reign personally upon the earth, and that the earth will be renewed and receive its paradisiac glory. We claim the privilege of worshipping Almighty God according to the dictates of our own conscience, and allow all men the same privilege, let them worship how, where or what they may. We believe in being subject to kings, presidents, rulers and magistrates, in obeying, honoring and sustaining the law. We believe in being honest, true, chaste, benevolent, virtuous, and in doing good to all men; indeed, we follow the admonition of Paul: 'We believe all things, we hope all things'; we have endured many things, and

hope to be able to endure all things. If there is anything virtuous, lovely, or of good report or praiseworthy, we seek after these things."

Missions are an important feature of Mormonism, members of the seventies as well as the apostles being sent forth, at the will of the first president, to secure converts. Successful missions have been established in Great Britain, Norway, Denmark, Germany, France, Switzerland and Australia. Recent colonies have been established in Mexico and in the Northwest Territory. One at Lee's Creek, Alberta, numbered, in 1893, over one thousand souls. All these have abandoned polygamy. The total number of Mormons in the United States in 1896 is given at about 330,000, of whom more than one third are of foreign birth, Great Britain and Scandinavia furnishing the largest proportion of them. Two thirds of the Mormons live in Utah; the other third are distributed, in their order of importance, in Idaho, Arizona, Iowa, Missouri, and in insignificant numbers in all but six states of the Union.

Two schisms have divided the church. The first was occasioned by the publication in 1851 of the revelation authorizing polygamy. Many denied the authenticity of this "revelation," and, under the leadership of the widow and sons of Joseph Smith, withdrew from the church and established the *Reorganized Church of Latter-Day Saints*, whose official headquarters are at Lamoni, Decatur County, Iowa. There they have a publishing-house and issue three periodicals, *Saints' Herald*, *Zion's Hope*, and a monthly, *Autumn Leaves*. They also support a college and a home for poor ministers. They have more than thirty thousand members. Their faith and church rule is essentially similar to that of the Latter-Day Saints, except in two particulars. They profess to believe "that marriage is ordained of God, and that the law of God provides for but one companion in wedlock for either man or woman, except where the marriage contract is broken by death or transgression." They believe in the supreme authority of the Bible, and that the Book of Mormon and the Doctrine and Covenants are auxiliary to the Bible, and, as opposed to the Utah Church, deny the supremacy of the "living oracles" or priesthood. They believe in continuous revelation through the head of the church, but that the revelations become binding only when approved in the church by "common consent." They claim to be the direct successors of the original church founded by Joseph Smith, and were so designated by the court of common pleas in Lake County, Ohio, in a successful suit for possession of property claimed by the Mormon Church. Possession of the lands at Independence, Missouri, the site of the future "Zion," is still being contested.

They have no salaried ministers, but support the families of missionaries or others who devote their entire time to the service of the church. They do missionary work in nearly all parts of the Union, including the state of Utah, in parts of Europe and Australia, in the Hawaiian and Society islands, and at a few other points.

Another secession occurred in 1869 in Utah, when

a considerable number, opposed to the hierarchical despotism of the Melchisedek or spiritual priesthood, withdrew and organized the *Church of Zion*.

Interest, towards the close of the year 1899, was aroused over the country on the subject of Mormonism owing to the election in Nov., 1898, to the Fifty-sixth Congress of a polygamist, Mr. Brigham H. Roberts, of Utah. At the roll call in the House of Congress, Dec. 4, 1899, Mr. Roberts answered to his name, when opposition was made to his taking a seat in the House owing to his polygamous proclivities. A monster petition was also presented praying that he be excluded from Congress, while a motion was made by Mr. R. W. Taylor, of Ohio, referring the matter of admission to a special committee. This was agreed to, the disposition of the case finally (Jan. 25, 1900) being that Mr. Roberts, by a vote of 268 to 50, was excluded from the House and refused mileage.

See *Geschichte der Mormonen*, Olshausen; *The Mormons*, by Jules Remy (1860); *The City of the Saints*, by R. F. Burton (1861); *The Church of Jesus Christ of Latter-Day Saints*, by James H. Anderson (1893).

LATUDE, HENRI MASER DE, a French adventurer; born at Montagnac, Languedoc, March 23, 1725. A young artillery officer, he sought to make himself conspicuous by revealing to Madame de Pompadour a plot to poison her. The plot was discovered to be of his own contriving, and he was sent to the Bastille in 1749. In spite of ingenious efforts to escape, he remained in prison till 1777, when he was released on condition of living in his native village. But having come to Paris again, he was imprisoned till 1784. When the revolution broke out, the case was brought before the public and used as a means of exciting hatred against the old régime. In 1793 a court awarded him 60,000 livres in damages to be paid by the heirs of Madame de Pompadour. He died Jan. 1, 1805.

LAUDANUM. See **OPIMUM**, Vol. XVII, p. 793.

LAUDERDALE, JAMES MAITLAND, EIGHTH EARL OF, an English political economist; born at Hatton, Midlothian, Jan. 26, 1759. He was educated in the Universities of Edinburgh and Glasgow, and in 1780 entered the House of Commons. He was one of the managers of the impeachment of Warren Hastings in 1788, and in the following year succeeded to the peerage. He was chosen one of the representative peers of Scotland in 1790, which position he resigned afterward. At the outbreak of the French Revolution he sympathized with the movement, and made a trip to France, where he became personally acquainted with several of its leaders. He also opposed, in Parliament, the coalition against France. In 1806 he was made Peer of the United Kingdom, Keeper of the Great Seal of Scotland, and Privy Councillor. He was the author of several pamphlets on politics, economics, etc., and of the book, *Inquiry into the Nature and Origin of Public Wealth* (1804), in which he criticised the then recent *Wealth of Nations*, by Adam Smith. He died Sept. 13, 1839.

LAUDERDALE, JOHN MAITLAND. See **MAITLAND**, Vol. XV, p. 308.

LAUDON, GIDEON ERNST, an Austrian general

of Scotch descent; born at Trotsen, Livonia, Oct. 10, 1716. He entered the Russian military service at 15, and reached the rank of lieutenant; entered the Austrian army as captain, and served without particular distinction until the outbreak of the Seven Years' War. In 1756 he was made lieutenant-colonel, major-general in 1757 and lieutenant-general in 1758. At Hoch-Kirchen, in that year, he won the battle for the Austrians under Count Daun against the Prussians, under Frederick the Great; and in the following year, at Kunersdorf, saved the day for the Russians. In 1760 he commanded the Austrian forces in the battle of Landslut, when the Prussians were again defeated, and in the Austrian defeat, near Leignitz, in Silesia, won the admiration of Frederick the Great by his masterly retreat from the field. At the close of the war he was made baron, and in 1778 field-marshal. He commanded the Austrian army in the Turkish war, and captured Belgrade. He died July 14, 1790.

LAUGHING-GAS OR NITROUS OXIDE. See **CHEMISTRY**, Vol. V, pp. 512, 514.

LAUGHING-JACKASS, an Australian bird. See **KINGFISHER**, Vol. XIV, p. 82.

LAUGHLIN, JAMES LAURENCE, an American economist; born in Deerfield, Ohio, April 2, 1850. He was graduated at Harvard in 1873; chosen instructor of political economy at Harvard in 1878, assistant professor in 1883. He was president of the Philadelphia Manufacturers' Mutual Fire Insurance Company from 1888 to 1890; professor at Cornell from 1890 to 1892; and after the latter year, at the head of the department of political economy in the Chicago University. He published *The Study of Political Economy* (1885); *The History of Bimetallism in the United States* (1886, 2d edition, 1895); *The Elements of Political Economy* (1887); and edited Mill's *Political Economy*, with notes (1884). In 1895 he entered into debate with the free-silver advocate, W. H. Harvey, and published *Facts about Money* in the same year.

LAUNDRY MACHINERY. A large amount of machinery is required to equip a modern, up-to-date laundry. The preferred form of washing-machine is known as a hydraulic washer, and is a large cylindrical affair, set on its side. Within is a smaller perforated cylinder, which is rotated by gearing and pulley mechanisms. When the water-tight lid is clamped down and the hot water turned in through a pipe, the inner cylinder is rotated at a speed of 135 to 170 revolutions per minute, and the soap and friction loosen the dirt from the clothes. Dash-wheels, somewhat similar to those of the cotton manufacturer, are also used to toss the clothes about and wash them. For drying the clothes, centrifugal extractors are used, these being baskets of tinned copper, 22 to 26 inches in diameter, which are made to rotate at the rate of 400 to 500 turns a minute, within a case, thus draining out the water. A tumbler is often used after the extractor, to loosen the tightly-matted clothes that come from the extractor-baskets. It is simply a horizontal barrel, with internal longitudinal strips, and, being rotated at a slow speed, loosens the mass of clothes without injuring them. The steam drying-closet is a

room having a door made of a series of upright panels, each of which may be drawn out separately, like drawers from a table. To each upright panel are attached horizontal bars, on which clothes are hung. A large amount of clothes is thus taken care of in a small space, the heating being done by means of steam-coils, which may be introduced in any desired quantity. Mangles are made in a number of patterns, some of them being heated by gas. The larger sizes have steam-cylinders, 24 by 100 inches, and are arranged to iron the goods on both sides, as for giving a soft satin finish to table linen. Several ingenious forms of starchers are made, what is known as the dip-wheel starcher being preferred for collars and cuffs. Machines for dampening collars and cuffs, and other machines for shirts, are manufactured, with large rubber rolls for drawing the goods under the sprinklers. The collar-and-cuff ironer has received a great deal of attention, and is made in more styles than any other laundry machine. The simple form used in small laundries consists of one or more hot covered cylinders, which roll over the goods, or between which the goods are passed and ironed by pressure. The most efficient machine of the class, and the one which gives the highest gloss demanded for this sort of linen, is manufactured in Troy, New York, and has a capacity of 14,000 pieces per day. The laundry pieces are fed in, like sheets of paper to a small printing-press, and passed over and under three hot rolls. Another collar-and-cuff ironer is made with graphite bearings for the hot rolls, so that no oil has to be used, and the danger of soiling the clothes is avoided. In the best machines the drums are all covered with seamless felt coverings, which are sufficiently soft so that the pressure will not split the edges of the collars and cuffs, a fault which many patrons of laundries have discovered to be only too common. A special pressing-machine is made for finishing the inside points of standing collars. There are also shirt-ironers with interchangeable bosom-boards, combined collar, cuff and shirt ironers, neck-band ironers, inside and outside band ironers, sleeve-ironers, body-ironers, etc. A special machine is made for folding collars, and another for shaping the ironed collars and cuffs to circular form. The fluters and seam-dampening machines are other convenient mechanisms. Special forms of stoves are built, with tiers for heating sad-irons and polishing-irons. Some of them will heat nearly a hundred irons at once. A considerable variety of minor conveniences are also manufactured for laundry use, most of them, like the larger machines, having come into use within the past twenty years.

C. H. COCHRANE.

LAUNITZ, ROBERT EBERHARD, a Russian-American sculptor; born at Riga, Russia, Nov. 4, 1806. After studying under Thorwaldsen at Rome, he settled in New York, in 1828, and became the first instructor of Thomas Crawford. He was made a member of the National Academy in 1833. Launitz executed the battle monument at Frankfort, Kentucky; the Pulaski monument at Savannah, Georgia; the monument to Gen. G. A. Thomas, at

Troy, New York, and other similar works, many of which are in Greenwood Cemetery, Brooklyn. Launitz has been called the father of monumental art in America. He died in New York, Dec. 13, 1870.

LAURACEÆ, a family of dicotyledonous plants, consisting of trees or shrubs. The family contains about one thousand species, mostly in the forests of tropical South America and Asia. An aromatic and fragrant character pervades the order, and among its products are cinnamon, camphor, and many valuable drugs and timber-woods. The sassafras, bay and spice-bush are the common representatives of the family in the United States.

LAUREATE, POET, an office in the household of the sovereigns of Great Britain. The term "laureate" was applied, so we are told in early English history, at first to graduates of the universities who had earned the laurel wreath for excellence in rhetoric and versification; later, to any poet of unusual merit. The office of royal poet was not established until 1591. Previous to that time, as early as the reign of Henry I, poets were a part of the king's household. It is recorded that Richard I and Edward I each carried with him, the one to Palestine, the other to Scotland, versifiers to sing his exploits. The compensation of these poets is not known. Later, Chaucer was attached to the royal household, granted a pension, an allowance for robes, and, as a special favor, allowed a gallon of wine a day (which was afterward commuted to an annuity of 20 marks). The first poet-laureate, as the term is used in the modern sense, was Spenser, appointed by Queen Elizabeth in 1591, and granted a pension of £50. Ben Jonson, in 1619, was the first to receive the office by letters-patent. To Jonson was granted a salary of £100 and a tierce of canary. This additional perquisite of wine was continued until the appointment of Pye in 1790, when it was commuted to £27 additional salary. Until Tennyson's appointment in 1850, the salary was £127 and the £27 for wine. In 1850 this was changed to £72. For a number of years it was the duty of the poet-laureate to write an ode on the birthday of the monarch, but this custom has been discontinued since the reign of George III. The office is now entirely honorary. The following are those who have held the laureateship, together with their terms of office: Edmund Spenser, 1591-99; Samuel Daniel, 1599-1619; Ben Jonson, 1619-37; an interregnum until 1660; William Davenant, 1660-68; John Dryden, 1670-89; Thomas Shadwell, 1689-92; Nahum Tate, 1692-1715; Nicholas Rowe, 1715-18; Lawrence Eusden, 1718-30; Colley Cibber, 1730-57; William Whitehead, 1757-85; Thomas Warton, 1785-90; Henry James Pye, 1790-1813; Robert Southey, 1813-43; William Wordsworth, 1843-50; Alfred Tennyson, 1850-92; an interregnum until 1896; Alfred Austin, 1896.

LAUREL, a town of Prince George County, central Maryland, eighteen miles N.E. of Washington, on the Big Patuxent River and the Baltimore and Ohio railroad. It has a cotton factory and iron-works. Iron ore and fine building-stone are found in the vicinity. Population 1880, 1,206; 1890, 1,984; 1900, 2,079.

LAURENS, JEAN PAUL, a French painter; born at Fourquevaux, March 28, 1838. He was a pupil of Bida and Léon Cogniet; received a first-class medal at the salon of 1872; made officer of the Legion of Honor in 1878. Among his best-known canvases are *The Death of the Duke of Enghien*; *The Excommunication of Robert the Pious*, now in the Luxembourg; *The Death of Marceau*, purchased by the city of Ghent for 40,000 francs; and *The Interdict*, in the Museum at Havre. Laurens is considered one of the best of modern historical painters.

LAURENTIAN SYSTEM. See GEOLOGY, Vol. X, pp. 327, 328.

LAURENTIUS, LORENZO, SAINT. See LAWRENCE, Vol. XIV, p. 370.

LAURIER, SIR WILFRID, a Canadian statesman; born at St. Lin, Quebec, Nov. 20, 1841. He was

WILFRID LAURIER.

educated at L'Assomption College, and was admitted to the bar in 1865, although it was his original intention to become a priest. He drifted into journalism, and first won notice by his attacks on abuses in church and state. His articles on the former subject caused his permanent exclusion from the Catholic Church. From 1871 to 1874 he was in the Quebec Assembly. He then entered the Dominion Parliament, and in 1877 was appointed Minister of Inland Revenue, a position which he held until 1878. On the retirement of Edward Blake in 1887 from the leadership of the Liberal party in Parliament, M. Laurier was unanimously chosen to succeed him. After the general election in the spring of 1896, in which the Liberals were successful, Mr. Laurier became Premier of Canada. He was knighted in 1897.

LAURIUM, a range of hills forming the S.E. portion of Attica, Greece, famous in ancient times for rich mines of silver, lead, zinc and antimony. The mines at one time were supposed to be exhausted, and were deserted. Since 1863, however, the scoriæ and refuse ore have been worked with profit, and the mines themselves have been reopened. They are connected with the port of Ergasteria by a railway seven miles long.

LAUSSE DAT, AIMÉ, a French scientist and soldier; born at Moulins, April 19, 1819. He was educated at the École Polytechnique, and in 1840 entered the engineering department of the French army. He was employed in the fortifications of Paris and in the Pyrennees; in 1851 became tutor at the École Polytechnique; professor of geodesy and astronomy in 1856; professor of geometry in the Conservatoire des Arts et Métiers (1865). During this time he retained his commission in the army; was made captain in 1853; commandant in 1863;

lieutenant-colonel in 1870; and served in the siege of Paris. He was promoted to the rank of colonel in 1874; retired in 1879; and two years later was made director of the Conservatoire. M. Laussedat became a commander in the Legion of Honor; was the inventor of several astronomical and surveying instruments; made experiments in the uses of balloons in military operations, and in the application of photography to astronomical observations and map-drawing, and published *Lessons in the Art of Drawing Maps* (1861) and *Biographical Sketch of Gustave Froment* (1865).

LAUZUN, ANTOINE NOMPAR DE C. See MONT-PENSIER, Vol. XVI, p. 793.

LAUZUN, ARMAND LOUIS DE GONTAUT, DUC DE BIRON, a French soldier; born in Paris, in 1753; captured Senegal from the English in 1779; fought with Lafayette in the American War of Independence; defeated the Vendéans at Parthenay in 1793. He was accused of oppression and falsehood by two fellow-generals, tried by the committee of public safety, and guillotined Jan. 1, 1794. His *Memoirs* were published in 1822.

LAVA. See GEOLOGY, Vol. X, pp. 242-251.

LAVAL-MONTMORENCY, FRANÇOIS XAVIER DE, first Canadian Roman Catholic bishop; born at Laval, France, March 23, 1622. He studied at the College of La Flèche, and received the tonsure at the age of nine. Being heir to the title and estates of his family, he resigned all his rights in favor of a younger brother. After finishing his theological studies at Paris, he was ordained in 1646. In 1657 the king nominated him for the see of Quebec, but his consecration was delayed till 1658. His title was Vicar Apostolic of Quebec and Bishop of Petraea in *partibus infidelium*. He reached New France in 1659, organized parishes there, and relieved the Jesuits of their charges as pastors of parishes. In 1662 he returned to France to obtain missionaries and means for his diocese. Coming back to Canada in the next year, he set about building a large church at Quebec and founding a "grand seminaire" for the education of priests and a "petit seminaire" as a preparatory college. In 1670 the vicariate of Quebec was made a titular bishopric, and Laval returned to France in 1672 to obtain the bulls of consecration. Having come back as bishop of Quebec in 1675, he laid the foundation of the Seminary of the Holy Family, which was to take the place of the two seminaries he had founded before, and gave all his property for its support. In 1684 he resigned the administration of his diocese, and retired to the seminary he had erected. Laval was a man of pure, upright and devout character. His name is commemorated in Laval University, at Quebec (q.v., Vol. XX, p. 168). The Roman Catholic Church in Canada has petitioned the Pope for his canonization. His *Life* has been written by Louis Bertrand de la Tour (Cologne, 1751), and by an anonymous author (Quebec, 1845). He died in Quebec, May 6, 1708.

LAVAL UNIVERSITY. See QUEBEC, Vol. XX, p. 168.

LAVELEYE, ÉMILE LOUIS VICTOR DE (1822-92), a political economist. See POLITICAL ECONOMY, Vol. XIX, p. 395.

LAVER, a general name applied to many of the edible seaweeds.

LAVIGERIE, CHARLES MARTIAL ALLEMAND, a French prelate; born Oct. 31, 1825, at Bayonne. He studied theology at the Seminary of St. Sulpice and the school of the Carmelites, and was ordained priest in 1849. He was professor in the Carmelites' school from 1850 to 1853; 1854 to 1861, in the faculty of theology at Paris; in 1863, made bishop of Nancy; in 1867, archbishop of Algiers, where he came into conflict with the government by trying to establish charitable institutions among the Arabs. The contest went so far that the Emperor, Napoleon III, wrote him a personal letter, advising him to leave temporal matters to the government and confine his attention to the spiritual wants of his Catholic parishioners. The archbishop, however, continued his work. In 1882 he was made cardinal, and two years later became archbishop of Tunis and primate of Africa. Mgr. Lavigerie at first advocated a monarchical government for France, and at one time wrote to the Count of Chambord, urging him to come to France and claim his hereditary right to the throne. Later, however, he declared it to be his opinion that the church should support the Republic. The cardinal won particular attention by his vigorous opposition to the African slave-trade. He died in Algiers, Nov. 26, 1892.

LAVINIUM AND LAURENTUM, two cities of ancient Italy. See LATIUM, Vol. XIV, p. 344.

LAVISSE, ERNEST, a French historian; born at Nouvion-en-Thiérache, Dec. 17, 1842. He was chosen professor of modern history in the University of Paris in 1888; elected to the academy in 1892. He wrote historical and biographical works, mostly on German history. Among them are *Study of the Origins of the Prussian Monarchy* (1875); *Studies of the History of Prussia* (1879); *Essays on Imperial Germany* (1888); *General View of the Political History of Europe* (1890), which has been translated into English by C. Gross (New York, 1891); and *The Youth of Frederick the Great* (1892).

LAW, DEPARTMENT OF, or the DEPARTMENT OF JUSTICE, an executive department of the United States Government, presided over by the *Attorney-General*, who is a member of the President's Cabinet, and whose general duties are: To represent the United States in matters involving legal questions; to give his advice and opinion, when required by the President or by the other executive departments, on questions of law arising in the administration of their respective departments; to exercise a general superintendence over United States attorneys and marshals; and to provide the government special counsel when required. He is assisted by a chief and other clerks.

The work of this department is distributed among certain officers, as follows:

The *Solicitor-General* assists the *Attorney-General* in the conduct of all cases in the Supreme Court and in the Court of Claims in which the

United States is interested; and when the *Attorney-General* so directs, any such case in any United States court or state court may be conducted and argued by the *Solicitor-General*. He acts as the *Attorney-General* when that office is vacant or that officer is absent.

Four *Assistant Attorneys-General* assist the *Attorney-General* and the *Solicitor-General*. Two argue cases in the Supreme Court and prepare legal opinions; one defends the United States in the Court of Claims, and the other is charged with the defense of the Indian deprecation claims.

The different law officers of the executive departments all perform their functions under the supervision of the *Attorney-General*. They are the *Assistant Attorney-General* for the Department of the Interior, the *Assistant Attorney-General* for the Post-Office Department, the *Solicitor of the Treasury*, the *Solicitor of Internal Revenue*, *Treasury Department*, and the *Solicitor for the Department of State*.

ATTORNEYS-GENERAL.—The following is a complete list of the *Attorneys-General* from the organization of the department, with the dates severally of their appointments: Edmund Randolph, 1789; William Bradford, 1794; Charles Lee, 1795–1797; Theophilus Parsons, 1801; Levi Lincoln, 1801; Robert Smith, 1805; John Breckinridge, 1805; Cæsar Rodney, 1807–1809; William Pinkney, 1811; Richard Rush, 1814–1817; William Wirt, 1817, 1825; John M'P. Berrien, 1829; Roger B. Taney, 1831; Benjamin F. Butler, 1833–1837; Felix Grundy, 1838; Henry D. Gilpin, 1840; John J. Crittenden, 1841; Hugh S. Legare, 1841; John Nelson, 1843; John Y. Mason, 1845; Nathan Clifford, 1846; Isaac Toucey, 1848; Reverdy Johnson, 1849; John J. Crittenden, 1850; Caleb Cushing, 1853; Jeremiah S. Black, 1857; Edwin M. Stanton, 1860; *Edward Bates, 1861; James Speed, 1864; Henry Stanbery, 1866; William M. Evarts, 1868; Ebenezer R. Hoar, 1869; Amos T. Ackerman, 1870; George H. Williams, 1871; Edwards Pierrepont, 1875; Alphonso Taft, 1876; Charles Devens, 1877; Wayne MacVeagh, 1881; Benjamin H. Brewster, 1881; Augustus H. Garland, 1885; William H. E. Miller, 1889; Richard Olney, 1893; Judson Harmao, 1895; Joseph J. McKenna, 1897.

*Titan J. Caffey, *ad interim*.

LAW, EDMUND. See PALEY, Vol. XVIII, p. 181.

LAW, RICHARD, an American jurist; born in Milford, Connecticut, March 17, 1733. He was educated at Yale, and was admitted to the bar in 1754; practiced at New London, where he became chief judge; was a delegate to the continental college from 1777 to 1778 and from 1781 to 1784; mayor of New London for twenty years; supreme court chief justice in his state, and district judge by Federal appointment. With Roger Sherman, he revised the Connecticut code of statute laws. He died at New London, Jan. 26, 1806.

LAW AND ORDER SOCIETIES are voluntary organizations of citizens for promoting the better administration of cities by procuring

the enforcement of the law. In the United States, municipal government has peculiar problems to confront. Cities have grown more rapidly than the capacity to control them; the citizens are generally unknown to each other, except in restricted ways, and therefore with difficulty act with concert of purpose and plan; civic pride is more a boast than a real sentiment; people of foreign birth, many of them utterly without education or discipline, crowd the tenements; population gets distributed by classes—wealth in one quarter, toil in another, and pauperism and crime in another. Out of this disorder arose a class of "practical politicians," who made public business a source of private gain, so that ignorant, unscrupulous men acquired vast wealth, either by office-holding or managing elections. They sold immunity to law-breakers, encouraged bribery, made the saloon a factor in politics, manipulated legislation for sinister ends, entrenched themselves within powerful organizations, and corrupted the sources of civic life. Men of eminence and responsibility gave stability to this system by patronizing it and seeking allies in it, in order to acquire or retain power. For a long time, society lay supine under this incubus, or, if aroused, tried only spasmodically to throw it off, while the "machine bosses," as manipulators of elections and legislatures are called, grew wanton and insolent.

When disclosure was made of the nefarious practices of the "Tweed ring" in New York in 1871, in which the authorities of the city were deeply implicated, it was seen that in order to bring the conspirators to trial it would be necessary to reinforce the ordinary operations of justice by the voluntary action of honest citizens. An able representative Committee of Seventy was organized to press the prosecution and execute the reformatory purpose of the community, and under its management the city was wrested from the control of scoundrels and they were punished. Since then similar proceedings have been adopted, as well in New York as in other large cities, when it has become necessary to rescue government from corrupt hands. Large committees of private citizens organize, which raise money to prosecute offenders, to advertise the community of corrupt deeds or designs, and of the character of the men who are seeking office, to watch registration of voters, challenge fraudulent votes, and see that the authorities conform to the requirements of law. But these committees are only temporary expedients, and things lapse into their old state when they are dissolved.

After the overthrow of the Tweed power it was felt in New York that the police and courts of the city were inadequate to deal with violators of the law unless citizens interested themselves in the administration of justice. Even where the officials were well disposed, it was often impossible to find complainants against flagrant offenders or to procure convicting evidence. In order to bring aid of this sort to the authorities, Rev.

Dr. Howard Crosby and some associates organized, in 1877, a "Society for the Prevention of Crime." Its object was to promote the enforcement of law through existing machinery and to reform the laws when necessary. It employed detectives and counsel, and went into court through its agents as complainants; it assisted grand juries with evidence; it watched the prosecution of offenders. On the death of Dr. Crosby the presidency of this society passed to Rev. Dr. Charles H. Parkhurst, who found the work so impeded by the police and their magistrates that he vigorously denounced them, and averred that he had evidence to prove their complicity with crime. He saw no relief from corrupt administration until the power of Tammany Hall was overthrown. His denunciations attracted attention, and the political opponents of Tammany thought to take advantage of them by a legislative investigation; but he declined to aid any official inquiry for partisan ends, and demanded a free and full examination of the whole corrupt business, let blame fall where it might. In 1894, at the demand of the press of the city, which had come to the aid of Dr. Parkhurst, the senate of state sent the Lexow Commission to the metropolis to investigate. This committee secured the services as counsel of John W. Goff, a lawyer of Irish birth, who in the following elections became recorder of the city, and its attention was converged on the police department. It was in session, with some intermission, for ten months; and while it failed to connect Tammany chiefs with particular crimes, it abundantly confirmed the public belief that the police levied blackmail on prostitutes, saloon-keepers, green-goods men, builders, merchants obstructing the streets, and other violators of city ordinances. There were involved in these offenses four men who had been or were police commissioners, four who had been or were inspectors, 22 who had been or were captains, and twoscore minor officers. Most of these men were afterward indicted, and the disclosures were followed by a Committee of Seventy, under whose auspices a reform municipal administration was put in power that autumn. While Dr. Parkhurst's society did not appear in this investigation, it was well understood that its work and influence instigated and animated it, and the efficiency of such organizations gained great credit everywhere, giving impulse to the formation of like agencies.

Dr. Crosby's example early began to be influential, and kindred societies sprang up in various cities, at first taking the name of Law and Order Societies, and devoting themselves especially to the suppression of social vices, as in Philadelphia, where the society has concentrated its work upon restricting the sale of liquor. Indeed, their chief field is the liquor traffic, which is too often lawless, and hence they are practical temperance societies. Besides the suppression of Sunday-opening saloons, licenses obtained by perjury, and other violations of law, these associations attempt the extinction of prostitution. In 1883 the Law

and Order societies of eight states met by delegates in Boston, and organized an International League, the executive committee of which meets monthly. It publishes a journal called the *City Vigilant*, and finds an organ in *Lend a Hand*.

This movement is strengthened by the formation of kindred societies. They may be roughly classified as they devote themselves predominantly to the suppression of crime, to the choice of suitable men for holding municipal office, or to the educational work of pointing out methods of obtaining good government. Of the first class are vigilance leagues. In 1892 the City Vigilance League of New York was formed at the instigation of Dr. Parkhurst, he becoming its first president, the objects of which are to ascertain facts concerning the social life, the official administration and the violations of law in each precinct of the city, with a view to loosening the hold of bad men on the community and improving methods of government. As a type of the second class of organization, reference may be made to the Civic Federation of Chicago, which was organized in 1894, and is in name and methods the type of a number of other reforming organizations. It aims to promote honesty and efficiency of civic administration, to bring into unison all citizens who care for the public welfare, and to discover and correct abuses of municipal government, separating city interests from state and national politics. There are scores of kindred societies scattered in the cities of the United States, bearing a great variety of names, but bent on securing government by the righteous and exact observance of law.

So profound and hopeful has been public interest in this reformation that a spirit of emulation has spread through the country in disseminating a knowledge of what constitutes good government and of the best modes of bringing it about. There are hundreds of "good-government" clubs, the aim of which is educational. These are not uniform as to name, and are of two types—those that seek mutual information and support, and those that are propagandist. The former are maintained by young people for the most part; the latter are organizations carried to toilers of the city, and aiming to stimulate them to larger civic pride and respect for administrative functions. One of the earliest of such societies is the Massachusetts Society for Promoting Good Citizenship, organized in Boston in 1887, under the presidency of Rev. E. E. Hale; but the number of related and affiliated societies is now legion, and their increase is rapid and full of promise.

D. O. KELLOGG.

LAWES, SIR JOHN BENNETT, an English agricultural experimentalist; born at Rothamsted, near St. Albans, Hertfordshire, Dec. 28, 1814. After studying chemistry in London and inherited his father's estate, he began in 1834 to experiment upon the best methods of raising farm crops and the useful effects of fertilizers. In this work he had the assistance of the eminent chemist Dr. J. H.

Gilbert, who became associated with Mr. Lawes in 1843. The results of these experiments have been published in a series of reports and papers, which are everywhere acknowledged as being of the highest value. Messrs Lawes and Gilbert also made experiments on the best feed for livestock, on drainage and sewerage, in animal and vegetable physiology, and in various other departments of rural economy. Mr. Lawes was made a baronet in 1883. He endowed his agricultural station with £100,000. The results of his experiments appeared in papers and magazine articles. He died in January, 1892.

LAW OF WATER DUTY. See IRRIGATION, in these Supplements.

LAWRANCE, JOHN, an American statesman; born in Cornwall, England, in 1750. After removing to America in 1767 he was admitted to the bar of New York in 1772; became aide-de-camp to General Washington in 1777; and presided in the same year as judge-advocate-general at the trial of Major John André. In 1784 Lawrance was elected to Congress; in 1794 he was made United States judge for the New York district; and two years later he was elected to the United States Senate, over which he presided in 1798. He was an ardent patriot, and the personal friend of Washington and Hamilton. He died in New York in 1810.

LAWRENCE, a city, and the capital of Douglas County, central eastern Kansas. It lies on the Union Pacific, the Atchison, Topeka and Santa Fé and the Southern Kansas railroads, and is also the terminus of two branch railway lines. The city is the center of trade for a fertile and populous section of the state, having a favorable situation between Topeka and Kansas City. The manufactures are in a thriving condition, the most important of them being flour, woodenware, castings, furniture, barbed wire, shirts, and carriages. This city is the seat of the Kansas State University, a large and prosperous College which occupies a commanding site on Mount Oread. Here also is located Haskell Institute, a government institution for the education of Indian youth, the second largest in the United States. It has a public library, numerous periodicals and several banks. Population 1890, 9,997; 1900, 10,862. See also LAWRENCE, Vol. XIV, p. 370.

LAWRENCE, a city of Essex County, north-eastern Massachusetts. Its great natural advantages have given Lawrence its industrial importance. The town is connected with Boston by the Boston and Maine and the Boston and Lowell railroads, and with Manchester, New Hampshire, by the Manchester and Lawrence railroad. Branch railroads extend to Lowell and Salem. There are numerous cotton and woolen mills here, some of the largest in the world, the Pacific Mills employing 6,000 hands; besides establishments for the manufacture of machinery, boilers and steam-engines, boots and shoes, paper and clothing. The high-school building is a costly and imposing edifice, and there is a large public library. The town is lighted by gas and elec-

tricity, and supplied with water from the Merimac. It is connected with Lowell, Haverhill, Andover and other neighboring places by electric railway. Population 1885, 38,862; in 1890, 44,654; in 1900, 62,559. See also LAWRENCE, Vol. XIV, p. 370.

LAWRENCE, ABBOTT, an American merchant; born at Groton, Massachusetts, Dec. 16, 1792. At the age of 15 he was bound an apprentice to his brother Amos, and in 1814 he became a partner of the firm of A. & A. Lawrence, which for many years conducted a prosperous business in the sale of foreign cotton and woolen goods on commission. Abbott was an advocate of protection to American industries, and an earnest supporter of the Whig party. He served several terms in Congress. From 1849 to 1852 he served as United States minister to Great Britain; performed afterward an important service in the settlement of the fishery question, which had threatened to lead to serious complications; and in 1842 served on the commission which settled the northeast boundary. He founded the Lawrence Scientific School of Harvard University, giving and bequeathing altogether \$100,000 for this purpose. He also left \$50,000 for the erection of model lodging-houses, and established many prizes and scholarships in the public schools. He gave liberally to Groton (now Lawrence) Academy. He died in Boston, Aug. 18, 1855.

LAWRENCE, AMOS, an American merchant; born at Groton, Massachusetts, April 22, 1786. After clerking in a country store he became a dry-goods merchant in Boston in 1807. Seven years later he entered into partnership with his brother Abbott, who had been his chief clerk for the previous five years. The business operations of the firm were highly successful. In 1830 the brothers Lawrence established a cotton-mill at Lowell, Massachusetts. After a serious illness Amos retired from the business in 1831, and devoted his life afterward chiefly to deeds of charity, giving liberally to educational institutions. Among them was Groton Academy, founded by his father, and afterward named in honor of his brother; also, Lawrence University, Wisconsin, named after him. He established and maintained a child's infirmary in Boston, and gave \$10,000 for the completion of the Bunker Hill monument. His public benefactions summed up to \$639,000. He died Dec. 31, 1852.

LAWRENCE, EUGENE, an American historical writer; born in New York City, Oct. 10, 1823. He received his education in New York, and studied law in Harvard, but practiced for only a short time; traveled in Europe, devoting his time to study in all the large libraries. On his return he turned his attention to writing, contributing to several magazines; edited a *Smaller History of Rome*; published *Lives of British Historians* (1855); *Historical Studies* (1856); *The Feuds and their Persecutors*; and *Columbus and His Contemporaries*. He died Aug. 17, 1894.

LAWRENCE, GEORGE ALFRED, an English novelist; born in 1827. He was educated at Ox-

ford, and took up the practice of law in London, but devoted himself chiefly to literature. Among his works are *Guy Livingstone* (1857); *Border and Bastile* (1863); *Sword and Gown* (1868); *Anteros* (1871); and *Silverland* (1873). He died in 1876.

LAWRENCE, GEORGE NEWBOLD, an American ornithologist; born in New York City, Oct. 20, 1806. He was a New York business man who devoted his leisure to the study of birds; made a study of the avifauna of tropical and subtropical America, and described over three hundred new species. He was one of the editors of *Birds of North America*, published in 1860.

LAWRENCE, JAMES, an American naval officer; born at Burlington, New Jersey, Oct. 1, 1781. In 1802 he was made lieutenant and took part in the war with Tripoli, where he distinguished himself on several occasions. In 1811 he was promoted to a captaincy, and made commander of the United States gunboat *Hornet*. In a fight with the English brig-of-war *Peacock*, off Demerara, Lawrence sank the latter after an engagement of fifteen minutes. For this victory he received the thanks of Congress. In 1813, as commander of the frigate *Chesapeake*, Lawrence had an engagement near Boston with the British frigate *Shannon*, under Capt. P. V. Broke. Lawrence was shot, and the *Chesapeake* was captured in spite of his dying cry, "Don't give up the ship!" on being carried below. He died July 5, 1813.

LAWRENCE, WILLIAM BEACH, an American jurist; born in New York City, Oct. 23, 1800. He was educated at Columbia College; went to Europe in 1821; was admitted to the bar on his return in 1823; was appointed secretary to the legation in London, 1827; *chargé d'affaires* there the next year; spent some time in Paris, and returned home in 1832; devoted himself to his profession for some time, and was interested in the Erie railway. In 1850 he removed to Rhode Island, where he became acting governor in 1851 and a member of the Constitutional Convention of 1853. He was a lecturer in Columbia Law School, and in 1869 was a member of the Social Science Congress which met in Bristol, England. Among his numerous works are *History of the Negotiations in Reference to the Eastern and Northeastern Boundaries of the United States* (1841); an edition of Wheaton's *International Law* (1855); *The Law of Charitable Uses* (1845); *Visitation and Search* (1858); *The Treaty of Washington* (1871); *Belligerent and Sovereign Rights as regards Neutrals during the War of Secession* (1873); and *Administration of Equity Jurisprudence* (1874). He died March 26, 1881.

LAWRENCEBURG, a city and the capital of Dearborn County, southeastern Indiana, situated on the Ohio River, and on the Cleveland, Cincinnati, Chicago and St. Louis and the Baltimore and Ohio Southwestern railroads, at the southern terminus of the Whitewater canal, 22 miles below Cincinnati. It has breweries, distilleries, and barrel, carriage, coffin, flour, pump, piano and furni-

ture manufactories. Pop. 1890, 4,284; 1900, 4,326.

LAWRENCEBURG, capital of Anderson Co., Ky., 24 miles W of Lexington. It is in a grain (especially corn) and tobacco-raising region; chief industry, whisky-distilling. Population 1900, 1,253.

LAWRENCE UNIVERSITY, a co-educational institution in Appleton, Wis., established in 1849, named after Amos Lawrence, who gave \$10,000 to start it, and controlled by the Methodist Episcopal Church. There are three courses of study: the ancient classical, the modern classical, and the scientific; also a preparatory course, an English course, and courses in music and painting. In 1898 there were 378 students, 23 instructors, and a library containing 15,620 volumes. There are a large recitation hall, a dormitory, and an observatory.

LAW SCHOOLS. See LEGAL EDUCATION, in these Supplements.

LAWTON, HENRY W., American army officer, was born in Ohio, March 17, 1843. He was appointed to the army from Indiana, and on the outbreak of the Civil War, in April, 1861, he entered

HENRY W. LAWTON.

Company E of the Ninth Indiana Volunteer Infantry as sergeant, but was discharged in July following, and joined the Thirtieth Indiana Volunteer Infantry as first lieutenant. He was promoted captain May 17, 1862, and lieutenant-colonel Nov. 15, 1864. He won the rank of brevet colonel of the volunteers for gallant conduct during the war,

and was honorably mustered out in November, 1865. In July, 1866, he entered the regular army as second lieutenant of the Forty-first Infantry, and was made first lieutenant in July, 1867; captain in March, 1879; and lieutenant-colonel on Feb. 12, 1889 and assigned to the inspector-general's department. After the war with Spain broke out he was made major-general of volunteers and commander of the Second Division of General Shafter's army at Santiago de Cuba, and distinguished himself at the battles at El Caney, July 1-2, 1898.

In Jan. 1899, he was ordered to the Philippines as second in command to General Otis. He reached Manila early in March and took command on the 18th of the 1st division of the Eighth Army Corps. Throughout the year he was actively engaged in expeditions in Luzon, both north and south of Manila, his operations against the Filipino insurgents meeting with marked success. Within the period he engaged in over twenty fights and captured some thirty towns, including Santa Cruz and San Isidro, and won the battle of Zapoti Bridge (June 13). From Oct. to Dec. his operations were chiefly in the north; his last expedition was against San Mateo, where a number of the hard-pressed insurgent forces had made a stand. Here, on Dec. 19, 1899, Lawton was killed in an attack upon the entrenchments of the place, greatly to the regret not only of his com-

mand, but to the whole United States nation, which recognized his gallantry and the great service he had rendered in the Philippines in breaking up and scattering the disaffected island forces of Aguinaldo and his compatriots.

LAYARD, SIR AUSTEN HENRY, an English traveler and diplomatist; born in Paris, March 5, 1817; passed his boyhood in Italy, and commenced his career as correspondent at Constantinople of a London paper. With the assistance of Sir Stratford Canning, in 1845, he began a series of discoveries of Assyrian antiquities, of which he gave an account in his *Nineveh and its Remains* and *Monuments of Nineveh*; and in 1849 undertook for the British Museum a series of excavations in Assyria and Chaldea. In 1852 he sat as member of Parliament for Aylesbury, and in 1860 for Southwark; in 1861-66 he was Under-Secretary of State for Foreign Affairs, and thereafter Chief Commissioner of Works. He was appointed ambassador at Madrid in 1869, and in 1877 was sent as plenipotentiary to that city. In April, 1877, he was made ambassador at Constantinople, and negotiated the treaty for the surrender of Cyprus to England. Died in London, July 5, 1894.

LAZZARONI, formerly a lower class of people in Naples, named from the Hospital of St. Lazarus, their place of refuge. From the Middle Ages they inherited the obligation to wear a special dress of the simplest kind, and were treated by the government as a separate class, electing their own chief, called *Capo Lazzaro*. See NAPLES, Vol. XVII, 190.

LEA, HENRY CHARLES, an American author; born in Philadelphia, Sept. 19, 1825. At the age of 17 he entered the publishing-house of his father, of which he afterward became the principal. He published several papers on chemistry and conchology, notably *Description of New Species of Shells*. During the Civil War he organized a municipal system of bounties for recruits to encourage volunteering, and wrote much for periodicals. After 1857 he devoted special attention to mediæval history, and wrote *Superstition and Force* (1866); *Essays on the Wager of Battle* (1866); *Sacerdotal Celibacy* (1867); *Studies in Church History* (1869); *History of the Inquisition of the Middle Ages* (1888); *Chapters from the Religious History of Spain* (1890); *A History of Sacramental Confession and Indulgences in the Latin Church* (1894). The Philadelphia Library received \$50,000 from him for expanding its facilities.—His brother, MATTHEW CAREY LEA, born in Philadelphia, Aug. 18, 1823, devoted himself to photographic chemistry, and published articles on the chemical effects of light, especially on the haloid salts of silver. He wrote *Manual of Photography* (1868). Died at Philadelphia, March 15, 1897.

LEA, ISAAC, an American naturalist of Quaker stock; born in Wilmington, Del., March 4, 1792. His mother fostered his natural fondness for botany, and his friend Lardner Vanuxem encouraged his interest in mineralogy and geology. In 1815 he became a member of the Philadelphia Academy of Natural Sciences, and 1853-58 was its president. Having married Matthew Carey's daughter, in 1821, he became a partner in Carey's publishing-house, and con-

tinued in the book-publishing business until 1857. But he devoted his leisure hours to science. In 1827 he commenced the publication of a series of memoirs on fresh-water and land shells. His first paper was on the genus *Unio*. His specimens of this genus alone number 10,000. He read before the Philadelphia societies at least 150 memoirs on natural history. Among his published writings are *Contributions to Geology; Fossil Footmarks; Observations on the Genus Unio* (1827-74). This last work forms 13 quarto volumes, magnificently illustrated. In 1858 he was elected president of the Philadelphia Academy of Natural Sciences, and of the American Association of Natural Sciences in 1860. He bequeathed his valuable collection of fresh-water shells, land and marine shells, minerals, fossils and geological specimens to the National Museum in Washington. He discovered the footprints of *Clepsysaurus Pennsylvanicus*, a large saurian, in the red sandstone of Pottsville, Pennsylvania, 700 feet below the conglomerate of the coal formation, and subsequently found many bones and teeth of this fossil animal. This discovery was of great interest, for the existence of an air-breathing animal as low as the coal measures had not at that time been definitely accepted. He died in Philadelphia, Dec. 7, 1886.

LEAD CITY, a city of Lawrence County, central western South Dakota; situated among the Black Hills, three miles S. of Deadwood, the county seat; on the Fremont, Elkhorn and Missouri Valley railroad. Situated here is one of the largest gold-mines in the world, there being in operation over 600 stamps. The yield of the district in 1895 was over \$2,250,000 in gold. Gold jewelry is manufactured. Population 1880, 1,437; 1890, 2,581; 1900, 6,210.

LEADING QUESTION. See **EVIDENCE**, Vol. VIII, p. 743.

LEAD PLASTER, in pharmacy. See **GLYCERINE**, Vol. X, p. 698.

LEADVILLE, a city of western central Colorado, the fourth in size and importance in the state. The city is situated near the Arkansas River, on California Gulch, just W. of the Mesquite range, on the Denver and Rio Grande, the Colorado Midland and the Denver, Leadville and Gunnison railroads. The surrounding scenery is grand and imposing. Leadville is the leading silver-mining center of Colorado. It is surrounded by the richest mines furnishing carbonate-of-lead ores; but other silver-bearing ores are also abundant, and during a few years past much gold has been mined. It has several smelting and ore-reduction works; also several stamp-mills where gold-bearing quartz is comminuted and the precious metal is amalgamated. Its population in 1890 was 10,384; but in 1900 it had risen to 12,455. The decrease is accounted for by the removal of some of the large smelting works to Denver, Pueblo and Colorado Springs. See also **LEADVILLE**, Vol. XIV, p. 379.

LEADVILLE MINES. See **SILVER AND SILVER-MINING**, in these Supplements.

LEAF. See **BOTANY**, Vol. IV, pp. 117-119.

Vol. 3-36

LEAF-CUTTER BEES, the popular name of several species of *Megachile*, which line their nests with pieces of leaves. Sometimes they construct burrows, which they line, but usually they make use of narrow crevices. They are often called "upholsterer" bees. *M. centuncularis*, a common species in Europe and the United States, uses rose-leaves with which to line its dwelling. The genus is cosmopolitan in distribution.

LEAF-INSECT OR WALKING-LEAF, popular names given to certain orthopterous insects of the family *Shasmidae*. The insects of the genus *Phyllium* have wings remarkably leaf-like in appearance. They are very interesting to students of mimicry. This genus is largely confined to the East Indian region. See **INSECTS**, Vol. XIII, p. 152; and **MIMICRY**, Vol. XVI, p. 343.

LEAF-ROLLER, the larva of any moth of the family *Tortricide*, which makes a case for itself by rolling up the leaves of plants. The number of genera and species is great, and as a rule the insects are very destructive of useful vegetation. Common leaf-rollers of the United States are the strawberry leaf-roller *Phoxoptera fragariae*, and the cotton or rose-leaf roller *Lozotenia gossypiana*. The latter works on the leaves of cotton, rose, clover, birch, apple, and many other trees and plants.

LEAF-SPOT, the general name given to a pathological condition of leaves, which may be caused by a number of different parasitic fungi. The ordinary fungicides are usually of no avail in eradicating this pest, for the condition is caused by internal parasites. To get thoroughly rid of spot-disease, the affected leaves should be burned. The ravages of this disease are most serious in the case of strawberry leaves. A strawberry patch, when so attacked, must be mown, let dry, and burned over. *Ramularia tulasnei* is the cause of the strawberry leaf-spot, producing yellowish-white spots edged with red or purple, which, in ripening, bear small, dark, oval bodies (*sclerotia*) from which the fungus is reproduced in the following season. *Septoria cerasina* produces deep purple spots upon plum and cherry leaves, and rapidly kill them. *Cercospora beticola*, or "beet rust," is a common pest of the sugar and garden beets. It causes rapidly spreading, light-colored patches of dead tissue. See *Spot-disease of Strawberry-leaves* (University of Wisconsin, 1884).

LEAGUE OF AMERICAN WHEELMEN, THE, an organization founded at Newport, Rhode Island, May 31, 1880, for the purpose of promoting the general interests of cycling; for ascertaining, defending and protecting the rights of wheelmen; for encouraging and facilitating touring; for promoting the improvement of the public roads and highways; and for regulating all amateur sports connected with the use of the wheel. The initiative was taken by Kirk Monroe, president of the New York Bicycle Club, and a start was made with two dozen clubs and 133 members. In September, 1880, the organization was perfected in New York City, and a membership of 527 reported. To its objects were added, at a meeting in Baltimore, Maryland, June 19, 1888, the securing of improvement in the condition of the public roads and highways. Since

the adoption of this clause the league has spent over \$120,000 to advance the cause of road improvement, and has published more than 2,000,000 pamphlets and magazines. It commenced an agitation which resulted in the construction of many miles of splendid roads in the Eastern states. It has also promoted the test of endurance in carrying military dispatches from San Francisco to New York, thus drawing attention to the condition of the Western roads, and it has become a political power in the interests of road improvements. (See **ROADS, MOVEMENT FOR GOOD**, in these supplements).

Divisions have been formed in every city of the Union, working in combination with the parent society. These undertake the issuance of road-books, tour-books, maps, directories and guides, supervise the amateur question at athletic meetings, and by means of chief consuls in each of the principal cities of the Union, watch over the interests of wheelmen, and, where necessary, defend them from unjust attacks. The rules require a member to be an amateur, white, and at least eighteen years of age.

The League has also made arrangements with one of the best hotels in nearly every town in the United States for reduced rates to touring members, frequently obtaining a reduction of thirty-five per cent. It assists in the recovery of stolen wheels by the offer of reward; publishes the *League of American Wheelmen Bulletin*, containing matters of interest to cyclists; and prosecutes persons injuring members when riding. The initiation fee is \$2, and a renewal of membership costs \$1 annually. The national secretary is Abbot Bassett, and the headquarters are at No. 12 Pearl Street, Boston, Mass.

LEAN, MRS. (FLORENCE MARRYAT), an English novelist; born at Brighton, Sussex, England, in 1837; daughter of Captain Frederick Marryat. She was an operatic singer and comedy actress. She was married first to Ross Church and later to Francis Lean. She wrote *Love's Conflict* (1865); *Tom Tiddler's Ground* (1886); *A Fatal Silence* (1891); *The Hampstead Mystery* (1894); and a book dealing with Spiritualism, entitled *There is No Death* (1891). *The Risen Dead* appeared in 1893. She also contributed constantly to magazines, and in 1872 became editor of *London Society*. Died at London, Oct. 27, 1899.

LEANING TOWERS. See **PISA**, Vol. XIX, p. 122.

LEAPING-FISH (*Salarias tridactylus*), a curious little fish of the blenny family, abounding on the coast of Ceylon. It is very active, and makes leaps of several times its own length.

LEATHER. Knapp's process of tanning with ferric salts, and Dr. Heinzerling's method of quick tanning by means of chromates, with an addition of aluminium salts, chloride of sodium, etc., have received but little attention from practical tanners in America, although making some progress in Germany. In Sweden an electric tanning process, invented by J. D. Abom, has been tried successfully. Ox-hides suitable for sole-leather were hung in tanning liquor between two copper plates, which served

as the electrodes. An alternating current from a Siemens dynamo, having an electromotive force of fifty volts and a strength of one hundred amperes, was passed into these plates. The hides were completely tanned in from fifty to ninety hours, according to the strength of the tan-liquor employed. An electric tanning process of another inventor, who moves the hides mechanically during the operation of tanning, is said to be making progress in France. But there are no reliable statistics in either of these cases. Among tanners it is an accepted maxim that no time-abridging process can produce good sole-leather, because for the thorough tanning of thick hides a slowly operating influence, and therefore a long time, is necessary.

For the "imitation of French kid" the skins are stained on the grain side with a black, sometimes made by boiling together four ounces of pulverized nut-galls, and two ounces of blue vitriol in one gallon of logwood liquor, and afterward adding four quarts of vinegar saturated with iron. Several other kinds of black are employed. After being blacked by several successive applications of the liquor, the skins are dried, then oiled with sperm-oil and glazed two or three times, according to the brightness of the finish desired.

For the finishing of "brushed kid" the skins are blacked on the grain side with a preparation made by suspending five pounds of iron in twenty-five gallons of strong vinegar for four weeks, and then adding for each quart of this solution half a pint of bullock's blood, either warm or coagulated. After being blacked with this preparation the skins are made wet with gum-water and then brushed with a soft brush. Next they are scraped on the flesh side with a steel slicker, and oiled on the grain side with the best of sperm-oil.

For finishing "pebble-grained goat" and "straight-grained goat" the skins are seasoned and blacked with a preparation of bullock's blood, logwood, boiled milk, water and a small quantity of vinegar black. After hanging in the drying-loft overnight they are glazed, and then grained twice and oiled with sperm-oil. For "oiled goat" the skins also are blacked, and then stuffed on the flesh side with a dubbing composed of oil and tallow. After drying, the oiled skins are grained in various ways, then treated to a coat of dubbing on the grain side, which afterward is flattened down with a dull slicker, and lastly they are treated with a coat of fine sperm-oil.

Russia leather now is smeared over on the outside, while still damp, with a solution of oil of birch bark dissolved in a little alcohol and ether. See also **LEATHER**, Vol. XIV, pp. 380-391.

LEATHER-BOARD, an imitation of sole-leather, first manufactured in the United States. See **LEATHER, ARTIFICIAL**, Vol. XIV, p. 391.

LEATHERWOOD OR **MOOSEWOOD** (*Dirca palustris*), a deciduous shrub three to six feet high, a native of North America. It belongs to the natural order *Thymelacææ*. The bark and wood are tough, and in Canada the bark is used for ropes, baskets, etc. The leaves are lanceolate-oblong; the flowers are yellow, and appear before the leaves.

LEAVENWORTH, a city, and the capital of Leavenworth County, northeastern Kansas, 20 miles N.W. of Kansas City. It is the oldest town in the state. Eight railroads converge here, and a splendid iron railway bridge crosses the river; the railroad systems include the Atchison, Topeka and Santa Fé, the Missouri Pacific, the Union Pacific, the Leavenworth, Topeka and Southwestern, the Kansas City, Northwestern and the Chicago, Rock Island and Pacific. Leavenworth has a fine park and ample water-supply, a good system of sewerage, street-railways, a telephone exchange, and is lighted with gas and electricity. Good bituminous coal is mined here, and fine building-stones are quarried. Among the thriving manufactures are flour, lumber, glucose, bricks, wagons, furniture, boots, shoes, boilers, engines, cigars, iron bridges, jewelry and machinery. The town was incorporated in 1856. The extensive military establishment of Fort Leavenworth adjoins the city on the north. Here also is located the state penitentiary. Population 1890, 19,768; 1900, 20,735. See also LEAVENWORTH, Vol. XIV, p. 391.

LEAVITT, JOSHUA, an American journalist; born at Heath, Massachusetts, in 1794. After practicing law at Putney, Vermont, for some years, he studied theology at New Haven, and was ordained pastor at Stratford, Connecticut, in 1825. In 1831 he founded the *New York Evangelist* to advocate the revival system in the Presbyterian Church. As he was also prominent in the antislavery agitation, he had but poor prospects in New York. In 1837 Leavitt became editor of *The Emancipator*, which he removed to Boston in 1841. From 1844 to 1847 he was chairman of the National Committee of the Liberty Party. In 1848 he became the managing editor of the *New York Independent*, and contributed to its pages for many years. He aided in founding and became secretary of the first temperance society in New York; as secretary of the American Seamen's Friend Association, established chapels in a great many ports in all parts of the world, and he was one of the abolitionists who were obliged to flee from Philadelphia to escape mob-violence. He died in Brooklyn, New York, in 1873.

LEBANON, a city of St. Clair County, southwestern Illinois, a summer resort for the people of St. Louis, from which city it is 23 miles E., on the Baltimore and Ohio Southwestern railroad. It is noted for its educational advantages, is the seat of McKendree College (Methodist), organized in 1828; has churches, mills, a machine-shop and various other manufactories, and has farming and coal-mining interests. Pop. 1890, 1,636; 1900, 1,812.

LEBANON, a city and the capital of Boone County, central Indiana, 26 miles N.W. of Indianapolis, on the Chicago and Southeastern and the Cleveland, Cincinnati, Chicago and St. Louis railroads. It has barrel and stave, refrigerator, washing-machine and furniture factories, a cooperage, grain-elevators, and flour, saw and planing mills. It is in a dairying region. Population 1890, 3,682.

LEBANON, a city and the capital of Marion County, central Kentucky, on the Louisville and

Nashville railroad, 55 miles S.E. of Louisville. It is a shipping-point for various adjoining counties, manufactures carriages, ice and furniture and whisky is distilled. Farms for the raising of thoroughbred horses are numerous in the vicinity. Timber is plentiful. A Baptist College for women is here, two Roman Catholic academies and a high school. Population 1890, 2,816.

LEBANON, a town and the capital of Laclede County, southern central Missouri, 67 miles S.S.W. of Jefferson City, on the St. Louis and San Francisco railroad. It is a business center for the surrounding fruit-raising region, contains an excellent seminary, and has considerable popularity as a health-resort, on account of its magnetic mineral springs, which have alkaline carbonated calcic-magnesian waters. Pop. 1890, 2,218; 1900, 2,125.

LEBANON, a town of Grafton County, southwestern New Hampshire, on the Mascoma River, four miles from White River Junction, Vermont, on the Boston and Maine railroad. It manufactures furniture, iron castings, elastic sponges, flannels, cloakings, shirts, overalls, underwear, machinery, watch-keys, wood-pulp and agricultural implements. West Lebanon, on the Connecticut River, is the seat of the Tilden Ladies' Seminary. The village is furnished with water-power by the Mascoma River, and the town has railroad-shops and various industries, and a public circulating library. Population 1890, 3,763; 1900, 4,965.

LEBANON, a post village and the capital of Warren County, southwestern Ohio, 30 miles N.E. of Cincinnati, on the Cincinnati, Lebanon and Northern and the Dayton, Lebanon and Cincinnati railroads. It has a national bank, the National Normal University, an opium-cure sanatorium, an orphans' home, a county infirmary and planing-mills. It has a reputation for the raising of Poland China hogs, which are said to have originally been bred here. Population 1890, 3,050; 1900, 2,867.

LEBANON, a city and the capital of Lebanon County, southeastern Pennsylvania, 24 miles E.N.E. of Harrisburg, on the Philadelphia and Reading, the Cornwall and the Cornwall and Lebanon railroads. In the vicinity are farms, anthracite coal-mines, iron-mines, limestone and brown sandstone quarries and brick-clay beds. It is engaged extensively in the working of iron; has rolling-mills, iron foundries and furnaces, machine-shops, stove-works, boiler, nut, bolt, chain and agricultural-implement works, and car, engine, rope, organ, soap, pottery and furniture factories. It has a widows' home, public libraries, gas and electric lights and electric street-railways. Population 1890, 14,664; 1900, 17,628.

LEBANON, a town and the capital of Wilson County, central Tennessee, 28 miles E. of Nashville, on the Nashville, Chattanooga and St. Louis and the Nashville and Knoxville railroads. It is in a rich wheat and corn region, hogs and mules are extensively raised in the neighborhood, and the town contains flour-mills, woolen-mills, barrel factories, and tobacco warehouses. It is the seat of Cumberland University, a Cumberland Presbyterian institution founded in 1842, which had 20 instructors, 225

students and 6,000 volumes in its library in 1896. Population 1890, 1,883; 1900, 1,956.

LEBANON SPRINGS, a post village and summer resort of Columbia County, northeastern New York, on the Lebanon Springs railroad. It contains a mineral spring whose waters possess curative qualities in certain diseases. The water is sufficiently abundant to furnish valuable motive power. Thermometers and pharmaceutical preparations are made in the vicinity. There are several Shaker communities near the village, and a hotel at which Lafayette was a guest. See MINERAL WATERS, Vol. XVI, p. 436.

LEBANON VALLEY COLLEGE, a co-educational institution located at Annville, Pennsylvania. It was organized in 1866 by the United Brethren. There are two courses, the classical and the scientific. The attendance averages about 115; there is a faculty of 10 members, and a library of 50,000 volumes. Besides its equipment on the campus, there is property amounting to \$22,000, which, with money from all other sources, brings an annual income of \$10,000.

LE BLANC, a thriving town of central France, in the department of the Indre, situated on the Creuse, near long. 1° W. Above Le Blanc the river expands so as to form a lake, but at the town it contracts and breaks into cascades with sufficient fall to turn the machinery of several manufactories. It has linen-yarn and cloth mills, potteries, tanneries, vinegar-works, forges, etc. It is very ancient, having been occupied by the Romans. Population, 6,000.

LEBRUN, CHARLES FRANÇOIS, a French statesman; born at St. Sauveur-Landelin, March 19, 1739. He served as adviser to Maupeou before the accession of Louis XVI, after which he retired and applied himself to literature, and in 1789 attracted attention by his *La Voix des Citoyens*. He was a Deputy to the States General; imprisoned during the Reign of Terror; became president of the Council of Five Hundred in 1796; and third consul in 1799, with control of finances and internal administration. Under Napoleon he held various offices; was created Duke of Piaccenza; and in 1810 was appointed governor of Holland. After the first restoration he was made a peer of France by Louis XVIII, but after the second restoration was not allowed to take his seat in the Chamber of Peers until 1819. He died at St. Mesme, June 16, 1824.

LEBRUN, MARIE ANNE ÉLISABETH VIGÉE, a French painter; born in Paris, April 16, 1755. She began painting portraits while quite young; executed portraits of Marie Antoinette and others; was made a member of the Academy in 1783, and in the same year left France, traveling through Europe. She painted portraits of George IV, Lady Hamilton, Lord Byron, Napoleon's sister, Caroline Murat, and a great many other notable people of her time. Seven or eight of her most important pictures may be seen at the Louvre. She died March 30, 1842.

LEBRUN, PONCE DENIS ECONCHARD, a French epigrammatist. See EPIGRAMS, Vol. VIII, p. 478.

LECH, a river of Austria and Germany, rising in Voralberg, Tyrol, Bavaria and Augsburg and joining the Danube a few miles from Donauwörth. It is 140 miles long, but not navigable, and is used only

to float logs from Füssen. It was while defending the passage of this stream against Gustavus Adolphus that Tilly was killed.

LECKY, WILLIAM EDWARD HARTPOLE, an English philosophic historian, was born at Newton Park, near Dublin, March 26, 1838. He graduated at Trinity College, Dublin, in 1859, and in 1861 published, anonymously, *Leaders of Opinion in Ireland*, a series of brilliant essays on Swift, Flood, Grattan and O'Connell. The work was republished in 1871, when its authorship was acknowledged. In 1865 Lecky published (2 vols.) his learned work, *History of the Rise and Influence of the Spirit of Rationalism in Europe*, in which he sketched the decline of belief in witchcraft and miracles, and the rise of rationalistic thought in science, politics and morals. The work

WILLIAM E. H. LECKY.

won for him the reputation of being an acute thinker, as well as a profound scholar. This was followed, in 1869, by a *History of European Morals*, from Augustus to Charlemagne, embracing a study of the moral life of pagan and Christian Rome, with a chapter on the influence of Christianity on the position of women in Europe. His *Magnum Opus: A History of England in the Eighteenth Century* (8 vols.) appeared between the years 1878 and 1890, to which was added, in 1892, a *History of Ireland in the Eighteenth Century* (5 vols.). In this thoughtful, scholarly and luminous work, Mr. Lecky deals on a large scale with the chief events that have influenced political and religious progress and that enter into the thought and manners of the people. The Irish section is a dispassionate and consecutive narrative of Irish history from the period of the Tudor conquest to that of the Union. His historical reading made him a strong opponent of Mr. Gladstone's scheme of Home Rule. The author's latest work, *Democracy and Liberty* (2 vols., 1896), is a valuable dissertation, though rather pessimistic in tone, on the development of democracy, and its tendency to degrade political life and introduce the mechanical or material element into it, despite the checks and safeguards that conservative minds desire to throw around it. Two addresses by Mr. Lecky, delivered before institutes in England, have been separately published, one on *The Political Value of History* (1892) and the other on *The Empire: Its Value and Growth* (1893).

LECLANCHÉ CELL. See ELECTRICITY, § 104, in these Supplements.

LECLERC, VICTOR EMMANUEL, a French soldier; born near Paris, March 17, 1772. He joined the republican army in 1791; rose to the rank of brigadier-general in 1795; married a sister of Napoleon Bonaparte in 1797, and accompanied his brother-in-law to Egypt. He was at the head of the army sent against Portugal in 1801, and in the same year was sent to Santo Domingo to subdue the French

portion and capture the Spanish part. This he did, and sent the black leader, Toussaint l'Ouverture, prisoner to Paris. He died of fever at Cape Français, Dec. 2, 1802.

LECOQC, ALEXANDRE CHARLES, a French musician; born in Paris, June 3, 1832, and trained at the Conservatoire, where he afterward became a professor, and was acknowledged the worthy successor of Auber in comic opera. His best-known works are *La Fille de Madame Angot* (1872); *Giroflé-Girofla* (1874); *Le Petit Duc* (1878); *Fleur du Thé* (1868); *Janot* (1881); *La Volière* (1888); and *L'Egyptienne* (1890).

LECOMTE, LOUIS, a French priest; born at Bordeaux, France, 1655. He was sent to China with five other Jesuits, selected for their mathematical attainments. They carried on astronomical investigations for several years, learned the customs of the country, and did some missionary work. On his return he wrote a book called *Nouveaux Mémoires sur l'État Présent de la Chine* (1696-1701); and also *Sur les Cérémonies de la Chine* (1700). Both books were condemned by the Congregation at Rome. He died at Bordeaux in 1729.

LE CONTE, LEWIS, an American naturalist; born near Shrewsbury, New Jersey, Aug. 4, 1782. He was educated at Columbia College, and afterward studied medicine, but removed to Georgia, and never practiced. However, he kept up scientific study and investigation, especially in botany. He would not publish the results of his work, but gave them to friends and to his brother. He died in Liberty County, Georgia, Jan. 9, 1868.—His son, JOHN, a physicist, was born in Liberty County, Georgia, Dec. 4, 1818. He graduated at Franklin College, Athens, Georgia, in 1838, and in 1841 at the College of Physicians and Surgeons, New York. After practicing for some years as a physician at Savannah, he was made professor of natural philosophy in Franklin College in 1846, and in 1856 became professor of the same branch in South Carolina College at Columbia. In 1869 Le Conte was appointed professor of physics and industrial mechanics in the newly founded University of California, and in 1875 he became president of that university, but retired in 1881 to the chair of physics. His scientific work extended over nearly fifty years. He published important papers on physical science in many periodicals, both in America and in England, and delivered lectures on *The Physics of Meteorology* at the Smithsonian Institution, in Washington, District of Columbia (1857), and on *The Stellar Universe* at the Peabody Institution, in Baltimore, Maryland (1867). After 1857 Professor Le Conte was an active member of the National Academy of Science. Among his publications are *Study of the Physical Sciences* (1858); *The Nebular Hypothesis* (1873); *Sound-Shadows in Water* (1882); and *Vital Statistics, and the True Co-efficient of Mortality, Illustrated by Cancer* (1888). He died in Berkeley, California, April 29, 1891.—His brother, JOSEPH, an American geologist; born in Liberty County, Georgia, Feb. 26, 1823. After graduating at Franklin College, Athens, Georgia, and obtaining his

degree of M.D. at the College of Physicians and Surgeons in New York, he practiced as a physician at Macon, Georgia, for several years. In 1850 he entered the Lawrence Scientific School at Harvard, and studied natural history under Professor Louis Agassiz, accompanying the latter on an exploring expedition to Florida in 1851. In 1852 he was made professor of natural sciences in Oglethorpe College, and a year later in Franklin College. In 1857 he accepted the professorship of chemistry and geology in South Carolina College, and in 1869 he became professor of natural history and geology in the University of California. Besides many important scientific papers, Professor Le Conte has published essays on education and the fine arts, and the *Mutual Relations of Religion and Science; Elements of Geology; Light, the Principles of Monocular and Binocular Vision; and Evolution: Its Nature, Evidences and Its Relation to Religious Thought* (1887).—Lewis's

brother, JOHN EATON, an American naturalist; born near Shrewsbury, New Jersey. In 1818 he entered the corps of topographical engineers of the United States army, and remained in that service till 1831, taking part in various surveys. Having attained the rank of major, he retired from the service in the last-mentioned year, in order to devote himself to the study of botany and zoology. He published several papers on insects, such as *North American Butterflies* and some papers on mammals, reptiles, batrachians and crustacea. He died in Philadelphia, Nov. 21, 1860, leaving a considerable collection of insects and an extensive series of water-color illustrations of American insects and plants that he had made with his own hands. He published *Monographs of the North American Species Utricularia; Gratiola and Ruellia; Annals of the New York Lyceum of Natural History; and A Monograph of North American Histeroides*.—His son, JOHN LAWRENCE, an American naturalist; born in the city of New York, May 13, 1825. As a student at Mount St. Mary's College, Emmittsburg, Maryland, and at the College of Physicians and Surgeons, New York, he devoted considerable attention to the study of natural history, which he subsequently extended. He visited the Lake Superior region three times, the Rocky Mountains, California, New Mexico, Honduras, Panama, Europe, Egypt, Algiers, etc., collecting many specimens of insects, especially of the coleoptera, upon which he published several treatises. In 1862 he entered the United States army as a surgeon of volunteers. Afterward he was made medical inspector of the regular army, with the rank of lieutenant-colonel, which he retained until the end of the war. Then he became chief clerk of the United States mint at Philadelphia, and remained in this position until the time of his death. The Smithsonian Institution published his *Classifi-*

JOSEPH LE CONTE.

cation of the Coleoptera of North America and his *List of the Coleoptera of North America* (1862-73). He was a charter member of the National Academy of Sciences, and in 1873 was president of the American Association for the Advancement of Science. He died Nov. 15, 1883.

LECOUVREUR, ADRIENNE, a French actress; born at Damery, France, April 5, 1692. She died March 20, 1730. See SAXE, Vol. XXI, p. 346.

LEDA, myth. See CASTOR AND POLLUX, Vol. V, p. 199.

LEDÓCHOWSKI, MIECZYSLAW HALKA, COUNT DE, a Polish cardinal, was born at Gorki, in Russia, Oct. 29, 1822. He began his theological studies under the Lazarists in the College of St John, Warsaw, and at the age of 18 received the ecclesiastical tonsure and habit from the bishop of Sandomir. After some studies at Vienna he proceeded to Rome, where he joined the *Academia Ecclesiastica*; became domestic prelate and prothonotary apostolic; and also went as auditor of the nunciature to Lisbon, Rio de Janeiro, and Santiago de Chile. He was nominated archbishop of Thebes, *in partibus infidelium*, on his appointment in 1861 to the nunciature of Brussels, where he remained four years. In Jan., 1866, he was translated to the archbishopric of Gnesen and Posen, with the title of primate of Poland. In consequence of his resistance to the laws enacted in Prussia, he was, in 1874, cast into prison, and, while there, was proclaimed a cardinal by the Pope, in a secret consistory held in Rome in 1875. He was released from captivity in 1876, and went to Rome. He was made prefect of the Propaganda in 1892. Died in Lucerne, Switzerland, July 28, 1894.

LEDUM, a genus of plants of the family *Ericaceæ*, consisting of small evergreen shrubs with large flowers, of which the corolla is cut into five deep segments. The species are natives of Europe and North America, and are commonly known as Labrador tea. Sir John Franklin and his party, in the Arctic expedition of 1819-22, are said to have used the *Ledum palustre* for tea. The leaves possess narcotic properties, and are regarded as useful in agues, dysentery and diarrhoea. The common species of the United States is *L. latifolium*.

LEE, a town of central Berkshire County, Massachusetts, on the Housatonic River and railroad, 11 miles S. of Pittsfield. It has a public library, excellent schools, a number of paper-mills, several iron foundries and machine-shops, and extensive woolen factories. The township is noted for its quarries of fine white marble, which is exported to distant cities. Population 1900, 3,596.

LEE, ALFRED, an American bishop; born in Cambridge, Massachusetts, Sept. 9, 1807. He graduated at Harvard; practiced law in New London, Connecticut, until 1833, when he began to study for the ministry in the General Theological Seminary in New York; deacon of the Protestant Episcopal Church (1838), bishop of Delaware and rector of St. Andrew's, Wilmington (1841). In 1884 he became presiding bishop of the church in the United States. He wrote *Life of St. Peter* (1852); *Life of St. John* (1854); *Harbinger of Christ* (1857);

and *Eventful Nights in Bible History* (1886). He died in Wilmington, Delaware, April 12, 1887.

LEE, ANN (1736-84), the founder of the sect of Shakers. See SHAKERS, Vol. XXI, p. 736.

LEE, ARTHUR, an American statesman and diplomatist; born at Stratford, Westmoreland County, Virginia, Dec. 20, 1740. Having been educated at Eton, England, he studied medicine at Edinburgh University, returning to America after graduation, and beginning practice as a physician in Williamsburg, Virginia. After a few years he went to London to study law, where he was admitted to the bar in 1770, in the same year being appointed agent for Massachusetts Bay Colony in London, in company with Franklin. In 1774 Lee presented to the British ministry the addresses of the American Congress to the people and King of England. In 1776 he was American commissioner in Paris, and with Franklin and Silas Deane secured a treaty of alliance with the French. In 1777 he was sent to Spain and afterward to Prussia to enlist sympathy for the American cause. After serving in Congress in 1782, he was, in 1784, made one of the commissioners to negotiate treaties with the Indians of the Northwest, and was from 1785 to 1789 a member of the Board of Treasury. He died at Urbana, Middlesex County, Virginia, Dec. 12, 1792.

LEE, CHARLES, a British soldier; born at Dernhall, Cheshire, England, in 1731. His early education, in England and on the Continent, revealed a proficiency in languages which, during his subsequent rambles in Europe, was of great service to him. He early developed a taste for military affairs, and in 1751 received a lieutenant's commission in the Forty-fourth Regiment, shortly ordered to join General Braddock in America, in the disastrous expedition to Fort Duquesne. He entered with spirit into the campaigns which marked the French and Indian war, being wounded during the futile attack on Fort Ticonderoga in 1758. In 1760 the regiment to which he was attached joined General Amherst's forces in the assault and capture of Montreal. In 1762, Lee having returned to England, the scene of his military service was transferred to Portugal, where he aided efficiently in repelling the Spanish invasion. Shortly after this he turned his restless thoughts to schemes of colonization in America, but estranged the parties upon whose approval success depended, by his arrogant and ungovernable temper—a trait already unhappily apparent, and destined to prove at least the proximate cause of his ultimate downfall. Failing in efforts looking to his advancement at home, he speedily sought and obtained a staff appointment in Poland, a few years later receiving a major-general's commission in the Polish army. During this eventful period of his life his experience may be well styled that of an adventurer, subject to all the vicissitudes incident to such a career. One characteristic, however, had become pronounced, through indulgence as well as natural proclivity,—an overweening vanity, with insatiable ambition. Embittered by defeat in his cherished projects in England, he turned his attention to America a few years previous to the Revolution, arriving in New York during the agitation just pre-

ceding the outbreak of hostilities. Of his services to the American cause at this time, as is true of the early military career of Benedict Arnold, only praise can be recorded. Whatever his secret motives, his patriotic utterances could but elicit the favor of the Continental Congress and popular admiration. With the movements of the army besieging Boston in 1775, and the appointment of Washington as commander-in-chief, the first intimations of Lee's designs become manifest. Though he fought bravely at Bunker Hill, it was evident that his animosity toward Washington was deep-seated. During Moultrie's repulse of Clinton in 1776, and in the campaign preceding the occupation of the Jerseys, Lee's self-love and temper were frequently displayed. On attaining the position of ranking major-general his purpose of self-advancement received such encouragement that he ventured to disobey the orders of his commander in the campaign which followed the evacuation of New York. Only when the American position had become so hazardous as to compel Washington to cross the Delaware was the traitorous design of Lee thwarted, by his capture while distant four miles from the army upon which Washington had placed every reliance. It was during Lee's imprisonment in New York that the incriminating correspondence with the Howes occurred, which, first made known to the world in 1857, has fully revealed the treasonable conduct of the pretended patriot. Inscrutable as appears his reinstatement upon his exchange, Lee rejoined Washington at Valley Forge, and had early opportunity to gratify his hatred in the campaign which culminated in the battle of Monmouth. Lee's behavior during that memorable conflict, when the American forces were saved from utter rout only by Washington's presence of mind, cannot be extenuated. Of Lee's dilatory movements in checking the onslaught of the British rear-guard, easily dispersed by Washington later in the day, there is but one possible explanation; and for Washington's conviction, as manifested in his scathing rebuke to Lee upon the field, there is every justification; and we have Lafayette's testimony that the commander's speech was suitable to the occasion rather than to wonted etiquette. Afterwards ordered to the rear, there followed his arrest, court-martial, and conviction, evoking the insults to Washington which led to his duel with Colonel Laurens, in which he was wounded, and finally to the letter libeling the Continental Congress, which resulted in his dismissal from the army. At his estate in the Shenandoah valley Lee wore away the remainder of his life in solitude and disgrace, dying miserably in a tavern, in Philadelphia, Oct. 2, 1782.

LEE, FITZHUGH, an American soldier; born in Fairfax County, Va., Nov. 10, 1835; graduated at West Point, but withdrew from the Union army and joined the Confederate forces, wherein he rose to the rank of major-general. From 1886 to 1890 he was governor of Virginia, and in the spring of 1896 he was appointed United States consul-general at Havana. In this position General Lee did signal service, not only keeping the State Department thoroughly informed as to Spanish policy and movements in the matter of the rebellion, but also upholding American

rights and interests with a vigor that won applause at home and respect in Havana and Madrid. During the trying period between the destruction of the *Maine* and his withdrawal from Havana on the 9th of April, 1898, his tact did much to avert the premature outbreak of war and to protect American life and property. Shortly after his return to the United States he was appointed (May 16) to the command of the Seventh Corps at Tampa, Fla. On the 13th of December he was appointed military governor of the province of Havana, and on the formal cession of Cuba on the 1st of January, 1899, he assumed the duties of his office.

FITZHUGH LEE.

LEE, FRANCIS LIGHTFOOT, an American statesman; born at Stratford, Westmoreland County, Va., Oct. 14, 1734. In 1765 he was elected to the House of Burgesses, and in 1775 was sent to Congress. Here he signed the Declaration of Independence and assisted in framing the Articles of Confederation. He died at Richmond, Va., April 3, 1797.

LEE, FREDERICK RICHARD, an English landscape painter; born at Barnstaple, Devonshire, in June, 1798. He chose a military career, but was obliged by ill health to quit it. He then turned his attention to painting, was an exhibitor at the Royal Academy from 1824 till 1870, and acquired a high reputation for landscapes, especially of English and Scotch scenery. He was elected an associate in 1834, and in 1838 a member of the Royal Academy, retiring in 1871. He died at Cape Town, South Africa, June 4, 1879.

LEE, HENRY, an American soldier; born at Stratford, Va., Jan. 29, 1756. In 1776 he became captain of cavalry, and in 1778 commanded an independent corps, with the rank of major, being popularly known as "Light-Horse Harry." In 1779 he received a gold medal from Congress for capturing Paulus Hook. He assisted Greene in the capture of Augusta, Ga., and took part in the battle of Eutaw Springs. After being a member of Congress, he was, in 1792, chosen governor of Virginia; and in 1794 he commanded the force sent by Washington to suppress the whisky insurrection in Pennsylvania. When Washington died, Lee, then again in Congress, pronounced his eulogy, and drafted the resolutions designating Washington as "first in war, first in peace, and first in the hearts of his countrymen." After Jefferson's election Lee retired from public life. He became involved in debt, and was confined in Spottsylvania County, during which time he wrote *Memoirs of the War in the Southern Department of the United States*. While returning from a health trip to the West Indies he died at Cumberland Island, March 25, 1818. He was the father of ROBERT E. LEE, q. v., Vol. XIV, p. 399.

LEE, LUTHER, an American clergyman; born at Schoharie, N. Y., Nov. 30, 1800. He became a preacher in the Methodist Episcopal Church in 1821

In 1836 he began to preach and lecture against slavery, and was several times attacked by mobs. In 1841 he founded and edited the *New England Christian Advocate*, an antislavery journal, at Lowell, Massachusetts, and subsequently he edited *The Sword of Truth and The True Wesleyan*. When, in 1843, the "Wesleyan Methodist Connection" was organized he became a pastor of that church at Syracuse, New York, and afterward at Fulton, New York. In 1856, Lee became president and professor of theology in the Michigan Union College at Seoni, but resigned the next year to officiate in churches in Ohio. From 1864 till 1867 he was professor at Adrian College, Michigan, and then returned to the Detroit conference in 1867. He was the author of *Universalism Refuted; Immortality of the Soul; Church Polity; Slavery Examined in the Light of the Bible* (1855); and *Elements of Theology*. He died at Flint, Michigan, Dec. 13, 1889.

LEE, ROBERT, a British divine and author; born at Tweedmouth, England, Nov. 11, 1804. After graduating at the University of St. Andrews he was ordained in the Church of Scotland in 1832. He became successively minister of Arbroath, Campsie and Old Grey Friars' Church in Edinburgh. In 1846, Lee was made professor of Biblical criticism in the University of Edinburgh. In 1857 he published *Prayers for Public Worship*, and used these prayers in his congregation. For this he was tried in the church courts and acquitted in 1864. Afterward he published *The Reform of the Church of Scotland in Worship, Government and Doctrine*, and introduced an organ in his church in 1865. For this innovation he was again tried, in both the ecclesiastical and civil courts. His most important work was a *Reference Bible* (1864), having about 60,000 references. He died at Torquay, March 14, 1868.

LEE, SAMUEL, an English Orientalist; born at Longnor, in Shropshire, May 14, 1783. He received his first instruction at a charity school, and at the age of 12 was apprenticed to a carpenter. While engaged at his trade he acquired the chief classical, Oriental and modern languages, subsequently studied at Queen's College, Cambridge, and took orders in the church. In 1819 he became university professor of Arabic, and in 1831 regius professor of Hebrew. He published several works on Biblical and linguistic subjects, among them being a *Hebrew Grammar* (1830); *Translations of The Travels of Ibn Batuta* (1833); and *Hebrew and English Lexicon* (1840). He died at Barley, Hertfordshire, Dec. 16, 1852.

LEE, WILLIAM HENRY FITZHUGH, an American soldier, second son of Gen. R. E. Lee; born at Arlington, Virginia, May 31, 1837; appointed lieutenant in the United States army in 1857, and served in the Utah campaign. In 1861 he joined the Confederate forces, became a brigadier-general in October, 1862, was captured and exchanged, and in April, 1864, as a major-general of cavalry, led his division from the Rapidan to Appomattox. In 1886 he was elected to Congress, and twice re-elected. He died at Ravensworth, Virginia, Oct. 15, 1891.

LEECHBURG, a post borough of Armstrong

County, central western Pennsylvania, on the Pennsylvania railroad, the Pennsylvania canal, and the Conemaugh River, 35 miles N.E. of Pittsburg. It is in a coal and natural-gas region, and has an academy, a wagon and carriage manufactory, tin factory and rolling-mill, all of which use natural gas for fuel. Population 1890, 1,921; 1900, 2,459.

LEECH LAKE, a lake about twenty miles long and sixteen miles wide, in the northern part of Minnesota, about seven miles south of Lake Cass. Its surplus water is discharged by a short outlet into the Mississippi River. It is in a heavily timbered region inhabited by Chippewa Indians. Elevation, 1,330 feet.

LEESBURG, a town and the capital of Loudoun County, northern Virginia, 36 miles N.W. of Washington, District of Columbia, on the Potomac River, and on the Southern railroad. It contains a seminary for young men and Leesburg Female Institute. It is in an agricultural region. The town has an abundant water-supply and electric lights and has saw and planing mills. The battle of Ball's Bluff was fought two miles from the town. Population 1900, 1,513.

LEESER, ISAAC, an American divine; born in Neukirchen, Westphalia, Dec. 12, 1806. After being engaged in commerce for a number of years he entered the Jewish ministry in 1829, as rabbi of the principal synagogue in Philadelphia. Among other works relating to the Jews, he has written *The Jews and the Mosaic Law* (1833); *Discourses on the Subject of Jewish Religion* (1836); and a translation of the Holy Scriptures from the original Hebrew (1845-53). He also established a magazine, *The Occident and American Jewish Advocate* (1843). His life was largely devoted to educational and charitable interests, which entitled him to universal esteem. His death occurred in Philadelphia, Feb. 1, 1868.

LEETONIA, a post village and a railroad junction of Columbiana County, central eastern Ohio, 65 miles N.W. of Pittsburg, on the New York, Lake Erie and Western and the Pittsburg, Fort Wayne and Chicago railroads. It has rolling and planing mills, coal-mines, coke-ovens, blast-furnaces, boiler-works, a nail and bolt mill, a foundry and lumber-yards. Population 1900, 2,744.

LEEWARD ISLANDS. See TAHITI ARCHIPELAGO, Vol. XXIII, p. 22; and WEST INDIES, Vol. XXIV, p. 510.

LEFEBVRE, FRANÇOIS JOSEPH, a French soldier; born at Ruffach, Alsace, Oct. 25, 1755; entered the French army in 1773; rose rapidly in the service, and became a brigadier-general in 1794; supported Napoleon, and was made a marshal upon the establishment of the empire. His distinguished bravery at the siege of Dantzic in 1807 was rewarded with the title of Duke of Dantzic; took Bilbao and defeated the British in Spain in 1808. He served in the Napoleonic campaigns, and commanded the left wing of Bonaparte's army in 1814, but surrendered upon the Bourbon restoration, being created a peer of France. He died in Paris, Sept. 14, 1820.

LEFEBVRE, JULES JOSEPH, a French painter of note; born at Tournay, March 10, 1836; was a pupil

of Léon Cogniet; gained the *grand prix de Rome* in 1861 by his painting, *The Death of Priam*. His first Salon picture, was a portrait (1855); afterward a frequent exhibitor; among his more prominent works being *Roman Charity* (1864); *Nymph and Bacchus* (1867); *Truth* (1870); *Madeleine* (1876); *Pandora* (1877); *Mignon* (1878); *Psyche* (1883); *Lady Godiva* (1890); and *A Daughter of Eve* (1892). He obtained three medals, in 1885, 1888 and 1870; medal of the first class at the Exposition Universelle (1878); medal of honor (1886); grand prize at the exposition of 1889; chosen member of the Academy of Fine Arts (1891); decorated with the Legion of Honor (1870); and made an officer of the same (1878). He excels in the portrayal of the nude, and his subjects are often allegorical or drawn from Greek and Roman mythology.

LEFÈVRE, TANNIGUI. See DACIER, Vol. VI, p. 759.

LEFEBVRE—DESNOUETTES, CHARLES, COMTE DE, a French general; born in Paris, Sept. 14, 1775. He entered the army, rising rapidly until 1808, when he became general of division; fought in all the campaigns of Napoleon, and was made a peer of France by him in 1815. When the Bourbons regained their power he was condemned to death, but escaped to the United States, where he carried on several schemes to liberate Napoleon, and for the founding of a French colony in Alabama. In his will Napoleon left him \$30,000. He was lost at sea, near Kinsale, Ireland, while returning to France, April 22, 1822.

LEFKOSIA, ancient capital. See CYPRUS, Vol. VI, p. 748; NICOSIA, Vol. XVII, p. 491; and in these Supplements.

LEGACY, a gift of personal property made by last will and testament. It may consist of a bequest of money, which is sometimes made a charge upon real estate. A legacy may be absolute and unconditional, or it may be subject to the happening of some uncertain event or condition. It may also be general, in which case it is made without reference to any particular property of the testator, as in the case of the general bequest of money which may be derived out of any of the estate; or specific, in which case it consists of a specified portion of the testator's personal estate, as distinguished from the remainder of the estate. A residuary legacy is a bequest of residue of the testator's personal estate after other interests are ascertained. A legacy is said to lapse when the legatee or beneficiary thereof dies before the death of the testator, in which case the interest does not become vested in him. Any person who is not an alien enemy or under statutory disability may become a legatee; but in some cases a legacy to one who is a subscribing witness to the will is held void. In both England and the United States legacies to charitable or other public institutions are favored by the courts, and frequently legacies of this class are sustained when they would in other cases be void for uncertainty. See also WILL, Vol. XXIV, pp. 570-574.

LEGAL EDUCATION IN THE UNITED STATES. The American lawyer receives his education in two ways,—by study in the office of a prac-

ticing attorney, and by attendance upon the lectures of a law school. To treat definitely and concisely of the former method is almost an impossibility. Until comparatively recent times, colleges where legal instruction was given in regular class-work were unknown. The early American lawyers were men educated in the offices of the attorneys and barristers. The first regular university instruction in common law was given by Blackstone, at Oxford, England, in 1758. With his appointment to the chair of English law began the agitation for separate law departments of instruction, which resulted, in America, in the establishment, in 1779, at the College of William and Mary, in Virginia, of such a school. Later, in the same year, lectures were given in law at Harvard College. In 1790 the University of Pennsylvania founded a chair of law, of which James Wilson was the first occupant. The first American law school distinct from a college was opened at Litchfield, Connecticut, in 1784. These schools were the result of overcrowded law-offices, and to no small extent was their establishment incited by the publication of *Blackstone's Commentaries* which furnished a text-book, hitherto a desired but unknown means of studying English law. The number of law schools in the United States increased from year to year, until in 1895 there were in operation 67 recognized colleges giving instruction in the various branches of jurisprudence. In the early years of these institutions the instruction given supplemented the office-practice, which was continued along with the lectures. In the beginning the lecture system was the only practical plan of instruction, owing to the temporary and limited employment of instructors. With the growth of the schools, methods and systems have sprung up almost equaling in number the schools themselves. These various methods may be classed as three: 1. Instruction by lectures; 2. Instruction by recitations upon lessons previously assigned; 3. Instruction by the presentation and study of leading cases. The last method is practiced in but three colleges,—Harvard University, Massachusetts; Metropolis Law School, New York; and Western Reserve University, Ohio. Of the 67 schools existing in 1895, 33 could be placed in the first class and 24 in the second. In some the two systems are combined, with the principal attention given to lectures. To take the place of the practice formerly obtained in the attorney's office, many of the schools conduct, as part of the curriculum, a moot court, in which the actual work of the regular court is carried on by the students. An agitation similar to that which, about 1890, modified the medical schools of the United States, and which was based upon an elevation of the entrance requirements, is necessary to place the law schools where they will relieve the country of a surplus of half-educated practitioners. An extended investigation of the entrance requirements of the various schools reveals a condition of affairs most deplorable. While some schools, by their high standards and rigid examinations, give hope of a future development, yet the laxity of the great majority gives an easy explanation of the low standards of the legal profession, so far as education is concerned.

The man whose preparation is such that he would be refused admission to the schools of any of the other professions is permitted to enter the law without objection. Almost without exception, the law schools require that an applicant for admission shall have read *Blackstone's Commentaries*, and yet many of those schools do not require the student to have sufficient knowledge to understand what he has read. In some states, laws have been passed which, to some extent, remedy the evils of the college system. In many states it is seriously debated whether it would not be advisable to require all law students to first take collegiate courses. The necessity of a grasp of general law, and not merely a technical understanding of a few principles connected with the studies taught in the average law school, is doubted by no one. As Roman law is recognized as the foundation of all law, it is indispensable that the law student should make a study of the essential principles of that ancient code, many of which are used in practice, unchanged, in the American and English courts. So, too, with international law, which is looked upon as a distinct branch of law, and an understanding of which is an essential in the well equipped. That the reform movement in legal education will cause the trustees of law schools to make such studies as the two just mentioned a part of the required course, is no longer a matter of conjecture. It is a certainty. In a number of law schools, which are maintained as parts of great universities, the students are required to attend the collegiate classes in taxation, political economy, international law and Roman law. In others, the option of so doing is given the students. According to the report of the United States Commissioner of Education for 1894, the proportion of law students who have first graduated from a collegiate institution is surprisingly small. Then there were in attendance at the various colleges 8,644 students, of whom but 1,783 were the possessors of college degrees. That the collegiate course is a benefit, and is recognized as such by the law-makers of the various states, is evident from the answers received by the Committee on Legal Education of the American Bar Association to questions sent to the various states, and embodied in the report of that committee at the Bar Association meeting in 1891. In answer to the question, "Does the law of your state require students to read for any specified time before applying for admission to the bar?" the following states returned a negative: Alabama, Arkansas, California, Florida, Georgia, Michigan, Mississippi, Missouri, Nevada, New Hampshire, North Carolina, South Carolina, Tennessee and West Virginia. The matter was reported to be regulated by the courts as follows: In Connecticut the candidate must be at least 18 years of age, must read in an office three years, unless a college graduate, when two years is sufficient, and one year must be in the state; in Illinois, two years of study required, unless the applicant is a graduate of one of the law schools of the state, or has a license to practice in another state; in New York, three years in an office, two for college graduates, two years at a law school being equivalent to two of these required years, except to college graduates, who can count this period as equivalent

to one year; in Oregon, two years of study in an office required of a college graduate, and three years of all others; in Pennsylvania, two years' study in an office, subject to county court regulations; in Rhode Island, two years in a law school or in an office, but six months' study, in either case, must be in an office within the state. In other states the period prescribed by statute is as follows: In Colorado, two consecutive years of study; in the Dakotas, two years in an office or in some law school of the United States, or partly in either; in Delaware, either three years of office study, with a preliminary examination, or a diploma from a law school; in Louisiana, two years in an office, or graduation from some law school of the state; in Maryland, two years of office study; in Minnesota, two years in an office, graduates of the University of Minnesota Law Department being admitted on their diplomas; in Montana, two years of office study; in Nebraska, two years in office of an attorney; in New Jersey, five years in an office, unless a college graduate, of whom but three years are required, a year and a half in a law school being equivalent to same amount of time in an office; in Ohio, two years of office study; in Vermont, three years in an office required of all but graduates of law schools, who are admitted by examination; in Wisconsin, two years of office study are required; in Wyoming, two years of office study, the last of which must be in the state. It might be well to add, as to the power of inferior courts to admit persons to the bar, that negative answers were received from 17 states,—Colorado, Connecticut, Illinois, Louisiana, Montana, Nevada, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oregon, Rhode Island, South Carolina, Vermont, Virginia, Wisconsin.

In the majority of law schools the course of study covers a period of two years, in a few three years, and in eight instances but one year. It is the tendency to increase the length of the course. The degree generally conferred is that of bachelor of laws. Many institutions offer an additional year for graduate study, upon the completion of which the degree of master of laws is conferred. The question of the entrance of women into the legal profession for a time stirred law school authorities. Women have not, however, sought admission in any considerable number, as, in 1894, of 7,311 students registered, only 54 were women. In 1890 there were but 4,518 students enrolled in law schools; in 1895 there were 8,644. In 1890, to a total population in the United States of 62,622,250, there were 87,422 practicing lawyers. The following table will show the number and location of the various law schools, together with the number of students and instructors in each, and the number of collegiate graduates. Where a law school is a department of a university, the university name is given, and not the distinctive college name. The statistics are for 1893-94, and were obtained from the United States Commissioner of Education. Two schools, Indian Central Normal College, and the American Temperance University at Harriman, Tennessee, are not included in the list, as no information was received regarding them.

public or private, and will constitute a legal tender in any quantity. The standard silver dollar, is a legal tender for all debts, public and private, except when otherwise stipulated in the contract, and fractional silver coins, consisting of those coins of smaller denominations than one dollar, are a legal tender for all debts, public and private, in amounts not exceeding ten dollars, but such fractional coins may be exchanged for legal-tender money at the United States Treasury in sums of twenty dollars and multiples thereof. United States Treasury notes are legal tender for the payment of all debts, public and private, except for duties on imports and interest on the public debt, and except when otherwise expressly provided in the contract. Certificates issued upon the deposit of gold or silver coin in the Treasury of the United States are receivable for all customs, taxes and public dues, and may be redeemed in the coin which they represent, at the option of the holder. National bank notes constitute a legal tender for taxes and excises, and all other dues to the United States, except duties on imports, and also for all salaries and other debts and demands owing by the United States to individuals, corporations and associations within the United States, except interest on the public debt. The minor coins, consisting of a five-cent piece, a three-cent piece and a one-cent piece, are a legal tender for any amount not exceeding twenty-five cents. The coinage of the three-cent piece has been discontinued. Trade dollars, which consisted of 420 grains of silver, are no longer legal tender. Foreign gold and silver coins are not legal-tender money in the United States. Acts of Congress as to the legal tender of money have been held by the supreme court of the United States to be constitutional, as applied to pre-existing contracts, as well as to those made after the passage thereof. See also *Tender*, under PAYMENT, Vol. XVIII, p. 441.

LE GALLIENNE, RICHARD, poet, journalist, and critic, was born at Liverpool, Eng., Jan. 20, 1866, of a Guernsey family. In 1891 he devoted himself to journalism, being connected with the *London Star*, *Chronicle*, and *The Speaker*, and is a current contributor to the leading English monthlies and reviews. He has also lectured largely, and in that capacity paid a visit in 1898 to the United States. His published works include *My Ladies' Sonnets*, *Some Characteristics of George Meredith*, *English Poems*, *The Religion of a Literary Man*, *R. L. Stevenson, an Elegy and Other Poems*, *Prose Fancies*, a paraphrase of the *Rubaiyat of Omar Khayyam*, *Retrospective Reviews*, *The Quest of the Golden Girl*, and *If I Were God*. *The Romance of Zion Chapel*, *Young Lives*; also an edition of *The Compleat Angler* of Isaak Walton.

LEGARÉ, HUGH SWINTON, an American statesman; born at Charleston, South Carolina, Jan. 2, 1789, of Huguenot and Scotch descent. Upon graduating from the College of South Carolina in 1814, he studied law, traveled abroad, and on his return to Charleston was chosen to the state legislature (1820), serving again (1824-30), and was attorney-general of South Carolina in 1830. At the same time he became chief editor of the *Southern Review*.

LEGAL TENDER. Under the laws of the United States, the gold coins of the United States are legal tender for their face value for any debt,

In 1832 he became *chargé d'affaires* at Brussels. In 1837 he entered Congress, but, although holding a high place in debate, his financial views dissatisfied his constituents and he failed of re-election. During the Presidential canvass of 1840 he contributed a series of notable papers to the *New York Review* touching ancient democracy and Roman law. In 1841 President Tyler nominated him for Attorney-General of the United States, and when Daniel Webster withdrew from the Cabinet in May, 1843, Legaré was appointed to fill the vacancy of Secretary of State. He died suddenly in Boston, on June 2, 1843, while attending, with President Tyler, the ceremonies at the unveiling of the Bunker Hill Monument.

LEGER, PAUL LOUIS, a French writer, born in Toulouse, France, Jan. 13, 1843. He has given his time to the history and philology of the Slav peoples, traveling all through Europe several times and learning nearly all the European languages. In 1869 he lectured at the Sorbonne; in 1871, he became professor of Oriental languages in the *École Spéciale des Langues Orientales*, and in 1885 professor of Slav languages and literature in the *Collège de France*. Among his works appear *Études Slaves* (1875); *Nouvelles Études Slaves* (1880); *La Bulgarie* (1885); *Histoire de l'Autriche-Hongrie* (1878); and *La Littérature Russe* (1892).

LEGGE, JAMES, a Scotch sinologue; born at Huntley, Aberdeenshire, Dec. 20, 1815. After studying theology at Highbury College, London, he was, in 1839, sent by the London Missionary Society to take charge of the Anglo-Chinese College at Malacca and in 1843 removed to Hong Kong, where he performed the functions of a missionary for thirty years. In 1875 Dr. Legge was made professor of the Chinese language at Oxford; he wrote a book on *The Notions of the Chinese Concerning God and Spirits*, in order to determine the controversy about the proper term for the Supreme Being in Chinese. His most important literary undertaking was his edition of the *Chinese Classics*, giving the original text, English translation, explanatory notes and copious prolegomena. He died at Oxford, Nov. 29, 1897.

LEGOUVÉ, GABRIEL JEAN BAPTISTE ERNEST WILFRID, a voluminous French dramatist and author; born at Paris, Feb. 15, 1807. He was educated at the College of Bourbon, and, after publishing some novels, turned his attention to writing dramas, as *Louise de Lignorolles* and *Adrienne Lecouvreur*, which latter was made famous by Rachel in 1849, and later by Bernhardt and Modjeska. He also wrote some comedies, as *Les Doigts de Fée*; *Réatrix*, dramatized from his novel of the same name; *Miss Suzanne*; *Les Deux Reines de France*; *Bataille de Dames*; *Les Contes de la Reines de Navarre*; and *Médéc*; and delivered popular lectures, which were collected under the title *Les Pères et les Enfants au XIXe Siècle* (1867-69). His long list of works include *Histoire Morale des Femmes*; *L'Art de la Lecture*; *Une Élève de Seize Ans*; etc. He was decorated with the Legion of Honor in 1845; became officer in 1864, and commander in 1887.

LEGROS, ALPHONSE, a Franco-English painter; born at Dijon in 1837. He studied painting at Lyons and Paris, and exhibited a portrait of his

father at the Paris Salon when he was only 19. Champfleury, seeing this portrait, encouraged the young artist. In 1859 Legros produced *The Angelus*; in 1861 *Ex Voto*; and other works followed. Removing to England in 1863, his rustic simplicity found more favor than in Paris. He became Slade professor in University College, London, and also taught painting in the South Kensington Museum. Among his later works are *The Pilgrimage*; *The Spanish Cloister*; *The Baptism*; *The Coppersmith*; and several portraits, among them those of Carlyle, Victor Hugo and Cardinal Manning. His works became widely known through engravings and lithographs.

LEGUMIN OR VEGETABLE CASEIN, an albuminoid substance, not essentially different from the casein of milk, found in the seeds of leguminous plants. It constitutes about a fourth of the substance of peas and beans.

LEGUMINOSÆ, one of the largest families of dicotyledonous plants, but allied to the *Rosaceæ* through the *Mimosas*. In general, the family is characterized by its one-celled pod and irregular (papilionaceous) flowers. It is divided into three prominent tribes, the *Papilionaceæ*, containing about 5,000 species, and such well-known plants as peas, beans, clover, locust, vetches, etc.; *Cesalpineæ*, with about 750 species, among which are cassia, honey-locust, logwood, redbud, etc.; and *Mimosæ*, with 1,350 species, among which are the acacias, mimosas and various other "sensitive plants." See also GRASSES, Vol. XI, p. 59.

LEH, a town of Kashmir, northern India, among the Himalayas, at the foot of Harding Pass, 11,530 feet in altitude, on a small plain of the Indus. It has several temples and a very large palace. It is the great rendezvous for communication between Punjab and Tibet and Chinese Turkestan, and the principal mart for shawl-wool brought from the latter country. Population, 4,000.

LEHIGH RIVER, a river of northeastern Pennsylvania, which rises in Wayne County and flows through a hilly and picturesque region, where much anthracite coal is found. After flowing in a southwesterly and then a southeasterly course, it turns northward and reaches the Delaware River at Easton. It is navigable for 70 miles from that point, and touches, in its course, Whitehaven, Mauch Chunk and Allentown, passing through a gorge or gap in the Kittatinny Mountain. Length, 120 miles.

LEIGHTON, a post borough of Carbon County, central eastern Pennsylvania, situated on the west bank of the Lehigh River, three miles below Mauch Chunk, on the Central Railroad of New Jersey and the Lehigh Valley railroad. The Carbon County Industrial Society has its exposition grounds here. Its principal manufactures are stoves, furnaces, cars, springs, carriages, bricks and leather. Population 1890, 2,959; 1900, 4,629.

LEHIGH UNIVERSITY, an educational institution at South Bethlehem, Pennsylvania. It was founded and endowed by Asa Packer in 1866. The college provides for three courses of study: classical, Latin-scientific, and scientific and literary, besides

an engineering department. The latter includes six courses—civil, mechanical engineering, mining and metallurgy, electrical engineering, chemistry and architecture. Bethlehem is located in the center of the great engineering and mining industries of the state, so that the technical facilities of the school are exceptionally good. There are five buildings devoted to instruction, a library containing 100,000 volumes, a chapel, an observatory and a gymnasium. There are 37 instructors and about 400 students. The endowment fund and income-bearing property amount to \$2,500,000. The income from other sources amounts to \$20,000.

LEH OBSERVATORY. See TIBET, Vol. XXIII, p. 342.

LEICHHARDT, LUDWIG, a German explorer; born in Trebatsch, Prussia, Oct. 23, 1813. He was educated at the University of Göttingen, went to Australia, and carried on geological investigations in New South Wales; set out in 1844 from North Monton Bay, and with seven comrades crossed the continent, a journey of 2,500 miles. In 1847 he attempted to repeat the adventure, but no reliable information of him was afterward obtained. He wrote *Contributions to the Geology of Australia and Journal of an Overland Expedition in Australia from Monton Bay to Port Essington* (1847).

LEIDY, JOSEPH, an American naturalist; born in Philadelphia, Pennsylvania, Sept. 9, 1823. He graduated in the medical department of the University of Pennsylvania in 1844. In 1845 he became prosector to the chair of anatomy of the same school, and in 1846 demonstrator of anatomy in the Franklin Medical College. In 1853 Dr. Leidy was made professor of anatomy in the University of Pennsylvania, and in 1871 he was called

JOSEPH LEIDY.

to the professorship of natural history in Swarthmore College, which position he held till 1884. On the establishment of the department of biology in the University of Pennsylvania in 1884, Dr. Leidy became its director. He held this office to the time of his death. He was a member of numerous scientific societies, and published some 800 papers on biological subjects. His principal works are *Memoir on the Extinct Species of the American Ox; A Flora and Fauna within Living Animals; Ancient Fauna of Nebraska; On the Extinct Sloth Tribe of North America; Cretaceous Reptiles of the United States; The Extinct Mammalian Fauna of Dakota and Nebraska; On the Fossil Horse; Parasites of the Termites; The Tapeworm in Birds; and Extinct Vertebrate Fauna of Western Territories*. He was also the author of *An Elementary Text-Book on Human Anatomy* (1861). The value of his scientific work was substantially recognized by the council of the Boston Society of Natural History, which awarded him the Walker prize. On account of the extraordinary merit of his researches, the prize, which usually

consists of the sum of \$500, was increased to \$1,000. Died in Philadelphia, April 30, 1891.

LEIF ERIKSON OR ERICSSON, a Norse discoverer; born in Iceland about 970. His father, Erik the Red, was discoverer and colonizer of Greenland. There are two sagas from which we derive our information of Leif Ericsson. Both tell essentially the same story, varying only in the cause ascribed for his setting out. In the *Flateyrbok* he is represented as setting out in search of land seen by Bjarne Hujulfson a few years before, while the *Hauksbok* saga says he was sent by King Olaf Trygvason to introduce Christianity into Greenland. Whatever the cause, they both agree that in the year 1000 he landed on the shores of North America—first in Newfoundland, then in Nova Scotia, and finally in New England, where he spent the winter of 1000-01, and which he called "Vinland," because of the abundance of wild grapes found there. He then set sail for Greenland, where he became chief of the colony. He is supposed to have died about 1020. The history represented in the sagas rests upon no slender foundation, being confirmed by Adam of Bremen, whose chronicle cites the discovery of Vinland as authentically reported to him by the Dane, Svend Estridson, who "knew the history of the barbarians (*sic*) by heart, as if it had been written." It may be mentioned that for several years the late Prof. E. N. Horsford pursued his researches concerning the identity of Vinland, claiming to have established the site of the chief settlement, Norumbega. See also AMERICA, Vol. I, p. 706; and NORUMBEGA, in these Supplements.

LEIGHTON, ALEXANDER. See BIBLIOGRAPHY, Vol. III, p. 659, and LEIGHTON, Vol. XIV, p. 427.

LEIGHTON, FREDERICK, BARON, a British artist, and late president of the Royal Academy, was born at Scarborough, England, Dec. 3, 1830. Manifesting in youth a passion for painting, he had it gratified by his parents, chiefly in Rome, where he studied under the Italian painter, Filippo Meli, as well as, later on, in Berlin and Florence. In the latter city, the American sculptor, Hiram Powers, had much to do with the decision which led young

LORD LEIGHTON.

Leighton to adopt art as a profession. In 1849 he produced at Brussels his first finished picture, *Cimabue Finding Giotto Drawing in the Fields*. After this he continued his studies in Frankfort-on-the-Main, in Paris, and in Vienna and Rome, where he achieved fame by his *Cimabue's Madonna Carried in Procession through the Streets of Florence*. This fine painting was exhibited in the English Royal Academy galleries in 1855, and so striking a work of art was it that it was purchased by Queen Victoria, and afterward exhibited at the Manchester Art Treasures and in the inter-

national exhibitions. After this success, Leighton rapidly produced other attractive pictures, distinguished for their profusion of rich color and light and their admirable decorative or Renaissance effect. The more important of these are *The Triumph of Music* (1865); *Paolo and Francesca* (1861); *Star of Bethlehem* (1862); *Girl Feeding Peacocks* (1863); *Orpheus and Eurydice* (1864); *Ariadne* (1868); *Hercules Wrestling with Death* (1871); and *The Daphnephoria* (1876), a marvel of classic art, with figures of rare beauty clad in matchless draperies, and aflame with color. In 1864 he became an associate of the Royal Academy, and five years later was chosen an academician, when he contributed *St. Jerome* and *Electra at the Tomb of Agamemnon* as his diploma work. In 1878 he was elected president of the Academy and received the honor of knighthood. In his hands the presidency became a great and honorable function, for Leighton, in addition to his gifts as an artist and a sculptor, was an accomplished man of the world, a fine scholar and linguist, and he had the grand manner which harmonized well with his elevated position. He was created a baronet in 1886. As a sculptor he won distinction in 1877 with his *Athlete Strangling a Python*, which was acquired by the Academy, under the Chantrey bequest, for two thousand guineas. His chief later paintings include *Cymon and Iphigenia* (1884); *Greek Girls Playing at Ball* (1889); *The Bath of Psyche* (1890); *Rizpah and The Frigidarium* (1894). He died in London, Jan. 25, 1896, and was buried in St. Paul's cathedral.

LEINSTER. See IRELAND, Vol. XIII, pp. 215, 229.

LEITHA, a river of lower Austria and Hungary, rising in Wiener Wald, flowing generally near the eastern boundary of Austria, but turning into Hungary about 17° W., and entering the Danube. Its length is less than 150 miles.

LEITNER, GOTTLIEB WILHELM, a Hungarian Orientalist; born in Budapest, Hungary, Oct. 17, 1830. In 1849 the family removed to Turkey, on account of the revolution of that year. While in Turkey he became proficient in Turkish, Arabic and modern Greek, and acted as interpreter to the British commissariat in the Crimean War. He went to England, became naturalized, was appointed professor of Oriental languages and Mohammedan law in King's College, and in 1864 director of a college at Lahore, in the Punjab. In 1866-68 he was engaged in exploring Tibet and other countries north of the Himalayas, and later carried on investigations in Kashmir and Badakshan. Among his publications are a translation of Heine's *Reisbilder*; a *Philosophical Grammar of Arabic*; *Races of Turkey*; *History, Songs and Legends of Dardistan*; and *Græco-Buddhist Discoveries*. Died in Bonn, March 24, 1899.

LELAND, CHARLES GODFREY, an American author; born at Philadelphia, Aug. 15, 1824. After graduating at Princeton College in 1846, he spent two years in travel in Europe, studying at Heidelberg, Munich and Paris, and lived among the gipsies in various countries, becom-

ing familiar with their language, beliefs and customs. After his return to America in 1848 he studied law, but gave it up for literature; edited, in New York, *The Illustrated News*; established, in Boston, *The Continental Magazine* (1861); returned to Philadelphia in 1863, and for several years edited *The Press*; went to Europe in 1869 and remained eleven years; and after his return devoted himself to the introduction of manual teaching in Philadelphia public schools. He is well known by his *Hans Breitmann's Ballads* (1870). Among his other writings are *Poetry and Mystery of Dreams*; *Meister Karl's Sketch-Book*; *Sunshine in Thought*; *Legends of Birds*; *Egyptian Sketch-Book*; *English Gypsies and Their Language*; *English Gypsy Poetry*; *Algonquin Legends*; *Practical Education*; *A Manual of Wood-carving and Leather Work*.

CHARLES G. LELAND.

LELAND STANFORD JUNIOR UNIVERSITY, an institution of learning at Palo Alto, California, founded and endowed by Leland Stanford and Jane Lathrop Stanford in memory of their only son. The university was opened to students of both sexes in 1891, under the presidency of David Starr Jordan. Mr. Stanford gave to the university property worth about nine million dollars, besides the present equipments. The endowment, at present, is in large tracts of land—one of 55,000 acres in Tehama County, another of 22,000 acres in Butte County, and the Palo Alto farm, consisting of 8,000 acres. The pres-

MUSEUM, LELAND STANFORD UNIVERSITY.

ent income is about two hundred thousand dollars. At the death of Mrs. Stanford the whole estate will fall to the university, bringing the endowment up to at least twenty million dollars. The control of funds and the general management are vested in a board of 24 trustees, chosen for life. The president, appointed and removable by the board, has control of the educational policy, chooses the faculty, has charge of the routine business, and is empowered to exercise an absolute veto on any legislation of the faculty. Each professor has charge of all matters relating to his department, being answerable only to the president. The general courses of the university

lead to the degree of bachelor of arts. The technical courses lead to the degrees of mechanical engineering and civil engineering. There is also a course in agriculture. A noteworthy fact is that no honorary degrees are given.

The campus is situated on the Palo Alto farm, and embraces one hundred acres. The buildings, all after the style of the old mission houses, are arranged in two quadrangles, one inclosing the other. The inner quadrangle is composed of one-story buildings joined by arcades. These are used as recitation-halls, and are fourteen in number. In the center is a court 600 feet long by 250 feet wide. The plan of the outer quadrangle embraces buildings two stories high, of the same style of architecture as the inner. The main entrance consists of a memorial arch 80 feet wide, 85 feet high, and having an open span of 46 feet. Outside the quadrangles are large dormitories and cottages, built for members of the faculty, or families who wish to live near the university while their children are being educated. The attendance has grown rapidly in numbers, and at present there is an average attendance of about a thousand, including men and women. There are 85 instructors, and the library contains over 30,000 volumes.

LEMAÎTRE, FRANÇOIS ÉLIE JULES, a French poet and critic; born at Vennecy, April 27, 1855. He finished his education in Paris, at the seminary of Notre Dame des Champs, and in the normal superior school; was professor of rhetoric at the Havre Lycée till 1880; in charge of the course in literature at the School of Letters of Besançon in 1882; in the following year professor of letters at Grenoble; and in 1884 retired to give his attention to literature. He became editor of the *Revue Bleue*; contributed to the *Temps* and to the *Journal des Débats*; received the decoration of the Legion of Honor in 1889, and in 1895 was made an academician. His best works are *Les Contemporains* (1886); *Impressions de Théâtre* (1888-90); *Sérénus, Histoire d'un Martyr* (1886); *Dix Contes* (1889); the comedies, *Revoltec* (1889); *Le Député Leveau* (1891); and in the same year *Mariage Blanc*.

LE MARS, a town and the capital and a railroad junction of Plymouth County, northwestern Iowa, 25 miles N.E. of Sioux City, on the Floyd River, and on the Illinois Central and the Chicago, St. Paul, Minneapolis and Omaha railroads. It is an important grain, live-stock and lumber market, and has flour and planing mills, gas and electric lights and good educational advantages. Population 1890, 4,036; 1900, 4,146.

LEMOINE, JAMES MACPHERSON, a Canadian historian and naturalist; born in Quebec, Canada, Jan. 24, 1825; was educated at Le Petit Séminaire, and was admitted to the bar in 1850. He devoted most of his time to researches in early Canadian history, and the study of natural history and ornithology. Among his works are *L'Ornithologie du Canada* (1860); *Legendary Lore of the Town St. Lawrence* (1862); *Picturesque Quebec* (1882); *Explorations in Eastern Latitudes*

(1889); and *Conférences et Mémoires; Histoire, Archéologie* (1882-90).

LEMOÏNNE, JOHN ÉMILE, a French journalist; born in London, Oct. 17, 1815. He pursued his earlier studies in England, and completed his education in France. He joined the staff of the *Journal des Débats*, as English correspondent, in 1840; subsequently was appointed editor of that newspaper, and conducted it successfully through all the vicissitudes of political strife. In 1876 he was elected a member of the Academy; Senator for life in 1880; and minister to Brussels the same year, but resigned in a few months. His *Études Critiques et Biographiques* (1852) and *Nouvelles Études* (1862) contain specimens of his best style. He also wrote many articles on England and other countries. Died in Paris, Dec. 14, 1892.

LEMON, MARK, an English journalist and humorist; born in London, Nov. 30, 1809. He was educated at Cheam, near Epsom, and about 1825 wrote a farce, the first of a long series of melodramas, operettas and songs, many of the latter gaining wide though transient popularity. He also produced several novels, children's stories and essays, and appeared as a lecturer and public reader. In 1841 he helped to establish *Punch*, of which, for the first two years, he was joint editor with Henry Mayhew, and thereafter sole editor till his death; was literary editor of the *Illustrated London News* for several years; and was connected with Charles Dickens in managing *Household Words*. He died at Crawley, Sussex. May 23, 1870.

LEMON-GRASS (*Andropogon Schwananthus*), a perennial grass, a native of India and Arabia, three to four feet high, possessing a strong lemon-like fragrance. An essential oil is obtained from it, which is used in perfumery, and an infusion of its leaves is used as tea. The name is also given to other fragrant species of the genus.

LEMON-OIL, an essential oil obtained by pressure or steam-distillation from lemon-peel, consists of limonene and other terpenes. Mixed with sugar and citric acid, it forms lemon-sugar, and is used in lemon flavors and medicine.

LEMONT, a post village of Cook County, northeastern Illinois, 25 miles S.W. of Chicago, on the Chicago and Alton railroad. It has quarries of fine Silurian limestone called Athens marble. Population 1900, 2,449.

LE MOYNE, a French pioneer family who rendered valuable services in Canadian exploration and colonization. Of these:—CHARLES LE MOYNE, born at Dieppe, France, in 1626, the founder of the family, emigrated to Canada in 1641; lived four years among the Hurons, and afterward at Villemarie, Canada, where he had received extensive land grants. In 1651 he repulsed the Iroquois Indians. In 1668 Louis XIV made him Sieur de Longueuil, and afterward, also, de Chateauguay. For a long time he was commander of Montreal and took part in expeditions against the Iroquois. He died in 1683. Of his eleven sons, Bienville and Iberville (q.v., in these Supplements) were the most noted. The fol-

lowing, also, distinguished themselves.—CHARLES, BARON DE LONGUEUIL, the eldest, was born at Villemarie in 1656. In his youth he served in the French army in Flanders, and afterward in Canada, where he was made major of Montreal in 1683. In 1690 he became governor of Montreal, and in 1711 he defeated the English expedition of Walker and Nicholson. He became commandant-general of the colony in 1711, governor of Three Rivers in 1720, and was governor of Montreal again from 1724 to 1726, during which time he rebuilt Fort Niagara. He was made chevalier of St. Louis. He died June 8, 1729.—JACQUES, SIEUR DE STE. HÉLÈNE, born in Montreal, April, 1659; served with his brother Pierre, in 1686, in De Troye's expedition against the English on Hudson Bay, which resulted in the capture of three forts and a war-vessel. In 1690 he shared the command of the force sent to capture Schenectady, when the French plundered and burned that town. In October of the same year he defended Quebec, which was besieged by Admiral Phips, and repulsed the English, but was wounded mortally at the moment of victory.—PAUL, SIEUR DE MARICOURT, born at Villemarie in 1663. He took part in expeditions to Hudson Bay with Iberville, and also at Quebec. Afterward he was engaged in Frontenac's expedition against the Iroquois, and negotiated peace with them in 1701, but was killed by them in April, 1704, after they had adopted him into their tribe and had begged him to be a mediator between them and the French governor.—JOSEPH, SIEUR DE SÉRIGNY, born at Villemarie, July 22, 1668. He went to France and commanded a flotilla which was to co-operate with the land-forces under his brother Iberville in taking possession of Hudson Bay. He afterward conveyed some of the first colonists to Louisiana, surveyed its coast, erected several forts there, drove the Spaniards from Dauphin Island (in Mobile Bay), and assisted in capturing Pensacola. He became captain of a ship of the line in 1720, and in 1723 was made rear-admiral and governor of Rochefort, France, where he died in 1734.—ANTOINE, SIEUR DE CHATEAUGUAY, born at Montreal, July 7, 1683. He entered the French army, and arrived at Louisiana in 1704 with a band of colonists. In 1717 he was made commandant of the troops in Louisiana, and in the next year king's lieutenant of the colony and knight of St. Louis; fought against the Spaniards, was taken captive and held till 1720. He then held command at Mobile until 1726, when he was removed from office and ordered to France. From 1727 to 1745 he was governor, successively, of Martinique, Cayenne and Cape Breton (then called Isle Royale). He died at Rochefort, France, March 21, 1747.

LEMPA, a river. See SAN SALVADOR, Vol. XXI, p. 268.

LEMPRIÈRE, JOHN, an English scholar; born about 1765. He was educated at Westminster, and at Pembroke College, Oxford; took orders in the Church of England; was, in turn, instructor in Lever's grammar school at Bolton; head master

of Abingdon and Exeter grammar schools, and rector of Meath, in Devonshire, and of Newton-Petrock. His famous *Classical Dictionary* (1792) remained for many years the standard work of reference in England on ancient mythology, biography and geography. Another work of Lemprière's was *Universal Biography* (1808). He died Feb. 1, 1824.

LEMURES. See LARES, Vol. XIV, p. 313.

LEMURIDÆ. See LEMUR, Vol. XIV, p. 442.

LENA, a post village of Stephenson County northwestern Illinois, on the Illinois Central railroad, 132 miles N.W. of Chicago. It has manufactures of carriages, sashes and blinds and shoes. It is the shipping-center of an agricultural and stock-raising region. Population 1900, 1,252.

LENA, a river of Siberia. See YAKUTSK, Vol. XXIV, p. 726; and SIBERIA, Vol. XXII, p. 5.

LENNI-LENAPE, early American Indians. See AMERICA, Vol. I, pp. 692, 693; and NEW JERSEY, Vol. XVII, p. 398.

LENORMANT, CHARLES, a French art critic and archæologist; born in Paris, June 1, 1802; studied for the law, and afterward traveled in Italy, where he gave special attention to archæology. In 1828 he accompanied Champollion, the younger, to Egypt, and later was a member of the commission for the exploration of Morea. After holding a number of official positions, he became professor of Egyptian archæology at the College of France, and conservator of the Royal Library. Besides an *Introduction to Oriental History* (1838), he wrote numerous articles on art, numismatics and ceramics. He died in Athens, Nov. 24, 1859.

LENORMANT, FRANÇOIS, a French archæologist, son of the preceding; born in Paris, Jan. 17, 1837; studied under his father, and at an early age engaged in numismatic and archæological researches. In the interest of his science he traveled in Germany, Italy, Greece, Turkey and Egypt, and in 1874 was appointed professor of archæology in the *Bibliothèque Nationale*. In 1878 he attended the congress of Orientalists at Florence. Besides being editor of the *Moniteur des Architectes*, and founder, with M. de Witte, of the *Gazette Archéologique*, he has contributed largely to French and other antiquarian journals, and was the author of numerous archæological works, the most important being *Manuel d'Histoire Ancienne de l'Orient*, which has been translated into English; *Les Premières Civilisations*; *La Propagation de l'Alphabet Phénicien dans l'Ancien Monde*, the value of which to paleography can scarcely be overestimated. He died in Paris, Dec. 10, 1883.

LENÔTRE, ANDRÉ, a French landscape-gardener; born in Paris, March 12, 1613; studied painting under Simon Vouet, and displayed his genius in laying out the gardens of Versailles, Fontainebleau, Chantilly, St. Cloud and others, in France. He visited England, and laid out the parks of Kensington, St. James and Greenwich. In Rome he designed the gardens of the Vatican. Louis XIV accorded him letters of nobility in 1675. The formal and stately style of landscape-

gardening which he introduced spread over the whole of Europe and maintained itself for nearly a century. He died in Paris, Sept. 15, 1700.

LENOX, JAMES, an American philanthropist, founder of the Lenox Library; born in New York City, Aug. 19, 1800; graduated at Columbia College, and later studied law. After the death of his father, from whom he inherited vast wealth, he devoted himself to collecting rare books and manuscripts, and in 1870 he deeded his collections, valued at \$1,000,000, to trustees, for the benefit of the public, and erected for their preservation a building which cost \$450,000. Mr. Lenox's benefactions also included the land and \$500,000 for the erection of the Presbyterian Hospital in New York. He died Feb. 18, 1880.

LENSES. See LIGHT, Vol. XIV, pp. 593-595; and OPTICS, Vol. XVII, pp. 802, 803.

LENSTRÖM, CARL JULIUS, a Swedish poet and art critic; born at Gefle, May 7, 1811; educated at Upsala, and entered the priesthood in 1834. He became assistant professor of literature at Upsala in 1836, and later was appointed rector of the bishop's see of Upsala. His writings comprise articles on religious science, philosophy, æsthetics, history of literature and art, linguistics and literature. Among his best-known works are *History of Swedish Poetry* (1839-40) and *History of Swedish Literature and Art* (1841).

LENTULUS, COSSUS, surnamed GÆTULICUS, a Roman consul, 1 B.C.; was sent into Africa in A.D. 6, where he defeated the Gætuli, who had risen against their ruler, Juba, hence the surname. On the accession of Tiberius in A.D. 14, Lentulus accompanied Drusus, who was sent to quell the mutiny of the legions in Pannonia. He died at a very great age, A.D. 25.

LENZ, HEINRICH OSCAR, a German explorer; born at Leipsic, April 13, 1848, and educated at the university of his native city. After making some geological excursions into Hungary, he joined the expedition of Güssfeldt to West Africa in 1874, and spent three years in examining the region along the coast between Gaboon and the Congo. In 1879-80 he explored Morocco, Timbaktu, and Senegal, and in 1885, having been foiled in his previous attempts to determine the watershed between the Nile and Congo basins, he led an expedition across Africa by way of Lakes Tanganyika and Nyassa, returning to Vienna in 1887. After his return he became professor of geography at the University of Prague. He has written *Skizzen aus Westafrika* (1878); *Timbaktu* (1884).

LENZ, JACOB MICHAEL REINHOLD, a German dramatist. See GERMANY, Vol. X, p. 540.

LEO XIII, POPE, the 258th Roman pontiff and 257th successor of St. Peter; son of Count Ludovico Pecci, by his wife, Anna Prosperi. He was born at Carpineto, in the diocese of Anagni, in the States of the Church, March 2, 1810, and was baptized by the names of Vincenzo and Gioacchino. In 1818 his father sent him, along with his elder brother, Giuseppe, to the Jesuit College of Viterbo. In November, 1824, he en-

tered the schools of the Collegio Romano, then restored to the Jesuits. Young Pecci signalized himself by his assiduity and talent, and in 1828 won the first premium in physico-chemistry, and the first *accessit* in mathematics. While studying philosophy, Pecci was intrusted, despite his youth, to give repetitions in philosophy to the pupils of the German College. In his third year of philosophy he sustained a public disputation and obtained the first premium (1830). The following

POPE LEO XIII.

year, being then but 21 years old, he obtained the *laurea* in philosophy. Even in Viterbo young Pecci was noticed for his ability and for his perfect propriety of conduct. In Rome he seemed entirely devoted to study, and took no part in entertainments, conversazioni, amusements or plays. At the age of 12 or 13 he wrote Latin, prose or verse, with facility, and it may be mentioned that after he became pope a volume of his verses, chiefly Latin, was printed at Udine. Having entered the College of Noble Ecclesiastics, the Abbate Pecci frequented the schools of the Roman University to learn canon and civil law. Cardinal Antonio Sala took much interest in the young student and assisted him with advice and instruction. Becoming a doctor in laws, he was made, by Pope Gregory XVI, a domestic prelate and referendary of the Segnatura, March 16, 1837. Cardinal Carlo Odescalchi gave Pecci holy orders, and on Dec. 23, 1837, conferred the priesthood upon him. Gregory XVI bestowed upon him the title of prothonotary apostolic, and appointed him apostolic delegate at Benevento, Perugia and Spoleto in succession. In these important posts he ruled with firmness and prudence, and while at Benevento by his energy he put a stop to the brigandage which had before infested that district. In 1843 he was again promoted by Pope Gregory XVI, being sent as nuncio to Belgium, and on January 17th, in that year, he was created archbishop of Damietta, *in partibus infidelium*, to qualify him for his office of nuncio. He remained at Brussels for three years and was nominated bishop of Perugia on Jan. 19, 1846, about four months previous to the death of Gregory XVI. He was created and proclaimed a cardinal by Pius IX, in the consistory of Dec. 19, 1853. In September, 1877, he was selected by Pope Pius IX to fill the important office of cardinal camerlengo of the Roman Catholic Church, which post had become vacant by the death of Cardinal de Angelis. In that capacity, after the death of the late pope (Feb. 7, 1878), he acted as head of the church in temporal matters, made the arrangements for the last solemn obsequies of the pontiff, received the Catholic ambassadors and superin-

tended the preparations for the conclave. Sixty-two cardinals attended the conclave, which was closed in the Vatican on Feb. 18, 1878. In the second scrutiny, on the evening of Tuesday, Cardinal Pecci's votes rose to 34 and in the scrutiny on Wednesday (February 20th) morning to 44. The election was then at an end, and the cardinal camerlengo was made pope by acclamation. The news was officially proclaimed to the outside world from the gallery of St. Peter's, when it was announced that his Holiness had assumed the name of Leo XIII. On March 3d he was crowned in the Sistine Chapel, all the ancient ceremonies being observed, save the benediction, *Urbi et Orbi*, from the loggia of St. Peter's. The history of the pope since his election is the history of the papacy, and as such it would occupy too much space to tell it here at the length that it might be thought to deserve. Suffice it to say, that Leo XIII adopted a course of perfect consistency as a pontiff willing to act with modern governments, but determined to abate no jot of his rights as head of the church and as the despoiled sovereign of Rome. After his accession he refused to accept the income regularly voted him by the Italian Parliament, confining his movements to the Vatican palace and grounds, secured to him by the government, and issued numerous encyclicals, demanding a restoration of the temporal power and sovereignty, yet moderate and dexterous in his relation with foreign powers. His chief minister was Cardinal Jacobini, a man of the world. With the help of his chief he was able to bring to a fairly successful issue the "Kulturkampf" in Prussia and to make tolerable terms for the clergy in France. His encyclical on "Labor" (1891) excited a profound interest. He celebrated his golden jubilee as bishop in 1893. The Pope summoned a conference of the patriarchs of the Eastern Church at the Vatican in October, 1894, but no practical results followed, and the same may be said of his letter to the English people in April, 1895, urging them to return to holy unity with the Church of Rome. In 1896, replying to an open letter of Gladstone's, he confirmed the decrees of his predecessors by a declaration that "all ordinations made under the Anglican rite are absolutely invalid." In 1898 he composed a Latin oratorio, *Battesimo di Clodoveo*.

LEO, HEINRICH, a German historian; born at Rudolstadt, March 19, 1799. He became professor of history at the University of Halle, and produced a large number of works of historical value; among them, a *Manual of the History of the Middle Ages* (1830); *History of the Italian States* (1829); and a number of articles in the *Evangelische Kirchenzeitung*. He died April 24, 1878.

LEO DIACONUS. See BYZANTINE HISTORIANS, Vol. IV, p. 613.

LEOMINSTER, a town and railroad junction of Worcester County, central Massachusetts, four miles S. of Fitchburg, on the Nashua River, and on the New York, New Haven and Hartford railroad. It has manufactories of furniture, horn

goods, forks, linen, woolens, shirts, buttons, toys, leather-board, paper boxes, shoes, paper, baby-carriages, and piano-cases; has city water, electric and gas lights, electric street and suburban railways, and a public library of nearly 15,000 volumes. Pop. 1890, 7,269; 1900, 12,392.

LEON, a town, the capital of Decatur Co., Iowa, 60 miles S. of Des Moines, on the Chicago, Burlington and Quincy and the Keokuk and Western railroads, in an excellent grazing country; makes large shipments of cattle, hogs, horses, and sheep. Pop. 1900, 1,905.

LEON, ISLA DE. See CADIZ, Vol. IV, 626-28.

LEONARDO OF PISA. See PISONUS, Vol. XIX, p. 124.

LEONCAVALLO, RUGGIERO, Italian opera composer; born in Naples, March 8, 1858. Has produced *I Pagliacci* (1892); *I Medici* (composed in 1877, but not performed till 1893); *La Vie de Bohême* (founded on Murger's novel, 1897); and *Roland of Berlin* (1899).

LEONE, PILATO. See BOCCACCIO, Vol. III, 844.

LEOPOLD II (LEOPOLD-LOUIS-PHILIPPE-MARIE VICTOR), King of the Belgians, son of King Leopold I; born at Brussels, April 9, 1835, and married, Aug. 22, 1853, the Archduchess Maria of Austria. As Duke of Brabant, he took a prominent part in several important discussions in the Senate, especially in that relating to the establishment of a maritime service between Antwerp and the Levant. On the death of his father, Dec.

LEOPOLD II, KING OF BELGIUM.

10, 1865, he succeeded to the throne as Leopold II. He was prominent in carrying out the work of exploring Africa, and was practically the founder of the Congo Free State, which, by the international conference of 1885, was placed under his individual sovereignty. By will dated Aug. 2, 1889, he bequeathed his sovereign rights to Belgium.

LEOPOLD II, Grand Duke of Tuscany. See FLORENCE, Vol. IX, p. 336.

LEOPOLDVILLE, the most important establishment in the Congo Free State, situated on the left bank of the Congo, at the outlet of Stanley Pool, and the capital of Stanley Pool district, founded in Feb., 1882, by Henry M. Stanley. Its importance is due to the fact that it is at the head of the 235 miles of cataracts in the Congo, and consequently at the lower end of upper Congo navigation, of which there are some 8,000 miles, including tributaries. Several steamboats have been transported overland in sections, and here put together for upper Congo service. A railroad from Matadi, at the foot of the rapids, to Leopoldville, 247 miles, was completed in July, 1898.

LEPIDODENDRON, a genus of fossil plants, belonging to the club-mosses, one of the groups of pteridophytes, found especially in the lower and middle Carboniferous deposits. They were

large, branching trees, with pine-like cones, and covered with spirally disposed leaves, replaced by peculiar rhombic scars, giving the name to the genus.

LEPIDOPTERA. See INSECTS, Vol. XIII, pp. 150, 151; and BUTTERFLIES AND MOTHS, Vol. IV, pp. 592-597.

LEPIDOSTEIDÆ, a family of fishes. See ICHTHYOLOGY, Vol. XII, p. 687.

LEPORIDÆ. See MAMMALIA, Vol. XV, p. 421.

LEPSIUS, KARL RICHARD, a German Egyptologist; born at Naumburg, Dec. 23, 1813. After studying at the universities of Leipsic, Göttingen and Berlin, he gained his doctor's diploma in 1833, with an essay on the Eugubine Tables. In 1834, at Paris, he gained the Volney prize by his essay on *Palæographie als Mittel der Sprachforschung*. After devoting considerable time to Egyptian studies at Rome, he made historical researches from 1842 to 1845 in Lower and Upper Egypt, and brought a valuable archæological collection home to Berlin, where he was professor for some years. In 1866 he explored the delta of the Nile. In 1874 he was made chief of the Prussian State Library at Berlin. He wrote, in German and English, a *Universal Standard Alphabet* (1855-63); *Chronologie der Ägypter* (1849); and *Die Denkmäler aus Ägypten und Ethiopien* (1849-59); and many other works. He died in London, July 10, 1884.

LEPTOCARDII. See ICHTHYOLOGY, Vol. XII, pp. 685, 695.

LEPTOSPERMUM, a genus of trees and shrubs, natives of Australia and New Zealand, of the family *Myrtaceæ*. They are evergreen, with leaves somewhat resembling those of myrtles. Some of them bear the name of tea-tree, because the leaves have been used as a substitute for tea. *L. scoparium* is sometimes called the New Zealand tea-plant.

LEPTOSTRACA, a subclass of marine crustaceans, composed of forms with a characters connecting the entomostracans and malacostracans. These animals were considered phyllopods by some authors. There are few species, the majority belonging to the genus *Nebalia*. Some species are found as Cambrian and Silurian fossils.

LERDO DE TEJADA Y CORREAL, SEBASTIAN, a Mexican statesman and diplomat; born in Jalapa, Mexico, April 25, 1825. In 1855 he became a judge of the supreme court of Mexico, and in 1857 was made foreign minister under President Comonfort. He was a Liberal in politics, and after the rise of the Church party, joined Juarez, with whom he acted until 1867, being one of the most active leaders in the movements which led to the overthrow of Maximilian. In December of the latter year he became chief justice of the supreme court, and on July 18, 1872, by virtue of his office, succeeded to the Presidency on the death of Juarez, being elected in December of the same year. He began his term under very favorable auspices, but gradually lost support, owing to his infringements of the rights of the states, and his evident desire to

centralize the government. He claimed to have been re-elected in 1876, but being overthrown by the revolutionary forces under Diaz, he fled to the United States, and eventually took up his residence in New York City, where he died, April 21, 1889.

LÉRINS, ILES DE, a few small French islands in the Mediterranean, off the coast of Alpes Maritimes, in long. 7° W., consisting of the fortified islands, Ste. Marguérite and St. Honorat, on the first of which was imprisoned the Man in the Iron Mask from 1686 to 1689. On the second was founded, in the fourth century, the convent of the Lérins, which became a famous school of theology, and passed into the Benedictine Order. After the middle of the seventeenth century it lost importance, and is now in ruins. Between the two islands is the anchorage of Frioul, accommodating vessels of sixteen feet draft.

LERMA, FRANCISCO DE ROXAS DE SANDOVAL, a Spanish statesman; born about 1550. Upon the accession of Philip III in 1598, he was given the title of duke, and made Prime Minister of Spain, in which capacity he was practically ruler for twenty years. In 1609 he issued the decree of proscription against the Moors, by which several thousand families, forming one of the richest and most industrious elements in the Spanish population, were driven out of the country. He lost the royal favor in 1618. He died in 1625.

LERNÆOIDEA, a group of copepod crustaceans parasitic in the skin and gills of fishes. The worm-like females are greatly degenerated, and scarcely have any resemblance to a crustacean. The young females have the normal crustacean characters before assuming the parasitic life. The males are free-swimming, and have the normal crustacean form. The *Lernæa* are often known as fish-lice.

LEROLLE, HENRI, a French painter; born at Paris in 1848; was a pupil of the School of Fine Arts and attended the studio of Lamothe. He received a first-class medal in 1880 and the decoration of the Legion of Honor in 1889. He was a member in the latter year, of the jury of admission at the Universal Exposition. Among his works, which are noted for their interpretation of nature in evening effects, are *In the Country* (1880); *At the Organ* (1885); *The Flight into Egypt* (1891).

LEROS, a Turkish island in the Ægean Sea, south of Samos, at lat. 37° 10' N., long. 26° 50' E. It is six miles long and four wide, is very fertile, and has good harbors. It was colonized from Miletus and ruled by her down to Roman times. The ruins of the town of Leros are here. White marble is quarried. Population, about 4,000.

LE ROY, a village of Genesee County, western New York, 23 miles S.W. of Rochester, on Oatka Creek, and on the New York Central and Hudson River and the New York, Lake Erie and Western railroads. It is in a salt and limestone region, has salt-works, lime-kilns, stone-quarries, and flour, gypsum, plaster, saw and planing mills. It

has good water-power, is the seat of Ingham University for women, has a union school, public library and an art museum. Population 1890, 2,743; 1900, 3,144.

LEROY-BEAULIEU, PIERRE PAUL, a French economist; born at Saumur, Dec. 9, 1843; studied at the Lycée Bonaparte, spent some time in Rome, and in 1864 and 1865 attended the Universities of Bonn and Berlin. On his return to Paris he gave himself up to a study of political economy, and contributed to various journals and reviews. His first memoir, *De l'Influence de l'État Moral et Intellectuel des Populations Ouvrières sur le Taux des Salaires*, was crowned in 1867 by the Academy of Moral Science. He was appointed professor of finance in the Free School of Political Science in 1872, and shortly after founded *L'Economiste Français*. He was elected a member of the Academy of Political and Moral Science in 1878, and in 1880 succeeded his father in law, Michel Chevalier, as professor of political economy in the Collège de France. The decoration of the Legion of Honor was bestowed upon him. Among his works, besides the one already mentioned, are *Essai sur la Répartition des Richesses* (1882); *Précis d'Économie Politique* (1888); *L'État Moderne et ses Fonctions* (1890).

LESBIC ÆOLIC, dialect. See GREECE, Vol. XI, p. 132.

LES CAYES OR AUX CAYES. See HAITI, Vol. XI, p. 544.

LES ECHELLES, a village in Isère, southwestern France, 14 miles S.S.W. of Chambéry. The valley beyond this village, on the road to Chambéry, is blocked up by a huge limestone rock 800 feet high, over which travelers formerly used to climb by means of ladders, hence the name of the village. Through this mass of limestone a tunnel now extends, 25 feet high, 25 feet wide and 1,000 feet long. The work was projected and commenced by Napoleon I, and finished in 1817 by the King of Sardinia.

LES ILES MALOUINES. See FALKLAND ISLANDS, Vol. IX, pp. 14-16; and in these Supplements.

LESLEY, JOHN PETER, an American geologist; born at Philadelphia in 1819. He graduated at the University of Pennsylvania in 1838, and during the three following years served as assistant on the geological survey of Pennsylvania. From 1841 to 1845 he studied theology at Princeton, New Jersey, and at the University of Halle, Germany. Then he became missionary to the Germans in Pennsylvania till 1847, and preached for three years in the Congregational Church at Milton, Massachusetts. But here his theological views underwent a change, in consequence of which he left the pulpit and settled in Philadelphia, where he engaged as a professional expert in geology. In 1872 he was appointed professor of geology and mining, and also dean of the scientific faculty in the University of Pennsylvania. His geological work included numerous special examinations of coal-oil and iron fields in the United States and Canada. In 1874 he was made chief geologist of Pennsylvania, with charge of a complete resurvey of the state. He was elected presi-

dent of the American Association for the Advancement of Science in 1884. Besides some seventy volumes of geological reports, he published a *Manual of Coal and Its Topography*; *The Iron Manufacturers' Guide*; and *Man's Origin and Destiny, as Seen from the Platform of the Sciences* (1868; revised 1887). Mr. Lesley was credited with the authorship of *Paul Dreifuss* (1882). The article PENNSYLVANIA, in this ENCYCLOPÆDIA, was contributed largely by him.

LESLIE, HENRY DAVID, an English composer; born at London, June 18, 1822; received his musical education there, under Charles Lucas. In 1855 he formed the celebrated Henry Leslie Choir, of which he was conductor until the choir was disbanded in 1887. He was appointed conductor of the Herefordshire Philharmonic Society in 1863, and in 1874 became director of the Guild of Amateur Musicians. His compositions include a *Te Deum and Jubilate in B* (1846); *Immanuel* (1854); *Bold Dick Turpin*, an operetta (1851); *Daughter of the Isles*, a cantata (1861); and *Ida*, an opera (1864). He died Feb. 4, 1896.

LESQUEREUX, CHARLES LEO, a Swiss botanist; born at Fleurier, Neuchâtel, Nov. 18, 1806; educated at Neuchâtel, Weimar and Berlin. He was principal of an academy at Chaux-de-Fonds, Switzerland, but was forced to resign on account of deafness. He emigrated to America through the influence of Professor Agassiz and assisted the latter in his work at Cambridge. He then went to Columbus, Ohio, where, with William T. Sullivant, he made a study of American bryology, their published collections of "Musci Exsiccati," being remarkably fine. He afterward made a special study of the fossil flora of the coal-measures in the United States, and in 1864 was elected a member of the National Academy of Sciences. Among his publications are *Catalogue of the Mosses of Switzerland and Mennirs* (1840); *Musci Boreales Americanis Exsiccati*, with Sullivant (1856); *Manual of the Mosses of North America*, with Thomas P. James (1884). He died at Columbus, Ohio, Oct. 25, 1889.

LESSEPS, FERDINAND, VISCOUNT DE, a French diplomatist and engineer; born at Versailles, Nov. 19, 1805. At the age of 24 he entered the French diplomatic service as *attaché* at Lisbon, and subsequently held consular appointments at Barcelona, Tunis and Alexandria. In 1841, while detained in quarantine at Port Said, his great project of cutting a canal through the Isthmus of Suez dawned upon him. He visited Egypt in 1854, and in 1856 published a report upon the proposed canal. The project was approved by the viceroy Said Pasha, but owing to the distrust of the Porte and the hostility of England, its execution for a time was suspended. In 1882, by his firmness and vigorous action in securing the

VISCOUNT DE LESSEPS.

neutrality of the canal, he aroused much hostility. He also promoted the construction of the Corinth canal. In 1873 he began to concentrate his energy on the Panama canal, a project which in 1874 was agitated vigorously by the French press. In 1876 he formed a company for making preliminary surveys, and in 1879 he obtained from the Colombian government the exclusive privilege of constructing a canal between the two oceans, through Colombian territory. When he opened subscription lists, all the capital was subscribed which he then thought necessary. The Inter-Oceanic Canal Company was definitely constituted Jan. 31, 1881, and the work was commenced in October. Lesseps, believing himself better informed than others, decided that the canal should be at sea-level. The estimated cost of such a canal had been \$300,000,000, but he reduced this to \$120,000,000. When the company dissolved in 1889 a total of \$280,000,000 had been expended, and but a small portion of the work completed. After certain charges of fraud and bribery had been brought against the company, the French government prosecuted Lesseps and the other officers of the company. A sentence of imprisonment was passed, but in the case of Lesseps himself it never was carried into effect. He was decorated with the grand cross of the Legion of Honor in 1869, made a member of the Academy of Sciences in 1875, and a member of the French Academy in 1884. In 1870 Queen Victoria made him Knight Grand Commander of the Star of India. In 1886 the French government sent him as delegate at the dedication of the *Statue of Liberty* in New York harbor. Died near Paris Dec. 7, 1894.

LESSER, A. MONAE, German-American physician; born in Brandenburg, Prussia, June 22, 1855; attended the high school and university. In the Franco-Prussian war (1870-71) he was the youngest Red Cross assistant in the field. He began his medical studies in 1876 at Berlin, continued them at Munich and Montreal, and in 1882 graduated at the New York University. In 1898 he was appointed surgeon-in-chief of the American National Red Cross, and served as such during the Cuban campaign in the Spanish-American war, his services receiving favorable mention in the official report of the surgeon-general of the United States army, and also high praise in the United States Senate. He is now (1899) surgeon-general of the Red Cross hospital in New York, and ranks as the leading yellow-fever specialist in the world. In his practice he never uses either quinine or alcohol. His wife is the well-known "Sister Bettina."

LESUEUR, a borough of Lesueur Co., Minn., on the Minnesota river, 60 miles S. W. of St. Paul, in a corn, wheat, cattle, pork, and sheep region; has a graded school, and factories of flour, woolen goods, and wagons. Population 1890, 1,763; 1900, 1,937.

LESUEUR, EUSTACHE, a French painter; born in Paris, Nov. 19, 1617. With Lebrun he studied in the school of Simon Vouet. In 1648, when the Academy of Painters was founded, Lesueur was one of the twelve original members. His works, which, from their ease and grace of style, have given the artist the name of the "French Raphael," are to be found in the principal churches of Paris. The Louvre possesses 36 religious and 13 mythological

pictures by him, the former including his great series of 22 paintings illustrating the life of St. Bruno, and his *St. Paul at Ephesus*. Died April 30, 1655.

LETTER OF CREDIT, a letter from a person in one place, directed to a person in another place or country, requesting him to furnish the party named therein, or the bearer, such credit as he may desire, which may or may not be limited in amount. The writer of the letter undertakes to stand responsible for the goods, money, or other credit which may be furnished in accordance with the terms of the letter. Letters of credit may be either general, as when directed to anyone who may see fit to honor the request, or special, when directed to some particular person. They may be procured by depositing money, collateral, or other valuable thing with the person issuing the letter, the debt created by honoring the letter being between the writer and him who honors the letter, and not between the latter and him to whom the money is paid. This class of letters of credit is in frequent use with persons who wish to travel abroad, and do not desire to carry the money necessary to defray their expenses. Letters of credit may also be issued merely as an accommodation, and without valuable consideration, in which case the act of honoring the letter creates a debt on the part of both the writer of the letter and him who receives the money or credit. The bearer of a letter of credit may use it or not, as he chooses, and he will be liable only upon his receiving money or credit thereon.

LETTERS OF MARQUE AND REPRISAL. See PRIVATEER, Vol. XIX, p. 764.

LETTIS AND LETTISH LANGUAGE AND LITERATURE. See EUROPE, Vol. VIII, p. 702; LITHUANIANS, Vol. XIV, pp. 701-03.

LETTUCE. See HORTICULTURE, Vol. XII, 284.

LEUCADIA, one of the Ionian Islands. See SANTA MAURA, Vol. XXI, p. 297.

LEUCÆMIA. See PATHOLOGY, Vol. XVIII, 376.

LEUCÆTHIOPE, peoples of Hamitic stock who preceded the Berbers of North Africa.

LEUCANILINE, a colorless organic base obtained by oxidation of rosaniline, one of the coal-tar dyes.

LEUCIN OR AMIDOCAPROIC ACID, a white crystalline substance ($C_6H_{11}O_2NH_2$), one of the chief products of the decomposition of nitrogenous matter; may be obtained by treating horn shavings or muscular fiber with sulphuric acid.

LEUCKART, KARL GEORGE FRIEDRICH RUDOLF, a German zoölogist; born at Helmstädt, Oct. 7, 1823, studied at Göttingen; in 1850 became professor of zoölogy at Giessen, and in 1869 at Leipsic. He especially distinguished himself by his study of the entozoa, and by his system of zoölogical classification. His great work is *The Parasites of Man* (English translation by Hoyle, 1886). His fame, however, rests mainly upon his ability as a teacher, more naturalists of celebrity having received their education from him than from any other instructor in Europe.

LEUCOCHALCITE, a nearly white hydrous copper arsenite, occurring with malachite and calcite.

LEUCOCYTES. See ANATOMY, Vol. I, p. 846.

LEUCOMA, a white opacity of the cornea, caused by inflammation leading to the formation of cicatricial tissue on the ulcerated surface or between the layers

of the cornea. It is re-absorbed on the cessation of the inflammation sometimes, and the cornea recovers its transparency; but in many cases it is persistent and incurable.

LECTRA, BATTLE OF, where the ascendancy of Sparta received a fatal check. See GREECE, Vol. XI, p. 103.

LEUTZE, EMMANUEL, an American painter, born at Gmünd, Würtemberg, May 24, 1816. His parents brought him to Philadelphia in his infancy. He first attempted drawing while attending his father's sick-bed, and soon became skillful. In 1840 he painted an *Indian Gazing at the Setting Sun*, and with such success that he received many orders for similar work, and in 1841 was enabled to visit Düsseldorf, where he studied under K. F. Lessing. There, and later in America, he produced historical paintings connected with American history; notably, *Columbus Before the Council of Salamanca*; *Columbus in Chains*; *Columbus Before the Queen*; *Washington Crossing the Delaware*; *Washington at Monmouth*; *Storming of Teocalli*; *Settlement of Maryland by Lord Baltimore*. One of his last pictures is entitled *Westward Ho*, painted for the staircase of the Capitol at Washington. He was made a member of the National Academy in 1860. His death occurred at Washington, District of Columbia, July 18, 1868.

LE VAILLANT, FRANÇOIS, a French traveler and ornithologist; born at Paramaribo, Dutch Guiana, in 1753. After studying natural history in France, he set out in 1781 for South Africa, where he traveled for 16 months, and on a second trip to the same regions in 1784 he traveled for eighteen months, making valuable collections. He died at Sézanne, France, Nov. 22, 1824. For his writings on ornithology, see ORNITHOLOGY, Vol. XVIII, pp. 8-11.

LEVANT, THE, a geographical name given to the eastern waters and shores of the Mediterranean, especially the coasts of Asia Minor, Syria and Egypt. The name Levant originated early in the middle ages, when the Italian republics controlled European commerce.

LEVEE, in the United States, an embankment to prevent inundation, especially on the Mississippi River. See MISSISSIPPI, Vol. XVI, p. 521.

LEVELERS, the name of a political party of Great Britain. See ACEPHALI, Vol. I, p. 92.

LEVELS AND LEVELING. See SURVEYING, Vol. XXII, pp. 707, 717-720.

LÉVÊQUE, JEAN CHARLES, a French educator; born at Bordeaux, Aug. 7, 1818. He was educated at the college and normal school of his native city; was professor of philosophy in the colleges at Angoulême and Besançon, afterward at the French School at Athens, and subsequently at Toulouse and Nancy. In 1861 he succeeded Barthélemy Saint-Hilaire in the chair of Greek and Latin philosophy at the College of France. He was chosen a member of the Academy of Moral and Political Sciences in 1865, and in 1873 was elected vice-president. His numerous philosophical works, for which he received several prizes, include *La Science du Beau* (1860) and *Harmonies Providentielles* (1872).

LEVI. See LEVITES, Vol. XIV, pp. 487-489.

LEVI, LEONE, an English statistician; born at Ancona, Italy, of Jewish parents, July 6, 1821. He settled in Liverpool in 1844; was naturalized in 1847 and early joined the Presbyterian Church; was one of the founders of the Liverpool Chamber of Commerce. In 1852 he became professor of the principles and practice of commerce in King's College, London. He did much for the reform of commercial law and practice and the utilization of statistics. Among his works are *Commercial Law of the World*; *History of British Commerce*; *War and Its Consequences*; and *International Law*. He died in London, May 9, 1888.

LEVULOSE. See SUGAR, Vol. XXII, p. 624.

LEVY, MAURICE, a French civil engineer; born at Ribeauville, Feb. 28, 1838; studied at the Polytechnic School and the École des Ponts et Chaussées; graduated in 1861, and became engineer-in-chief in 1880. Attached at first to the service of the city engineers of Paris, he became director of the navigation of the Marne and member of the commission on general levels of France. He also engaged in teaching, becoming professor of applied mechanics at the École Centrale and the Collège de France; and in 1885 succeeded Serret in the chair of Mécanique Céleste. In 1879 he became an officer of the Legion of Honor, and a member of the Academy of Sciences in 1883. Aside from articles on hydrodynamics, heat, etc., his chief work is *La Statique Graphique et ses Applications aux Constructions*.

LEWALD, FANNY, a German novelist; born at Königsberg, March 24, 1811, of Jewish parents, but became in childhood a convert to Christianity. She began to write when about thirty, and from 1840 lived in Berlin; in 1855 she married Adolf Theodor Wilhelm Stahr, the literary critic. At different times she visited many parts of Europe with her father and her husband. Her books on Italy (1847) and Great Britain (1852) were the most valuable outcome of these journeys. Her best work is perhaps *Von Geschlecht zu Geschlecht* (1863-65). She also wrote *Diogena* (1847); *Wandlungen* (1853); *Die Kammerjungfer* (1856); *Benedikt* (1874); and *Stella* (1883). Died in Dresden, Aug. 5, 1889.

LEWES, the main headstream of the Yukon; rises in Hootalinqua (or Hotilinku) spring, in 59° 10' N. lat., and 132° 40' W. long., in British Columbia; flows N.W. into Yukon district, Canada, and, joining the Pelly near Fort Selkirk, forms the Yukon; length about 400 miles. At the confluence its discharge is 37,700 cubic feet per second; that of the Pelly is 29,300 cubic feet.

LEWES, a town of Sussex Co., Del., on Delaware Bay, opposite the Delaware breakwater, which forms a good harbor, 35 miles S. S. E. of Dover; is a station of the Old Dominion steamship line; has a large trade in fruit and early vegetables; fishing, farming, and wrecking are the chief pursuits. Pop. 1900, 2,259.

LEWIN, THOMAS, an English author; born at Ifield, Sussex, April 19, 1805; educated at the Merchant Taylors' School, and at Worcester and Trinity colleges, Oxford; called to the bar in 1833, practiced in Chancery, and in 1853 was appointed one of the conveyancing counsel to the court. Wrote *The Law of Trusts and Trustees* (1842),

which has become an authority on this subject. *The Life and Epistles of St. Paul* is Lewin's great work, for the final preparation of which he spent over twenty years in the study of the apostle's missionary journeys, visiting nearly every place named in the New Testament in connection with Paul. Some of his other writings are *Cesar's Invasion of Great Britain* (1862); *Siege of Jerusalem by Titus* (1813); *Fasti Sacri; or, A Key to the Chronology of the New Testament* (1865). Mr. Lewin's views regarding the sacred localities in Jerusalem differed essentially from those of Robinson and others, and have occasioned considerable controversy.

LEWIS, ANDREW, an American general; born in Donegal, Ireland, about 1730; when very young, was brought to America by his parents, who settled at Bellefonte, Virginia. He was a volunteer in the Ohio campaign in 1754; commanded the Sandy Creek expedition in 1756; was captured by the French at Fort Duquesne in 1758; appointed Virginia commissioner to make treaty with the Iroquois at Fort Stanwix in 1768; was made brigadier-general in 1774, and defeated the Shawnee Confederacy at the mouth of the Great Kanawha River. He took part in the convention of 1775, and, at the request of Washington, in 1776 was appointed brigadier-general by Congress, and put in command of the expedition to dislodge Lord Dunmore from Gwynn's Island. Owing to ill health, he retired from the army in 1777, and died in Bedford County, Virginia, Sept. 26, 1780. General Lewis's statue is one of the cluster around the Washington monument in Richmond.

LEWIS, CARROLL. See DODGE, CHARLES L., in these Supplements.

LEWIS, DIO, an American physician; born at Auburn, New York, March 3, 1823; studied at Harvard Medical School, and practiced for a time at Port Byron, New York, and at Buffalo. He founded an institution for training teachers at Boston in 1863, and in 1864, at Lexington, Massachusetts, he established a school for young ladies. He published numerous works on health and hygiene, and wrote a great deal on education and gymnastics as an element in educational training. His death occurred May 21, 1886, at Yonkers, New York.

LEWIS, EDMONIA, an American sculptor; born near Albany, New York, July 4, 1845, of mixed white, African and Indian blood, and educated at Oberlin, Ohio. She early began to model in clay. Her first work was a bust of Colonel Robert G. Shaw, who commanded the first negro regiment from a free state enlisted in the national service. In 1865 she went to Rome, where she studied her art, and where she remained. Her works show considerable talent. Among them are *The Freed-Woman*; *Death of Cleopatra*; *The Old Arrow-Maker and his Daughter*; *Hagar*; *Rebecca at the Well*; and *The Marriage of Hiawatha*.

LEWIS, JAMES, an American actor, born in Troy, New York, in 1838; taught school in his young days, and made his first appearance on the stage at the Troy Museum when about 20 years of age. Afterward he appeared in Albany, and then went South and West, appearing during

the tour in Cleveland, Ohio, in the famous company of John Ellsler. The troubles incident to the Civil War forced him to give up a part of his Southern trip, and he returned North, and joined the company of the Continental Theater in Boston, where he was very successful as Dick Swiveller in a dramatization of *The Old Curiosity Shop*. He joined the company of Augustin Daly in 1869, and for over a quarter of a century was identified with the superb productions of that manager, his Touchstone being considered by many as his best personation, though the low comedy rôle of the modern plays produced by Daly always was raised to the plane of the artistic by Mr. Lewis's rare gifts as a comedian. He died at West Hampton, Long Island, Sept. 10, 1896.

JAMES LEWIS.

LEWIS, MORGAN, an American general and statesman; born in New York, Oct. 16, 1754, son of Francis Lewis, one of the signers of the Declaration of Independence; graduated at Princeton in 1773, and studied law in the office of John Jay. He joined the Continental army in 1774. In 1786 he was aid to General Gates, with the rank of colonel; fought at Saratoga in 1777, and in 1778 at the battle of Crown Point. After the war he was made attorney-general of New York in 1791, and a judge of the supreme court in 1792. In 1804 he was elected governor of New York, but in 1807 he returned to the practice of law. In 1812 President Madison made him quartermaster-general of the United States army, and in the next year he was promoted to the rank of major-general. He served at Niagara, and afterward took charge of the defense of New York. At the close of the war he advanced the funds necessary for the discharge of the American prisoners in Canada. He afterward devoted himself to agriculture, serving also as president of the New York Historical Society, and grand master of the order of Free Masons. He died in New York City, April 7, 1844.

LEWIS, WILLIAM BEVAN, a British physician and author; born at Cardigan, South Wales, May 21, 1847; educated at Guy's Hospital, London, and received his license from the Royal College of Physicians and Surgeons of that city. In 1871 he became connected with the West Riding Asylum, and later lecturer on mental diseases at the Yorkshire College and Leeds School of Medicine, and examiner in mental diseases at Victoria University. He wrote a large number of works, principally on brain and nervous diseases.

LEWIS, WILLIAM JAMES, an English scientist; born near Newtown, Montgomeryshire, Wales, Jan. 16, 1847; educated at Oxford. He was a member of the English total-eclipse expeditions of 1870 and 1871. He published his observations in *Solar Eclipses*, issued by the Royal Astronomical Society

He contributed several papers on crystallography to the *Philosophical Magazine*. He held an appointment in the mineral department of the British Museum from 1875 to 1877. In 1881 he became professor of mineralogy at Cambridge.

LEWISBURG, a borough and the capital of Union County, eastern central Pennsylvania, on the west branch of the Susquehanna River, 80 miles above Harrisburg, and on the Pennsylvania and the Philadelphia and Reading railroads. It is the seat of Bucknell University, a Baptist co-educational school, with 29 instructors, 432 students and a library of 13,250 volumes, and a college, an academy, a girls' seminary, music and art schools, an observatory with a Clark equatorial telescope, and other buildings. Lewisburg is supplied with city water, gas and electric lights and a fire department. It manufactures hosiery, nails, furniture, bed-springs, flour and carriages, and contains a boat-yard, iron-works, woolen factory and a manufactory for farming-tools. Population 1900, 3,457.

LEWISBURG, a town and the capital of Greenbrier County, southern central West Virginia, in a "blue-grass" region, nine miles from White Sulphur Springs, on the Greenbrier River, and on the Chesapeake and Ohio railroad. It is named for General Lewis, who was stationed at a fort here previous to the battle of Point Pleasant with the Indians. It is engaged in farming, stock-raising and some manufacturing. Population 1890, 1,016.

LEWISIA, a genus of plants of western North America, belonging to the family *Portulacæ* or purslanes. *L. rediviva* is a low, acaulescent, fleshy perennial, with fusiform roots, and occurring in masses. The leaves are narrow and clustered, and the flowers showy. The specific name refers to the fact that the thick roots are wonderfully tenacious of life.

LEWISTON, a post village, the former capital of Idaho, and now the county seat of Nez Percés County, situated at the confluence of the Clearwater and Snake rivers, at the head of steamboat-navigation. It has flour and shingle mills, and is a wheat-shipping port. Population 1900, 2,425.

LEWISTON, a city of southeastern Maine, on the Grand Trunk and the Maine Central railroads. It is the second city of the state in population. The most important manufactures are those of cotton and woolen goods, machinery, boots and shoes, jute bags, grain-sacks and brushes. The mills which manufacture these goods are worked by water-power, the water being conveyed to the mills by a canal. Lewiston has a public library, a large public park and auditorium. Population 1890, 21,701; 1900, 23,761. See LEWISTON, Vol. XIV, p. 495.

LEWISTOWN, a town and the capital of Fulton County, northwestern central Illinois, 48 miles N.W. of Springfield, on the Chicago, Burlington and Quincy and the Fulton County Narrow Gauge railroads. It has woolen, carriage, wagon, plow, spoke, can, duplex-scale and hub factories. Population 1890, 2,166; 1900, 2,504.

LEWISTOWN, a town and the capital of Fergus County, central Montana, 100 miles N.W. of Billings, on Big Trout Creek. It is in a farming,

mining and stock-raising region. Population 1890, 785; 1900, 1,096.

LEWISTOWN, a borough and the capital of Mifflin County, central Pennsylvania, at the mouth of Kishacoquillas Creek, on the Juniata River, and on the Pennsylvania railroad and canal. It has flour-mills, furnaces, ax factories, steel-works, and is noted as a shipping-point for iron, coal and grain. The surrounding mountain scenery attracts many summer visitors. It has an academy and a public library. Population 1890, 3,273; 1900, 4,451.

LEXICOGRAPHY. See DICTIONARY, Vol. VII, pp. 179-193.

LEXINGTON, a post-village of McLean County, northeastern central Illinois, on the Chicago and Alton railroad, 95 miles S. of Chicago. It is engaged largely in stock-raising, especially horses, and farming. It has large tile-works. Population 1890, 1,187; 1900, 1,415.

LEXINGTON, a city of northeastern central Kentucky, on the Chesapeake and Ohio, the Cincinnati, New Orleans and Texas Pacific, the Lexington and Eastern, the Southern and the Louisville and Nashville railroads. Hamilton Female College, Sayre Female Institute and St. Catherine's Academy are situated here. The city has large flouring-mills, distilleries, copper-works, and hemp, saddle and harness manufactories. It is the commercial center of the famous blue-grass region, and has a large trade in blooded horses and cattle, hemp, tobacco and Bourbon whisky. The Henry Clay Monument is one of the ornaments of the city. The city is supplied with water by the Holley system, and has gas and electric lights, electric street-railways, race-tracks, and a public library. Pop. 1890, 21,567; 1900, 26,369. See LEXINGTON, Vol. XIV, p. 494.

LEXINGTON, a village of Middlesex County, Massachusetts, 11 miles N.W. of Boston, containing a granite monument, erected on the village green, to commemorate the patriotism of those who fell in the first battle of the Revolution. On the night of April 18, 1775, 8,000 British regulars were secretly dispatched from Boston to arrest Samuel Adams and John Hancock at Lexington, and to seize the military stores collected at Concord. News of their approach was spread through the intervening towns by Paul Revere, and at daybreak, when the British arrived at Lexington, they found fifty minute-men drawn up on the village green. The advance-guard, under Major Pitcairn, fired upon them, but they held their ground until the main body of the British, under Lieutenant-Colonel Smith, appeared. They then gave way, and the regulars pushed forward to Concord. Here they were unable to discover any military stores, and while they were committing some depredations, affairs took a sudden turn. Two hundred regulars, who guarded Concord bridge, were routed by some 400 minute-men, who had hastily collected from neighboring towns. The position of the British thus became perilous. About noon they started for Boston, subjected to a galling fire from all sides. Exhausted by their march of eighteen miles and their fast of fourteen hours, they fell

into a disorderly flight, and were saved only by the timely assistance of Lord Percy, who came from Boston with a reinforcement of 1,200 and two cannon. Seven miles from Boston, their passage was for a while disputed by a force of militia.

MINUTE-MAN, LEXINGTON.

The whole countryside was out against them; once more their retreat became a rout, and at sunset they entered Charlestown, under the welcome protection of the fleet, in full retreat, just in time to avoid an encounter with Colonel Pickering and 700 Essex militia. The loss of the British was 273, that of the Americans 93. Twenty-three towns were represented among the wounded and slain, and by the end of the week 16,000 men were besieging Gage in Boston. Population 1890, 3,197; 1900, 3,831. See also UNITED STATES, Vol. XXIII, p. 738, § 62.

LEXINGTON, a village and the capital of Holmes County, central Mississippi, 35 miles N. of Canton, on the Illinois Central railroad. It is the trade center of an extensive cotton-growing district. Population 1890, 1,075; 1900, 1,516.

LEXINGTON, a city and the capital of Lafayette County, central western Missouri, 40 miles E. of Kansas City, on the south bank of the Missouri, situated on a bluff 300 feet above the river, and on the Missouri Pacific railroad. It has great commercial prosperity, having a very large river trade, has a wide strata of excellent coal underlying the town, is the center of a hemp-growing region, and has brick-yards and canning factories. It is noted for having been besieged three times during the Civil War—Sep-

tember, 1861; October, 1861; and October, 1864. It is the seat of Wentworth Military Institute and three female colleges. Population 1890, 4,537; 1900, 4,190.

LEXINGTON, a city of Dawson County, southern central Nebraska, 35 miles W. of Kearney, on the Union Pacific railroad and on the Platte River. It is the shipping-point of a fertile prairie farming region. It has banks and several newspapers. Population 1900, 1,343.

LEXINGTON, a village and the capital of Davidson County, western central North Carolina, on Abbott's Creek and on the Southern railroad, 15 miles N.E. of Salisbury. It has a shuttle and bobbin factory, cotton-mills, a foundry, machine-shop and flour-mills. It is in a lumbering, agricultural, and gold, silver and zinc mining region. Population 1900, 1,234.

LEXINGTON, a town and the capital of Rockbridge County, central western Virginia, situated in the fertile valley bounded on the southeast by the Blue Ridge, and known as the "Valley of Virginia." It is the western terminus of the James River and Kanawha canal; has immense water-power, and contains flour-mills and a foundry. It is near the Natural Bridge and the Peaks of Otter; is the seat of Washington and Lee University (q.v.) and of the Virginia Military Institute, and is the burial-place of Robert E. Lee and "Stonewall" Jackson. Population 1890, 3,059; 1900, 3,203.

LEYDEN JAR. SEE ELECTRICITY, Vol. VIII, pp. 5, 7, 34.

LEYDS, WM. JOHANNES, D. C. L., political agent since 1898 of the South African Republic, and since the Jameson Raid, in 1896, chief adviser of President Kruger, was born in Java in 1859 and educated at Amsterdam University. In 1884 he was appointed attorney-general and in 1888 state secretary of the Transvaal. During the year 1899, Dr. Leyds endeavored to win sympathy and aid in Europe for the Boer republic, and is understood to have acted as financial agent for it and its president at European capitals. In this capacity he continued throughout 1900 to act for the Transvaal and its authorities.

LIAS, formation. See GEOLOGY, Vol. X, pp. 354-357.

LIBEL, an injurious attack upon a man's reputation or character, by written or printed words or signs. Slander refers to the same injury by spoken words. The United States received the law of libel from England without material change, and with the exception of matters of detail and questions of practice administers it much in the same method as obtains in England. Some of our state constitutions declare that every citizen shall have unrestricted liberty to speak, write, and publish his sentiments on all subjects, and that in prosecutions for libel the truth of his assertions may be given in evidence, and shall be a defense if published with good motives and for justifiable ends. If, in any state, this privilege is not declared by the constitution, it is held to be a part of its common law; so that the right to

defend against a charge of libel, by showing that the publication was truthful and was made for justifiable ends, may be said to be guaranteed in all of the states. See also **LIBEL**, Vol. XIV, pp. 505-507; and **PRESS LAWS**, Vol. XIX, pp. 710-714.

LIBERAL REPUBLICAN PARTY. See **REPUBLICAN PARTY**, in these Supplements.

LIBERAL-UNIONIST ASSOCIATION. An organization formed to resist the Home Rule policy adopted by Mr. Gladstone in 1886, and embodied in his two projects, the "Government of Ireland" and "Land Purchase (Ireland)" bills. Under the leadership of the Marquis of Hartington, afterward the Duke of Devonshire, and Mr. Joseph Chamberlain, one of the members for Birmingham, they allied themselves with the Conservatives on the Irish question in that year, and secured the defeat of Mr. Gladstone. The association has extended over the whole of the United Kingdom, and has upwards of 250 branches in England and Wales, besides those in Scotland and Ireland. For the purposes of better organization, a representative body, known as the Liberal-Unionist Council, was called into being, consisting of 94 members, the majority of whom are elected by the branch associations in all parts of the United Kingdom, the remainder acquiring their seats in the council by virtue of their official connection with the Liberal-Unionist party both in and out of Parliament. See also **GREAT BRITAIN** and **HOME RULE** in these Supplements.

LIBERIA (the United States of Liberia), a republic of Africa. The country has about 500 miles of coast-line, extending inland about 200 miles, with an area of about 32,954 square miles. The total population is now estimated at 1,068,000, of which 18,000 are Americo-Liberians, and 1,050,000 aboriginal inhabitants. Capital, Monrovia, with a population, in 1897, of 5,000. The other chief towns, with their populations, are Edina, 5,000; Buchanan, 5,000; Harper, 3,000; Robertsport, 1,200; and Sinoe (Greenville), 1,000.

The revenue in 1894 was \$158,861, and expenditure \$151,975. The revenue is derived chiefly from customs duties. The public debt, created in 1871 by a loan in England, with accrued interest (7 per cent, unpaid since 1874) is about \$1,350,000. The total exports and imports combined scarcely exceed \$2,500,000.

The constitution of Liberia is modeled after that of the United States. The President and House of Representatives are elected for two years, and the Senate for four years. There are now eight Senators and thirteen Representatives. The President of the republic must be 35 or more years of age, and must have property to the value of \$600. As chief executive he is assisted by an advisory Cabinet of five ministers, viz., secretaries of State, Treasury and Interior, and Attorney-General and Postmaster-General. For defense, every citizen from 16 to 50 is liable to serve, if capable of bearing arms; and in 1898 two small steel gunboats of 150 tons, armed with four Nordenfjeldt quick-firing guns, were owned by the republic. See

also **LIBERIA**, Vol. XIV, pp. 508, 509; and **AFRICA**, in these Supplements.

LIBERTY, a post village and the capital of Union County, southeastern Indiana, situated on the Cincinnati, Hamilton and Dayton railroad, 43 miles N.W. of Cincinnati, Ohio. It has large flouring-mills, a factory of agricultural implements, planing-mills and stone quarries. The principal business in the vicinity is farming and stock-raising. Population 1900, 1,449.

LIBERTY, a post town and the capital of Clay County, western Missouri, 16 miles N.E. of Kansas City, on the Hannibal and St. Joseph and the Chicago, Milwaukee and St. Paul railroads, four miles N. of the Missouri River. It is the seat of William Jewell College (Baptist) and Clay Seminary for young ladies (non-sectarian). It contains flour-mills, wagon and plow factories, and ships wheat and live-stock. Population 1890, 2,558; 1900, 2,407.

LIBERTY, a station in Bedford County, Virginia, on the Norfolk and Western railroad, 25 miles W. of Lynchburg. See also **BEDFORD CITY**, in these Supplements.

LIBERTY, NATURAL. See **POLITICAL ECONOMY**, Vol. XIX, pp. 358, et seq.

LIBERTY, STATUE OF. See **BARTHOLDI**, and **BEDLOE'S ISLAND**, in these Supplements.

LIBERTY PARTY, THE, grew out of the Anti-Slavery Society, and was more widely known for the high character and persistent agitation of its adherents than for its numbers. In 1840 it nominated James G. Birney (see **UNITED STATES**, Vol. XXIII, p. 766), secretary of the Anti-Slavery Society, for President, casting 7,059 votes; and again in 1844, when he received 62,300 votes. It contained such men as Lewis Tappan, Gerrit Smith, Samuel Lewis and Salmon P. Chase. It merged into the Free-Soil party in 1848.

LIBOCEDRUS, a genus of coniferous trees, closely related to *Thuja*, the arbor-vitæ. The known species are natives of California, Chile, New Zealand, China and Japan. *L. decurrens*, the California species, is known as "white cedar." It is a beautiful tree, attaining a height of 120 to 200 feet, with a trunk 6 or 7 feet in diameter, and has a light, soft, durable wood.

LIBRA, Roman standard of weight; also same as **AS**, a copper coin. See **WEIGHTS AND MEASURES**, Vol. XXIV, p. 488.

LIBRA, sign of the **ZODIAC** (q. v.), Vol. XXIV, p. 791.

LIBRARIES, UNITED STATES. The public libraries of the United States since 1880 have been rapidly increasing in numbers, and by the returns of 1893, issued by the Bureau of Education, the libraries containing 1,000 volumes and upward were 3,804, aggregating about 31,000,000 volumes. Some of these libraries have been started and are maintained by subscription; others by private endowments; others again by state and municipal governments. The increase of municipal public libraries has been especially noticeable, the founding of libraries in the towns being encouraged by the legislatures of the respective

states, giving to the towns the right to levy a certain amount of taxes for this purpose, and by granting exemption from taxation to library property. In many places, too, libraries are established in connection with the public schools, under certain restrictions open to the residents of the town in which they are located, and aided in some instances by the state, as in New York, where the custom is to appropriate to any public school for library purposes as much as it can secure from other sources.

Among state libraries, that of New York, at Albany, still ranks first in the United States. In connection with it is a school for librarians. One of the unique features of this library is a sort of clearing-house, devised by Melvil Dewey, state librarian, which is used by all the libraries of the state of New York; its purpose is the utilizing of duplicates. Unnecessary books are sent to this clearing-house, where they are appraised by an official of the state library, and the senders may then select from the collection of duplicates, books of an equal value in money. Among the libraries recently established by private parties are the Newberry and Crerar in Chicago, and the Pratt in Baltimore. The cities of Boston, Chicago and St. Louis have recently completed new buildings for their public libraries, that in the latter city being of special magnificence, and ranking as one of the finest structures of the kind in the world.

The Congressional Library is growing yearly, and the United States Government is steadily increasing the department and bureau libraries, the most extensive of these collections being the library of the surgeon-general's bureau. The wise and generous provision, after years of delay, for a separate library building of the most ample dimensions, of absolutely fire-proof materials, and on a plan combining utility and beauty in a high degree, is most creditable to the judgment and liberality of Congress. The extent of accommodation for books is 4,500,000 volumes, and the limitation of cost \$6,000,000.

The Government encourages the growth of libraries, and renders them valuable service by allowing books for libraries to be imported free of duty and transported at a greatly reduced rate of postage, as well as by defraying the cost of foreign exchanges through the Smithsonian Institution. The government has further benefited the libraries of the country by printing at its own expense *The Proceedings of the National Academy of Sciences*; *Annual Reports of the American Historical Association*; and *Annual Reports of the Smithsonian Institution*.

College libraries in the United States are both large and numerous, yet while resembling in many of their functions the general public library, they differ in the fact that they are designed rather for purposes of reference than for general reading. Until within recent years the policy in colleges has been to confine the use of the library to the instructors; but the present tendency is to encourage the student to make the widest use of

the library, the idea having gained ground that it is an essential part of a liberal education to learn to use books. Indeed, brief courses in bibliography are now given as a part of the course of instruction in many colleges and universities. According to the returns of 1893 the number of volumes in the college libraries of the United States numbered 5,319,602. One of the largest college libraries recently established is that of the University of Chicago. Columbia College in 1895 received very large endowments for the erection and support of a new library building.

In some of the states, typically in New England and New York, laws exist encouraging the formation of town-libraries by the loan or gift of books, and even by small money appropriations. Under this inducement hundreds of country towns have become possessed of fair collections of books for reference and for circulation.

The present tendency in the administration of libraries is to give more attention to securing a large circulation of the books at hand than in making new acquisitions. The result has been to further every possible improvement by which books may be more accessible to the general public, by means of deliveries and branch libraries and by doing away with all red tape. One of the elements which has served also to bring about a more general use of the library is the growth of the educational movement known as university extension.

Catalogues are now generally upon the card system. The cards have on them the titles of the books, sometimes the subjects, and again the names of authors, thus making a threefold reference index. They are placed in compartments of a drawer for consultation. By this process the catalogue may be added to, changed, and kept complete for each addition to the library.

Many valuable ideas and suggestions were advanced in regard to libraries and their administration at a meeting of librarians held in Chicago in 1893. This "World's Library Congress," as it was called, was one of the congresses held in connection with the World's Columbian Exposition. The idea of a meeting of librarians, both of the United States and Europe, originated with Mr. Melvil Dewey, president of the American Library Association. Only three foreign representatives were present at the sessions of this congress, two from England and one from Germany. The program consisted of papers prepared by specialists relating to almost every phase of library administration. The reports of the congress were edited by Mr. Dewey.

The following list, taken from *Flint's Statistics of American Libraries*, issued in 1893, gives the location, name, year of founding, and number of volumes of all college and state libraries in the United States, and of all general libraries approximating 20,000 volumes and upward, with the addition of some of a smaller number but of a special nature, or when located in certain localities where the existence of even a small library has a special significance.

LIBURNIA. See LIBURNIANS, Vol. XIV, p. 551.

LIBYANS. See CARTHAGE, Vol. V, p. 160.

LICATA or ALICATA (q.v., Vol. I, p. 574).

LICENSE, in general, a right or permit given by competent authority authorizing the person to whom it is issued to do an act or a series of acts which it would be illegal for him to do without such permit. A license may be either oral or in writing. Various licenses are described under the following headings: GAME LAWS, Vol. X, p. 62; GOTHENBURG, *ib.*, p. 846; LIQUOR LAWS, Vol. XIV, pp. 688-690; MARRIAGE, Vol. XV, p. 567; NEWSPAPERS, Vol. XVII, p. 414; PATENTS, Vol. XVIII, p. 356; POLICE, Vol. XIX, p. 335; PRESS LAWS, *ib.*, p. 710; and THEATER, Vol. XXIII, pp. 227, 228. In general, modern licenses are survivals of MONOPOLY (q.v., Vol. XVI, p. 758).

LICHEN, skin affection. See SKIN DISEASES, Vol. XXII, p. 122.

LICHENINE. See LICHENS, Vol. XIV, pp. 558, 559.

LICHI. See LITCHI, in these Supplements.

LICINIO, GIOVANNI A. See PORDENONE, Vol. XIX, p. 519.

LICK, JAMES, an American philanthropist, the founder of the great California observatory known by his name, was born in Fredericksburg, Pennsylvania, Aug. 25, 1796. After spending many years in South America he settled in California in 1847, and there amassed an immense fortune. Though generally regarded as a man of solitary and avaricious habits, in 1874 he assigned real and personal property, valued at about \$3,000,000, to seven trustees, to be applied to various public and charitable enterprises. Before his death several changes in his deed of trust were made and new trustees designated;

but the provisions finally set apart \$60,000 for the erection of a monument in Golden Gate Park to Francis Scott Key, author of the "Star-Spangled Banner;" \$100,000 for the erection of a group of bronze statuary in front of the City Hall, San Francisco, representing the history of California; \$150,000 for the erection and support of public baths in San Francisco; \$100,000 to found an Old Ladies' Home in San Francisco; \$540,000 to found and endow the California School of Mechanical Arts; and \$700,000 for constructing an observatory and erecting therein a more powerful telescope than had ever been made, the observatory to become a part of the University of California. Mr. Lick died Oct. 1, 1876, and in 1887 his remains were placed in a vault at the base of the 30-foot pier supporting the great telescope.

LIDDON, HENRY PARRY, an English clergyman, was born Aug. 20, 1829, at Stoneham, Hants; graduated in 1850, at Christ Church, Oxford; took holy orders in 1854; vice-principal of the theological school at Cuddesdon; prebendary of Salisbury Cathedral (1864-70); resident canon of St. Paul's, London (1870-90); professor of biblical interpretation at Oxford (1870-82); thrice select preacher, and once Bampton lecturer at the same university; died suddenly, Sept. 9, 1890, at Weston-super-mare.

Canon Liddon was regarded in England as one of the foremost of pulpit-orators, and many flocked to hear his sermons at St. Paul's. He was a champion of advanced Anglican views, which were not acceptable at court and stood in the way of his preferment. His sermons have been collected into several volumes. His best work was his Bampton lectures, published as *The Divinity of Our Lord and Saviour, Jesus Christ*, a book that was several times reissued. Many were looking to him, as the most competent person, for a life of Dr. Pusey, on which he was known to be engaged, but he left it unfinished. However, other hands took up his material and plans, and in 1896 the third of four volumes, entitled *Life of Edward Bouverie Pusey*, was published as the work of Canon Liddon. The Canon's *Letters from Egypt and Syria* appeared posthumously in 1891.

LIE, JONAS LAURITZ EDEMIL, a Norwegian novelist; born at Eger, near Drammen, June 11, 1833. He spent his youth at Tromsø, a town and island in Finmark. He prepared to enter the navy, but being compelled by near-sightedness to give this up, he turned his attention to the law; after practicing for some years at the little town of Kongsvinger, he moved in 1868 to Christiania, and devoted himself entirely to literature. He has spent a great deal of time in travels, and for 12 years preceding 1893 was absent from Norway altogether, but in the latter year he returned to his native land.—His wife, THOMASINE HENRIETTE LIE, has been a steady co-worker in his literary productions.—Among his novels are *Den Fremsynte* (1870); *Adam Schrader* (1879); *Livsslaaven* (1883); *Familjen paa Gilje* (1883); *En Malström* (1884); *Niobe* (1893). He wrote two dramas, *Faustina Strozzi* (1875) and

Grabows Kat (1880). See also *Literature*, under NORWAY, Vol. XVII, p. 592.

LIEBKNECHT, WILHELM, a German socialist, was born at Giessen, Mar. 29, 1826, and died at Charlottenburg, Aug. 6, 1900. His education was received at his native city and Berlin. Involved in the revolutionary uprisings of 1848, and condemned to death, he fled to Switzerland and England, in which countries he lived a long time. Returning to Germany without permission, he was imprisoned. When finally released, a seat was found for him in the Reichstag by his admirers. In company with Bebel, he was immured for two years in the fortress of Hubertsburg from 1872. He was later chosen to represent Berlin in the Reichstag, and became editor of *Vorwärts*, the principal Socialist daily paper in Germany.

LIEN. See AGENT, Vol. I, pp. 280-281; LIEN, Vol. XIV, pp. 569-570; INNKEEPERS, Vol. XIII, p. 82; and SALE, Vol. XXI, pp. 205-210.

* LIFE INSURANCE IN THE UNITED STATES. Life insurance is peculiarly adapted to the genius and institutions of the people of the United States. Commencing practically in 1843, when the Mutual Life Insurance Company of New York issued its first policy, the business has had a marvellous growth until it now exceeds, in the amount of insurance in force, that of all other countries combined.

According to the latest official returns, the insurances in force in the regular or level-premium companies in the United States and Great Britain were as follows: In the United States, Jan. 1, 1896, \$6,617,508,355; in Great Britain, latest returns, £658,170,728; or, counting \$4.84 to the pound sterling, \$3,185,546,324.

The statistics for companies in the United States are compiled from the official returns of these companies to the insurance departments. The statistics for those of Great Britain are compiled from *Bourne's Insurance Directory*, published in 1896.

The regular companies in the United States, as contra-distinguished from co-operative or assessment associations and from beneficial organizations, such as Odd-Fellows, Masonic, trades unions and other fraternal societies, were, on Jan. 1, 1896, 55 in number, with assets amounting to \$1,165,426,149; surplus of \$163,983,129; income in 1895, \$273,691,282; and the payments to policy-holders the same year, \$126,360,612.

The outstanding insurances Jan. 1, 1896, in assessment companies, were about \$7,500,000,000; in the various beneficial and fraternal societies probably as much more, although in the absence of official returns it is impossible to give exact figures.

Prior to 1843 there were but few life insurance companies in the United States, and the amount of business was quite insignificant. It is interesting to note, however, that the oldest company in the world confining its business strictly to insurances upon lives and annuities is the Presbyterian Ministers' Fund of Philadelphia. This company, organized in 1759, or three years prior to

the celebrated Equitable of London, has been steadily pursuing its business from that year to the present—or for 137 consecutive years. It is in a healthy and prosperous condition, although its business, confined to insurances upon the lives of Presbyterian ministers, is necessarily very small. It is believed that this little company was the first to recognize the right of policy-holders in case of discontinuance to surrender-values for their over-payments, a right which is conceded almost universally now by the companies and enforced by the statutes of many states. In 1852 this company inserted the following clause in its policies: "Should the assured at any time desire a cancellation of the policy, an estimate will be made of the value thereof, on life-insurance principles, and the amount will be credited as a single payment for the assurance of a single sum payable on the death of such minister, or at his request, and at the election of the corporation may be repaid to him, deducting five per cent."

In June, 1860, the New York Life Insurance Company began the issue of ten-payment whole-life policies with the guaranty of a paid-up policy for a proportionate amount in case of lapse after two annual premiums had been paid. This commendable course has since been followed by all other American companies.

Not only has the business of life insurance had a phenomenal growth in volume during the past fifty years, but it has improved greatly in quality. In the earlier years the contracts were iron-clad, and, to say the least, were very favorable to the companies. If the insured was unable or unwilling to pay a stipulated premium, the policy and all premium payments were usually forfeited to the company. Harsh restrictions and penalties were imposed in case of travel, residence or occupation, which were assumed to involve extra hazard. The companies of late years have been in keen competition in the race for liberal concessions to the assured. At the present time, in many companies there are few or no restrictions in regard to residence, travel, occupation, and, after one or more years, even as to suicide. One company has gone so far as to agree that the prompt payment of premiums is the sole requisite for the prompt payment of the insurance, without other conditions. There is, of course, danger in such extremes of liberality, but it is sought to be justified by the general truth that life insurance is safe or possible only on the general hypotheses that, to the average man, life is more precious than money; that the insured has a greater interest in his own life than the company has; and that he may be trusted to take care of it. Like all general truths, this one may have exceptions, and the danger is rather in too great liberality than in too great caution on the part of the companies.

In the earlier years of American life insurance, companies were obliged to rely upon foreign tables of mortality, and the standard of valuation adopted almost universally in the United States was the English Carlisle table. Statistics of

mortality in American companies were carefully gathered, and in 1859 was published the so-called American Experience Table, compiled by the writer chiefly from the rates of mortality which prevailed among the insured in the Mutual Life Insurance Company of New York. This table first demonstrated the fact that the rates of mortality among insured lives in the United States, while higher at younger and older ages than among similar insured lives in Great Britain, were lower at the middle ages, say from thirty to sixty, during which period nearly all the insured were included. This proved that American companies were on a safe basis as regards the mortality rates assumed. The American Experience Table at once commanded confidence, and was soon adopted as the official standard for premiums and valuations of insurance contingencies by nearly all the companies and by nearly all the states. It is still the best index of the relative mortality at the several ages which has been experienced in the past, and which may be expected to prevail in the future among American insured lives.

In the earlier years the surplus of life-insurance companies was divided among their members in proportion to the premiums paid by each. This was a most unequal and unsatisfactory method. In 1862 the contribution plan of dividing surplus was devised by the writer and his assistant at that time, Mr. D. P. Fackler, and was applied in the following year to the distribution of the surplus of the Mutual Life Insurance Company of New York. By this plan the individual contributions to surplus from favorable mortality, from higher interest and from economy in expenses, are ascertained separately, and the surplus divided in proportion to the individual contributions thereto. The contribution plan at once superseded the old methods, and has been adopted very generally by American companies.

In the earlier years surplus was usually divided at infrequent intervals, usually once in five years, and was applied either to purchase additional insurance payable with the policy, or toward the cancellation of premium notes when these were accepted by the companies. In time, however, the surplus was divided annually, and could, at the option of the assured, be applied either to increase the insurance, to reduce the premium, or be withdrawn in cash.

There is one specialty in American companies which is worthy of attention, and that is the very large amount of insurance written upon Tontine plans. Tontine insurance, as now written, is simply an agreement by which surplus is retained and accumulated for the exclusive benefit of those policy-holders who survive and keep their policies in force until the end of the tontine period agreed upon—generally ten, fifteen or twenty years. Upon ordinary plans the surplus is divided annually; upon both plans the full sum insured is always payable at death.

Life insurance is, in effect, an arrangement or device by which the pecuniary loss to family or

dependents which would result from the death of their protector, is borne by a large number of associates, upon each of whom the burden or loss falls but lightly. In the case, however, of a person who dies after paying one premium, or only a small number of premiums, the pecuniary gain to his beneficiaries is abnormally great, since the amount of insurance is very large in comparison with the premiums paid therefor. To pay dividends, in addition to the insurance in such cases, only aggravates the relative inequality between persons dying early and those who live longer and pay premiums for many years. The Tontine system, by awarding and paying surplus to the latter class only, equalizes these otherwise unavoidable and unforeseen inequalities. Moreover, each person should be allowed full liberty in the choice of different forms of insurance, and so-called Tontine companies issue all kinds. The fact that such a large number of applicants prefer and select Tontine policies may be considered a proof of the confidence of the companies and of their patrons in the system. In the volume of business, the Tontine companies surpass by far the companies which refuse to issue that class of policies. Incidentally it is claimed that lapses are fewer among Tontine than among ordinary policies, and that there is a great advantage to those who survive the Tontine period in the opportunity of closing their contracts and of receiving their full equities, both of reserve and surplus, in cash or in paid-up insurances, or of continuing their policies with greatly reduced premiums.

In one respect life insurance in the United States differs in a remarkable degree from that in Great Britain, and, in fact, from that in all other countries. Each of the United States, in the absence of legislation by the national government, has sovereign power to impose such restrictions, conditions and taxes, however onerous or oppressive, as it may see fit, upon corporations of every other state seeking to do business within its precincts. Each state has its own insurance department and its own statutes regulating life insurance. In consequence, the policy-holders of life insurance companies are subjected to hazard, inconvenience, danger and expense by reason of diverse and oftentimes incongruous legislation. The burdens imposed upon the management of our life-insurance companies by reason of the requirements of the different states, and of the necessity laid upon them to protect the interests of the policy-holders by guarding them against unfavorable and unwise legislation, is very serious.

The business of life insurance in the United States is usually conducted on the mutual plan. The members of a mutual life-insurance company constitute a society, and each member is at once insurer and insured, entitled to participate in the management, and share in the profits in proportion to his interest.

A life-insurance company essentially consists of a trust fund, and the proper administration of such a fund demands *equity* between the bene-

ficiaries. As the policy-holders, the sole beneficiaries of such a trust fund, reside in different states, the necessity of uniform laws for the administration of the trust inheres in its very nature. The rights of a beneficiary residing in one state in the administration of such a trust should be determined by the same law which governs those of his fellow-beneficiaries residing in other states. Any discrimination in favor of a beneficiary residing in one state would impair the vested rights of beneficiaries residing in other states. Uniform law for life insurance is demanded precisely as in the case of the administration of the Peabody trust fund, where the statutes of one state govern its transactions in all other states. Uniform, stable and just law is an absolute essential to safety and success in the administration of the business of life insurance.

In striking contrast with the American system of state supervision by legislative enactments, is the system adopted in Great Britain. There the companies are required simply to file with the Board of Trade sworn statements as to the amount of assets, of income and of liabilities, giving the table upon which such liabilities are computed; and the public is left to find out their relative merits or standing by such illumination as active competition and public information may afford. No attempt at supervision of companies is made, and in Great Britain no tax is laid upon life insurance. There it is assumed, and very justly, that life insurance is a public benefaction; that it tends to promote thrift and economy on the part of its citizens and to avoid the burden of paupers upon the state, and that as such it should be fostered and encouraged by every proper means.

In other words, life insurance in the United States is the subject of supervision and tax by each separate state, while in Great Britain publicity and natural competition are relied upon to keep the companies in sound condition. The two methods are in sharp contrast. It cannot be denied that the American system has one advantage in the complete published returns, even to the minutest detail, of its items of assets, liabilities and methods of business, which are open to the inspection of the public. American companies are thus enabled to dispel honest doubts and disarm designing criticism by the simple logic of facts, and to demonstrate beyond question their claim to the confidence of the community.

While there have been in former years failures among life-insurance companies in the United States, they may all be attributed to inexperience in management or to extravagance in expenditures. In no single instance can a failure be attributed to defects in the principles upon which this system rests and to which it owes its claim to the confidence of the community. These principles are based upon science and sound business experience, and are likely to endure.

Notwithstanding the failures which have occurred among former weak and unsound life-insurance companies, the loss to the public has been

small compared with that in other branches of business.

The following statistics regarding the regular life-insurance companies doing business in New York, from the dates of their respective organizations to Dec. 31, 1892, are compiled from the thirty-fourth annual report of the New York Insurance Department:

Paid policy-holders-----	\$1,529,578,279
Assets on hand-----	903,734,537=\$2,433,312,816
Total premiums received-----	2,281,934,040

Excess of premium receipts acc'd for-- \$ 151,384,776

The former superintendent of the New York Insurance Department well said in his annual report for 1884, referring to the administration of life-insurance companies: "Never was there presented anywhere a statement of trusteeship accounting that equals this, and it needs but publicity to silence the doubts of those who have been prejudiced by the failures that have occurred in the business. The losses occasioned by these failures, unfortunate as they were, are insignificant when compared with the great benefits conferred by the solvent companies in the return to the policy-holders and their beneficiaries of the amount shown by the preceding statistics."

SHEPPARD HOMANS.

LIFE-SAVING APPARATUS. The devices mainly depended upon by life-saving crews are the breeches-buoy, the Lyle gun, the life-car and the lifeboat. The breeches-buoy consists of a pair of canvas breeches, with a buoyant ring around the top, and tackle for attaching it to run on a life-line, as between a wrecked vessel and the shore. The Lyle gun, invented by Captain David A. Lyle, United States of America, is of bronze, and weighs, with its line-carrying projectile, a little more than two hundred pounds. Its range is about seven hundred yards. The life-car used in the United States service is boat-shaped, double-ended, and has a small hatch which may be fastened either from the inside or outside. It is designed to run on the life-line, when the seas are so heavy as to make the use of the breeches-buoy difficult, or for transporting women, children or sick persons from a wreck. With these and the common lifeboat, the crews of the United States life-saving service have reduced the deaths by shipwreck during the past twenty-five years to less than seven per cent of the loss during the previous twenty years. Only one shipwrecked person out of 84 is the average of those drowned on the United States coasts where the service is maintained.

The Royal Lifeboat Institution of Great Britain in 1891 built a jet-propelled lifeboat named the *City of Glasgow*, which proved so successful that another, somewhat larger, has been built for the National Lifeboat Institution of Holland. The system of jet-propulsion has not been looked upon with favor by mariners and naval experts, but in this instance it proves serviceable. The *Glasgow* has 200-horse-power engines driving

a centrifugal pump arranged to run only in one direction. There are no paddle-wheels or screw-propellers, the propulsion being effected by the discharge of water-jets located at about the center of the vessel. The discharge-streams can be driven in any direction, serving to steer as well as to drive the boat. There is also a rudder, but it need not be used except in case of emergency. The discharge-streams are under the control of the steersman, who may adjust them at any angle, or even turn them straight outward, by means of controlling valves. By directing one forward and the other backward, he can turn the boat around within a circuit of the diameter of its own length, a maneuver not possible with any other form of propulsion. By reversing the jets the vessel can be stopped from full speed in twenty seconds. It is this exceeding quickness of maneuvering which has made this form of propulsion acceptable in the life-saving service. The Holland boat is built entirely of steel, and is 55 feet all over, 13½-foot beam, and 5½ feet deep, drawing 3¼ feet of water. The engines are 250 horse-power.

Numerous life-arrows, kites and similar devices have been invented to carry lines to wrecked vessels, but none has proved superior to the Lyle gun. Various circular life-buoys are in use, some of them capable of sustaining a dozen or more persons in the water. The life-raft is in use on most modern steamboats of any size. It consists usually of two parallel double-pointed steel cylinders, filled with air, and connected by a framework that forms the floor of the raft. Passenger vessels uniformly carry life-preservers, the common form being a sort of jacket containing cork floats sewed in around the body.

C. H. COCHRANE.

LIFE-SAVING SERVICE, UNITED STATES. This service, under the present system, has been in existence since 1871. It is an organization for the succor and rescue of seafarers subjected to shipwreck upon the sea and lake coasts of the United States. With the exception of about fifty stations supported by the Danish government, mainly on the coast of Jutland, and a few on the coast of Belgium, the life-saving service of the United States is the only government establishment of the kind in the world. It is distinguished not only by its uniqueness and magnitude, but also by the extraordinary success which has attended its efforts to save life and property upon occasions of maritime disaster. This service is under the control of the United States Treasury Department. It includes all points of danger on nearly ten thousand miles of coast, divided into twelve districts. A general superintendent presides over the organization, who, with his assistant, has his headquarters in the Treasury at Washington. There is an inspector of life-saving stations at New York, and there are two superintendents of construction for the Atlantic and lake coasts and two for the Pacific, who supervise the building and repairs of the stations and purchase their

equipments. An officer of the revenue marine acts as assistant or local inspector in each district. He sees that the stations are kept in proper order and the crews well practiced in the use of the life-saving appliances. Besides the local inspector, there is, in each district, a superintendent, who manages its affairs, under the direction of the general superintendent. At each life-saving station there is a keeper, who must be an expert surfman. He is, by law, an inspector of customs, and has power over all stranded property. Under him is a crew of seven experienced surfmen. These men have to patrol a certain beat every night, and during foggy days. On these patrols they look out for vessels in danger or distress. For the proper watching of the coast the station-men are divided into four watches, of two men in each, and each man is provided with a beach-lantern and pouch of Coston signals, which are cases of combustibles, capable of being lighted at will by percussion. The first watch leaves the station at sunset. One of the two men composing the watch goes to the left, the other to the right. Each one marches on until he meets the patrolman of the adjacent station in his direction. After exchanging metal checks (suitably inscribed) each patrolman returns to his station, and presents his check to the keeper as proof of the performance of his duty. Then a second watch sets out and goes over the same ground, then a third; and so on until the night is passed. This constant patrolling of desolate coasts on dark nights and foggy days is often a very severe task, but it is faithfully performed.

The stations usually are two-story wooden houses containing six or seven rooms. They are well supplied with all life-saving appliances, and also are fitted up for the residence of the crews. On dangerous coasts, where wrecks are frequent, they are only about five miles apart. Most of them are now connected by telephone. At many of them a team of horses is kept, in order to lighten the labors of the men in moving heavy apparatus to the places where rescues have to be made.

The mode of service at wrecks is as follows: When a vessel is driven ashore by day, she is seen by the station-lookout, who is on top of the house. If it is by night, the patrolman walking along the coast descries her struggling in the breakers, and he at once ignites his Coston lights. These lights emit a brilliant red flare of about two minutes' duration. This notifies the persons on board that they have been seen and that assistance is near. The patrolman then hurries to the station, where he reports to the keeper. The latter then hastens with his crew and a wagon-load of apparatus to the assistance of the distressed vessel. Sometimes the large lifeboat is launched, at other times the lighter surfboat is hauled overland to a point opposite the wreck, and there launched. The keeper, being the commander and the steersman of the boat, he has to decide what course of action must be pursued. When he reaches the vessel, women, children, helpless persons and pas-

sengers are first taken into his boat—no scrambling, pushing or pressing is allowed on such occasions—and the wrecked crew and officers are shipped last. Baggage or goods are not allowed to be taken into the rescuing boat until every living person has been landed.

Should the sea be so turbulent that no boat can live in it, the method of rescue by means of the wreck-ordnance is resorted to. A line attached to the shot of the wreck-gun is fired over and across the wrecked vessel. Pulling on this line, the people on the wreck haul on board a rope, without ends, and finally get a tail-block, which has a whip-line rove through it. They fasten the tail of the block to a mast of the wrecked vessel, or to any other firm portion of the hull situated well up. Next the hawser is pulled on board in a similar way, and fastened to the mast, above the other rope. The shore end of the hawser is drawn over an upright crotch or shear-legs, guyed or braced to a sand-anchor in its rear. When all is ready, the wrecked people are brought ashore, either one by one in the breeches-buoy, or six at a trip in the life-car. The latter is seldom used on our coasts, the breeches-buoy and surf-boats being employed generally. For illuminating the beach during the wrecking operations, the surfmen suspend a so-called "sausage-light" from a tripod on shore. Immediately upon being landed the rescued people are conveyed to the station, and there they are cared for until they are able to help themselves. Besides the saving of life, the rescue of property is a conspicuous though secondary feature of the service. The surfmen are experts in floating stranded vessels, extricating them from dangerous situations, relieving leaking vessels, and rendering service in various ways. In the majority of cases they succeed in saving the vessels and cargoes without any other aid than that of the ships' crews, and often alone.

That the crew may become skilled in the handling of the life-lines and breeches-buoys, a constant system of practice is maintained at the stations. For this purpose a pole is set up in the shallow water near the shore, say 75 yards from the place of practice. This pole represents the mast of a wrecked vessel. The crew are called upon in the boathouse, by number, first, and are examined orally. They have to recite the details of the exercise as set down in the service-manual. At the words of command they then fall into place at the drag-rope, and draw the apparatus to the drilling-ground. A man has been placed upon the pole. At the word "action" the crew proceed to rig the apparatus and bring their comrade down from the pole in the breeches-buoy. The time required is noted and recorded. If in one month after the active season has commenced the work cannot be done in five minutes, the men are cautioned. Further admonition is rarely necessary. In fact, an active rivalry exists between many of the stations to perform this mimic rescue in the shortest time. It has been effected in two and a half minutes. This was in the day-

time. At night-drills it has been done in three minutes.

In addition to the wrecking-drill the crew are exercised every week in boat-practice, including launching and landing through the surf, with at least half an hour's rowing; they are also practiced in signaling with miniature flags, accompanied by oral examinations in the main features of the international code of signals, and they are drilled regularly in the manipulation of persons apparently drowned, one of the surfmen serving as the subject to be resuscitated. When this ceaseless round of practice-work is superimposed upon the regular patrol and other duties, it will be understood that the time and muscles of the surfmen are fully engaged. On the monthly visits of the inspectors the latter mark in their drill-books the proficiency of each member of the station force, and report it to the general superintendent, who keeps the record of the rating of every man in the life-saving service.

Upon the sea and lake coasts of the United States there were on June 30, 1895, 251 government life-saving stations. Of these, 184 are on the Atlantic shores, 13 on the Pacific, and 53 on the Great Lakes. One river station is at Louisville, Kentucky, on the falls of the Ohio River.

The life-saving districts are classified by districts, each district including a number of stations situated along a certain coast. The districts, with the extent of coast-line which they include, are the following:

First District—Coasts of Maine and New Hampshire.

Second District—Coast of Massachusetts.

Third District—Coasts of Rhode Island and Long Island.

Fourth District—Coast of New Jersey.

Fifth District—Coasts of Delaware, Maryland and Virginia,—from Cape Henlopen to Cape Charles.

Sixth District—Coasts of Virginia and North Carolina,—from Cape Henry to Cape Fear.

Seventh District—Coasts of South Carolina, Georgia and eastern Florida.

Eighth District—Gulf Coast of United States.

Ninth District—Lakes Erie and Ontario.

Tenth District—Lakes Huron and Superior

Eleventh District—Lake Michigan.

Twelfth District—Pacific coast.

The distribution of stations is regulated by the nature of the coast and the amount of commerce passing by or approaching it. From the eastern extremity of the coast of Maine to Cape Cod there are but 16 stations for 415 miles. The coast, for a great part rocky and precipitous, gives numerous harbors of refuge. Along Cape Cod a dangerous region appears, where there are ten stations, about eight miles distant from each other. The bight formed by the shores of Long Island and New Jersey, with New York harbor at the apex, is renowned for its dangerous nature. Along 250 miles of the shores of this much-frequented waterway there are 79 stations, giving an average distance of about three miles from station to station.

Farther south there is less commerce, and fewer stations are provided. For 175 miles from Cape Hatteras south to Cape Fear there are but six stations, the distance between stations averaging nearly thirty miles. The coast of Florida is of such formation that vessels are generally wrecked close to shore and the crew can save themselves. Refuge-stations for the supply of food and water are provided along the uninhabited portions of this coast. Their average distance apart is 26 miles. At each mile along the coast a guide-post is erected, giving the distance and direction to the nearest refuge-station. Each has provisions enough for twenty-five persons for ten days.

The Great Lakes have a coast of 2,500 miles' extent. Most of the harbors of refuge are artificial, defined by piers and maintained by dredging. These are the scenes of most of the wrecks, as vessels in storms make for the nearest of them, and are liable to strand upon the shoals at their mouths. Forty-five stations protect this great extent of coast, being generally placed at or near harbors.

All these stations are fully supplied with life-boats, wreck-guns, beach-apparatus and restoratives. The stations on the Atlantic coast from the eastern extremity of the state of Maine to Cape Fear, North Carolina, are manned by crews of experienced surfmen from September 1st until May 1st; upon the lake coasts the stations are manned from the opening until the close of navigation; and on the Pacific coast they are manned all the year round. Exceptions are made at the station on Beaver Island, Lake Michigan, and at the stations on Neah Bay and Cape Arago, in Washington. These three stations depend on the volunteer efforts from the neighboring people in case of shipwreck. Neither are the houses of refuge manned by crews. Such houses are located exclusively upon the Florida coast. A keeper, who is supplied with boats, provisions and restoratives, resides in each of them throughout the year. He is required to make extended excursions along the coast after every storm and find out if any shipwreck has occurred. (See DROWNING, Vol. VII, pp. 475, 476.)

The following is a general summary of disasters which have occurred within the scope of life-saving operations from Nov. 1, 1871 (date of introduction of present system), to close of fiscal year ending June 30, 1895:

Total number of disasters.....	8,302
Total value of property involved.....	\$133,641,974
Total value of property saved.....	\$102,342,047
Total number of persons involved.....	67,258
Total number of lives lost.....	750
Total number of persons succored.....	12,013
Total number of days' succor afforded.....	31,353
The cost of maintaining the service during the year ending June 30, 1895, was \$1,345,324.	

It is a notable feature of the United States life-saving service that it has always been free from any connection with politics. This feature has been secured by direct provision of law. It is undoubtedly one of the main factors of the remarkable success of the service. The keepers and crews of the stations are chosen solely for

their fitness and capability, and are retained in the service so long as they remain efficient, no matter what their political status may be.

The life-saving crews are forbidden to solicit any rewards for services, but on account of the meagerness of their wages and the great risks of their calling, they are not forbidden to accept rewards if the owners or masters of wrecked vessels, or other persons, see fit, voluntarily, to bestow rewards upon them.

LIGHTFOOT, JOSEPH BARBER, an English bishop, was born in Liverpool in 1828; graduated at Trinity College, Cambridge, in 1851; fellow of and tutor in his college, 1852-61; took orders in the Church of England, 1854; Hulsean professor of divinity at the University, 1861; Lady Margaret professor of divinity in the same institution, 1875; canon of St. Paul's Cathedral, London, 1871; select preacher at Oxford, 1874-75; made bishop of Durham, 1879; died at Bournemouth, Dec. 21, 1889. Dr. Lightfoot was one of the best critical scholars of the New Testament. The grammatical analysis and textual notes of his commentaries on *Galatians* (1865); *Philippians* (1868); and on *Colossians* and *Philemon* (1875), placed him in the front rank of modern exegetical scholars. He was one of the English committee on the revision of the *New Testament*. His reply to the anonymous *Supernatural Religion* was issued in 1875 in the *Contemporary Review*, and was published again in 1890. He began an exhaustive treatment of the Apostolic Fathers, but his work went no further than the epistles of *Clement* (1869, new ed., 1890) and of *Ignatius* and *Polycarp* (1885-89).

LIGHT AND AIR, RIGHTS TO. See PRESCRIPTION, Vol. XIX, p. 706.

LIGHTHOUSE BOARD, THE, was created by act of Congress approved Aug. 31, 1852. This act requires the President to appoint two officers of the navy, two officers of the corps of engineers of the army and two civilians of high scientific attainments, together with an officer of the navy and an officer of engineers of the army as secretaries, who shall constitute the United States Lighthouse Board, the Secretary of the Treasury to be *ex officio* president of the board. The Lighthouse Board is attached to the office of the Secretary of the Treasury, and, under his superintendence, attends to the administration of all matters relating to the construction, care, and maintenance of the United States lighthouses, lightships, buoys, and all other aids to navigation. The board meets on the first Monday in March, June, September and December. In addition to these, meetings are called about once every two weeks. The board divides its duties, among standing committees on engineering, on floating aids to navigation, on lighting, on tests and experiments, and on locations. The last-named committee has charge of matters relative to the location of lighthouses, buoys and other aids to navigation.

The Lighthouse Board was required by law to divide the Atlantic, Gulf, Pacific and Lake coasts into lighthouse districts, not to exceed twelve in number. To each district was assigned an officer of the army or navy as inspector; and the President

was required to detail from the engineer corps of the army such officers as might be required to superintend the construction and renovation of lighthouses therein. In 1874 two more districts were placed under the jurisdiction of the board, including the Ohio, Missouri and Mississippi rivers.

At the close of the fiscal year 1895, there were under the control of the Lighthouse Board the following aids to navigation: Lighthouses and lighted beacons, including post-lights in third, fourth, fifth, sixth, eighth and thirteenth districts, 1,396; lightships in position, 41; lightships for relief, 4; electric and gas buoys in position, 23; fog-signals operated by steam or hot air, 130; fog-signals operated by clock-work, 185; post-lights on the Western rivers, 1,411; day or unlighted beacons, 424; whistling-buoys in position, 66; bell-buoys in position, 96; other buoys in position, including pile-buoys and stakes in fifth district and buoys in Alaskan waters, 4,547.

Lighthouses are graded in different orders, according to the sizes of the lenses, the first order being the most powerful. The Lighthouse Board experimented with various illuminants, such as sperm, lard, colza and mineral oils, and finally decided that mineral oil is the best and cheapest, and consequently it is used almost entirely. The consumption of mineral oil is about twice as great as that of lard-oil, but its cost is about one-quarter of the latter. The following table shows the candle-powers of the lamps used in the different orders of lights:

First order	-----5 wicks	-----450 candle-power.
Second order	-----3 wicks	-----163 candle-power.
Third order	-----2 wicks	-----78 candle-power.
Fourth order	-----1 wick	-----32 candle-power.
Fifth order	-----1 wick	-----18 candle-power.
Sixth order	-----1 flat wick	-----125 candle-power.

The above-mentioned 1,411 post-lights are located on the banks of the Mississippi, Ohio, Missouri, Savannah, Cape Fear and Hudson rivers, and at the mouth of the Red River, Louisiana. They consist of a high post set in the ground, properly braced, and supporting a box at the top, in which is placed an ordinary kerosene lantern, and they are located so as to indicate the channel. They can easily be shifted to correspond to the changes in the channel.

In the construction, care and maintenance of the various aids to navigation there were employed during the year 1895. Steam-tenders, 32; steam-launches, 4; sailing-tenders, 2; light-keepers, 1,203; other employees, including crews of lightships and tenders, 1,078; laborers in charge of river lights, 1,364. See also LIGHTHOUSE, Vol. XIV, pp. 615 et seq.

LIGHTNING-ARRESTER, a device for the protection of electrical apparatus, such as dynamos, telephones, etc., having outside wires, from injury by lightning. During the time of electrical disturbances such machines afford convenient paths to the earth for electricity, and are liable to injury by the passage of too strong currents through them. The principle of the arrester lies in the fact that the electrical machines in question usually have connected with them numbers of coils of wire, through which the discharge must pass to reach the ground. Another

conductor offering less resistance than these coils is therefore placed near the wire leading to the telephone or dynamo, but not touching it. The intervening air-space possesses resistance enough to the steady, relatively weak current which is intended to pass through the machine to insulate it from the second conductor or arrester, but for varying currents of great intensity, such as electrical discharges in the atmosphere, the air-space offers less resistance than the coils of wire in the machine. The great difficulty in the construction of such arresters is that the air between the machine and the arrester when heated loses, to a certain extent, its resistance, and hence conducts off, also, the current intended to remain in the circuit of the machine. Several devices have been invented to prevent this, the most successful of which is to make the air-space a strong magnetic field, which causes the arc to be diverted at right angles to the lines of force, and destroyed.

LIGNIN. See *PHYSIOLOGY*, Vol. XIX, p. 44.

LIGNITE (called also "wood-coal" and "brown-coal"), a mineral coal retaining the texture of the wood from which it was formed. See also *COAL*, Vol. VI, p. 46.

LIGONIER, a town of Noble County, north-eastern Indiana, situated on the Elkhart River, and on the Lake Shore and Michigan Southern railroad, 35 miles N.W. of Fort Wayne. It manufactures carriages, tubs and barrels, and has flour and lumber mills. Population 1900, 2,231.

LIGOR. See *MALAY PENINSULA*, Vol. XV, pp. 322, 323.

LI HUNG CHANG, a viceroy of China, and the highest ranking officer in the empire, was born in the village of Hwei-Ling, in the province of Nganhwei, in 1822. He took the Hanlin degree in 1849. When the Taiping rebels invaded Nganhwei in 1850, he joined the army as secretary. He was appointed provincial judge of Chêhkiang province, and in 1861 governor of Kiangsu. In conjunction with General Gordon he recovered Su-

LI HUNG CHANG.

chau in 1863, and drove the rebels entirely out of Kiangsu. For his services he received the yellow jacket and peacock's feather, and was created an hereditary noble of the third class. Two years later he was appointed governor-general of the Liang-Kiang provinces, and subsequently commanded against the Nienfei and Mohammedan rebels. In 1872 he was appointed governor-general, or viceroy, of Chili, the metropolitan province. His advancement was due to his own achievements, his practical ability elevating him to his high rank. He was frequently, but improperly, styled viceroy of China, whereas his jurisdiction was confined to the province of Chili. He always proved himself to be a friend to foreigners and to European culture and industry. A member of the Board of Admiralty, he originated the Chinese navy; and he was

the chief promoter of the China Merchants' Steam Navigation Company, the only native steamship line. He has practically controlled the foreign policy of the empire, and every department of imperial administration, with consummate forethought and address. In 1894 the Emperor of China appointed him commander-in-chief of the Chinese forces, both naval and military, which were engaged in the war with Japan, but early in the war marked his displeasure by depriving him of the yellow jacket and the peacock's feather, and later superseded him in the chief command. Later, however, he was reinstated in his former offices as the result of his negotiations for peace with Japan. In 1896 he made a tour through Europe and America. On his return to China Earl Li, as this enlightened statesman is sometimes called, was made foreign secretary of the empire; but in 1898 he was temporarily disgraced and excluded from the Tsung-li-Yamên. He was afterwards reinstated by the Empress-Dowager and given a commissionership in Southern China. When the Boxer rising broke out, in the summer of 1900, Earl Li came to the front as intermediary between the Chinese Court and the foreign Powers in possession of Peking. He is at present engaged in this delicate bit of diplomacy.

LILIUOKALANI, LYDIA KAMAHEHA, ex-Queen of Hawaii; born Dec. 2, 1838. She was the eldest sister of King Kalakaua, and when he left the islands for a visit to the United States she became regent. After his death in San Francisco she was proclaimed queen, Jan. 29, 1891. She had attempted to abolish the constitution of 1837, and to reign as an absolute monarch, and thereby aroused the opposition of the liberal party in the kingdom, which consisted largely of white immigrants from the United States. A committee of public safety was formed by the latter, who proclaimed her deposed and the monarchy abolished, Jan. 17, 1893. In Jan., 1895, an insurrection occurred, with the purpose of reinstating her, but the movement was quelled, and the ex-Queen was arrested. She afterward resigned all pretensions to the throne, and took the oath of allegiance to the republic, and in Feb., 1896, was pardoned. She was married to John O. Dominis, an American from Boston, who died in 1891.

LILLY, WILLIAM SAMUEL, an English writer, born at Fifehead, Dorsetshire, in 1840, and educated at St. Peter's College, Cambridge, graduating senior scholar and classical prizeman. He entered the Indian civil service by open competition; was under-secretary to government in 1869; and was called to the English bar in 1873. He published *Ancient Religion and Modern Thought* (1884); *Chapters in European History* (1886); *A Century of Revolution* (1889); and *Claims of Christianity* (1894).

LILYBÆUM OR LILYBAION. See *MARSALA*, Vol. XV, p. 571.

LILY OF THE VALLEY, a name given to *Convallaria*, a genus of plants of the family *Liliaceæ*, having terminal racemes of flowers; a white, bell-shaped or tubular six-cleft or six-toothed perianth; a three-celled ovary, with two ovules in each cell, and a succulent fruit. The species commonly known as the lily of the valley (*C. majalis*), the

Maiblume, or Mayflower, of the Germans grows in bushy places and woods in Europe, the north of Asia and North America, and has a leafless scape, with a raceme of small flowers turned to one side.

LIMA, a post village of Livingston County, western New York, on Honeoye Creek, 4 miles S. of Honeoye Falls, on the Lehigh Valley and the Lima and Honeoye Falls railroad. It is the seat of Genesee Wesleyan Seminary. Population 1890, 1,003.

LIMA, a city and the capital of Allen County, northwestern Ohio, on the Pittsburg, Fort Wayne and Chicago, the Cincinnati, Hamilton and Dayton, the Lake Erie and Western and the Ohio Southern railroads. In 1885 petroleum was discovered here, and since then the city has grown rapidly and become one of largest shipping-points for this product in the country. Mining and edged tools are manufactured extensively. Population 1900, 21,733. See also LIMA, Vol. XIV, p. 645.

LIMACIDÆ. See MOLLUSCA, Vol. XV, p. 660.

LIMASSOL, a seaport. See CYPRUS, Vol. VI, p. 748.

LIME. See LIME, Vol. XIV, p. 648 and LINDEN, in these Supplements.

LIME-BALL LIGHT. See DRUMMOND LIGHT, in these Supplements.

LIME-LIGHT OR OXYCALCIUM LIGHT. See MAGIC LANTERN, Vol. XV, p. 212.

LIMESTONE. See GEOLOGY, Vol. X, pp. 232, 238, 239.

LIMICOLÆ, a group of birds, including the plovers, snipes and their allies. They are all small wading birds. See also ORNITHOLOGY, Vol. XVIII, p. 45.

LIMICOLÆ, a group of annelid worms, including the aquatic oligochætes. The opposite term *Tenicolæ* is applied to the group of terrestrial forms. The *Limicolæ* are numerous in species and in individuals. The naiads are probably the best-known representatives. See also WORM, Vol. XXIV, p. 677.

LIMITATION OF ACTIONS. These statutes, as they exist in the various states of America, resemble, in many respects, the statutes in force in England. They may be said generally to begin to run from the time the cause of action accrues. When money is payable in installments the limitation usually begins to run from the time the last installment becomes due. There are many circumstances, however, which will operate to take a case out of the statute of limitations.

In the following column the periods of limitation fixed by statutes in the various states are tabulated for ready reference purposes. It may be stated, as a general proposition of law, that the statutes never run against an express trustee, and that in many cases provision is made for an extension of the period of limitation in cases where the statute runs against the interests of the state, minors, married women, lunatics, or persons abroad. It would be impossible to express such exceptions in tabular form, and would trench upon the province of a legal text-book. In every case reference should be made to the precise words of the statute, and the advice of an experienced attorney taken.

LINCOLN, a city and the capital of Logan County, central Illinois, 28 miles N.E. of Springfield, a flourishing manufacturing city, on the Peoria, Decatur and Evansville, the Chicago and Alton and the Illinois Central railroads. It is also the center of a rich agricultural district, with a good

coal-supply, and makes extensive shipments of grain and other produce. Its manufactures include flour, canned goods, excelsior, horse-collars, press-drills, bricks and tiles, and machinery. It has a public library and an electric street-railway. Lincoln University, founded in 1865, is situated here, with 160 students in 1896 and a library of 3,000 volumes. It is the location of the Odd Fellows' Orphans' Home of Illinois; and the State Asylum for Feeble-Minded Children. Population 1890, 6,725; 1900, 8,962.

LINCOLN, a city and the capital of Lincoln County, central Kansas, 32 miles W.N.W. of Salina, on the Saline River, and on the Union Pacific railroad. It is in a corn, wheat and wool growing region, produces marble, coal and building-stone, and has good water-power. It is the seat of the Kansas Christian College. Population 1900, 1,262.

LINCOLN, a city of southeastern Nebraska, and the state capital. It is on the Burlington and Missouri River, the Chicago, Rock Island and Pacific, the Fremont, Elkhorn and Missouri Valley, the Missouri Pacific and the Union Pacific railroads. It is characterized by its great commercial activity, being a great distributing-point for the whole southern part of Nebraska and a great deal of Kansas, of all kinds of merchandise and lumber, coal, grain and livestock. It has large stockyards and slaughtering and meat-packing houses. In manufacturing, the city is not so advanced as in commerce. Bricks, tiles, pottery, carriages and machinery are the principal products. It has several educational institutions, among them the University of Nebraska, Nebraska Wesleyan University, Cotner University, Union College, Nebraska Military Academy and normal and musical schools. Pop. 1890, 55,154; 1900, 40,169. See also LINCOLN, Vol. XIV, p. 658.

LINCOLN, BENJAMIN, an American general; born at Hingham, Massachusetts, Feb. 3, 1733. At the outbreak of the Revolution he was active in organizing the Massachusetts troops; in 1776 was appointed major-general of the state militia; commanded the expedition that, in 1776, cleared Boston harbor of British vessels. Having reinforced Washington after the defeat on Long Island, he was given an appointment as major-general in the Continental army. Lincoln served with Schuyler against Burgoyne during the next summer, and afterward was wounded at Bemis Heights, while reconnoitering. In August, 1778, he was placed in command of the army in the South. In 1780 he was besieged at Charleston by Sir Henry Clinton with a superior force, had to capitulate, and returned to Hingham on parole. But after being exchanged in 1781 he joined Washington again on the Hudson, was with him at the siege of Yorktown, and was deputed by Washington to receive the sword of Lord Cornwallis on his surrender of the British forces. From 1781 to 1784 Lincoln was Secretary of War. After quelling Shay's rebellion in Massachusetts in 1787, he was elected lieutenant-governor, and in 1789 Washington appointed him collector of the port of Boston, which office he held till 1808, when he retired from public life. He died in Hingham, May 9, 1810. His *Life* was written by Francis Bowen in Sparks's *American Biography*.

LINCOLN, ROBERT TODD, an American public man, eldest son of Abraham Lincoln; born at Springfield, Illinois, Aug. 1, 1843, and was educated at Phillips Exeter Academy and at Harvard. During the latter years of the Civil War he served as a captain on the staff of General Grant. After the war he practiced law in Chicago until 1881, when he became Secretary of War in Garfield's Cabinet. This office he retained until the close of President Arthur's administration, when he returned to his law practice in Chicago. In 1889 President Harrison appointed him minister to England, which position he resigned on the accession of President Cleveland in March, 1893.

ROBERT T. LINCOLN.

LIND, JENNY. See GOLDSCHMIDT, MADAME JENNY MARIA LIND, in these Supplements.

LINDAU, PAUL, a German dramatic author and critic; born June 3, 1839, at Madgeburg, Prussia. He studied philosophy and literature at Halle, Leipsic, Berlin and Paris; returned to Germany, and afterward edited *Die Gegenwart* and *Nord und Süd*, both of which he founded. Among the earliest fruits of his literary talents were the books of travel *Aus Venedig* (1864) and *Aus Paris* (1865); and later, *Aus der Neuen Welt* (1884), the last being a journal of American travel, including a visit to the Northwest, where he witnessed the opening of the Northern Pacific railway. His skill as a writer of critical sketches in a satirical and humorous manner is shown in *Harmlose Briefe Eines Deutschen Kleinstädters* (1870) and *Literarische Rücksichtslosigkeiten* (1871); and his caliber as a literary critic in studies on *Molière* (1871) and *Alfred de Musset* (1877), and in *Dramaturgische Blätter* (1875-78), *Nüchterne Briefe aus Baireuth* (1876), *Baireuther Briefe* (1883), and *Aufsätze* (1875). But he is, perhaps, better known as a writer of plays and novels, the subjects of which are taken almost exclusively from modern life. The former possess the merits of lively dialogue and a fair degree of dramatic power; the most successful was perhaps *Maria und Magdalena*. A collection of his theatrical pieces was published in three volumes as *Theater* (1873-81). The novels include *Herr und Frau Bower* (1882); *Toggenburg* (1883); *Mayo* (1884); *Berlin* (1886-87); and *Im Fieber* (1889).

LINDEN or LIME. The American linden (*Tilia Americana*) is a well-known timber tree, often planted along alleys for shade. It furnishes "bast," or bast-bark, equal to its European namesake. This bast is here sold for tying bundles of kindling-wood and various other binding purposes, especially in nurseries. Dried linden flowers are often used for making tea, which is taken as a sedative. See also LIME, Vol. XIV, p. 648.

LINDLEY, SIR NATHANIEL, an English jurist, the son of Dr. John Lindley, botanist and author; born at Acton Green, Middlesex, in 1828, and educated at University College, London. He was called

to the bar at the Middle Temple in 1850, and practiced in the Court of Chancery. He was appointed a queen's counsel in 1872, and in 1875 was appointed a judge of the Court of Common Pleas, receiving, at the same time, the honor of knighthood. In November, 1881, he was chosen one of the lords justices of the Court of Appeal, and soon afterward was sworn of the Privy Council. Lord Justice Lindley is known to the English-speaking world as the author of a masterly *Treatise on the Law of Partnership and Companies* (6th ed. 1893), which is the standard text-book on this branch of law. He also wrote an *Introduction to the Study of Jurisprudence*.

LINDSAY, a town of Victoria County, Ontario, Canada, on two branches of the Grand Trunk railroad, 80 miles N.E. of Toronto. It has a large trade in grain, lumber and flour, and manufactures iron, machinery, leather, flour and wooden articles. It is the trade center of a farming and lumbering region. Population 1891, 6,081.

LINDSBORG, a village of McPherson County, central Kansas, 18 miles S. of Salina, on the Smoky Hill River, and on the Union Pacific and Missouri Pacific railroads. It is an agricultural center, and has manufactories of brooms, machinery, castings, and flour and saw mills. It was settled by Swedes, and Bethany College, a Swedish institution, is located here. Population 1900, 1,279.

LING, PETER HENRIK, a Swedish poet and gymnast; born at Ljunga, Småland, Nov. 15, 1776. After studying theology, he wandered through Germany and France, leading an adventurous life. In 1805 he became fencing-master in the University of Lund, and in 1813 at the military school at Carlsherg, and in 1814 was appointed director of the gymnastic institute in Stockholm. His main endeavor was to adapt his gymnastics to the needs of the various parts of the body instead of to the arms only. At first his exercises were confined to the muscular development of the body, but later made use of his system for the cure of certain chronic diseases, the treatment becoming known as the Swedish movement cure. His success led to his being made a member of the Swedish Academy and the receipt of various honors from the king. His main poetical works are the *Gylfe* (1812) and *Asarne* (1816-26). His *Elementary Principles of Gymnastics* and other works on the movement cure were published after his death. As a poet he belonged to a group of men of letters who endeavored to re-awaken the spirit of ancient pagan heroism by turning the thoughts of their countrymen to the early history and mythology of their Swedish ancestors. He died in Stockholm, May 3, 1839.

LINGUATULIDÆ, a family of animals, believed to be degenerated arachnids. The adults are elongated, worm-like animals, living in the lungs and nasal cavities of various animals. No appendages are present, except a pair of hooks at the anterior end. One species (*Pentastomum Tenioides*) lives in the nasal sinuses of the dog and wolf. The ova pass to the exterior with mucous discharges, develop into mite-like forms, which, if taken into the alimentary canal of a rabbit, bore through into the liver and become encysted. Later, these larvæ

migrate to other tissues. If infected tissues be eaten by a dog the larvæ attaches to the membrane of the mouth and passes into the nasal chambers, where the adult form is assumed. The family is also called *Pentastomide*.

LINGULIDÆ. See BRACHIOPODA, Vol. IV, p. 194.

LINNÆA, a genus of plants of the family *Caprifoliaceæ*, or honeysuckles. It contains but a single species, *L. borealis*, the twin-flower found in the more northern regions of Europe, Asia and North America. It is a small trailing evergreen herb, characterized by lanceolate calyx-lobes and bell-shaped flowers occurring in pairs.

LINO TYPE, the name of a machine that produces words in stereotyped lines, or bars, from matrices of type automatically set. The earliest type-setting machine on record is described in Herhan's specification in the British Patent-Office, under date of 1794.

Church of Connecticut improved upon it by suggesting the keyboard principle in 1822. The casting system was pursued, and was intended to supersede the manipulation of separate types. Movable matrices were cast in single lines. His attempt was designated as the "guide-plate" principle. He put the types in channels, and operated them with keys arranged like the keys of a harpsichord.

Variations, modifications and improvements began to follow rapidly, beginning with about 1840, when Delacambre and Young took out the first of a rapid series of patents. Clay and Rosenberg, also in 1840; Joseph Mazzini, in 1843; William Martin, in 1849; Mitchel, Boule and Carlland, in 1853; Simoncourt and Wiborg, in 1854; Coulon, in 1855; Delacambre and Alden, in 1856; and Robert Hattersley, in 1857,—all followed with their different ideas of improvement. The Alden (England, 1856, and United States, 1857) was in practical use for many years in New York, on book-work. Its capacity was rated at three thousand five hundred ems an hour. Type of ordinary manufacture was used, but each character had a nick peculiar to itself. The machine was about the size of an ordinary table, the upper part describing the outline of the letter D. The operator sat at one end of the flat side. The curved portion contained a horizontal wheel, holding the type in cells. By the rotation of the wheels several receivers were also made to rotate, and these picked up the proper types from their respective cells.

It was reserved for Hattersley to produce the first machine to remain in practical use for any length of time.

To the main frame he fastened a type-table, containing a metal case in which the types could move freely. "Followers" were arranged in the rear, that pressed the type against a fixed plate by means of a vulcanized india-rubber spring. The last type of a row was depressed by a piston into a guide-plate provided with grooves converging to a single outlet below. As the composition proceeded, a lever pushed the stick forward. The types were placed in the composing-stick direct by only one motion. Distribution was accomplished

by placing the types in an inclined galley, the line lowest in the column resting on a sliding bar, having within it a series of metal pieces, the ends of which projected, so that when the bar was moved, they pushed against the lower line of type in the galley, thus sliding it into the groove, each piece working upon a separate line. The matter was read as it approached a given point; the operator touched a key on the board before him, and the letter which answered to the key was instantly conveyed to its proper receptacle.

Beginning with the year 1822, there were, in England, thirty-five patents granted on type-setting machines up to the year 1872; and beginning with 1840, and ending at the same time (1872), the United States granted thirty-five patents. Since that time the advance is counted by the hundreds.

Those attracting the greatest amount of public attention are, at the present time, the Frasier, described in Vol. XXIII, p. 701; the Thorne, the Mc-Millan, the Mergenthaler and the Rogers. For the Thorne and Rogers, and more recent patents, see TYPE-SETTING MACHINES, in these Supplements.

The most difficult of all the problems to be conquered in type-setting mechanisms is the automatic

THE MERGENTHALER LINOTYPE.

justification of the lines—that is, equal spacing of the words constituting the line of printed characters. The difficulty about justification arises from the fact that the size of the spaces required is not known until the line is set. The hand-compositor goes back over his line and changes the spaces as may be necessary to justify. There is no easy way to imitate this by machinery.

To Otto Mergenthaler of Baltimore belongs the credit of utilizing many brilliant thoughts of inventors in this field. He conceived the idea of setting up a line of matrices, and using expansible

spaces operated automatically. After the line of matrices is set up and spaced so as to justify, he casts against this mold a solidified line of type (a linotype) containing the same characters as the matrices set up. Freed from the restrictions imposed when using type, he can make the matrices of whatever size and material the purpose requires.

The matrices in the linotype are made of brass. In shape they are a parallelogram, an inch and a quarter long by three quarters of an inch wide. The thickness of the matrix corresponds with the width of the letter, thick for an "m," thin for an "i" or an "l."

The character is stamped on the side edge of the matrix, the depth corresponding to the shoulder on the type, and is about one third the distance from the bottom of the matrix. These matrices are stored in what may be likened to a toboggan-slide, composed of two parallel plates separated by five eighths of an inch and containing grooves in their opposing faces. The matrices lie with their side edges engaged in the grooves. Each set of grooves contains the matrices for only one character. At the lower end of each set is an anchor escapement, connected indirectly to a key on the keyboard. When a key is depressed it operates the escapement so as to allow the bottom matrix to escape by force of gravity from the grooves, and fall to a traveling-belt which urges it to the left, toward the assembling-point. The other matrices in the groove slide down the distance of one matrix.

The spacing devices, which are made of steel, are about four inches long by nine-sixteenths of an inch wide. They are in two parts, fitted by a dovetailing process, a long piece sliding on a short piece. They form double wedges, the outer faces being parallel. The spacing is effected by releasing, one by one, at the end of each word, a wedge-shaped bar, which are stored in a separate magazine, from which they are discharged into the receiver in a manner similar to that in which the matrices are fed.

It is this peculiar spacing feature that has been heretofore regarded as one of the impossibilities in the construction of a machine that could take the place of hand-justifying, but the simplicity of the wedge, the ease with which it falls into place, and the certainty of a correct spacing, has been so thoroughly accomplished, that the wonder is that it had not been thought of before. The wedges are about three inches in length, and, while the thin part only is first inserted by the space-key at the proper places, the whole series will be, by the touching of another key, driven to just the right pressure for the complete and even justification of the line. The possibility of such a procedure first came to Merrit Galley, of New York, who built a machine and secured the necessary letters patent in 1872. His space-wedge was first a pair of plain wedges playing on each other; then, to give a better alignment, a shouldering feature was introduced, whereby a perfect pressure between the type or matrices was secured, and the justification made perfect.

In the original machine electrical connections were made, so that what was done on one machine could be repeated on as many machines as were

put in connection with the original worker. Thus, a machine at Washington, with one operator, could report proceedings in New York, Boston, Philadelphia, Chicago, San Francisco, etc., and cast the lines of type, all under the manipulation of the single operator in Washington. Mr. Mergenthaler caught at the idea and succeeded in making it practical.

For correction of a mistake, or for any other reason, the operator can, by hand, transpose or change any matrix in the line.

By a movement of the hand-lever, the completed line is started over to the casting-mechanism. A pair of rails fastened to a vertically sliding frame carries the line of matrices down between two metal jaws projecting from a plane face of iron. These jaws close to the exact pressure or length of line. A cross-bar below rises and strikes the bottoms of all the long sliding pieces of the justifying spaces, forcing them, in their wedge form, farther into the line, and so widening all the spaces until the line fills the distance between the jaws. Thus is accomplished the act of justification.

The mold is made of hardened steel, and is the segment of a cast-iron disk 14 inches in diameter, capable of rotation, and carried on a frame that slides in the direction of the axis. This mold advances and aligns the line by pressing it against the fixed plane surface behind the matrices, the stamped characters just meeting and closing the opening at the front face of the mold. The pot containing the melted type-metal follows behind the mold, and closes the opening at the back face. The hot metal is injected from a row of holes in the pot into the mold, and, when chilled, the pot, mold and line of matrices are separated. The cast linotype is ejected, having passed by and between knives so as to have it machine-finished to exact size, and placed on a galley.

The sliding frame raises the line of the matrices up to the height of the space-box; an arm comes down from above, separates the brass matrices from the spaces, allowing the latter to slide *en masse* into their box, and carries the matrices up to the top, where they are fed by a vibrating arm, into the distributor.

The Distribution To explain the distribution it must be said that a large V is cut in the top edge of each matrix. This V is serrated with seven teeth on each side. The distributor-bar is horizontal, of steel, shaped at its bottom edge to correspond to the serrated V of the matrix. The matrices are fed on to this bar and are supported by their engaged teeth. As they hang from this bar, they are slid along by conveyer-screws, and driven through a set of passages leading to the toboggan-slide previously mentioned. These passages are distant one quarter of an inch from center to center. The teeth on the bar are cut away in sections, so that at every quarter of an inch there is a different combination of teeth left full on the bar. Certain of the teeth on the matrices are also cut away, the combination being the same for all of any one character, and different from any other characters. So long as there is on the matrix one pair of full teeth corresponding to a pair of full teeth on the bar, the matrix is sup-

ported, but when it arrives at a point on the bar over its appropriate passage, there are no teeth on the bar, and, there being nothing to support the matrix, it drops into its passage and slides from there into the toboggan-groove. As those in advance of it in the groove are used, it follows down, and finally becomes the bottom matrix once more, and starts over the same circuit again.

There are ninety keys on the key-board. Infrequently used characters are kept on a convenient frame, and can be readily inserted by hand. Blank matrices are used as "quads."

Any size type, from agate to small pica, inclusive, will run in the same grooves, so that any of the included fonts may be used in one machine. The machine can also be changed to any reasonable length.

As soon as one line is completed and started to the caster, the operator proceeds to set up another line. The keys are operated like typewriter-keys. The operator has nothing to do but to manipulate the keys and start the line. The capacity of the machine is from 8,000 to 10,000 ems per hour.

The moment the linotypes leave the machine they are ready to go into the form without any second operation. The spacing in any one line is uniform. After a line is once set up, the casts from it may be repeated as often as desired, at the rate of six a minute. The lines being solid, there is no piling. Leads are inserted at the pleasure of the maker-up of the forms. The old style hand-distribution does not exist, as the linotypes are melted over, when they have served their purpose. The metal is kept hot by Bunsen gas-flames, consuming a total of about fifteen feet of gas per hour. The space occupied by each machine is five by five feet and its weight is about two thousand pounds.

D. O. KELLOGG.

LINTON, ELIZABETH (LYNN), an English essayist and novelist; born at Keswick, Feb. 10, 1822. In 1858 she was married to WILLIAM JAMES LINTON (q.v., *post*, p. 1892). She was an indefatigable worker. Besides her numerous novels she did a great deal of magazine-work, and at one time was a constant contributor to the *Saturday Review*, in which her papers on *The Girl of the Period* attracted much attention. She wrote *Grasp Your Nettle* (1865); *Sowing the Wind* (1867); *Joshua Davidson* (1872); *Patricia Kemball* (1874); *Under Which Lord?* (1879); *The Rebel of the Family* (1880); *Christopher Kirk and* (1885); *Paston Carew* (1886); *Through the Long Night* (1888); and *The One Too Many* (1894). Died in London, July 14, 1898.

LINTON, SIR JAMES DROMGOLE, an English water-color and oil painter, born in London, Dec. 26, 1840. After instruction from Mr. Leigh, he became an illustrator of books and magazines, and at the age of 21, exhibited water-colors at the Dudley Gallery and Royal Academy, of which he was chosen a member in 1867. His water-color *Maundy Thursday* attracted much attention in 1874, and he received for it the gold medal of the Philadelphia International Exhibition. As a painter in oils he also attained success, particularly in historical subjects. In 1884 he was chosen president of the Royal

Institute of Painters in Water-Colors, and in the following year was knighted. Among his best-known pictures in water-colors are *Off Guard*; *Priscilla*; and *The Cardinal Minister*. He worked continually to gain for painting in aquarelle the attention it merits, and in 1863, being dissatisfied with the treatment of water-colors by the Royal Academy, founded, with other artists, the association of which he was afterward president.

LINTON, WILLIAM JAMES, an English-American author, engraver, and painter in water-colors; born in London, Dec. 7, 1812. He illustrated *Jackson's History of Wood-Engraving*, *The Lake Country*, and *Deceased British Artists*. In his youth Linton was an enthusiastic Chartist, a friend of the political refugees who came to England, and a supporter of the republican and revolutionary movements in Europe. In 1851 he was one of the founders of the *London Leader*. In 1858 he married ELIZABETH LYNN (q. v., ante, p. 1891). In 1867 he came to the United States, settling first at New York and afterwards at New Haven. American books and magazines profited by his admirable illustrations, and he greatly improved the art of wood-engraving in this country, of which art he may be said to have founded a school. He published *Claribel and Other Poems* (1865); *History of Wood-Engraving in America* (1882); *Golden Apples of Hesperus* (1882); *Rare Poems of the Sixteenth and Seventeenth Centuries* (1883); *A Manual of Wood-Engraving* (1884); *The Masters of Wood-Engraving* (1889); and a *Life of Whittier* (1893). He wrote his *Memories* in 1895. Died at New Haven, Conn., Dec. 29, 1897.

LINUM, the genus to which belongs the common flax (*L. usitatissimum*), and the typical genus of the small family *Linaceæ*. The flowers are perfectly regular and symmetrical, with the parts in fives, and of various shades, the wild species of North America being yellow, the common flax blue, and certain cultivated ones red.

LIODON, a genus of extinct marine reptiles of the family of *Mososaurians*. Their remains are found in the cretaceous strata of western United States, some specimens being 75 feet long.

LIPPE, a principality of northwestern Germany. Area, 469 English square miles; population 1895, 134,854; capital, Detmold, pop. 1895, 11,237.

The budget is arranged for two years. For 1895-96 the revenue was estimated at \$297,653; for 1896-97, at \$298,579; expenditure about the same. Reigning prince (1899), Alexander, born Jan. 16, 1831, son of Prince Leopold and of Princess Emilie of Schwarzburg-Sondershausen; succeeded to the throne at the death of his brother, March 20, 1895. Regent, Count Ernst of Lippe Biesterfeld, born June 9, 1842. The elder brother, Waldemar, of the present prince, who reigned before him, was born April 18, 1824; succeeded his brother Dec. 10, 1875.

The house of Lippe is the oldest branch of the ancient family of Lippe, formed in the latter part of the sixteenth century. The prince has not a civil list, but the expenses of the court are provided for by revenues from his hereditary domain. See also LIPPE, Vol. XIV, p. 683.

LIPPINCOTT, SARA JANE CLARKE, an American

authoress; born in Pompey, Onondaga County, New York, Sept. 23, 1823. She was educated at Rochester, New York, and in 1843 moved to New Brighton, Pennsylvania. She began her literary career by writing a series of letters, under the pseudonym "Grace Greenwood," to the New York *Mirror*. In 1853 she married Leander K. Lippincott, of Philadelphia. Mrs. Lippincott was a lecturer for the anti-slavery cause, and wrote *Greenwood Leaves* (first and second series, 1849 and 1851); *Haps and Mishaps of a Tour in Europe* (1852); *Bonnie Scotland* (1860); *New Life in New Lands* (1872); *Stories for Home Folks* (1885); and *Stories and Sketches* (1892).

LIQUEFACTION OF GASES. See PNEUMATICS, Vol. XIX, p. 245; HYDROGEN, Vol. XII, pp. 433, 434; and CHEMISTRY, in these Supplements.

LIQUID AIR. Of late, chemists have been interesting themselves over the novelty of liquid air and discussing its industrial applications and probable uses as a therapeutic agent. As a refrigerating medium it is hardly likely to compete with ice; in this and in other forecasts of its uses its adoption is as yet speculative. As a local anæsthetic, it has, however, been very successful, though the fear is that the part anæsthetized may become irretrievably frozen. That it may take the place of steam as a motive power, of gunpowder in the armies and navies of the world, of dynamite in blasting and other engineering work, as well as of ice in refrigerating meats, etc., while in transit to distant markets, are expectations that may or may not be realized. As a freezing agent, there is no denying its terrible power, and the unscientific mind stands appalled to think that air—the simple air we breathe—can become so intensely cold in the process of liquifying that a temperature below zero of 312° can be reached. At this low temperature pure alcohol can be readily frozen, and mercury can be solidified so hard that, as it has been said, it may be used as a hammer to drive nails into hard wood. As an explosive, for blasting purposes, great power is also claimed for liquid air; while it will sear living flesh like a red-hot iron, and may thus take the place of all chemical cauterizing in surgery. In Germany, thanks to the initiative of Herr Carl Linde, liquid air has already passed as a mere product of the laboratory to the practical purposes of commerce. In this country, it has been freely, and to a large extent successfully, exploited by Mr. Charles E. Tripler, of New York, who is understood to be perfecting a machine that will produce liquid air not only for hospital purposes, but for the widest uses of commerce. In this connection we may chronicle the labors of Prof. James Dewar, of London, who for some years past has been engaged on experimental researches at low temperatures and has succeeded in liquifying hydrogen, a feat of great scientific interest as well as of immense future importance.

LIQUOR LAWS IN THE UNITED STATES. Various laws have been passed in the separate states with a view to prohibit, regulate or restrict the sale of intoxicating liquors within the jurisdiction of such states. It would seem that almost

every system which has been tried still appears among the existing laws of some state, even though discontinued elsewhere. The laws through which effort has been made to control the liquor traffic may be classed as prohibition, local option, license, or civil-damage liquor laws.

Prohibition laws generally provide that no person shall be permitted to manufacture, sell, keep for sale, give or otherwise furnish intoxicating liquors within the state, and severe penalties are enacted for violations of the law. Beginning with Maine in 1851, prohibition laws were enacted in nearly every state of the Union north of Pennsylvania and the Ohio River. In 1880 Kansas led the experiment of incorporating into her constitution a provision that — "The manufacture and sale of intoxicating liquors shall be forever prohibited in this state, except for medical, scientific, and mechanical purposes;" and two years later Iowa followed this example, but the courts set the amendment aside for some defect in its enactment. In 1892, prohibition prevailed in Maine, New Hampshire, Vermont, Kansas, and the two Dakotas.

Option laws provide that any specified district in the state may, upon a vote of the people therein, prohibit the sale of liquor within its boundaries. These laws, when put in force by such vote, operate in about the same manner as general prohibitory laws. The manner of the vote and the districts which may take advantage of the law are the chief points of difference. In some states the vote is taken direct upon the question, and in others the officers vote for determining the question.

The districts are variously composed. Some states provide that cities and towns may determine the question for themselves, others provide that a vote may be taken by counties.

License laws are enacted in most states, under which the applicant for license as a liquor-dealer must pay a certain sum named in the statute or determined upon by the city or village authorities, and must comply with certain requirements as to character, citizenship, etc. Frequently he is required to give a bond conditioned that he will observe the laws concerning the sale of liquor. These license fees range from forty dollars to one thousand dollars per year, those states and communities that look with small favor on the traffic in intoxicants, employing heavy excise dues either to keep the sale in responsible hands, or to make it unremunerative and thus virtually to prohibit it.

In the following states a license-fee of five hundred dollars or over is required: Arkansas, Illinois, Michigan, Minnesota, Missouri, Nebraska, Pennsylvania, Montana and Washington. In every state where liquor is permitted to be sold by private persons, a license fee is charged.

Civil-damage liquor acts are in force in many states, permitting husband, wife, child, parent, guardian or other person who has sustained injury or loss of support by any intoxicated person or in consequence of his intoxication, to maintain an action for damages in his or her name against any person who has sold or given intoxicating liquor

to the offender. This right of action is frequently extended against the owners of the premises in which the liquor is sold. These laws have been very generally held to be constitutional even when the state permits licenses for the sale of such liquor to be issued. Civil-damage acts have been passed in Illinois, Indiana, Iowa, Nebraska, Wisconsin, Michigan, New York, New Hampshire, Ohio, Kansas, Maine, Massachusetts, Vermont and other states.

The provisions above mentioned have been effectual to a greater or less extent, but none of them have succeeded in entirely abolishing the evils of intemperance. The failure of prohibition laws results from their ineffectual enforcement in localities where public opinion is not strongly in their favor, as is the case in large cities. Local option is less open to this difficulty, because this scheme is seldom adopted unless the opinion of the district involved is overwhelmingly favorable; yet here important difficulties arise. In many cases neighboring towns or localities where liquor is sold reap the financial benefits, while the evil is not materially lessened in the local-option district.

Two methods of handling the liquor traffic under a license system have attracted particular attention, one for its demonstrated control over saloons and the other for its promise. The first is known as the Brooks Law of Pennsylvania and the other as the Raines Law of New York.

The Brooks law was approved May 13, 1887, and it aimed by stringent measures to reduce the number of saloons and to place their management in the hands of responsible men, whose interest it should be to watch the traffic and insist on the enforcement of the law. Its distinguishing feature is the purpose to array liquor-dealers on the side of order. It had been the custom under the cheap-license system in Pennsylvania, as in many other states, for great brewers to supply the money to purchase the license and then to bind the licensee to sell their goods. The brewers desired as large a saloon constituency as possible, and they practically furnished the capital. The saloon-keeper under this plan is little more than a brewer's agent and his destitution makes him irresponsible. Enterprising men will not engage in the liquor business, the profits of which go to a powerful company or manufacturer behind him. The Brooks bill met the situation by requiring a license fee of \$500 in cities of the first class, of \$300 for those of the second class, although \$75 will procure a license in a rural township. No person can have more than one license, and in obtaining that he must swear that he has no interest in the profits of the sale of liquors in any other place in the county, and that no other person has a pecuniary interest in the business for which he asks a license. He can sell only in the place specified in his application, and if he transfers his license it must be with the permission of one of the excise judges, and his place of business goes with it. The statements of a petition for license must be veri-

fied by oath; the petitioner must have upon his application the indorsement of twelve qualified electors as to his character and veracity, and he must furnish a bond of \$2,000, with a power of attorney to confess judgment in his name for this amount, and also two sureties, who must be freeholders owning \$2,000 of realty over all incumbrances, for his observance of all the provisions of law relating to the sale of intoxicating beverages. Licenses are issued out of the Court of Quarter Sessions, the judges sitting openly on days publicly designated to hear petitions therefor. Applications must be filed in advance with the clerk of the court and advertised. Residents of the ward, borough or township are entitled to appear and contest the granting of any license on several grounds, as the character of the petitioner, the proximity of a church or school-house to the proposed saloon, or even that the saloon is not needed for the accommodation of the public. The usual provisions are incorporated against keeping open on Sundays or after midnight, against selling to minors, habitual drunkards or intoxicated persons, and against the patronage of disreputable or disorderly persons. The penalties are heavy and augment rapidly with each conviction for violation of the law. The operation of the law at once reduced the number of saloons to a third of the number under the old system, the arrests for disorderly conduct fell off notably, and the sales of liquor on Sunday in Pennsylvania ceased. The effects of the law are considered satisfactory by its friends.

The Raines Law was approved March 23, 1896. It aimed to destroy the ascendancy of the political machine in the large cities, particularly in New York and Brooklyn, so far as that rested upon control of dram-shops. Its characteristic feature is the "removal of the liquor trade from connection with local politics," and it is one of the measures of reform that followed the defeat of Tammany in New York, in 1894, and the election of Mayor Strong that year in the same city, by a union of citizens bent on good government. This law abolishes all local excise boards and places the control of the entire liquor business in the hands of a state commissioner; it forbids the free-lunch counter in saloons; it puts severe restrictions on the licensee, but protects him by drastic measures from being blackmailed by politicians or the police. Tax-payers are given an interest in the law by the provision that one third of the liquor money shall go into the state treasury, and the other two thirds to the cities, towns or counties where levied. It was estimated that the state proportion under the conditions prevailing in 1896, would be \$2,750,000, and such receipts were conjectured to be very potent as a relief to taxpayers.

The state commissioner is entitled to the services of four deputies and sixty inspectors. What was formerly called a license, under the Raines law becomes a tax: in other words, any one having the necessary qualifications as to character and securities for the observance of the

liquor laws of the state, may engage in the business, subject to an annual tax, and this tax is made so high that only men with something at stake can afford to pay it. Thus "the annual tax on an ordinary liquor-shop is in New York City, \$800; Brooklyn, \$650; all cities with a population between 500,000 and 50,000, \$500; between 50,000 and 10,000, \$350; between 10,000 and 5,000, \$300; between 5,000 and 1,200, \$200; all other places, \$100. There is no discrimination in the tax between the sale of spirits and the sale of wine and beer. Sunday opening is forbidden. No liquor-shop is to be within two hundred feet of a church building or a school-house. No *new* liquor-shop is to be allowed in a residence district without consent of two thirds of the property-owners. There are restraints on groceries and on clubs. Local option as to sale of liquors in cities is forbidden, but is granted to towns."

The high tax was expected to reduce the number of saloons by 40 per cent of their former number. The operation of this law is too recent for any analysis of the results, but one of the objects of the law was to displace the discretionary authority of excise boards with statutory specifications.

A novel liquor system was adopted in South Carolina in 1892, and it went into effect July 1, 1893. An amendatory act was passed the following year, in which some improvements were made. The principle of this system is entire state management of the traffic. The governor appoints a commissioner, whose duty it is to purchase liquor with the funds of the state and sell it to dispensers throughout the various counties. A state board of control consists of the governor, attorney-general and comptroller-general. Its duty is to take charge of the sale of liquor throughout the state. This board appoints county boards of control to supervise the business in the county and to appoint county dispensers. One dispenser may be appointed in each county, and such others as the county board, with the approval of the state board, may decide are necessary. But the freehold voters in any township may prevent the appointment of a dispenser for their township by presenting a petition to the county board signed by a majority of such voters. These dispensers are public officers, and are paid fixed salaries out of the receipts of the sales of liquor. The profits of each dispensary are divided equally between the county and town or city wherein it is located.

The dispensers may purchase liquor only from the state commissioner, who must sell to them at a profit not exceeding fifty per cent of the cost. His profits go to the state. The county dispenser must sell at a price not to exceed fifty per cent above the cost to him. They cannot keep open at night, nor sell to minors, habitual drunkards, or to any stranger unless he be identified by a reputable citizen. All sales must be made upon written request from the person desiring it, which request must state the name, age and residence of the applicant, and the quantity and kind of liquor

desired, and for whose use it is obtained, and must be signed by the applicant in his true name.

Printed blanks for requests are furnished to the dispensers, which must be accounted for, and which must be used in making requests for liquor. The county dispenser must make monthly reports and forward all requests which have been honored by him to the county auditor, who files them as records. Dispensers must be appointed upon petition, must be persons believed to be abstainers, must not be restaurant-keepers or keepers of places of public amusement, and must not have been convicted of violation of any state liquor law. Dispensers must sell only in original packages, which are furnished by the state commissioners in quantities ranging from one half pint to five gallons, and these packages can not be opened on the premises where they are sold. All liquors are tested by the chemist of the South Carolina College, and must be unadulterated. All liquor shipped must bear the certificate of the commissioner, whether shipped to a point in the state or outside of it, and it is unlawful for any carrier to transport packages of liquor without it bears such certificate. Dispensers and the commissioner are placed under heavy bond to carry out the law, and state constables are appointed to see to its complete observance.

GOTHENBURG SYSTEM. This dispensary plan is an adaptation of the Gothenburg system in Sweden, of which a brief account may be given. Its essential features are the elimination of private profit from the sale of spirits, placing public houses, chartered by the state, under the charge of official managers, while the profits are placed at the disposal of the commune for public improvements. The system has been tested in Norway and Sweden, and it has been claimed that the trade is kept within bounds, and that public morals have been distinctly improved. The nation benefits by the public works created out of the profits, as well as by the employment of laborers on these works. In 1894 the Norwegian Legislature adopted a system by which it was provided that 15 per cent of the profits realized should go to the communal treasury, 20 per cent to the chartered company to provide for the legal rate of interest on capital, and for donations in aid of temperance and charitable institutions, and the balance, 65 per cent, to the state. The act also provided a local veto clause by means of which a bare majority of those voting should decide for or against the continuance of the *Samlag* (association for the sale of liquor). On one occasion nine tenths of all the rural areas in Sweden voted against the *Samlag*. This reform act was passed to remove the grave objection to the system, viz., that the rate-payers endeavored to push the sale of liquor, and, consequently, to increase the profit, so as to reduce their taxes. A special fund has been proposed for the money which would accumulate under the operation of the act; and it was understood that the fund should be for old-age pensions. Mr. Joseph Malins, the founder of the British Good Templars

Lodge, is strongly opposed to it, grounding his objection on the fact that under the system convictions for drunkenness had increased rather than diminished. He published his argument in the *Wesleyan Methodist Magazine* for October, 1895.

LIQUOR QUESTION. See INDIAN AFFAIRS, in these Supplements.

LISBON, a village and the capital of Ransom County, southeastern North Dakota, situated on the Cheyenne River and on the Northern Pacific railroad. It is the trade center of a rich farming, especially wheat growing, region, and has a foundry and flour-mills. Population 1900, 1,046.

LIS PENDENS, a phrase in law meaning literally, a pending suit, and as such affecting property and rendering the same incapable of sale or transfer during the pendency of the suit. The doctrine of *lis pendens*, complicated as it is by questions of absolute and constructive notice, is essentially a legal rather than a lay matter, and as such one for the consideration of a lawyer and his advice in all cases.

LISSEN CEPHALA, a term derived from the Greek, denoting a "smooth brain," or one deficient in convolutions. It was proposed by Owen as the name of a group or class of animals called by others the *Ineducabilia*, and in it he placed the *Edentata*, *Chiroptera*, *Insectivora* and *Rodentia*. The cerebral hemispheres are small, the cerebrum has few and simple convolutions, or more generally is smooth and does not cover the olfactory lobes of the cerebellum. It is part of a classification based on brain-structure, and has no general acceptance.

LISTA-Y-ARAGON, ALBERTO, a Spanish poet and critic; born at Triana, near Seville, Oct. 15, 1775. He was educated at the University of Seville, and in 1796 became professor of mathematics at the College of San Telmo, in Seville. He was obliged to flee from Spain during the Napoleonic wars; returned in 1817, and held professorships in Bilbao, Madrid, Cadiz and Seville. Among his works are *Poems* (1822); *Selections from the Best Spanish Writers of Prose and Verse*; and translations of the historical works of the Comte de Ségur. His critical doctrine may be said to be a compromise between French classicism and the literary theories of the romantic school. He died Oct. 5, 1848.

LISTER, SIR JOSEPH, an English surgeon; born at Upton, Essex, April 5, 1827; graduated in the academical department of the London University in 1847, and in the medical department in 1852; became a fellow of the Royal College of Surgeons, England, in 1852, and of the Royal College of Surgeons, Edinburgh, in 1855. He was successively assistant-surgeon and lecturer on surgery, Edinburgh; regius professor of surgery, Glasgow; professor of clinical surgery, Edinburgh; professor of clinical surgery, King's College Hospital, London, and was made surgeon extraordinary to the queen. In 1880 he received the royal medal of the Royal Society, and in 1881 the prize of the Academy of Paris, for his invaluable discoveries in anti-septic treatment in surgery known as "Listerism"; for

a description of which see SURGERY, Vol. XXII, pp. 678, 679. In 1883 he was created baronet. Among his works are *Remarks on a Case of Compound Dislocation of the Ankle with Other Injuries, Illustrating the Antiseptic Treatment* (1870), and *A Contribution to the Germ Theory of Putrefaction* (1875).

LISZT, JOHANN BENEDICT, a German mathematician and physicist; born in Frankfort-on-the-Main, July 25, 1808. He was teacher in a technical school in Hanover for two years, and from 1839 till his death held the chair of physics in the University of Göttingen. He made researches in the mathematics and physiology of optics and in the theory of knots (q.v., Vol. XIV, p. 127), in which he anticipated the labors of Tait. He died Dec. 24, 1882.

LISZT, FRANZ, a Hungarian pianist and composer; born at Raiding, Hungary, Oct. 22, 1811.

FRANZ LISZT.

His father was steward to Prince Esterhazy and was also an amateur musician. When his son was six years old he began giving him lessons on the piano-forte, and at nine the boy attracted so much attention by his playing that several Hungarian noblemen gave him the means for six years' study in Vienna.

Here he was put under Czerny and Salieri. In 1823 his father took him to Paris, hoping to place him in the Conservatoire, but, as admission was refused to him as a foreigner, he continued his studies in Paris under Reicha and Pärer, and at the same time aroused the enthusiasm of the musical world by his playing on the piano-forte. His father's good sense, however, prevented the boy from being spoiled by so much admiration, and restricted him to systematic study. In 1825 he made his first attempt at serious composition in the one-act operetta *Don Sanche*, which was well received. After his father's death in 1827 he fell a prey to morbid fancies, became a St. Simonian, but afterward returned to the Catholic Church. His enthusiasm was re-awakened by the violin playing of Paganini, and he began the career of virtuoso. From 1839 to 1847 he traveled continually from city to city, everywhere eliciting enthusiastic admiration and applause, which came alike from all classes, from the greatest musicians and the uncritical public. In 1848 he gave up this career and accepted the appointment of conductor of the Court Theatre in Weimar. Here he brought out the works of the new school of music, which up to this time had received but little attention from the public, and became the patron of several of the rising generation of musicians, notably of Richard Wagner, to whom he gave his daughter in marriage, and whose operas, *Tannhäuser*, *Lohengrin* and *Flying Dutchman* were produced under his management. Among his pupils on the piano-forte was Hans von Bülow.

At about this time he turned his attention seriously to composition, and began to write the works to which he owes his reputation as a composer. These include two concertos and 15 Hungarian symphonies; for orchestra, *Faust* and the *Divina Commedia* grand symphonies; the oratorio *St. Elizabeth*, the *Gran Mass*, the oratorio *Christus*, and numerous other sacred compositions, besides a number of songs, of which Heine's *Du bist wie eine Blume*, Goethe's *Ueber Allen Gipfeln ist Ruh* and Hugo's *Comment disaient-ils* are examples. In 1859 Liszt resigned his position at Weimar. In 1865 he took the orders of the Catholic priesthood, receiving the title of abbé, after 1871 residing principally at Pesth. Liszt was an author as well as musician, and in 1852-4 published a *Life of Chopin*, translated into English by Walter Cook (1877), essays on Wagner's opera, and a paper on *Bohemians and their Music in Hungary*. In 1845 he was decorated with the Cross of the Legion of Honor, and in 1861 was made commander. As a man, Liszt was impetuous and generous. Opinions vary as to the permanent value of much of his work, but his personal influence, especially on the younger musicians of his time, was very great. As a pianist his mastery of the instrument was phenomenal. He died in Bayreuth, Oct. 31, 1886.

LITCHFIELD, a manufacturing town and the capital of Litchfield County, northwestern Connecticut, on the Shepaugh, Litchfield and Northern railroad, 30 miles W. of Hartford. It has fine water-power, contains a soldiers' monument, and from 1784 to 1838 was the seat of Judge Tapping Reeve's celebrated law school, Judge James Gould conducting it after the death of its founder. The salubrity of its climate has made it popular as a summer resort. Near by are valuable beds of nickel ore; it manufactures paper, oil, satinets and nickel-ore smelters. It obtains water-power from Bantam Lake, just to the south. The township contains the villages of Bantam Falls, East Litchfield, Litchfield, Milton and Northfield. Pop. 1890, 1,058; 1900, 1,120.

LITCHFIELD, a city and railroad center of Montgomery County, southwestern central Illinois, 42 miles S. of Springfield, on Shoal Creek Basin, on the Jacksonville, Louisville and St. Louis, the Chicago, Peoria and St. Louis, the Wabash and the Cleveland, Cincinnati, Chicago and St. Louis railroads. It produces coal, natural gas and oil; has a good grain trade, contains an Ursuline convent, flour-mills, grain-elevators, car manufacturing and repairing shops, machine-shops, and carriage, threshing-machine, paint, broom, brick and tile and cider and ginger-ale factories. It has parks, a public library, electric lights and water-works. Population 1890, 5,811; 1900, 5,918.

LITCHFIELD, a post village and the capital of Meeker County, southern central Minnesota, 75 miles W. of St. Paul, on the Great Northern railroad. It has good water-power, a flour-mill, an iron-foundry and a furniture factory, and is situated in a fertile, undulating agricultural country. Population 1900, 2,280.

LITCHI OR LEE-CHEE (*Nephelium Litchi*) one

of the most delicate fruits of China, Cochinchina and the Malay Archipelago. The tree which produces it belongs to the family *Sapindaceae*, and has pinnate leaves. The fruit is of the size of a small walnut, and grows in racemes. It is a red or green berry, with a thin, tough, scaly rind and a colorless pulp, in the center of which is one large dark-brown seed. The pulp is slightly sweet. The Chinese preserve the fruit by drying.

LITHARGE, an oxide of lead. See LEAD, Vol. XIV, p. 376.

LITHODOMUS, LITHODOME (Gr., "stone-house"), a mytiloid, mussel-like bivalve, cylindrical in form, with a wedge-shaped termination facilitating perforation of limestone, coral and shells, in which it burrows freely. The excavations, at first small and shallow, become enlarged with the growth of the shell, sometimes attaining a length of two or three inches.

LITHOGRAPHY. The art of lithography is in the main the same to-day as it was twenty years ago. There have been, however, some improvements made in the method of placing the drawing upon the stone. In most shaded drawings there are considerable spaces where the desired effects of shading are simple and uniform. These are produced by lines, grains and stipples. The work of filling in these spaces takes considerable time. In order to save this time the required markings are molded in points or short, narrow ridges on one face of a rubber sheet, similar to the working side of a rubber stamp. This molded face is then inked and laid flat upon the stone, while pressure is brought upon the back of the corresponding portion of the rubber sheet. In this way the markings on the inked side are transferred to the stone with much greater rapidity than can be done by hand-work. Besides, the shadings thus produced are more perfect and regular than shadings drawn on the stone by hand. Another process by which drawing upon the stone is facilitated, is the employment of the "air-brush." A tube is connected with a bellows worked by the foot. This tube has a fine nozzle through which a continuous current of air is blown out. A smaller tube conveys ink to the aperture of the air-tube. This ink is blown out by a current of compressed air in the form of a fine spray, exactly in the same way as liquids are sprayed out of an atomizer. As this approaches the stone, the line of ink becomes narrow and dark. As it is lifted farther away from the stone, the ink-spray widens, and grows thinner and paler, so that any variety of effect, from the lightest field to the darkest shading, can be readily produced, and with a rapidity far beyond that of the old method of drawing upon the stone. The flow of ink can also be increased or diminished by simple pressure of the fingers, thus rendering it possible easily to produce uniform fields of strong shades or bright light.

Some attempts have recently been made to use aluminium in lithography instead of the ordinary lithographic stone. The employment of the former, however, has not gone further than the experimental stage as yet, though if found practi-

cable it will possess great advantages over the old method. It is asserted that drawings can be fixed on aluminum as easily as on stone, and the metal possesses the advantage of being lighter, and, since it can be melted and re-rolled, very much cheaper. Moreover, as it is malleable it may be bent or curved for use on modern, high-velocity, rotary presses. The experiments in aluminum will be hastened, no doubt, by the reports that the quarries at Solenhofen, Bavaria, which have hitherto supplied the world, are beginning to be exhausted. It is said, however, that there have been opened in Tennessee quarries practically inexhaustible, from which stones have been taken equal in quality to the Solenhofen products. See LITHOGRAPHY, Vol. XIV, pp. 697-701.

LITITZ, a post borough of Lancaster County, southeastern Pennsylvania, on the Philadelphia and Reading railroad, 27 miles S.W. of Reading; founded by the Moravians, in 1756. It has several boarding-schools and seminaries, including Linden Hall Seminary, which has a library of four thousand volumes, has a fine mineral spring and is a summer resort; it has manufactories of beer, cigars, flour and machinery. Population 1900, 1,637.

LITOLFF, HENRI CHARLES, an English pianist and composer; born in London, Feb. 6, 1818. His father, an Alsatian, was a soldier who was taken prisoner and carried to England, where he afterward settled as a violin-player and married an Englishwoman. At 12 the son showed great talent in pianoforte playing, and was taken as a pupil gratis by Moscheles. He made his first appearance at Covent Garden Theater in 1832. At 18 he contracted a marriage which his parents had forbidden, and went to live in France. For some time thereafter he led a wandering life, giving concerts in the principal European capitals with great success. His first wife having died, he married Madame Meyer, the widow of a music-publisher of Brunswick, where he settled and continued the business. Here his adopted son Theodor, to whom he transferred the management of affairs, began the publication of cheap but accurate editions of classical music, the first of many such which have since been published. Having been divorced from his second wife, he moved to Paris in 1860, and married the daughter of the Count de la Rochefoucauld. As a pianist Litolff ranked high, possessing passion and brilliancy of execution, though often unequal and inaccurate. The same fault is noticeable in his compositions. They contain beautiful and poetic ideas and are remarkable for their originality, but are full of imperfections. Among his best works is the *Spinnlied*. He composed among others, the operas *Héloïse et Abelard*, *Les Templiers*; *King Lear*. Died at Bois-Colombes, near Paris, Aug. 6, 1891.

LITTELL, ELIAKIM, an American publisher; born in Burlington, New Jersey, Jan. 2, 1797. Having learned the printer's trade, he established at Philadelphia, in 1819, a literary paper entitled the *National Recorder*, changing the name in 1821 to the *Saturday Magazine*. In 1822 it became a monthly, called the *Museum of Foreign Literature*

and Science. It presented to American readers selections from the best periodical literature of Europe. After conducting this successfully for twenty-one years, he began to publish, in 1844, in Boston, *Littell's Living Age*, a weekly literary periodical of high character and taste, which is still continued. He died in Boston, May 17, 1870.

LITTLE COLORADO RIVER. See **COLORADO RIVER**, Vol. VI, p. 163.

LITTLE CROW, a hereditary chief of the Sioux Indians; born near St. Paul, Minnesota. After 1851, when the Sioux, by treaty, ceded their lands beyond the Mississippi River to the government, they were removed to reservations in northern Minnesota. Here, in 1862, the Indians suddenly rose in a body, and along the frontier line of more than two hundred miles in extent, slew men, women and children to the number of one thousand. Little Crow was the acknowledged leader and instigator of this horror. On Sept. 23, 1862, the United States forces under General Henry H. Sibley met the Indians and defeated them, took 2,000 prisoners and released 120 white female prisoners. About forty Indians were hanged, and the others removed to the Missouri River. Little Crow and several hundred of his followers fled with their families and took refuge among other neighboring bands, where for a time they dwelt in concealment. In 1863 the chief was discovered while on a raiding expedition, and shot. His scalp is in the collections of the Minnesota Historical Society. His death occurred near Hutchinson, Minnesota, in 1863.

LITTLEDALE, RICHARD FREDERICK, an Irish clergyman; born in Dublin, Sept. 14, 1833. He was graduated at Trinity College, Dublin, in 1854, ordained in 1856; was curate at St. Mary Virgin, Soho, 1857-61. He was obliged to give up his parochial work in 1861 on account of chronic ill-health, and after that year devoted his entire attention to literature, writing upon ecclesiastical subjects. His works include *Religious Communities of Women in the Early Church* (1861); *The Mixed Chalice* (1863); *The Catholic Ritual in the Church of England* (1865); *Plain Reasons Against Joining the Church of Rome* (1879). He contributed articles to this **ENCYCLOPÆDIA** on church history and theology, among them the articles on *Jesuits*, *Council of Trent*, and *Vatican Council*. He died Jan. 11, 1890.

LITTLE FALLS, a town and the capital of Morrison County, central Minnesota, located on the E. bank of the Mississippi, 97 miles above Minneapolis, on the Northern Pacific railroad. It is in a forest and grain-growing region, with good water-power and several manufactories. Population 1890, 2,354; 1900, 5,774.

LITTLE FALLS, a picturesque post village of central New York, on both sides of the Mohawk River. Population 1890, 8,783; 1900, 10,381. See also **LITTLE FALLS**, Vol. XIV, p. 703.

LITTLE KANAWHA RIVER. See **WEST VIRGINIA**, Vol. XXIV, p. 518.

LITTLE ROCK, the capital city of Arkansas and of Pulaski County, situated on the S. bank of

the Arkansas River, near the center of the State. It is on the St. Louis, Iron Mountain and Southern, the Little Rock and Memphis, and the St. Louis Southwestern railroads, all of which have repair-shops here. The city contains a handsome State capitol, a Roman Catholic Academy, Arkansas Female College, Philander Smith College

THE CAPITOL, LITTLE ROCK.

(Methodist Episcopal, founded 1877), the Sherman high-school for white and the Union high-school for colored pupils; a convent, the Roman Catholic Cathedral of St. Andrew, etc. The principal articles of manufacture are flour, castings, wagons, cotton, cotton-seed oil, furniture and machinery. There are granite quarries here. The streets are well paved, and are lighted with electricity and gas and have electric railways. The city is supplied with water and sewer systems, and has a public library of 82,000 volumes. Population in 1890, 25,874; 1900, 38,307. See also **LITTLE ROCK**, Vol. XIV, p. 703.

LITTLE RUSSIANS. See **RUSSIA**, Vol. XXI, pp. 79, 80, 109, 110.

LITTLE THIBET. See **LADAK AND BALTI**, Vol. XIV, p. 198.

LITTLETON, a post village and township of Grafton County, northern New Hampshire, on the Mink or Ammonoosuc River, 28 miles from Mt. Washington, on the Boston and Maine railroad. On account of its picturesque scenery and healthful climate it is much visited by tourists to the White Mountains. The town has manufactories of woolen goods, axes and scythes. Population 1890, 3,365; 1900, 4,066.

LITTLETON, ADAM, an English lexicographer, born at Halesowen, Worcestershire, Nov. 8, 1627. He was educated at Christ Church, Oxford, and in 1669 became rector at Chelsea, in 1670 chaplain of Charles II; rector of the Church of St. Botolph, Aldersgate, from 1685 to 1689. He wrote on philological subjects, made several translations from the Latin and Greek, and published sixty-one sermons. His greatest work is his *Latin, Greek, Hebrew and English Dictionary* (1678, several times reprinted). He also made a fine collection of rare books and manuscripts. He died June 30, 1694.

LITTLE TURTLE, a chief of the Miami Indians. It is thought that he received the rudiments of an education in a Canadian Jesuit school. He was remarkable both for his intelligence and for his prowess in war. He defeated General Harmar on the Miami River in 1790, and General St. Clair at St. Mary's on November 4 of the fol-

lowing year. After trying to dissuade his friends from forcing an engagement, he took part in the battle of Fallen Timbers on Aug. 20, 1794, when the Indians were defeated by Anthony Wayne, the "Chief who never sleeps." In 1795 he signed the treaty of Grenville, which ended the war. In 1797 he made a visit to Philadelphia, and there met President Washington, Count Volney and others. He died in Fort Wayne, Indiana, July 14, 1812.

LITTORALE. See KÜSTENLAND, in these Supplements.

LIVADIA, the ancient *Lebadea*, a town of Greece near the cave of Trophonius, seat of the ancient oracle, 60 miles N.W. of Athens. Population, 5,000. See ORACLE, Vol. XVII, p. 808.

LIVER. See DIGESTIVE ORGANS, Vol. VII, pp. 229-231; Diseases of, see PATHOLOGY, Vol. XVIII, pp. 385, et seq.

LIVERMORE, MARY ASHTON RICE, an American woman's suffrage lecturer and authoress; born in Boston, Massachusetts, Dec. 19, 1821. She was educated in the young ladies' seminary at Charlestown, and became a governess in Virginia. She returned to Massachusetts; taught school at Duxbury; and later married Daniel P. Livermore, a Universalist minister. In 1862 she was appointed an agent by the United States Sanitary Commission, and traveled through the Northwest, organizing sanitary societies. In the following year she made a tour of the camps and hospitals on the Mississippi, and took an active part in the organization of the Northwestern Sanitary Fair in Chicago in 1863, by which \$100,000 was raised for the Commission, \$3,000 of which being realized by the sale of the original draft of Lincoln's emancipation proclamation. After the war, Mrs. Livermore lectured on woman's suffrage, and in 1870-71 was editor of the *Woman's Journal*. She published *Pen Pictures* (1865); *Thirty Years too Late* (1878); and *My Story of the War* (1888).

LIVERPOOL, the greatest seaport, and next to London the wealthiest city in Great Britain, is situated in Lancashire, on the right or east bank of the Mersey, three miles from the Irish Sea, three quarters of an hour by rail from Manchester, four and a half hours from London, six from Edinburgh and eight by steamer from Dublin. It is faced by the thriving town of Birkenhead, and lies on five hills, sloping toward the river, which is crowded with shipping and bordered by the grandest range of docks in the world. The estuary is here three quarters of a mile wide, and a system of steam ferry-boats and an underground railway keep up a constant communication, day and night, between the two shores. Liverpool now contains an unusual number of splendid buildings, but, partly on account of the inequalities of its site, is rather wanting in long, broad, stately streets. In the fashionable east end there are several fine large squares, and on the outskirts of the town are six public parks—the Prince's, the Botanic Gardens, the Sefton, the Stanley, the Newsham, and the Sheil; and it has

been proposed to connect these by a continuous belt of boulevards. Altogether, £700,000 has been expended on these "lungs" of the city, which cost some £12,000 annually to maintain. The finest street, architecturally, is Lime Street, in the very heart of Liverpool, on one side of which stands St. George's Hall, the principal building in the city. The Sailors' Home, comprising a library, navigation school and savings bank, is the residence of some 8,000 sailors every year. A nautical college was founded in 1892, and at this institution boys are taught and men are prepared for service examinations in the mercantile marine. There are in Liverpool and out-townships over three hundred and fifty places of worship, belonging to the Church of England, Roman Catholics, Baptists, Congregationalists, Wesleyans, Unitarians, etc., English and Scotch Presbyterians, and churches and Dissenting chapels in which the service is conducted in Welsh, Catholic Apostolic and Greek Churches, and synagogues, one of which is among the finest structures in the town. The see of Liverpool was created in 1880, with an endowment of £100,000. The city is specially munificent in its charities. Of these the chief are the Bluecoat Hospital, maintaining and educating 350 children, the Orphan Asylum, the Seamen's Orphan Asylum in Newsham Park (1874), containing about 400 boys and an equal number of girls; schools for the Blind and the Deaf and Dumb, Industrial schools, the Royal Infirmary, the Northern and Southern hospitals (the latter opened in 1872), Lying-in, Homœopathic, Eye and Ear institutions, and Children's Infirmary. There are several theaters, and high-class concerts are held in St. George's and the Philharmonic halls. Liverpool has daily and weekly newspapers and literary periodicals, besides the *Daily Telegraph and Shipping Gazette* and the *Journal of Commerce*. Railway lines run through the town to the docks in tunnels under the houses; the Lancashire and Yorkshire railway is carried above the houses on a splendid viaduct to Tithebarn Street Station. The Midland has a handsome station, and the London and North-Western (Lime Street) is not only the largest in Liverpool, but one of the largest in the world. The area of the docks and quays is estimated at 1,105 acres and the length of quay space at 25 $\frac{2}{3}$ miles. The total income for rates and dues on ships and cargo paid to the docks in 1894 amounted to £1,130,000. The docks present to the river an unbroken line of over six miles, having in the north the Canada and in the south the Herculeum docks, and flanked by the Custom House, one of the finest in the kingdom, and by the tall row of the Albert Dock warehouses, erected at a cost of £358,000. The North Docks ("Langton" and "Alexandria") were opened by the Prince of Wales, 1881. There are over 60 docks and basins, all save four constructed since 1812. The Canada and Herculeum docks are devoted exclusively to timber, the King's to tobacco, and the Queen's to cotton, dye-wood, jute and other East and West Indian

products; the George is mainly used for export purposes; the Victoria, Clarence and Trafalgar by steamers engaged in the Irish trade, while the Nelson, Salisbury and Bramley Moor docks are occupied by steamships trading to the West Indies, the Pacific, Mediterranean, and to Dutch and German ports. The Corn docks, capable of holding the largest vessels in the grain trade, are provided with a range of splendid warehouses, to hold 165,000 tons of corn, ten stories high, with water-tight and rat-proof cellars, and elevating machinery, worked by hydraulic power, able to transfer from the ships 250 tons per hour. The "quantities" of timber imported annually exceed—of yellow pine, 2,060,000 cubic feet; of Quebec oak, 1,058,000; of birch, 431,000; of pencil cedar, 66,850; of mahogany, 7,000,000; of spruce deal and boards, 84,222 "standard" (of 165 cubic feet apiece); from the Baltic, 646,000 cubic feet of fir logs and 391,400 cubic feet of pitch pine. About four-fifths of all the traffic between North America and Great Britain is carried on through Liverpool, which has also a large share of the Eastern and Australian trade. Liverpool is the greatest cotton market in the world. It is also the second largest wool market in the country. The chief exports are cotton manufactures, cotton yarn, woolen manufactures, linens, iron, hardware and cutlery, haberdashery and millinery. In 1894, 488 sailing-vessels (347,282 tons) and 2,831 steamers (4,289,631 tons) entered, and 459 sailing-vessels (311,495 tons) and 2,311 steamers (3,708,451 tons) entered from and cleared to foreign countries. In the same year 180 sailing-vessels (149,263 tons) and 374 steamers (706,169 tons), and 240 sailing vessels (228,624 tons) and 396 steamers (748,681 tons) entered from and cleared to British possessions and protectorates. Besides its enormous trade, Liverpool has a vast passenger traffic with New York and other North American ports, in addition to those of the Pacific, Mediterranean, India, etc. The Cunard Company alone has over 50 vessels, half of which are employed in the Atlantic service. Other celebrated lines are the National, the White Star, the Inman, the Guion, the Dominion, the Allan and the Anchor, each of which has greatly increased the size, speed and number of its vessels of late years. There is also an extensive local steam-packet service daily to Dublin and Belfast, twice or thrice weekly to Cork, the Isle of Man, Glasgow, etc. The great center of the passenger traffic is the famous Landing Stage, a vast pontoon, dominating the Mersey, from which tenders convey their complement to the large steamers lying out in the river, and where there is a constant bustle about the steam ferry-boats. It is little short of a mile in length. A railway tunnel under the Mersey, to afford more direct communication with Birkenhead, Cheshire and the South, was opened Feb. 13, 1885, and a ship-canal to connect Liverpool with Manchester was commenced Nov. 11, 1887, and opened in 1894. There are extensive sugar refineries, shipbuilding-yards, iron and brass

foundries, engineering works, rice, flour and saw-mills, cigar factories and manufactures of chain cables, anchors, cordage, chemicals, soap, glass, spirits, nautical instruments, etc. The market accommodation of Liverpool is superior even to that of the metropolis. Messrs. Hawksley and Deason impounded the waters of the river Vyrnwy, in North Wales, some forty-five miles distant from Liverpool, and made a lake of 1,121 acres, which now supplies about 13,000,000 gallons daily to the city. The water was turned on in 1892, and the cost of the whole undertaking is estimated at £2,150,000. An overhead railway, extending the whole length of the docks, was opened in 1893. University College has 50 professors and teachers and 482 students (1895). Liverpool sends nine members to Parliament. In politics it is strongly Conservative. Its merchant-princes, as a rule, are men of old family, long connected with the city, and claiming descent from the landed families of Lancashire. Population 1800, 77,708; 1831, 205,572; 1861, 443,938; 1891, 517,980. The Parliamentary borough contains nine divisions, each of which returns one member. These are Abercromby, population 55,530; East Toxteth, 63,677; Everton, 78,285; Exchange, 47,738; Kirkdale, 77,372; Scotland, 53,713; Walton, 66,503; West Derby, 76,971, and West Toxteth, 64,710. Population of Liverpool, estimated for 1898, municipal borough, 633,645. See also LIVERPOOL, Vol. XIV, pp. 712-17.

LIVERPOOL, a post village of Onondaga County, central New York, on the east shore of Onondaga Lake, on Oswego canal and on the Rome, Watertown and Ogdensburg railroad. It has salt-works, and manufactures cigars and willow baskets. Population 1900, 1,133.

LIVIA DRUSILLA, wife of Augustus and mother of TIBERIUS; q. v., Vol. XXIII, pp. 335-337.

LIVINGSTON, a city and the capital of Park County, southern central Montana; situated at a railroad junction on the Northern Pacific railroad and on the Yellowstone River, 100 miles S. E. of Helena. From here a branch of the Northern Pacific railroad runs down to the National Park. It has railroad car-shops, and is surrounded by a farming community; stock-raising and coal and gold mining are engaged in. Population 1890, 2,850; 1900, 2,778.

LIVINGSTON, PHILIP, a signer of the Declaration of Independence; born at Albany, New York, Jan. 15, 1716. After graduating at Yale College he became a merchant in New York, and was for nine years an alderman of that city. From 1758 to 1769 he was a member of the provincial assembly, in which he steadily opposed all arbitrary measures of the mother country. In 1774 he was delegated to the Continental Congress, then assembled at Philadelphia, and continued to be a member of that body until his death. As such he signed the Declaration of Independence in 1776. Mr. Livingston was liberal to colleges—a professorship of divinity at Yale bears his name as one of its founders—and during the Revolutionary War he sold part of his

property in order to sustain the public credit. He was one of the contributors to the building of the first Methodist church in America, and one of the founders of the New York Chamber of Commerce. He died in York, Pennsylvania, June 12, 1778.

LLANDAFF, HENRY MATTHEWS, VISCOUNT, an English statesman and jurist; born in 1826, in Ceylon, where his father, Henry Matthews, was a puisne judge. He was educated in the Universities of Paris and London, and was called to the English bar at Lincoln's Inn. He was appointed a Queen's counsel in 1868, and from 1872 to 1876 acted as examiner to the Council of Legal Education. In his forensic career he was engaged in many noted lawsuits, among others the Tichborne case and the Crawford-Dilke divorce case. Thrice he essayed to represent the borough of Dungarvan in the Imperial Parliament before he sat for it from 1868 to 1874. At the general election of 1886 he had the distinction of winning the seat for East Birmingham, being the first Conservative who ever sat for that stronghold of sturdy radicalism. On the formation of Lord Salisbury's second ministry he became Home Secretary, and by his resolute enforcement of capital punishment in several notorious murder cases and his invariable defense of the police, he raised many storms of adverse criticism in the sensational newspaper press. In 1892 he was again returned for East Birmingham; and in 1895 he was raised to the peerage as Viscount Llandaff.

LLANO ESTACADO OR STAKED PLAIN. See TEXAS, Vol. XXIII, pp. 202, 203.

LLANQUIHUE, province and lake of CHILE. Vol. V, pp. 616, 622.

LLEWELYN AP GRIFFITH, a prince of Wales, who succeeded his uncle, David II. He fought with the barons under Simon de Montfort in their contest with Henry III, defeated Mortimer in 1264, and made peace with the king three years later. He refused to do homage to Edward I, who made war on him and forced him to surrender Wales to the English. He was allowed, however, to marry De Montfort's daughter, to whom he had been affianced, and who was captured by the English. He renewed the war in 1282, and was killed in battle the same year.

LLOYD, CHARLES HARFORD, an English musician; born Oct. 16, 1849, at Thornbury, Gloucestershire. He was educated at Magdalen Hall (now Hertford College), Oxford, graduating Mus.B. in 1871, B.A. 1872, and M.A. 1875. While an undergraduate he was one of the founders of the Oxford University Musical Club, and became its first president. He was appointed organist of Gloucester Cathedral in 1876, and in 1882 of Christ Church Cathedral, Oxford. Among his compositions are *Hero and Leander* and *Song of Balder*, cantatas; the music for *Alextis*; *The Gleaners' Harvest* for chorus of female voices; the anthem, *Art Thou Wary?* and a *Sonata in D Minor* for the organ, besides part-songs, madrigals, etc.

LLOYDS. See FIRE INSURANCE, in these Supplements.

LOADSTONE. See MAGNETISM, Vol. XV, p. 274; and IRON, Vol. XIII, pp. 285-287.

LOAM, a clay. See *Kaolin*, under MINERALOGY, Vol. XVI, p. 424; Loamy Soil, see HORTICULTURE, Vol. XII, pp. 232, 218.

LOAN, a bailment of an article or a sum of money, either with or without reward. As applied to an article of personal property, it generally signifies a bailment without reward; but it may and frequently, as in the case of a loan of money, does include a bailment with reward. A loan may be for consumption and a return in kind, or for use with a return of the specific article loaned. In case of a loan without reward, and for use merely, the borrower may use the article during the time for the purpose and to the extent contemplated by the parties, but may not, as a rule, permit others to use it. He is bound to use extraordinary care and diligence in preserving the property, and must return it at the time and place agreed upon. The lender, when the property is loaned without reward, may terminate the loan at his pleasure. In case of a loan for use and for reward, commonly called hiring, the borrower is bound to use only ordinary care in protecting the property. Loans for consumption or for which a return in kind is to be made, of which a loan of money is an example, partake more of the nature of a sale or exchange. The property passes to the borrower absolutely, and he is expected to return like property of equal value. For a discussion of the subject under the Roman law, see ROMAN LAW, Vol. XX, pp. 701, 702; see also NATIONAL DEBT, Vol. XVII, pp. 243-247; and COMMERCE, Vol. VI, pp. 206, 207.

LOAN AND BUILDING ASSOCIATIONS. See BUILDING SOCIETIES, Vol. IV, pp. 513, 514; and BUILDING AND LOAN ASSOCIATIONS, in these Supplements.

LOBANOFF-ROSTOFKI, PRINCE ALEXIS BORISOVICH, Russian statesman and diplomat; born in Rastoff, Dec. 30, 1824.

He was a member of one of the leading Russian families, and received his education at the principal government school. He entered the Foreign Office in 1843; and in 1847 was appointed chief secretary to the foreign minister. He was a member of the Russian embassy to Berlin in 1850; in 1856 joined the legation at Constantinople; and three years after was minister plenipotentiary to the Porte. In 1863-66 he was in private life, and in 1866 he entered the service of the Interior Department, serving first as governor of Orel, and later as adlatus to the Minister of the Interior. In 1878 he reentered the Foreign Office service as ambassador to the Porte; in 1879 was transferred to London; and in 1882-95 was ambassador at Vienna. He accepted the office of Minister of Foreign Affairs, made vacant by the death of M. de Giers in 1895. As ambassador to three of

PRINCE LOBANOFF.

the most important courts of Europe, at times when the slightest indiscretion on his part might have precipitated a war, Prince Lobanoff conducted himself in his office so that he won the admiration of those governments most interested and of all with whom he came in contact. After taking office as foreign minister he displayed great activity and tact, and in the short time of his service did much to elevate Russia in the rank of nations. He aided the Balkan principalities, restrained the Japanese, and brought about peace between Bulgaria and Servia. In the performance of these multifarious labors for his country he died at Scheptowka Station, Austria, while accompanying the Czar from Vienna to Kieff, Aug. 30, 1896.

LOBAU, an island in the Danube near Vienna. In 1809 it was the scene of an important encounter between French and Austrian forces. See AUSTRIA, Vol. III, pp. 133, 134.

LOBDONUM. See INCENSE, Vol. XII, p. 718; and LADANUM, in these Supplements.

LOBECK, CHRISTIAN AUGUST, a German classical scholar; born in Naumburg, June 5, 1781. He was private instructor at Wittenberg in 1802; professor in 1810; professor and librarian at Königsberg after 1814. He was the author of *Paralipomena Grammaticæ* (1837); *Pathologia Sermonis Græci Prolegomena* (1843); and *Aglaophamus* (1829), on Greek mysteries, which has been the basis of all works on the same subject since. See MYSTERIES, Vol. XVII, p. 124.

LOBEIRA, BASCO, a Portuguese author; born in Oporto about 1360. He was knighted by King John I, on the battle-field of Aljubarrota, in 1386. Lobeira was the author, or at least the first translator into Portuguese, of the *Amadis de Gaul*, the first of a long series of romances of chivalry, very popular for a time in Portugal and Spain, to ridicule which Cervantes' *Don Quixote* was written. It is asserted that the romance originated first in France, but Lobeira's version is at least the first of which we have any definite knowledge. He died in 1403. See AMADIS OF GAUL, Vol. I, p. 650.

LOBEL OR DE L'OBEL, MATHIEU, an English botanist and physician to James I of England; born at Lille, in Flanders, in 1538. He studied medicine at Montpellier, and became physician to the Prince of Orange, and, after the death of the latter, settled in England and became the physician of King James. In 1870 he published, with Pierre Pena, the French botanist, *Stirpium Adversaria*, which was, perhaps, the first attempt at a natural method of botany; in 1576 *Plantarum seu Stirpium Historia*; in 1581, *Icones Stirpium*. The genus *Lobelia* was named after him. He died at Highgate, London, March 2, 1616.

LOCAL GOVERNMENT ACT, for England and Wales. This act, involving great changes in the laws and government administration throughout England and Wales, was introduced in the British Parliament by Mr. Ritchie, president of British Local Government Board, on March 18, 1888.

When the bill was returned to the House of Commons the changes made by the House of Lords were accepted, and the bill received the royal assent Aug. 13, 1888.

The new act provided as follows:

A council should be established in every administrative county, as defined by this act, and intrusted with the management of the administrative and financial business of the county, and should consist of the chairman, aldermen and councilors. Three fourths of the members of the council (the councilors) were to be elected by the burgesses and electors throughout the county for three years; the other fourth (the county aldermen) were to be selected by the councilors. There was to be transferred to the county council all business done by the quarter sessions in respect of the following matters: The making, assessing and levying of a county, police, hundred and all rates, and the application and expenditure thereof, and the making of orders for the payment of sums payable out of any such rate or out of the county stock or county fund, and the preparation and revision of the basis or standing for the county rate; the borrowing of money; the passing of the accounts of and the discharge of the county treasurer; shire halls, county halls, assize courts, judges' lodgings, lock-up houses, court-houses, justices' rooms, police stations and county buildings, works and property, subject, as to the use of buildings by the quarter sessions and the justices, to the provisions of this act respecting the joint committee of quarter sessions and the county council; the licensing, under any general act, of houses and other places for music or for dancing, and the granting of licenses under the Race-courses Licensing Act (1879); the provision, enlargement, maintenance, management and visitation of and other dealings with asylums for pauper lunatics; reformatory and industrial schools; construction and repair of bridges and roads repairable with bridges, fixing the fees of inspectors and analysts; appointment of county treasurer, county surveyor, public analysts, coroners and health officers, and the determination of their salaries; the division of the county into coroners' districts, and the assignment of such districts; the division of the county into polling-districts for the purposes of Parliamentary elections, the appointment of places of election, the places of holding courts for the revision of the lists of voters and the costs of and other matters to be done for the registration of Parliamentary voters; the execution as

local authority of the acts relating to contagious diseases of animals, to destructive insects, to fish conservancy, to wild birds, to weights and measures and to gas-meters, and of the Local Stamp Act (1869); any matters arising under the Riot (damages) Act (1866); the registration of rules of scientific societies; the registration of charitable gifts under 52 Geo. III, ch. 102; the certifying and recording of places of religious worship under 52 Geo. III, ch. 155; the confirmation and record of the rules of loan societies under 3 and 4 Vict., ch. 110; and any other business transferred by this act.

The duties collected by the commissioners of inland revenue in each administrative county were made payable to the county council, and also four tenths of the probate duties. Also, the county councils were authorized to pay all officials heretofore paid by local grants.

The mayor, aldermen and burgesses of each county borough, subject to certain modifications, were given all the powers of a county council under the act, in so far as they were not before in possession of or subject to the same, but they were still to be governed in many respects by Municipal Corporations Act; and the provisions of the Local Government Act with respect to the constitution, election, proceedings or position of the county council or the chairman thereof, the county treasurer and other county officers, the standing joint committee of the justices and the council, coroners, gas-meters, the transfer to the council of powers relating to county and other rates and the preparation or revision of the basis or standard for the county rate, were not to apply to county boroughs. Provision was made for an adjustment of the financial relations between counties and county boroughs by agreement or by the commissioners appointed under the act.

The Local Government Act (1894), which received the royal assent March 5th of that year, completed the scheme of local government inaugurated by the Local Government Act of 1888. The latter act not only provided for district councils, the plan for which had to be abandoned in the original act, but also set up a new parochial organization in the rural districts, instituting, in connection with the new bodies, a franchise of a very wide character, which, however, has not been extended to the county council elections. This act, popularly called the "Parish Councils Act," was introduced in Parliament in the session of 1893. It also conferred on the county councils many new powers and duties, in addition to those conferred by the act of 1888. Before the passage of this act, parish affairs, so far as they were popularly managed at all, were controlled by the freeholders or rate-payers, who had from one to six votes, according to their property qualification, in the vestry. Powers of the vestry, however, were extremely limited. One of the chief changes of the new act was the establishment, in parishes situated in rural sanitary districts, of parish meetings and parish councils, into whose care was given all the secular business of the vestry. The franchise was extended from freeholders to all persons registered in the parish as Parlia-

mentary electors, including: freeholders, to the value of 40 shillings annually; freeholders for life with holdings of an annual value of £5; copy-holders for life, with holdings of an annual value of £5; leaseholders, for sixty years or more, of leases worth annually £5; leaseholders, at will, of leases worth annually £50; occupiers, as owners or tenants of lands worth annually £10; occupiers, of any dwelling worth annually £10; occupiers, as lodgers in rooms worth annually £10. An elector cannot vote more than once in any parish, but can vote in as many parishes as he has the necessary qualifications. Councils were established in all rural parishes with a population of 300 or over, and made optional with the parish meeting in parishes with a population between 100 and 300. The council constituted to have a chairman and five to fifteen councilors, all of them parochial electors. The council was given power to hold lands; to borrow money; to appoint overseers of the poor; to rate owners; to nominate constables; to decide appeals from overseers; to maintain footpaths, etc.

Rural district councils and urban district councils were established by the act to succeed to the powers of the old rural and urban sanitary authorities, with the same increased franchise. Both married and single women having the necessary property qualifications can vote at parish meetings, and are eligible for election as parish councilors.

Among the additional powers conferred by the act of 1894 on county councils were those of establishing parish councils; fixing the number of parish councilors; fixing or altering number of rural or urban district councilors; dealing with default of district councils; custody of parish books; retirement of councilors, etc.

LOCAL GOVERNMENT BOARD of England and Wales. This board, first constituted Aug. 19, 1871, under an act passed earlier in the same year, was established to take over all the powers and duties vested in or imposed on the Poor Law Board. It assumed the functions of the Home Secretary under the Registration Acts, the Sanitary Acts, the Local Taxation Acts, and the duties of the Privy Council under the Prevention of Diseases and Vaccination Acts. Since that time its powers have been increased and its sphere and operations extended by many statutes. The board consists of a president and of certain *ex officio* members, all of whom are members of the government for the time being. The president is assisted by a Parliamentary secretary, a permanent secretary and a numerous staff of officers, inspectors, etc. The duties of the department include a general supervision and control of the administration of the Poor Law, laws relating to public health, and numerous functions which fall to be performed by many local authorities. Its medical department includes a medical inspector and staff for general sanitary purposes, under it being the national vaccine establishment and the animal-vaccine lymph station. It inspects alkali-works and canal-boats. It has certain statutory powers as to bridges and highways. It watches over the actions of such local bodies as the board of guardians, the quarter sessions in counties, and the town council in burghs.

This is done by means of inspectors; and if the local body does not perform its duty, this board may take action, by ordering the removal of the nuisance, or make good the faulty proceedings of the inferior body. It has also certain powers of reapportionment of county councils, altering boundaries and transfer of powers from one body to another. By the Census Act of 1890 the Local Government Board was made the central superintending authority in England, and authorized to prescribe the necessary forms and instructions which are to be prepared and issued by the Registrar-General. See also ENGLAND, Vol. VIII, p. 252.

LOCAL-OPTION LAWS. See LIQUOR LAWS, Vol. XIV, p. 689; and LIQUOR LAWS IN THE UNITED STATES, in these Supplements.

LOCH, LORD, RT. HON. HENRY BROUGHAM, G. C. M. G., British diplomat, late governor of Cape Colony and high commissioner for South Africa, was born May 23, 1827, and died June 20, 1900. In 1857, he was attached to the diplomatic mission to China under Lord Elgin, and as secretary to the embassy brought to England the treaties of Yeddo and Tien-tsin, and the convention of Peking. During the war in China, he was made prisoner and carried about in a cage by his captors to be exhibited to the natives. Afterwards liberated, he became secretary to Sir Geo. Grey, in 1861-63, English home secretary. He subsequently was governor of the Isle of Man, governor of Victoria, and governor of the Cape. Representing British interests in South Africa, he was a conspicuous figure during the Matabele War. He resigned the governorship of the Cape in 1895.

LOCKE, DAVID ROSS, an American humorist, better known as **PETROLEUM V. NASBY**; born at

DAVID R. LOCKE.

Vestal, Broome County, New York, Sept. 20, 1833. In his youth he learned the printer's trade. After being connected with several papers in Ohio, he became successively editor of the *Plymouth Advertiser*, the *Mansfield Herald*, the *Bucyrus Journal*, and the *Findlay Jeffersonian*. While editing the *Jeffersonian* he began, in 1860, to insert his "Nasby" letters, afterwards collected and published under the title *The Struggles—Social, Political and Financial—of Petroleum V. Nasby* (1872). In 1865 Locke became proprietor and editor of the *Toledo Blade*, in which he satirized President Johnson's method of reconstructing the Southern States. In 1871 he removed to New York and became managing editor of the *Evening Mail*, but he returned to Ohio after a few years. Mr. Locke published *Divers Views, Opinions and Prophecies of Yours Truly* (1865); *Swingin' Round the Circle* (1867); *Nasby in Exile* (1882); and many political, social and literary pamphlets. He died in Toledo, Ohio, Feb. 15, 1888.

LOCKER-LAMPSON, FREDERICK, an English writer of *vers de société*, was born in Greenwich in 1821. He was for many years a clerk in the English Admiralty Office. In 1850 he married a daughter of the Earl of Elgin, and in 1874, two years after her death, the only daughter of Sir Curtis Lampson, a wealthy London banker, when he added the surname Lampson to his own. He was a dilettante in his tastes, and a great collector of drawings by the old masters and of early editions of rare Elizabethan authors. In 1857 he published a collection of bright and clever poetical trifles, entitled *London Lyrics*. This gave its author a vogue in England with other clever society poets. A further collected volume, *Patchwork*, came from his pen in 1879; and in 1892 he published a revised and extended edition of *Lyra Elegantiarum*, an anthology of social verse, which he had edited originally in 1867. After his death at Rowfant, Sussex, May 30, 1895, an autobiography appeared, entitled *My Confidences: Addressed to My Descendants*. It is full of delightful cheerful reminiscence.

LOCK HAVEN, a city and the capital of Clinton County, central Pennsylvania, pleasantly situated in a mountain valley on the south bank of the west branch of the Susquehanna, 28 miles above Williamsport. It is on the Beech Creek and Pennsylvania railroads, and on the West Branch canal. Lock Haven does a large business in making and shipping pine lumber. It contains a state normal school, large foundries and tanneries, saw, paper and planing mills, machine-shops, and fire-brick, sewer-pipe and cigar factories. Population 1890, 7,358; 1900, 7,210.

LOCKING-MECHANISMS FOR RAILWAY SWITCHES. A useful electric locking-device has come into use in connection with the mechanical locks on numerous railway lines. It consists primarily of a pair of electromagnets secured in a strong cast-iron box attached in line with the lever to be locked, acting, when charged with an electric current, to hold the end of a short lever out of a notch in a locking-disk secured to the flop. While there are no trains in the vicinity, the electric lock remains inoperative, and does not interfere with the mechanical lock, but when a train approaches, and at a distance, say, of one mile, warns the switchman to adjust his levers for its passage. His reversing of a lever is made to shut off the electric current, demagnetizing the lock-magnet so that the short lever is dropped into place and the switches are locked so as to maintain the right of way for the coming train until the last pair of wheels on the last truck have passed the switches, when the current is restored automatically and the operator is again free to set the switches. The advantage of this is, that it obliges the operator, after having once given the right of way to a train, to leave things alone, and no nervousness or mischance on his part, or mischievousness on the part of others, can interfere with the maintenance of the right-of way thus reserved for the train.

Hydraulic systems of locking-switches have been objected to in cold climates, because of the liability of the water to freeze. This has been obviated

largely by mixing glycerine with the water, thus materially lowering the freezing-point. It is claimed that with a proper mixture the system can be operated successfully at a temperature 20° F. below zero. The system has the advantage, over mechanical connections of rods and levers, that it requires much less power to shift the levers, since an accumulator is stored with power to do the actual work, while the operator has only to set the levers, which are short and light, in proper position. Additional safety is provided for in the most recent of these locking systems, by a double motion, not practicable with mechanically operated locking-mechanisms. The first and partial movement of the switch-lever turns on the fluid to the switch, unlocks and moves it, then returns to the cabin and releases the lever, which can then be pulled the remainder of its stroke, releasing the signal-lever.

C. H. COCHRANE.

LOCKJAW. See TETANUS, Vol. XXIII, pp. 199, 200.

LOCKLAND, a village of Hamilton County, southwestern Ohio, 11 miles N. of Cincinnati, on the New York, Lake Erie and Western railroad. It has starch, flour, paper, lumber and asbestos mills, brickyards and cotton-goods factories. Population 1890, 2,474; 1900, 2,695.

LOCKPORT, a village of Will County, northeastern Illinois, 30 miles S.W. of Chicago, on the Chicago and Alton and the Atchison, Topeka and Santa Fé railroads, and on the Illinois and Michigan canal. It is in an agricultural and limestone-quarrying region, and has manufactories of flour, oatmeal, wire, strawboard, barbed wire and brass castings. Population 1890, 2,449; 1900, 2,659.

LOCKPORT, a city of northwestern New York, on the New York Central and Hudson River and the New York, Lake Erie and Western railroads. At present the principal manufactories are those of Holly water-works machinery, milling machinery, indurated fiber products, flour, steam-dredges, boilers, engines, railroad trucks, aluminium, glass, carriages, furniture, paper, pulley-blocks, saws, reversible seats, and stave, broom, veneer and chair making machinery. Population 1900, 16,581. See also LOCKPORT, Vol. XIV, p. 764.

LOCKROY, ÉDOUARD ÉTIENNE ANTOINE SIMON, a French journalist and politician; born in Paris, July 18, 1838. He studied art, graduated at the École des Beaux-Arts, and accompanied Renan on his archaeological expedition to Judea and Phœnicia. On his return he took part in Garibaldi's Sicilian expedition; published some articles in *Figaro* and other journals which caused his imprisonment for four months; was an original member of the National Assembly (1871); became editor of *Le Peuple Souverain*, and again got into trouble with the authorities; was imprisoned twice in 1872 for a duel, and in 1873 for newspaper articles; in the latter year was elected to the Council; in 1888 was Minister of Public Instruction; and in 1889 directed the organization of the exposition. He published *À bas le Progrès* (1870); *L'Île Révoltée* (1877); *Ahmed le Boucher* (1888); and *Journal d'une Bourgeoise Pendant la Révolution* (1881).

LOCKWOOD, BELVA ANN BENNETT, an American reformer; born in Royalston, New York, Oct. 24, 1830. She was educated at a district school, and taught at the age of 15. At the age of 18 she married Uriah H. McNall, who died in 1853; graduated at Syracuse University 1857; taught in New York; then moved to Washington, District of Columbia, where she opened a school and began to study law; in 1868 married Ezekiel Lockwood; was admitted to the bar in 1873, and to supreme court practice in 1879. She was an active advocate of woman suffrage, and in 1884 was nominated by the Equal Rights Party for the Presidency of the United States.

LOCKWOOD, SIR FRANK, an English lawyer; born in Doncaster in 1846, and educated at the University of Cambridge. He was called to the bar, at Lincoln's Inn, in 1872; appointed a queen's counsel in 1882, and a bencher of the society in 1884. He served as one of the royal commissioners to inquire into the corrupt practices at the Chester election in 1880; was appointed recorder of Sheffield in 1884; and was member of Parliament for York in 1885-95. He was concerned with Lord Russell of Killowen (then Sir Charles Russell) as counsel for the Irish party before the Parnell Commission, and for years occupied a leading position at the bar. His abilities as a wit and caricaturist were as marked as his legal acumen. In 1889 he illustrated C. J. Darling's facetious *Scintille Juris*, and in 1895 published *The Law and Lawyers of Pickwick*. In October, 1894, he was appointed Solicitor-General; was knighted in November, 1894; and in 1896 visited America in company with Lord Russell. Died in London, Dec. 19, 1897.

LOCKYER, SIR JOSEPH NORMAN, an English astronomer; born at Rugby, May 17, 1836. He was educated partly in Germany, and entered the British War Office in 1857. In 1860 he became a fellow of the Royal Astronomical Society, and in 1869 he was elected to the Royal Society. He was chief of the expedition sent to Sicily in 1870, to observe the solar eclipse, and of that to India in 1871. In 1874 he became editor of *Nature*. Lockyer's investigations were mainly in the field of solar physics and spectroscopic observations. He published *Elementary Lessons in Astronomy*; *Contributions to Solar Physics* (1873); *The Spectroscope* (1873); *Studies in Spectrum Analysis* (1878); *The Dawn of Astronomy* (1893); and *Star-Gazing, Past and Present* (1878). He was awarded the Janssen prize for astronomy by the Academy of Sciences in 1890, and was chosen editor of *Nature*. In 1897 he was made K. C. B.

LOCOMOTIVE. See RAILWAY, Vol. XX, pp. 245-255; and RAILROADS, in these Supplements. The locomotive-engine has changed very little, and that only in details of construction, since the times of Trevithick and Stephenson. The locomotive which won the victory at Rainhill, the *Rocket* and the *Planet* type, introduced by Stephenson in 1833, are the base-types of all that have succeeded them. The same form of boiler, the same valve-motion, the same system of producing draft, and in fact every essential element of the modern machine, may be found in the old engines of two generations ago, and in

very good form and proportions. The modifications which meantime have occurred have been mainly in the adaptation of the machine to heavy or to light, to fast or to slow, transportation, and by change of proportions of parts, rather than by change of fundamental construction. The only radical alteration of late years has been the application of the compound system (well known for a century, nearly, in other departments of steam-engineering) to the locomotive. The essential and peculiar requirements of the case come of the necessity of being able to stop and to start, and to reverse, the engine without delay or difficulty; and this has come to mean the provision of a system by means of which the engine may be handled precisely like the simple engine, and can, in fact, be converted from simple to compound, and the reverse, instantly as required. The engine is started as a simple machine, and, once fairly under way, is made to work as a compound. So effective are the devices now in use for this purpose, that the engine-driver has but to handle his reverse-lever and throttle precisely as with the older form, and the rest is accomplished automatically.

The modern locomotive, in the best form of compound machine, illustrates the most remarkable combination of tremendous power with concentrated volume and small weight that has yet been produced by the engineer, and in the latest form its economy is, all things considered, hardly less remarkable than its power and its concentration of energy into small weight and space. The form of the standard American engine is seen in the accompanying illustration.*

connected to the crank-shaft, F, by the connecting-rod, G H the driving-wheels, I J the truck-wheels, carrying the truck, K L; M N is the fire-box, O O the tubes, of which but four are shown. The steam-pipe, R S, leads the steam to the valve-chest, T, in which is seen the valve, moved by the valve-gear, U V, and the link, W. The link is raised or depressed by a lever, X, moved from the cab. The safety-valve is seen at the top of the dome, at Y; and the spring-balance, by which the load is adjusted, is shown at Z. At *a* is the cone-shaped exhaust-pipe, by which a good draft is secured. The attachments *b, c, d, e, f, g*—whistle, steam-gauge, sand-box, ball, head-light and "cow-catcher"—are nearly all peculiar, either in construction or location, to the American locomotive. The locomotive is furnished with a tender, which carries its fuel and water.

The compound locomotive in its simplest form, that with two cylinders, the high-pressure on the one side, the low-pressure on the other, was probably first designed in 1834, by Röntgen, a Dutch engineer, whose specifications described a *machine à vapeur expansive à cylindres indépendants et combinés*. It is not known that the invention was actually brought into use. Mr. A. Mallet was probably the first to introduce these machines practically into regular work, building his first engines at Creusot for the Bayonne and Biarritz railway in 1875. Von Borries followed with his engines, in Germany, in 1880, and the compound locomotive has since then rapidly taken its place on all the great railways of the world.

Fig. 1.—THE LOCOMOTIVE. Scale $\frac{1}{100}$.

The peculiarities of the American type (Fig. 1) are the truck, I J, or bogie, supporting the forward part of the engine, the system of equalizers, or beams, which distribute the weight of the machine equally over the several axles, and minor differences of detail. The cab, or house, *r*, protecting the engine-driver and fireman, is an American device, which is gradually coming into use abroad also. The American locomotive is distinguished by its flexibility and ease of action upon even roughly-laid roads. In the sketch, which shows a standard American engine in section, A B is the boiler, C one of the steam-cylinders, D the piston, E the cross-head, con-

Several thousands were in use in 1896, of which it is estimated one half were in England and Germany, and only about ten per cent in the United States, and about the same proportion in France.*

The compound engine is finding its way into common use rapidly now, and exhibiting a gain over the simple engine of from 10 to 25 per cent in steam-consumption, and of 15 to 30 per cent in the demand for fuel, at full loads and steady speeds. It is, in some respects, found less perfectly adapted to varying loads and unfavorable conditions of operation, but it has its own special advantages in nearly all cases. The adoption of the "multiple-cylinder" system, the use of a

* *Manual of the Steam-Engine*, Vol. 1, Fig. 95, p. 195. R. H. Thurston. New York: J. Wiley & Sons.

* *Vide Borries on the Compound Locomotive*, *Transactions of the American Society of Mechanical Engineers*, 1893, No. DXXXVII.

pair of cylinders "in series," in place of a pair of cylinders "in parallel" as the electrician would perhaps designate it, an "*en cascade*" as French engineers denominate the arrangement, has the special advantage of reducing the internal wastes known as initial or cylinder condensation, which amounts to twenty and even to forty per cent, often, of the total supplied from the boiler, to about one half these figures. The restricted range of expansion in each cylinder, as compared with the larger ratio in the simple engine, makes the fraction of this steam condensed at entrance comparatively small; while the series arrangement permits the wastes of the high-pressure engine to be applied to satisfying the demand for excess of steam in the low-pressure cylinder for a similar waste there. The loss is thus that of restricted expansion in a single cylinder. With three cylinders, in series, as in many marine engines and in some experimental locomotives, the internal losses of this sort are thus reduced to one third their former, and very serious, amount. This reduction in the demand for steam permits larger proportion of heating-surface in the boiler, and thus a second and superadded economy there, which proves to be a very important quantity.

The special feature of the successful forms of compound locomotive, constituting their element of superiority, in the most usual type, is what is known as the "intercepting-valve." The simplest construction is evidently that which employs but two cylinders, and those arranged on either side the engine, as in usual practice, and only differing from the older form in the fact that one is a small, high-pressure cylinder, the other a comparatively large, low-pressure cylinder. The intercepting-valve is that contrivance which permits the action of direct steam in both cylinders at starting, precisely as in the simple engine, thus evading the otherwise fatal objection to the system that starting-power could not be insured to move the train from rest. With an intercepting-valve, or its equivalent, steam is permitted to enter both engines, as ordinarily, and the locomotive acts as a simple machine until fairly under way, when the operation of the valve,

sometimes by the hand of the engine-driver, sometimes automatically, changes the course of the steam, and it enters, first the high-pressure cylinder and thence passes into the low-pressure, stroke by stroke, and the machine is a compound engine so long as at speed. Reversal of the valve at stopping converts the machine into a simple engine, and handling at stopping and starting, and in reversing, becomes as easy and safe as with the older form. This is the one peculiar and characteristic feature of the compound locomotive. An illustrative example of this remarkable and ingenious contrivance follows.

The arrangement adopted by Mr. Pitkin is seen in the figures 2 and 3.

Fig. 2.—THE PITKIN COMPOUND.

It includes one high and one low pressure cylinder, with the intercepting-valve seen in the next illustration. The "receiver" between the two cylinders has a volume fifty per cent greater than that of the small cylinder. The valves are arranged and the general disposition of parts is as in the standard engine of the old form.

The intercepting-valve, as here seen in section, is as at the instant of starting, and before compound working begins, the ports *c* and *d* closed and no connection existing between the receiver and

Fig. 3.—PITKIN'S INTERCEPTING-VALVE.

the large cylinder, while the latter receives steam through a reducing-valve and the port *a* and the passage *b*.

On starting, the exhaust from the small cylinder fills the receiver, and the back-pressure taking effect, through *e*, on the intercepting-valve and destroying its equilibrium, it at once moves over, and the large cylinder takes its steam properly for compound-working.

The dash-pot, *h*, prevents too sudden movement.

This engine has the following dimensions: Cylinders, diameter, 20 and 29 inches; stroke of piston, 24 inches; ratio of cylinders, 2.1; diameter drivers (6), 68 inches; weight of engine, 126,800 pounds; heating-surface, 1,677 square feet; grate-surface, 28.57 feet. About 80 per cent of the total weight is on the drivers.

There were, in 1896, about 170,000 miles of railway in the United States, valued at not less than \$10,000,000 with their equipments, employing a million or more men. The locomotive has arrived at such perfection as to be capable of drawing a heavy train on a good road at the rate, for a short distance, of 100 miles an hour, and, for distances of 400 and 500 miles, as from New York to Buffalo, or from London to Aberdeen, 50 to 55 miles an hour, with occasional spurts of 70 or even 80 miles. The "world's records" stood, January, 1896, thus:*

ently strong probability of finding a permanent place, especially in Europe, where all roads are good, and in parts of the United States, where they are good, or at least are passable, at all seasons. This type of vehicle was remarkably successful for a time in Great Britain, especially in and near London, from 1827 to 1834, at one time about thirty being in steady work in and about that city. Some of these, as the carriages of Hancock, carried thousands of passengers, traveled thousands of miles, and held fixed routes for months together. The rise of the steam-railway, however, and the opposition of other interests, together with restrictive legislation, completely broke up this then promising business, and self-propelled carriages never have regained the place then held by them. Those now coming into use are propelled by steam, in larger numbers by electricity, and in still larger proportion by petroleum engines. Such engines have been found capable of traversing hundreds of miles of highway in France, with success and promptness, and without accident or danger.

These locomotives are now built in considerable numbers on both sides of the Atlantic, and those which have survived the test of actual work are claimed to be absolutely safe, to be free from noise, jar, heat and odor, to be easy of manipulation, and safe of control, powerful and economical, and not costly.

These machines are propelled very successfully by the electric current derived from a storage battery, where current is "on tap" at convenient points, and at moderate cost; and such vehicles—for example, that of Messrs. Morris and Salom of Philadelphia—have proved themselves exceedingly satisfactory. At the *Petit Journal* competition of 1895, 102 vehicles were entered, of which 23 were supplied with petroleum motors, 12 were driven by steam, 2 by compressed air, and 1 combined steam and petroleum as a working-fluid. Of these, 17 started in the race. A speed of 17 miles an hour was attained, and the route between Paris and Bordeaux, a distance of 725 miles, was traversed successfully in 22½ hours; while the time, out and back again, was 48 hours and 53 minutes. In the *Times-Herald* contest at Chicago in 1895, 6 vehicles entered, and the route of 54 miles' length was traversed by the victor in the race and 70 miles additional voluntarily added. Steam in this field has, at least at the moment, been distanced by petroleum and electric motors; but builders of either type are now ready to supply light, strong and swift self-moving carriages, and to meet any requirement as to character of work to be done by them.

R. H. THURSTON.

LOCOMOTIVE, ELECTRIC. See MOTORS, in these Supplements.

LOCY, WILLIAM A., an American zoölogist; born in Detroit, Michigan, Sept. 14, 1857. He was graduated at the University of Michigan in 1881; spent a year in graduate work in the department of biology in the same institution, and

The journey from New York to San Francisco has been made by a special train in 3 days 7 hours 49 minutes 16 seconds. The regular schedule time is now about four days.

Road-locomotives, steam-carriages, "automobile" vehicles, as they are variously called, and the lighter construction coming to be known as "motor-cycles," have recently been revived extensively, and are brought forward with appar-

* *Science*, Dec. 13, 1895, p. 801.

a year in Harvard University, publishing, while there, a thesis containing the first printed account of the arthropod eye. He became professor of biology in Lake Forest College in 1887, and in 1891 was elected professor of physiology at Rush Medical College, in its medical department, retaining both chairs. By the authorities of Rush Medical College he was sent to Europe to purchase apparatus and inspect the laboratories of the Old World, and while in Germany carried on work under Du Bois-Reymond and Gad in the University of Berlin. On account of ill health he gave up his professorship at Rush Medical College in November, 1891. In January, 1896, he succeeded Dr. E. G. Conklin in the chair of zoölogy at Northwestern University. His contributions to the scientific periodicals of both Germany and America include *Primary Segmentation of the Vertebrate Brain*; *The Derivation of the Pineal Eye*; *On Teaching Zoölogy to College Classes*; and *The Optic Vesicle of Elasmobranchs*. Dr. Locy exercised editorial supervision in the department of general biology and zoölogy for these Supplements, and wrote for the same the articles on EMBRYOLOGY; HUXLEY'S SEGMENTATION OF THE VERTEBRATE HEAD AND BRAIN; and SENSE-ORGANS.

LODGE, HENRY CABOT, an American author; born in Boston, May 12, 1850. He graduated at Harvard College in 1871, and from the Law School in 1874; lectured, in the university, on American history (1876-79); edited the *North American Review* (1873-76) and the *International Review* (1879-81). He served two years in the state legislature; represented his district in Congress from 1886 to 1892; and was elected United States Senator in 1893. He wrote *Life and Letters of George Cabot* (1877); *Short History of English Colonies in America* (1881); *Life of Alexander Hamilton* (1882); *Life of Daniel Webster* (1883); *Studies in History* (1884); *Hero Tales from American History*, with Theodore Roosevelt (1895); *The Story of the Revolution* (1899); and edited *The Works of Alexander Hamilton* (1885). He was a delegate-at-large to the Republican national conventions in 1884 and 1896.

LODGE, OLIVER JOSEPH, an English physicist; born near Stoke-upon-Trent, Staffordshire, June 12, 1851. He finished his education at the University of London in 1877; became demonstrator, and in 1877 assistant professor, in physics at the University College, London; and after 1881 was professor of physics at the University College, Liverpool. He was a member of the Institute of Electrical Engineers and several physical societies of Liverpool and London. He did much work in the field of electrical induction and in clearing up the function of ether in propagation of electromagnetic and electrostatic disturbances. Among his publications are a text-book on *Mechanics* (1877), *Modern Views on Electricity* (1889); *Lighting-Guards*; *Pioneers of Science*; and *The Work of Hertz and Some of His Successors* (1894).

LÓDZ, a town in western Poland. It is almost exclusively engaged in the manufacture of cotton goods. The remarkable growth of the place is due to the prohibitive duties of Russia, which

compelled foreign traders to set up their mills within the Russian boundaries. Population 1897, 315,209. See also LODZ, Vol. XIV, p. 768.

LOESS, an alluvial deposit. See GEOLOGY, Vol. X, p. 367; and CHINA, Vol. V, p. 632.

LOGAN, a village and the capital of Harrison County, central western Iowa, 28 miles N. of Council Bluffs, on Boyer River, and on the Chicago and Northwestern railroad. It ships building-stone, black walnut lumber, stock and grain. Population 1900, 1,377.

LOGAN, a city and the capital of Hocking County, southern central Ohio, 51 miles E.N.E. of Columbus, on the Hocking canal, and on the Columbus, Hocking Valley and Toledo railroad. It is in a coal and iron mining region; has flour-mills, woolen, brick and furniture factories, a foundry, a blast-furnace and a large trade. Population 1890, 3,119; 1900, 3,480.

LOGAN, a city and the capital of Cache County, northern Utah, 70 miles N. of Salt Lake City, on Logan River, and on the Union Pacific railroad. It is the center of a fine wheat, stock and dairy region, and has a number of manufactories and excellent water-power. It has several educational institutions, among them Brigham Young College, New Jersey Academy and the Utah Agricultural College and Experiment Station, and Methodist and Episcopal academies. Population 1890, 4,565; 1900, 5,451.

LOGAN, FORT, a United States military post in the DEPARTMENT OF THE COLORADO, having a post-office, telegraph and railroad station of the same name; in Arapahoe County, northern central Colorado, 10 miles S. of Denver, on the Denver and Rio Grande and Union Pacific railroads. It is garrisoned by ten companies of troops, comprising both cavalry and infantry.

LOGAN, MOUNT, the highest peak in North America, situated in the British Northwest Territories, near the Alaskan boundary, about 26 miles N.N.E. of Mount St. Elias, in long. 60° 34' N., long. 140° 24' W. In 1892 the United States Coast and Geodetic Survey sent out J. H. Turner, who, by triangulation, found its height to be 19,514 feet, or over 1,000 feet higher than Mount St. Elias and Mount Orizaba, previously believed to be the highest peaks in North America.

LOGAN, GEORGE, an American public man; born at Stenton, Pennsylvania, Sept. 9, 1753. He studied medicine at Edinburgh, and then traveled a year on the Continent, returning in 1780. In 1798 he went to France, on his own responsibility, as a peacemaker between that country and his own, and succeeded in having the embargo on American shipping removed. On his return he was denounced by the Federalists, who secured the passage of a bill through Congress making it a high misdemeanor for a private citizen to take part in a controversy between the United States and a foreign power. Dr. Logan was in the United States Senate from 1801 to 1807, and went to England in 1810, on his own responsibility, to try and avert war, but was unsuccessful. He devoted much time to scientific agriculture, upon which

subject he wrote several papers. He died at Stenton, April 9, 1821.

LOGAN, JAMES, an American statesman; born at Lurgan, Ireland, Oct. 20, 1674. He lived in Ireland and then in England till 1699, when he went to the United States as William Penn's secretary. Soon afterward he became provincial secretary, commissioner of property, and receiver-general of Philadelphia, and from 1702 to 1747 was a member of the provincial council. In 1715 he was made a justice of the court of common pleas, and in 1723 presiding judge. The same year he became mayor of Philadelphia, and from 1731 to 1739 was chief justice of the supreme court. His latter years, spent in retirement, were devoted to science and literature, especially the classics, and he was a member of the first board of trustees of what is now the University of Pennsylvania. He died at Stenton, Pennsylvania, Oct. 31, 1751.

LOGAN, JOHN, an Indian chief; born about 1725. He came of the Cayuga tribe, and was called Tah-gah-jute, his English name being adopted in honor of James Logan, the friend of the Indians, and secretary to William Penn. Logan dwelt near the Moravian settlement at Shamokin Creek, on friendly terms with his neighbors. Later he lived near Reedsville, Pennsylvania, where he was chosen chief of the Mingo tribe, and in 1770 retired to the banks of the Ohio River. In 1774 his entire family was massacred by settlers on the Ohio River. Logan suspected that the deed was done at the instigation of Michael Cresap, and during several months his tribe perpetrated many barbarities on the whites, he personally taking thirty scalps. The Indians were defeated near the Great Kanawha River. At that time he would not appear among those who sued for peace, but instead led the emissary of Governor Dinsmore into the woods and told the story of his wrongs, made famous by Jefferson in his *Notes on Virginia*. In his declining years Logan became a drunkard and killed his wife. He was killed at Detroit in 1780, by a party of Indians whom he had attacked while intoxicated.

LOGAN, JOHN ALEXANDER, an American soldier and statesman; born in Jackson County,

Illinois, Feb. 9, 1826. At the beginning of the Mexican War, though but twenty years of age, he at once enlisted and became a lieutenant in an Illinois regiment. He returned home with an excellent military record, and commenced the study of law. In 1849 he became clerk of Jackson County, and at the expiration of his term went to Louisville, Kentucky,

where he was admitted to the bar in 1851. In the fall of the same year he was elected to represent Jackson and Franklin counties in the legisla-

ture, and from that time was almost uninterruptedly in the public service, either civil or military. He was twice re-elected to the legislature, and in 1854 was a Democratic Presidential elector. On the outbreak of the Civil War he resigned his seat in Congress, enlisted in the Union Army, and rose to the rank of major-general. After the war he served two terms in Congress; from 1871 to his death he was a United States Senator from Illinois; and in 1884 was nominated for the Vice-Presidency on the ticket headed by James G. Blaine. General Logan wrote *The Great Conspiracy* (1886), and *The Volunteer Soldier of America*, published in 1887, after his death. He died in Washington, District of Columbia, Dec. 26, 1886.

LOGAN, MAJOR JOHN A., son of the above, was born in Illinois, July 24, 1865, and for some time was a student at West Point. During the Harrison administration he held a consular appointment abroad, and when the war with Spain broke out he served on the staff in Cuba, under General Bates. He also acted for a time as assist.-adjut.-general, with the rank of lieutenant. For gallant conduct at El Caney he was promoted to the rank of major. On returning from Cuba, he was ordered to Manila with his regiment (the 33rd Infantry) and arrived there Oct. 27, 1899. While in action against the Philippine insurgents at San Jacinto, Nov. 12, 1899, he was shot by a Filipino sharpshooter.

LOGAN, SIR WM. E., a Canadian geologist, born at Montreal, April 20, 1798, and died in Wales Eng., June 22, 1875. Was for many years director of the geological survey of Canada.

LOGANIACEÆ, a family of dicotyledonous plants represented in the United States by the genera *Gelsemium* (yellow jessamine), *Polypleurum*, *Spigelia* (pink-root), and *Metreola*. They may be herbs, shrubs, or trees, whose entire and opposite leaves are connected by an interpetiolar sheath. The 4 to 5 parted perfect flowers occur in terminal or axillary cymes, the stamens are inserted on the corolla-tube, and the ovary is inferior. There are, in all, about thirty genera and more than 350 species, mostly native to the tropics. *Logania*, the typical genus, is an Australian form. Many highly poisonous plants are contained in this family; for example *Strychnos nux-vomica*, the poison-nut. Curare, strychnine and other alkaloids of medicinal importance are obtained from members of the family.

LOGANSPOURT, a city and the capital of Cass County, northern central Indiana. The city has a normal school, a state asylum for the insane, a public park, water, natural and manufactured gas, electric light-works and an electric street-railway. It carries on the manufacture of flour, lumber, castings, etc., and is the seat of extensive railroad-shops. Its trade with the surrounding country is considerable. It is the seat of a Universalist College. Population 1900, 16,204. See also LOGANSPOURT, Vol. XIV, p. 772.

LOGOS, THE. See CHRISTOLOGY, in these Supplements.

LOGGERHEAD-TURTLE. See TORTOISE, Vol. XXIII, p. 458.

GENERAL LOGAN.

LOGGIA, an Italian word signifying an open arcade inclosing a passage or open apartment. It is a favorite class of building in Italy and other warm countries. The Loggia dei Lanzi at Florence, begun by Orcagna in 1376, is one of the finest examples. See ORCAGNA, Vol. XVII, p. 815.

LOGOGRAPHERS. See RHETORIC, Vol. XX, p. 509.

LÖHER, FRANZ VON, a German historian; born at Paderborn, Westphalia, Oct. 15, 1818. He studied at the Halle, Munich, Freiburg and Berlin; traveled extensively in Europe, Canada and the United States in 1846-47; took part in the political movements of 1848, and was imprisoned by the Prussian government; was acquitted in a short time; was professor at Göttingen until 1855, when he went to Munich as professor and secretary of the academy. He founded the *Westphalia Zeitung* in 1848, and became known as the author of *Das System des Preussischen Landrechts* (1852); *Fürsten und Städte zur Zeit der Hohenstaufen* (1846); *Land und Leute in der Alten und Neuen Welt* (1857-58); *Jakobaea von Baiern* (1861); *Neapel und Sicilien* (1864); *Griech. Küstenfahrten* (1876); *Russlands Werden und Wollen* (1881); and *Kulturgeschichte der Deutschen im Mittelalter* (1891). He died March 2, 1892.

LOKI, a deity. See ÆSIR, Vol. I, p. 210.

LOLIGINIDÆ, a family of cephalopod mollusks, represented on our coasts only by the typical genus *Loligo*. The body is conical, tapers posteriorly, and the fins are large. The family is composed of four living genera.

LOLLAND. See LAALAND, in these Supplements.

LOMBARDO, PIETRO, an Italian architect; born near Lugano, about 1438. He founded a school of architecture, which predominated in Venice until the Palladin style came into vogue. In 1499 he became architect-in-chief of the ducal palace, and directed the architectural work of the republic for 12 years. Among his famous works are the *Monument to Dante*; *Scuola di San Marco*; his masterpiece, the *Church of Santa Maria dei Miracoli*; and a great many smaller works. He died, probably at Venice, about 1511.

LOMBARD UNIVERSITY, a co-educational institution situated at Galesburg, Illinois. It was founded by the Universalists in 1851, and offers three courses, classical, scientific and literary. It also has a preparatory department, and the Ryder Divinity School is connected with it. Besides a large campus and equipments, the university owns property worth \$200,000, which yields an income of \$15,000. The attendance averages about 150; in 1895 there were 18 instructors, and the library contained 7,000 volumes.

LOMBARDY. See ITALY, Vol. XIII, pp. 441, 448, 469 et seq.

LOMBROSO, CESARE, an Italian criminologist; born in Venice, November, 1836. He was educated at the University of Turin; became professor of diseases of the mind in the University of Pavia (1862); was director of a hospital for the insane at Pesaro,

and then professor of medical law and psychiatry in Turin. He held that criminality is fatalistic, and derived through inheritance or climatic environment. He wrote *Epileptic Insanity* (1863); *Psychiatrico-Legal Investigations by Experimental Methods* (1867); *Anthropometry of Four Hundred Criminals* (1872); *The Criminal: An Anthropological and Medico-Legal Study* (1875); *The Man of Genius* (1891); and *Female Offenders* (1895).

LOMNICKY, SIMON. See SLAVS, Vol. XXII, p. 152.

LOMOND, LOCH, a lake of Scotland. See DUM-BARTON, Vol. VII, p. 524.

LONDON. Thomas Hughes once, in a lecture, expressed his judgment of the London problem by stating that it was the effort of 5,000,000 people to live together,—an effort which, he trusted, would never again be repeated. To a stranger it is perplexing to know just what London is. The name has various legal meanings; as, the City of London, including Southwark, which covers thirty acres more than one square mile, and, while having a night population of only 37,700, is frequented by day by 301,000 persons. There is another London for registration purposes, a third under the County Council, and still another constructed into boroughs for Parliamentary representation. Outside of this zone lie suburbs, which include nearly six times the area of the London under the County Council.

In 1891 these areas were returned as follows:

	ACRES.	DWELLINGS.	POPULAT'N.
Registration, London.....	74,672	544,977	4,211,743
County Council, London..	75,442	548,315	4,282,118
Parliamentary London.....	80,148	580,381	4,437,021
Greater London.....	443,421	789,408	5,633,806

It will be seen that the first three of these systems differ but slightly in area, houses and population. They include the city, although it has its own organization and peculiar system of government. An account of the whole region, its his-

THE HOUSES OF PARLIAMENT.

tory and its great works is given under LONDON, Vol. XIV, pp. 818-851.

Since that article was published the government of the metropolis has been changed, the Metropolitan Board of Works having been superseded by the County Council, with larger powers. This Council was established by act of Parliament in 1888, and it went into operation in the follow-

ing year. The old board comprised forty-five members, who represented thirty-eight vestries and district boards. The Council consists of 118 elected councilors, who serve for three years, and 19 aldermen, having each a six-years' term, representing 196 civil parishes, co-extensive with thirty poor-law unions. In it the city is represented by four members, but not at the cost of a surrender of any of its liberties or autonomy. The jurisdiction of the Council extends to four dioceses, and is exercised in parts of the three counties of Middlesex, Surrey and Kent. It has no control over the police, which is under the Secretary of State for Home Affairs, and has Greater London for its field of operations.

In the selection of councilors, since 1891 women householders and peers may vote, but no elector can legally vote more than once in the county. The chairman of the Council is elected annually, and is, *ex officio*, a justice of the peace. The aldermen are chosen by the Council.

Plans for the unification of London were proposed to Parliament by a Royal Commission in 1894, under which the whole administrative county and the old city should be merged in a new corporation, to be known as the Mayor and Commonalty and Citizens of London; the city livery companies to be transferred to some department of the imperial government. The Progressives of the Council favor such an amalgamation, but the city authorities resist it, and no action has been taken by Parliament to effect such a union. Within the Council two parties have arisen, of nearly equal strength—the Moderates, or Conservatives, who would restrict the functions of the Council to necessary administrative work; and the Progressives, who are accused of socialistic tendencies, and whose policy, as put forward in 1895, include the municipal ownership of the public markets, of the gas and water supply, of the docks, and the river Thames improvements; the management of the street-railways for public profit; the erection, by authority of the council, of artisans' dwellings and lodging-houses; reform of the poor-law; a sequestration of a considerable part of the income of the city companies for public uses; compensation to tenants for improvements; taxation of ground values; and improved registration.

So vast and complex are the interests involved, that it is by no means an easy task to find an acceptable method of administration. Very few are the dwellers in London who have a freehold in their dwellings. Ground is occupied through lease upon lease, with the consequence that tenants care little for their residences, are migratory, and the crowding is excessive. The official definition of overcrowding is two persons to one room, and this is the condition of one third of the population in East London. Something has been done to improve artisans' dwellings by the County Council, and street after street may be found, in Marylebone and the East, built on monotonous model under official plans. Marked inroads have been made upon the squalor and dense-

ness of tenement districts by means of these civic improvements, and of the Peabody and Waterlow foundations, but the almost universal registration tenure in London of improvers and occupants, is paralyzing to reforms in this direction. For these reasons, London, with all its wealth and resources, and with enormous expenditures on public works, is not picturesque. The West End, where wealth is centered, the river embankments, the centers of trade, have their massive buildings, green-swards, noble monuments and parks, but they are belted with narrow streets and uniform houses not pleasing to contemplate.

The water system is still under the control of eight companies, drawing their supply from the Thames and the Lea. The difficulty of making an acceptable appraisalment has hindered the County Council from acquiring these properties, but a persistent movement is on foot to do so. The system is inadequate, although the supply equals thirty-five gallons *per capita*, and projects are contemplated for drawing a new supply from Wales at an outlay of \$150,000,000. The Council has under its control the care of the insane, the purification of the Thames, parks and open spaces, weights and measures, artisan house-building, public amusements, and public works. The London School Board is a separate organization. The estimated expenses of the County Council for the year ending March 31, 1896, were \$17,961,497 for maintenance, \$37,878,885 for capital account, of which \$24,000,000 were for loans to local authorities. Its consolidated stock in 1895 was returned at \$162,866,560. During the history of the County Council the parks and open spaces have increased from 2,656 to 3,684 acres, and 2,000,000 tons of sludge has been annually removed from the Thames.

It is worthy of note that the entire cost of the administration of municipal matters did not exceed 15 pence in the pound for the county outside the city, and 12½ pence for the city. Among the breathing-spaces recently opened to the teeming millions of the metropolis may be mentioned Whitfield Gardens in Tottenham Court Road, formerly part of an old burial-ground; Lincoln's Inn Fields in the heart of the lawyers' world, which was acquired at a cost of \$60,000; and Telegraph Hill, Hatcham.

The metropolis comprises the following Parliamentary boroughs, each returning the number of members that appears in parenthesis after its name: Battersea (1), Clapham (1), Bethnal Green (2), Camberwell (3), Chelsea (1), Deptford (1), Finsbury (3), Fulham (1), Greenwich (1), Hackney (3), Hammersmith (1), Islington (4), Kensington (2), Lambeth (4), London City (2), London University (1), Marylebone (2), Newington (2), Paddington (2), St. George's, Hanover Square (1), St. Pancras (4), Shoreditch (2), Southwark (3), Strand (1), Tower Hamlets (7), Wandsworth (1), West Ham (2), Westminster (1).

London's main thoroughfares run, like the river, from west to east. One continuous road extends from Shepherd's Bush, through Bays-

water, Oxford Street, Holborn, Cheapside, White-chapel and Mile End Road to Stratford-le-Bow, a distance of twelve miles. Nearly parallel to it, but joining it at Cheapside, is the great thoroughfare from Hammersmith and Kensington, receiving tributary streams of traffic from Fulham, Brompton and Chelsea, and running, by Hyde Park, through Piccadilly, the Strand, Fleet Street and Ludgate Hill.

The longest continuous line of streets from north to south is one of ten miles, from Stamford Hill, by the Kingsland Road and Bishopsgate Street, across London Bridge, by the Borough and Clapham roads to Balham. Some of the streets in the older part of the town, in Spitalfields, Clerkenwell and Holborn, were narrow, mean, straggling and irregular, but many improvements have changed, and are changing, this part. The Strand, Fleet Street and Cheapside are the thoroughfares where the traffic becomes most congested. Some main thoroughfares (such as the Marylebone Road), which have heavy traffic, are very badly lighted, so that the pedestrian, on a dark night, encounters no small risk to life and limb when crossing them. Other roads, particularly those in the west and southwest districts,—Mayfair, Tyburnia, Kensington, and Belgravia,—are spacious, regular and stately.

The Tower Bridge was opened in 1894. It was built by the corporation of the city at a cost of \$4,250,000, and is on the bascule principle, each leaf of the opening span being 100 feet long by 50 feet wide. The total length of the bridge and its approaches is 2,640 feet.

New electrical railways were begun in 1895; one, consisting of two tunnels, from Liverpool Street to Shepherd's Bush, 6½ miles, and connecting with other electric lines at Bank Station; another starting from the Mansion-House, passing by a tunnel near Blackfriars Bridge under the Thames, and extending to Waterloo Station on the Surrey side.

THE MANSION-HOUSE.

Schools, Museums, Etc. On March 25, 1895, there were, besides upward of 700 endowed schools and collegiate institutions, "board-" schools with accommodation for 469,167 children, and accommodations for 44,905 more were in course of construction, and numerous "voluntary" schools with accommodation for 255,936

pupils. The School Board is composed of 56 members. Westminster (the old foundation public school of St. Peter's), St. Paul's (removed to West Kensington), Merchant Taylors', and the City of London schools and Christ's Hospital, are historically famous; also, University College School, King's College School, and others.

Places of Amusement. The finest concert-rooms are at St. James's and Queen's halls. The first is splendidly decorated, and used for classical and orchestral concerts. There are, also, Steinway and St. George's Halls and Portman Rooms. At the Exeter Hall (which holds 4,000 people), the "May meetings" are held, and it is the headquarters of the Young Men's Christian Association. It is also used for religious meetings. The Royal Albert Hall, Kensington, holds 10,000 people. There are sixty theaters, music-halls, etc., and others are either in course of erection or projected. At the Royal Italian Opera, Covent Garden, operas are produced during the season, while a magnificent "English Opera House," now called the Palace Theatre of Varieties, in Shaftesbury Avenue, was opened Jan. 31, 1891, with Sir Arthur Sullivan's *Ivanhoe*. Drury Lane is now used chiefly for spectacular pieces. The Vaudeville, Toole's, Terry's, Globe, Criterion, Opera Comique, Comedy, Garrick and Court, are among the best comedy theaters. Melodrama has its home at the Adelphi, Princess and Olympic; farce and burlesque at the Strand and Gaiety; opera bouffe at the Savoy, Prince of Wales and Lyric. The Haymarket and St. James's have been chiefly distinguished by the production of modern, social and historical dramas, while the Lyceum has seen the revival of Shakespeare's plays and the blending of realism and romanticism under the management of Sir Henry Irving. There are also many handsome singing-saloons, or "music-halls," and some of the most wonderful spectacular effects of the age have been produced at Olympia and the exhibitions at Earl's Court.

Courts of Law, Prisons, Cemeteries. The courts of law, which give employment to about 3,000 barristers and 5,000 solicitors, formerly scattered in Westminster, Lincoln's Inn and the city, were all united in 1882 in the magnificent Royal Courts of Justice, in the Strand. Solicitors' chambers are chiefly about Lincoln's Inn Fields, and those of barristers in the Inns of Court, which comprise the Middle and Inner Temples, and Gray's and Lincoln's Inn. There are sixteen police courts throughout the metropolis (including two in the city), and the police force in 1895 consisted of 32 superintendents, 595 inspectors, 1,869 sergeants, and 12,785 constables, with 324 horses; while the city force consisted of 133 officers and 795 constables, with 86 constables of private-service duty.

Fire Brigade. In London, up to 1825, almost the whole of the fire-engines were under the control of the insurance companies. The present fire brigade was placed under the control of the Metropolitan Board of Works in 1865, and received

support from the rates, the treasury, and the insurance companies. The rate was $\frac{1}{2}$ d in the pound on the annual value of property ratable to the relief of the poor in the metropolis. In 1889 the brigade comprised 591 men and 55 land-engine stations, besides four floating-steamers. In 1889-90 the brigade was greatly strengthened and increased. It is now under the control of the County Council.

The officers and men number 741; there are, besides, 17 pilots, 75 coachmen and 137 horses. The *matériel* consists of 57 land-stations, 4 floating-stations, 52 hose-cart stations, 181 fire-escape stations, 9 steam fire-engines (barges), 50 land steam fire-engines; 95 engines worked by hand, besides 8 steam-tugs, 13 barges, 12 skiffs, 221 fire-escapes, 9 ladders (extra length), 9 ladder-vans, 2 ladder-trucks, 105 hose-carts and hose-reels, and 34 miles of hose, etc. The area that is so protected is 118 square miles, including the city and county of London, and extends from Roehampton to Plumstead, and from Sydenham to Highgate. The stations are connected by telephone with each other and with police-stations, public buildings and fire-alarm street-instruments. The annual cost is about \$650,000. The number of fires in 1894 was estimated at 3,410, and of these 180 resulted in serious damage.

Trade, Commerce, Etc. In 1895, 225 public and private banks had their head offices in London. The magnitude of their transactions may be estimated from the yearly returns of the clearing-house, through which, in 1894, exchanges were made amounting to \$31,685,000,000. There are some 1,250 stock-brokers, 90 head life assurance offices and about as many fire-offices.

For the conveyance of the inhabitants, besides private carriages, over fifteen thousand cabs and two thousand omnibuses are used. Hundreds of little steamers ply on the river. There are 16 great stations of the leading railway lines and over 200 minor stations. The underground lines of the Metropolitan and District railways form a complete circle to the center of the metropolis. Numerous tramway lines extend toward the suburbs in all directions. New electric and subway lines have been built, one of which, constructed in 1896, involves a tunnel under the Thames at Blackfriars Bridge.

The shipping of the port of London is enormous, over 54,500 ships, with a total tonnage of over 14,000,000 tons, entering and clearing annually. The exports are about \$383,500,000, or more than one fourth of those of the United Kingdom. The customs duties exceed fifty million dollars, being one half of the total of the United Kingdom, and more than three times greater than those of Liverpool. The value of the merchandise stored in London has been estimated to exceed two billion five hundred million dollars. The current prices of many commodities are cheaper than in other towns, but the luxurious ideas of a wealthy community render London a most expensive place of residence for the upper classes who court society. House-rents and the propor-

tionate taxes are exceptionally high. The healthfulness of London—its death rate (19.5 per 1,000) being less than in most of the large towns in Europe or in America—is partly due to favorable conditions of climate and situation, but also, in great measure, to its admirable sanitary arrangements. Twenty companies supply about twenty-eight million cubic feet of gas *per diem*. Several of the principal thoroughfares and many of the public and private buildings are now lighted by electricity. The town is well paved, and the wooden and asphalt pavements, now so general, have greatly lessened the noise in the streets.

LONDON, a city of Ontario, Canada. The later additions to the city are Huron College, a mercantile college, and insane and orphan asylums, hospitals and several libraries and manufactories. Population 1891, 22,281. The suburbs of East London and West London, and others not returned within the city limits, aggregate about 16,500. See also LONDON, Vol. XIV, pp. 851, 852.

LONDON, a village and the capital of Laurel County, southeastern central Kentucky, 68 miles S. of Lexington, on the Louisville and Nashville railroad. It has flour, planing and saw mills, and coal is mined. A ladies' seminary is situated here. Population 1900, 1,147.

LONDON, a city and the capital of Madison County, western central Ohio, situated 25 miles W. of Columbus, on the Cleveland, Cincinnati, Chicago and St. Louis and the Pittsburg, Cincinnati, Chicago and St. Louis railroads. It is in a rich agricultural region, and has large shipments of wheat, poultry and eggs. It is noted for its monthly stock sales. Population 1890, 3,313; 1900, 3,511.

LONDON, UNIVERSITY OF. See UNIVERSITIES, Vol. XXIII, p. 854.

LONDONDERRY, CHARLES WILLIAM STEWART VANE, MARQUIS OF, the third of the title, a British soldier and statesman; born in Dublin, Ireland, May 18, 1778. He served during the Napoleonic wars, both as a soldier and diplomat, and received a vote of thanks from Parliament; was with Abercrombie in Egypt; rose to the rank of adjutant-general to Wellington (1809); ambassador to Berlin (1813); to Austria (1814); and a member of the Congress of Vienna (1815). He died in London, March 6, 1854.

LONG, CHARLES CHAILLÉ, an American soldier and diplomat; born in Princess Anne, Maryland, July 2, 1842; enlisted in the volunteer service in 1862, and rose to the rank of captain. He became attached to the Egyptian army, and in 1874 was assigned as chief of staff to General Gordon; led two expeditions up the Nile, on the first of which, accompanied by only two soldiers and his servants, he secured a treaty from King M'Tsi acknowledging himself a vassal of Egypt. In September, 1877, he resigned and returned to New York, but in 1882 again went to Egypt, where he practiced law in Alexandria. During the massacres in that city at the time of Arabi Pasha's insurrection (1882), Colonel Long reestablished the American consulate and protected the refugees. He afterward removed to Paris, and in 1887 became United States consul-

general in Korea. He published *Naked Truths of Naked People* (1877); *The Three Prophets: Chinese Gordon, the Madhi, and Arabi Pasha* (1884).

LONG, JOHN DAVIS, American lawyer and public man; born in Buckfield, Maine, Oct. 27, 1838; graduated at Harvard in 1857, studied at the Harvard Law School, and was admitted to the bar in 1861. Entering politics he was elected to the Massachusetts Legislature, and reelected and made speaker of the House three successive years. In 1879 he was elected Lieutenant-Governor, and then Governor of Massachusetts for three consecutive terms. In 1883-89 he was member of Congress, and was a candidate for the United States Senate. On being defeated by Mr. Dawes he resumed the practice of his profession, and did not again hold office till appointed Secretary of the Navy in 1897.

LONG, STEPHEN HARRIMAN, an American engineer; born in Hopkinson, New Hampshire, Dec. 30, 1784. In 1814 he entered the United States army as a lieutenant in the corps of engineers; was assistant professor of mathematics at the United States Military Academy till 1816; was transferred to the topographical engineers; 1818 to 1823 had charge of explorations between the Mississippi River and the Rocky Mountains; and in 1823-24, of the sources of the Mississippi, receiving the brevet of lieutenant-colonel. From 1827 to 1838 he was engaged in railroad engineering, and then became major of the topographical engineers. While engaged in railroad-building he introduced a new kind of truss-bridge, which was called by his name and has been generally adopted in the United States. In 1861 he was made chief, with the rank of colonel, and in 1863 he was retired from active service. One of the highest peaks in the Rocky Mountains is named after him. He died Sept. 4, 1864.

LONGAN (*Nephelium Longan*), a fruit of the same genus as the Japanese *Litchi*, but reckoned superior to it.

LONG BRANCH, a town and fashionable summer resort of New Jersey. There is a life-saving station here, and the whole town, spread along the beach for nearly five miles, and also its suburbs, are well connected by rail and trolley. Permanent population 1890, 7,231; 1900, 8,872. Its summer population has been known to exceed 30,000. See also LONG BRANCH, Vol. XIV, p. 857.

LONGFELLOW, SAMUEL, an American clergyman, brother of Henry Wadsworth Longfellow; born at Portland, Maine, June 18, 1819. In 1846 he graduated at the Harvard Divinity School, and in 1848 was called to a church at Fall River. In 1853 he became pastor of a Unitarian church in Brooklyn, New York, but resigned in 1860, continuing to preach without pastoral charge until 1878, when he became minister of a church in Germantown, Pennsylvania. He published, among other works, *A Book of Hymns and Tunes* (1859); *Life of Henry Wadsworth Longfellow* (1886); *Final Memorials, etc.* (1887); *Thalatta: A Book for the Seaside*; and *Lectures, Essays and Sermons of Samuel Johnson*, (1883). He died in Portland, Oct. 3, 1892.

LONGIPENNES, an order or suborder of car-

inate, swimming birds, including the gulls, terns, albatrosses and petrels, its members being remarkable for long and narrow wings and great powers of flight. They are not naturally divers, though of pelagic habits. The present division of the group is into the *Gavia*, gulls and terns, and *Tubinares*, albatrosses and petrels.

LONG ISLAND. See HEBRIDES, Vol. XI, p. 607.

LONG ISLAND CITY, a city of New York, separated from Brooklyn by Newton Creek, but now part of Greater New York. It is the terminus of the Long Island and the Flushing and North Side railroad. It has large oil-refineries, sulphuric-acid factories, and many other large and important manufacturing establishments. Blissville, now incorporated within the city limits, on Newtown Creek, is the seat of large distilleries, and of factories for compressed yeast, fertilizers, etc. Astoria, the northwestern portion of Long Island City, contains carpet and piano factories, and many good residences. The part of the city called Ravenswood contains also many handsome residences. Long Island City has an extensive front along the East River, Newtown Creek and Long Island Sound, Newtown Creek being navigable at this point. The city has water-works, gas and electric-light plants and street-railways. The public schools have an enrollment of over six thousand pupils. Both Jamaica and Long Island City claim to be the county capital, each having several county buildings. Population of the city 1890, 30,506. See also LONG ISLAND CITY, Vol. XIV, p. 866.

LONG ISLAND SOUND. See LONG ISLAND, Vol. XIV, p. 865.

LONGITUDE AND LATITUDE. See GEOGRAPHY, Vol. X, p. 198.

LONGMONT, a town of Boulder County, northern central Colorado, 30 miles N. of Denver, on the Burlington and Missouri River and the Union Pacific railroads, and on Vrain Creek. It is in a fertile agricultural region, where some gold and lignite are found. Flour and canned goods are manufactured. It is supplied with city water, electric lights, a public library and free reading-room, common schools and an academy. Population 1890, 1,543; 1900, 2,201.

LONG PARLIAMENT. See CROMWELL, Vol. VI, pp. 599-602; and CHARLES I, Vol. V, pp. 404-407.

LONG PRAIRIE, a village and the capital of Todd County, central Minnesota, 24 miles W. of Little Falls. It is situated on Long Prairie River, in a fertile plain studded with beautiful little lakes. It is the seat of a seminary, and has several mills. Population 1900, 1,385.

LONGSTREET, AUGUSTUS BALDWIN, an American author; born in Augusta, Georgia, Sept. 22, 1790. In 1815 he was admitted to the Georgia bar; in 1821 he was a member of the legislature, and in 1822 became judge of the Ocmulgee judicial district. In 1838 he became a minister in the Methodist Episcopal Church, and was stationed at Augusta. From 1839 to 1848 he was president of Emory College, Oxford, Georgia; then became president of Centenary College, Louisiana; for six years, of the

University of Mississippi; from 1857 to 1861, of South Carolina College; and then again of the University of Mississippi. He contributed extensively to periodical literature, and was the author of *Georgia Scenes, Characters, Incidents, etc., in the First Half-Century of the Republic, by a Native Georgian* (1840), and *Master William Mitten* (1864). He died at Oxford, Mississippi, Sept. 9, 1870.

LONGSTREET, JAMES, an American soldier; born in Edgefield district, South Carolina, Jan. 8, 1821. He graduated at the Military Academy at West Point in 1842. and was on duty on the Mexican frontier till 1846; took part in the Mexican War (1846-48), where he was wounded; served as paymaster in the United States army, being promoted major on the staff in 1858. He resigned his commission to take part with the South in the Civil War; was present at the battle

GENERAL LONGSTREET.

of Bull Run. During the early part of 1862 he was made major-general, and won reputation, under General Lee, in the campaigns against McClellan, Pope, Burnside and Meade. After the battle of Fredericksburg, Longstreet was promoted to the command of a corps, with the rank of lieutenant-general. He took an active part in the battle of Gettysburg, and in the campaign of the Wilderness was wounded severely, but recovered in time to take command of his corps during the siege of Petersburg. He surrendered with General Lee in April, 1865. After the war General Longstreet acted zealously for the restoration of harmony between the two sections. He made New Orleans his residence, and, having been amnestied by President Johnson, he was so cordial toward the administration that President Grant appointed him surveyor of the port of New Orleans, after which he served four years as commissioner of engineers for Louisiana, and in 1880 was sent as minister to Turkey, where he remained until 1881. He was subsequently United States marshal for the northern district of Georgia, and was appointed commissioner of railroads by President McKinley in 1897.

LONGSTREET, WILLIAM, an American inventor; born in New Jersey about 1760. He removed to Georgia during boyhood; in 1790 appealed to the governor and legislature of Georgia for funds with which to construct a vessel, which was to be propelled by steam. He failed in securing these, but several years afterward secured funds from private sources and built a boat, which was launched and ran up the Savannah River, against the current, with the speed of five miles an hour. This was a few days after Fulton's experiment on the Hudson. He also invented the breast roller of cotton-gins. Died in Georgia in 1814.

LONGTON, a municipal borough and market town in Staffordshire, Eng., 2 miles S. E. of Stoke-upon-Trent; is one of the chief pottery towns, and

has blast furnaces, and coal and iron mines. Pop. 1891, 34,327.

LONGVIEW, a post village, the capital of Gregg Co., Texas, on Sabine river, 125 miles E. of Dallas, on the St. Louis South-Western and the Texas and Pacific railroads; has saw and planing-mills, plow-works, and a foundry; and ships lumber, cotton, hides, etc. Pop. 1890, 2,034; 1900, 3,591.

LONGWALL SYSTEM. See COAL, *ante*, pp. 842-43.

LÖNNROT, ELIAS, a Finnish philologist; born at Sammatti, near Helsingfors, April 9, 1802. After obtaining the degree of M.D. at the University of Helsingfors in 1832 and practicing as a physician at Kajana, he was, in 1853, made professor of Finnish language and literature at the University of Helsingfors, having for years collected Finnish songs, proverbs and tales and studied the Finnish language thoroughly. His master work is the gathering and compilation of the *Kalevala*, a national epic, consisting of a collection of poetical folk-lore, and imitated by Longfellow in his *Hiawatha*. He died March 19, 1884. See FINLAND, Vol. IX, pp. 219, 220.

LOO-CHOO. See LEW-CHEW, Vol. XIV, pp. 489, 490.

LOOKOUT, CAPE, the most southerly point of Carteret County, North Carolina, extending southward into the Atlantic, in lat. 34° 35' N., long. 76° 34' W.

LOOM. What appears to be the most important improvement which has been made in looms since the time of Jacquard was placed on the market by the Hunt Loom and Fabric Company of San Francisco in 1876. It is a self-feeding attachment, by means of which the loom weaves with a continuous supply of filling-thread. All the waste of weft is saved, and there is no stopping of the loom, except to repair a broken warp-thread. When such break occurs the loom stops automatically and a bell is rung. As a result, one attendant can run a large number of looms.

The latest form of Jacquard silk-loom, as built by Knowles, has a heavy frame without harness motion, but arranged for extensive Jacquard patterns, with four sets of cards, and is equivalent to four 600-needle Jacquard machines. Very elaborate patterns result. The Knowles chain-multiplier is attached to this loom, and runs in connection with the box-motion. The power is applied by means of a friction pulley with a brake, so that the loom can start or stop without jar or strain and before the Jacquard cylinders have changed for the next pick. See also WEAVING, Vol. XXIV, pp. 464-466; and TEXTILES, Vol. XXIII, pp. 206, 207.

C. H. COCHRANE.

LOOMIS, ALFRED LEBBEUS, an American physician; born in Bennington, Vermont, June 10, 1831; graduated at Union College in 1851, and received the degree of M.D. from the College of Physicians and Surgeons, New York, in 1853; devoted himself to the study and cure of pulmonary diseases, and soon won a national reputation; visiting physician to Bellevue Hospital in 1860, and to Mount Sinai Hospital in 1874; in 1867 professor of pathology and

practice of medicine at the College of Physicians and Surgeons, to which a friend of his donated \$100,000 for the founding of a Loomis laboratory; president of the New York Pathological and Medical societies, of the New York Academy of Medicine (1890-92), and of the Congress of American Physicians and Surgeons (1894). His best-known books are *Lessons in Physical Diagnosis* (1877); *Diseases of the Respiratory Organs, Heart, and Kidneys* (1876); *Lectures on Fevers* (1882); *Diseases of Old Age* (1882); *Text-Book of Practical Medicine* (1884). Died in New York, Jan. 23, 1895.

LOOMIS, ELIAS, an American physicist; born in Wellington, Connecticut, Aug. 7, 1811; he graduated in 1830 at Yale, where he became tutor from 1833 to 1836; spent a year in Paris, attending the lectures of Arago, Biot, Dulong, etc.; professor of mathematics and natural philosophy in Western Reserve College, Ohio, from 1837 to 1844; professor of natural philosophy in the University of the City of New York from 1844 to 1860, when he was called to the chair of natural philosophy and astronomy in Yale. He published a series of textbooks, embracing the whole range of mathematics, natural philosophy, astronomy and meteorology, which reached an aggregate circulation of 500,000 copies. His *Treatise on Analytical Geometry and Calculus* has been translated into the Chinese language, and his *Treatise on Meteorology* into Arabic; his *Treatise on Astronomy* is used as a text-book in England. His scientific papers, exceeding 125 in number, embrace the various departments of meteorology, the phenomena of auroral exhibitions and atmospheric electricity, territorial magnetism, astronomical observations, shooting-stars, solar spots, etc. He assisted in the first observations by which the velocity of the electric fluid on telegraph wires was determined, Jan. 23, 1849. Professor Loomis was a member of the principal scientific societies of the United States and also of several scientific academies of Europe. Among his most prominent books are *Progress of Astronomy* (1850 and 1856); *Natural Philosophy* (1858); *Practical Astronomy* (1855 and 1865). He died in New Haven, Connecticut, Aug. 16, 1889.

LOON OR GREAT NORTHERN DIVER. See LOOM, Vol. XV, p. 2.

LOOSJES, ADRIAAN PIETERSZON. See HOLLAND, Vol. XII, p. 97.

LOPE DE AGUIRRE, a Spanish desperado; born in the province of Asturias, at the beginning of the sixteenth century. While still a youth he went to South America, where, in consequence of his many and terrible crimes in Peru and elsewhere, he was declared an outlaw. He then joined a band of characters like himself, who spread terror wherever they went. He eventually murdered his leader and made himself chief, and later killed several of his comrades from mere wantonness. At length, having committed innumerable crimes, including piracy, he murdered the governor of Venezuela and looted the royal treasury. This thoroughly aroused the authorities, who began a resolute pursuit, and, having captured Aguirre, who was abandoned by most of his men, shot him in 1561.

LOPES OR LOPEZ, FERNÃO, a fifteenth-century chronicler. See PORTUGAL, Vol. XIX, p. 556.

LOPEZ, NARCISO, a Spanish-American soldier; born in Caracas, Venezuela, in 1799. At the beginning of the war of independence in Venezuela, although belonging to an old and wealthy family, he took the popular side, but soon afterward forsook it to enter the Spanish army and was rewarded with the rank of colonel. He then went to Spain and served against the Carlists. In 1839 he was made major-general and was appointed governor of Valencia. In 1843 he retired to private life in Cuba, and in 1848 joined the revolutionary party. On account of the discovery of a conspiracy against the government, in which he was interested, Lopez fled the following year to New York. He afterward led three filibustering expeditions from the United States to Cuba, but was captured and suffered death by the garrote, in Havana, Sept. 1, 1851.

LOPHIODONTIDÆ. See MAMMALIA, Vol. XV, p. 428.

LOPHIOMYS. See MAMMALIA, Vol. XV, p. 418.

LOPHOBRANCHII. See ICHTHYOLOGY, Vol. XII, p. 694.

LOQUAT, a name given to *Eriobotrya japonica* or *Photinia japonica*, a genus of the family *Rosacea*, and associated with apples, pears, etc., in the group *Pomeæ*. As the specific name indicates, it is a native of Japan and eastern Asia, and is in cultivation as a handsome greenhouse shrub or small tree. It has large evergreen leaves, downy yellowish-white flowers, and an edible yellow fruit resembling a small apple.

LORAIN, a post village of Lorain County, central northern Ohio, 25 miles W. of Cleveland, on Lake Erie, at the mouth of Black River, and on the Cleveland, Lorain and Wheeling and the New York, Lake Erie and Western railroads. It has car-shops, churches, a graded school and planing-mills; has an excellent harbor; has natural gas, and is an important coal-shipping point for central Ohio. The Johnson Steel Company here employs two thousand men. There are also extensive brass-works. Population 1890, 4,863; 1900, 16,028.

LORD, JOHN, an American clergyman and lecturer; born in Berwick, Me., Sept. 10, 1812; graduated at Dartmouth in 1833; studied theology at Andover in 1837; after occupying pulpits in the Congregational churches of New Marlboro and Stockbridge, Mass., he decided, in 1843, to devote himself to historical studies and lecturing; in 1843-46 he lectured successfully in England on the Middle Ages; returning to the United States, he started on a lecturing career that lasted almost fifty years and included over 6,000 lectures; he held a professorship of history at Dartmouth from 1866 to 1876. His noteworthy works are *Modern History for Schools* (1850); *The Old Roman World* (1867); *Ancient States and Empires* (1869); *Points of History* (1881); and *Life of Emma Willard* (1883). At the time of his death he was engaged on a revision of his *Beacon Lights of History* (5 vols., 1883). He died in Stamford, Conn., Dec. 15, 1894.

LORDS, HOUSE OF. See PARLIAMENT, Vol. XVIII, pp. 310-314.

LORD'S SUPPER. See EUCHARIST, Vol. VIII, pp. 650-654.

LORELEI, a cliff on the right bank of the Rhine, half a mile above St. Goar. It rises perpendicularly to a height of 427 feet, and is penetrated by a railway tunnel. Here is the famous echo, celebrated in Heine's exquisite *Volkslied*, based on the tradition of the cave in the rock, the abode of the Lorelei, a water-maiden, whose song and beauty allured boatmen into a whirlpool at the base of the rock. Near its foot is a basin, which is noted for its abundance of trout. The scenery here is regarded as the most magnificent on the Rhine.

LORENZETTI, AMBROGIO. See SCHOOLS OF PAINTING, Vol. XXI, p. 434.

LORETTO, SISTERS OF, a Roman Catholic order of nuns who devote themselves to the cause of education and the care of poor orphans; was founded by Charles Nerinck, a priest (1761-1824), who started the first community, in Kentucky, in 1812; since then it has prospered, and owns and manages several orphanages in the United States, and an academy at Florissant, Missouri.

LORICATA. See ROTIFERA, Vol. XXI, p. 8.

LORIMER, JAMES, a Scotch lawyer and educator; born at Aberdalgie, near Perth, Scotland, Nov. 4, 1818. He graduated at the University of Edinburgh, and subsequently studied at the Academy of Geneva and at the Universities of Berlin and Bonn. In 1845 he became a member of the Scotch bar, and in 1862 professor of public law at the University of Edinburgh. He was one of the founders of the Institute of International Law in 1873. He died in 1890.

LORING, GEORGE BAILEY, American agriculturist; born in North Andover, Mass., Nov. 8, 1817. Educated at Harvard University and at the medical department, he was appointed in 1843 surgeon to the Marine Hospital at Chelsea. In 1849 he was appointed on a commission to revise the system of the United States marine hospitals. For many years he devoted himself to the study of theoretical and practical agriculture and wrote many papers thereon. He was United States Centennial commissioner (1872-76); president of the state senate of Massachusetts (1873-77); member of Congress (1876-81); and Commissioner of Agriculture (1881-85). In 1889 he was appointed minister to Portugal, resigning in 1890. He delivered several notable addresses at anniversary and centennial celebrations of towns, and wrote various papers touching his favorite subject, including *Relations of Agriculture to the State in Time of War* (1862); *Classical Culture* (1866); *Eulogy on Louis Agassiz* (1873); *The Cobden Club and the American Farmer* (1880); etc. He also made a memorable address at the National Cotton Convention at Atlanta (1881), and was a frequent contributor to leading agricultural publications. Died in Salem, Mass., Sept. 14, 1891.

LORING, ELLIS GRAY, an American lawyer;

born in Boston, Massachusetts, in 1803. Having partially completed an undergraduate course at Harvard, he studied law, and being admitted to practice, became eminent in his profession. He ardently espoused the cause of negro emancipation, being one of the twelve charter members of the first antislavery society in Boston (1833). He argued effectively before the Massachusetts supreme court in favor of the slave-child "Med," eliciting a decision that every slave brought within the limits of the state by the owner was *ipso facto* free, even the opposing counsel acquiescing in the decision. The case of Abner Kneeland, a professed atheist, indicted for blasphemy, likewise drew from Mr. Loring a powerful plea in behalf of liberty and the right of free speech. It is noteworthy that his adherence to the principles of antislavery involved the highest sacrifice of personal tastes, Wendell Phillips bearing eloquent testimony to Mr. Loring's courageous advocacy of unpopular opinions. He died in Boston, May 24, 1858.

LORING, WILLIAM WING, an American soldier and Confederate general; born in Wilmington, North Carolina, Dec. 4, 1818; at 13 enlisted in a company of volunteers and took part in the Seminole war, attaining the rank of second lieutenant; admitted to the bar in 1842; and having returned to Florida, was chosen to the legislature of that state; at the beginning of the Mexican War was made captain of a regiment of mounted riflemen, emerging from the campaign with the rank of lieutenant-colonel; subsequently ordered to Texas, with the rank of colonel, but resigned his commission in 1861, in order to enter the Confederate service as brigadier-general; fought with distinction, and was promoted to the rank of major-general. In 1869 he accepted a position in the service of the Khedive of Egypt, being made chief of staff and military adviser in an expedition to Abyssinia; decorated by the Khedive, and having been mustered out of the Egyptian service, returned to America, publishing an account of his foreign experience in *A Confederate Soldier in Egypt* (1883). He died in New York City, Dec. 30, 1886.

LORIS-MILIKOFF. See MELIKOFF, in these Supplements.

LORNE, JOHN GEORGE EDWARD HENRY DOUGLAS SUTHERLAND CAMPBELL, MARQUIS OF, the eldest son of the Duke of Argyll, a British statesman; born in London, Aug. 6, 1845; educated at Eton, St. Andrews University, and Trinity College, Cambridge; elected to Parliament as a Liberal (1868). In 1871 he married the Princess Louise Caroline Alberta, sixth child of Queen Victoria, and in 1878 was appointed Governor-General of Canada, where he became quite popular. His term of office ex-

(Now)

DUKE OF ARGYLL.

pired in 1883. He wrote *A Trip to the Tropics and Home, through America* (1867); *Guido and Litta, a Poem* (1875); *The Psalms Literally Rendered in Verse* (1877); *A Life of Lord Palmerston* (1890).

LORRAINE, CLAUDE. See CLAUDE, Vol. V, 814.

LORRIS, GUILLAUME DE. See WILLIAM OF LORRIS, Vol. XXIV, pp. 584-85.

LOS ANGELES, a city of southern California, incorporated in 1850; noted for its healthful and beautiful location, and a favorite winter resort for Eastern tourists and invalids. According to the census of 1890 its manufactures had a combined capital of \$7,000,000, employed 5,000 persons, and produced \$10,000,000 worth of merchandise annually. In the vicinity are found gold, silver, coal, and other minerals, and productive petroleum-veins. In 1894-95 numerous petroleum-wells were sunk in different parts of the city, the oil being of a very low grade. Los Angeles is on the Los Angeles Terminal, the Santa Fé, and the Southern Pacific railroads; it has a state normal school, the Medical School of the University of Southern California, several Roman Catholic seminaries, and St. Vincent (Roman Catholic) College, and does a large trade in oranges, wines, raisins, and other southern fruits. Its chief manufacture is that of water-pipes for irrigation works. Pop. 1890, 50,395; 1900, 102,479. See also LOS ANGELES, Vol. XV, pp. 7, 8.

LOS GATOS, a town of Santa Clara Co., Cal., 8 miles S. of San José, on the Southern Pacific railroad, in a fertile region, where olives and grapes are cultivated; has an ice-factory, wineries, a canner, box-factory, fruit-drier, and planing-mills. Pop. 1890, 1,652; 1900, 1,915.

LOSSING, BENSON JOHN, American engraver and historian; born in Beekman, N. Y., Feb. 12, 1813. In 1826-35 he was a watchmaker in Poughkeepsie, and then became co-proprietor and editor of the Poughkeepsie *Telegraph*. In 1836 he began publishing the Poughkeepsie *Casket*, and in 1838 became a wood-engraver in New York city, where he edited *The Family Magazine*, the first fully illustrated periodical in America (1838-40), and *The Young People's Mirror* (1848-49); he edited in Philadelphia *The American Historical Record* (1872-75). He wrote *Pictorial Field-Book of the Revolution* and of *The War of 1812* (1852 and 1868); *History of the United States* (1854-56); *The Civil War in America* (3 vols., 1866-69); *The American Centenary* (2 vols., 1875); *Cyclopædia of American History* (1881); *History of the City of New York* (2 vols., 1884), etc. He also contributed to *Harper's Magazine* and other periodicals, and was a very industrious collector of documents relating to American history. Died near Dover Plains, N. Y., June 3, 1891.

LOSSINI. See LUSSIN, in these Supplements.

LOT, one of the largest tributaries of the Garonne, France, rises on Mont Lozère, in the Cévennes, flows westerly, and joins the Garonne at Aiguillon, after a course of 300 miles, almost two-thirds of which, as far as Entraigues, are navigable; average width in its lower course, 330 to 500 feet.

LOTHAIR II. See GERMANV, Vol. X, p. 488.

LOTHROP, HARRIET MULFORD (STONE), an American authoress, who writes under the pseu-

donym "Margaret Sidney"; born in New Haven, Conn., June 22, 1844. Educated near home, she traveled widely through the United States, and early entered upon a literary life, though she published nothing before 1877, when her short stories and poems began to appear in the periodicals. In 1881 she married Mr. Daniel Lothrop, a well-known Boston publisher, and lived in Hawthorne's old Concord home. She has written *Five Little Peppers and How They Grew* (1882); *The Pettibone Name* (1883); *Ballad of the Lost Hare* (1884); *The Golden West* (1885); *Hester and Other New England Stories* (1886); *Two Modern Little Princes* (1887); *Dilly and the Captain* (1888); *Old Concord* (1888); *Kensington Junior* (1888); *An Adirondack Cabin* (1890); and *Whittier with the Children* (1893).

LOTI, PIERRE. See VIAUD, *post*, pp. 3039-40.

LOTOPHAGI (Gr., "lotus-eaters"). See LOTUS-EATERS, Vol. XV, pp. 11-12.

LOTTO, LORENZO (c 1476-1555). See SCHOOLS OF PAINTING, Vol. XXI, p. 436.

LOTUS, a genus of the family *Leguminosæ*; but the name is commonly applied to several species of the water-lily family, notably the castalies of the Nile, which were held sacred by the Egyptians. In the United States it is commonly used for the showy *Nelumbium speciosum*, which is a sort of water chinquepin; it also seems to have been applied to several thorny shrubs of the Arabian deserts.

LOUBET, ÉMILE, seventh President of the French republic; born at Marsanne, in Drôme department, Dec. 31, 1838; studied law, obtained the degree of doctor of law, and settled at Montélimar, of which place he was mayor from 1870 till Feb., 1899. In 1876, 1877, and 1881 he was elected to the Chamber of Deputies as a Republican of the Left; in 1885 he was elected to the Senate; and for three months in 1887-88 was Minister of Public Works in the first cabinet of M. Tirard. On Feb. 27, 1892, he became premier and Minister of the Interior; but on Nov. 28 following his ministry was defeated on a question arising out of the Panama Canal scandal and resigned, whereupon M. Ribot became premier (Dec. 5, 1892), and M. Loubet was reappointed Minister of the Interior; but he retired on the reconstruction of the cabinet in Jan., 1893. In 1896 and 1898 he was elected president of the Senate; and, on the sudden death of President Faure, he was, on Feb. 18, 1899, elected to succeed him.

LOUDON, JOHN CLAUDIUS, a Scotch writer and horticulturist; born at Cambuslang, near Glasgow, April 8, 1783; graduated at Edinburgh University; in 1803 went to London, where he became a landscape-gardener. He published the *Encyclopædia of Gardening* (1822); *Encyclopædia of Agriculture*; *Encyclopædia of Plants*; *Encyclopædia of Cottage, Garden, and Villa Architecture* (1832). The publication of his *Arboretum et Fruticetum* (1838), an account of all the trees and shrubs of Great Britain, was so costly as to involve him in financial difficulties. In his later years he lost the use of his hands, but he continued to conduct several magazines on landscape-gardening, with the assistance of his wife, JANE WEBB LOUDON, who was

thoroughly in sympathy with his line of study, and an agreeable writer. He died in London, Dec. 14, 1843.

LOUDONVILLE, a post village of Ashland County, central northern Ohio, 50 miles S.W. of Akron, on the Black Fork of the Mohican River and on the Pittsburg, Fort Wayne and Chicago and the Toledo, Walhonding Valley and Ohio railroads. Wheat, corn and wool are the principal products of the neighborhood. It has a tannery and large flour-mills. Population 1900, 3,511.

LOUDON, JAMES, D.C.L., LL.D., President of Toronto University, was born in Toronto in 1841, was educated at the Toronto Grammar School and at Upper Canada College, and entered Toronto University in 1857. He graduated in 1862, winning the gold medal in mathematics. In 1875, after teaching classics, mathematics, and physics, in University College, and filling the post for ten years of Dean of Residence, he was appointed professor of Mathematics and a Senator of the University. On the death of Sir Daniel Wilson, in 1892, Professor Loudon succeeded to the Presidency of the University. He is also a Fellow of the Royal Society of Canada, and has made some important discoveries in geometrical optics. In 1894, the honorary degree of LL.D. was conferred upon him by his *alma mater*, and two years later a similar honor was paid him by Princeton University. In 1900, Trinity University (of Toronto) made him an honorary D.C.L.

LOUIS I, late King of Portugal, second son of Donna Maria II, Queen of Portugal, and Dom

LOUIS I.

Fernando, Prince of Saxe-Coburg, was born October, 1838. He succeeded to the throne on the death of his brother, King Pedro V, Nov. 11, 1861. He married, Oct. 6, 1862, Pia, youngest daughter of Victor Emmanuel, King of Italy, by whom he had two sons: Carlos, born Sept. 28, 1863 (who succeeded him), and Alfonso, born July 31, 1865. He was a man of much culture, and fond of music; he

published in 1877 a translation into Portuguese of Shakespeare's *Hamlet*, followed in 1880 by the *Merchant of Venice* and *Richard III*. As a king he proved liberal-minded and faithful to the letter and spirit of the Portuguese constitution. He died in Lisbon, Oct. 18, 1889.

LOUIS (LUDWIG) I, KARL AUGUST, King of Bavaria; born in Strasburg, Aug. 25, 1786. A highly educated monarch, devoted more to art and literature than to affairs of state. The famous Glyptothek, at Munich, is a monument to his enthusiasm for esthetic culture. His gifted character contrasted strangely with his scandalous liaison with Lola Montez, by which he sacrificed the love and respect of his people. Having as-

cended the throne in 1825, after the revolution of 1848 he abdicated in favor of his son Maximilian Joseph (Maximilian II). He died in Nice, Feb. 29, 1868.

LOUIS II, OTTO FREDERICK WILLIAM, son of Maximilian II, King of Bavaria; born in Nymphenburg, Aug. 25, 1845; succeeded his father March 10, 1864. In him his grandfather's ardent love of the beautiful was intensified, assuming the most fantastic forms, imbued with melancholy romance. Although destined to take an active part in political affairs of vital importance, siding with Austria in 1866 and with Prussia in 1870-71, and manifesting no little insight into intricate mat-

LOUIS II, KING OF BAVARIA.

ters of state, he became at length a recluse, rarely mingling with his people and evidently averse to public festivities. Amid the sublimity of mountain scenery, dwelling alone in sumptuous palaces and surrounded by objects of artistic luxury and the most refined taste, his strange nature was absorbed in studious reverie, his solitary thoughts finding their highest expression in a passionate love of music. To this happy predilection was due the dramatic development of modern music under Richard Wagner, of whom the young king became an ardent patron and admirer. Mental alienation, however, had already declared itself in eccentricities affecting the welfare of the state. In 1886 Louis was confined in the palace of Berg, near Munich, and three days after committed suicide by drowning. See also BAVARIA, Vol. III, p. 454.

LOUIS IV, FREDERICK WILLIAM LOUIS CHARLES, Grand Duke of Hesse-Darmstadt; born Sept. 12, 1837. He married the Princess Alice, second daughter of Queen Victoria, July 1, 1862. He succeeded to the grand-dukedom on the death of his uncle, Louis III, June 13, 1877, and on Dec. 14, 1878 was left a widower with one son and four daughters, one of whom married Nicolas II, Czar of Russia. Some years later he morganatically married Madame de Kolomine, but after a short time divorced her. He died March 13, 1892.

LOUIS, PIERRE CHARLES ALEXANDER. See MEDICINE, Vol. XV, p. 816.

LOUISBURG, a famous fortress, built by the French soon after the peace of Utrecht, in 1713; on the southeast coast of Cape Breton Island, in Nova Scotia, lat. 45° 53' 30" N., long. 60° W. Its excellent harbor induced the French, who early settled in the place, to build a very strong fortress here, at an expense of thirty million francs. During the war between France and England, which broke out in 1744, the New England colonists attacked this place, as it menaced their fisheries by sheltering French privateers.

The New Englanders, 4,000 strong, besieged Louisburg, and the garrison, 1,600 strong, were compelled to surrender, June 28, 1745. By the peace of Aix-la-Chapelle, in 1748, the town was restored to France.

In 1758 a British general, Wolfe, the subsequent hero of Quebec, besieged Louisburg, and compelled the French garrison to surrender as prisoners of war. The town was then made the heap of ruins which still remain. In 1895 a population of 1,100, mostly fishermen, lived at Louisburg, which is still a British possession.

LOUISIADE ARCHIPELAGO, a group of islands in Melanesia, southeast of the coast of New Guinea, between lat. 10° and 12° S. and long. 151° 30' and 154° 30' E. They extend about 240 miles in an east-southeasterly direction, and have an area of 850 square miles—South-east, the largest, containing 380 square miles. Gold has been found on Misima and Tagula. Misima is the most populous, having about 4,000 inhabitants. The people are mostly pure Papuans, though there are a few Malaysians. The chief exports, besides gold, are trepang, copra, and pearl shells.

LOUISIANA has an area of 48,720 square miles, of which 45,420 is land area, the remainder being land-locked bays, inland lakes and river surface. The population in 1890, according to

STATE SEAL OF LOUISIANA.

the decennial census, was 1,118,587, consisting of 558,395 whites, 559,193 negroes and 999 Chinese, Japanese and civilized Indians. The percentage of increase in population for the ten years 1890 to 1900, was 23.5, the density to the square mile at the latter date being 30.4. The state had three cities, in which resided 264,496 of the population, constituting 23.65 per cent of the entire number of inhabitants. The number of males was 559,350, of females 559,237, making the number of females to each 100,000 males 99,980, a more nearly equal division between the sexes than that possessed by any other state of the Union. The population of the state for 1900 (12th census), was 1,381,625. The negro population increased 75,538 in the ten years, 1880 to 1890, the number at the latter date being 559,193. Of the 69,294 farms in Louisiana 2,196 are under 10 acres; 10,270, 10 and under 20; 22,148, 20 and under 50; 11,271, 50 and under 100; 20,109, 100 and under 500; 2,023, 500 and under 1,000, and 1,277, 1,000 acres and over.

The following is an abstract of the agricultural statistics of Louisiana, as gathered from the census returns. The corresponding figures for 1880 are also given, the comparisons showing much to the credit of the state:

ITEMS.	1890.	1880.
Total number of farms -----	69,294	48,292
Acres in farms -----	9,544,219	8,273,506
Value of farms, fences and buildings -----	\$85,381,270	\$58,989,117
Value of farm-implements and machinery -----	\$7,167,355	\$ 5,435,525
Value of live-stock -----	\$17,898,380	\$12,345,905
Estimated value of all farm products -----	\$54,343,953	\$42,883,522
Bushels of Indian corn -----	13,081,954	9,889,689
Bushels of oats raised -----	297,271	229,840
Acres in cotton -----	1,270,154	864,787
Bales of cotton produced -----	659,180	508,569
Acres planted in cane -----	193,694	181,592
Pounds of sugar produced ---	292,124,050	206,047,200
Gallons of molasses -----	14,341,081	11,696,248
Acres in rice -----	84,377	42,000
Pounds of rice produced -----	75,645,433	23,188,311
Bushels of Irish potatoes -----	375,842	180,115
Bushels of sweet potatoes ---	1,912,080	1,318,110

Of the 29,000,000 acres in Louisiana, only 2,507,935 are under cultivation. The gain in values noted in the table given above has continued since the census year, as is shown by the report of 1894, which places the value of the agricultural products for the year at the sum of \$75,000,000, distributed as follows: Sugar, \$35,000,000; cotton, \$21,000,000; rice, \$3,000,000; fruits and vegetables, \$2,000,000; corn, oats and hay, \$10,000,000; oranges, \$1,000,000; live-stock and other products, \$3,000,000. The growth of all agricultural industries has been prodigious, especially in the southwestern part of the state, where the cultivation of rice was not taken up to any extent until 1884, when immigration from the northwestern states set in. In the year mentioned but one harvesting-machine for gathering rice was in use, and but 250 cars of rice were shipped. In the next year there were five machines; in 1886, there were 50; in 1887, 200; in 1888, 400; in 1890 there were 1,000 machines, and the shipments of rice had grown to more than 2,000 cars. In 1891 there were 2,000 machines, and the shipments of rice more than 5,000 cars; in 1893 the number of machines was in excess of 3,000, and the shipments more than 10,000 cars. In 1895 Louisiana produced four-fifths of the crop of the United States. The centenary of sugar-manufacturing in the state was celebrated in 1894. A school of training in the scientific manufacture of sugar has been established, its first class being graduated on the day of the celebration, the buildings connected with the school standing on the same spot on which the first sugar was made in Louisiana in 1794 by Étienne de Bore. An experimental farm is attached to the school, and a course of three years covers chemistry, mechanics, agriculture, sugar-making and drawing of sugar machinery. Students attend from Mexico, the Spanish West Indies, and from Spain, in addition to the liberal patronage given the school from Louisiana and other of the sugar-making states.

Tobacco is extensively grown, and many manufacturing factories have been established near the seat of

production, thus saving all freights on the raw article.

Garden products, fruits, watermelons and cantaloupes are raised, and shipped from points along the lines of railway to New Orleans and also to northern cities. Grapes, strawberries and figs flourish in nearly all parts of the state, and pears, pomegranates and olives are raised with much profit in many sections. Oranges are raised along the gulf coast, and the annual crop is one of much value. Sweet potatoes are extensively cultivated, and of late years the Irish potato has received much attention at the hands of those situated along the lines of railway. The crop is harvested from March to June, and by means of rapid transit they are placed in the northern markets at a time when prices are higher than at any other season of the year. By reason of the climate, and the native grasses, which grow luxuriantly for nine months in the year, stock-raising is an industry of great profit and is receiving more attention at the hands of agriculturists from year to year. Horses and mules, sheep and hogs are all reared with little attention or artificial food, and the ease of reaching markets given by the numerous lines of railway makes the industry a profitable one.

According to the census of 1890 the sum of \$34,754,121 was invested in the 2,613 specific manufacturing industries of Louisiana, giving employment to 31,901 persons, who received in wages the annual sum of \$13,159,564. The value of the material used was then estimated at \$33,282,724 and the finished products were of the total value of \$57,806,713. The principal industry was the manufacture of sugar and molasses-refining, which returned \$12,603,913. This was followed by lumber and other mill products from logs and bolts to the value of \$5,599,744. Rice cleaning and polishing yielded \$4,009,901. Other industries of importance were men's clothing (factory product), foundry and machine-shop products, leather, cotton-compressing and oil, cotton-seed and cake.

The enrollment in the public schools of Louisiana for 1894, as reported by the state board of education in October, 1895, was 155,926, the average attendance being 109,435. The number of public schools was 2,746, an increase of 101 over the preceding year. Eight hundred and twenty-five schools were devoted to negro youth and 915 negro teachers employed. The total receipts for school purposes for the year amounted to \$1,166,995, the expenditures to \$732,388. Much interest is taken in the cause of education, the legislature appropriating money for the first time for the maintenance of teachers' institutes. The state normal school has been in existence for ten years, and has sent out 167 graduates. The spring term of 1894 had an attendance of 193 students and 107 in the model department. The State University and Agricultural and Mechanical College had 194 students, of whom 85 were in the collegiate course. The leading institution of higher education is Tulane University (q. v., in these Supplements). Col-

leges under church supervision are the Centenary College, managed by the Methodist Episcopal Church South, and located at Jackson; Leland University, for negro students, under the auspices of the Baptists, at New Orleans; Keachie College, at the town of the same name, under Baptist control, and Jefferson College, at Convent, and the College of the Immaculate Conception, at New Orleans, both under the control of the Roman Catholic Church. The Methodist Episcopal Church controls New Orleans University, at New Orleans, and at the same place the Congregational Church has established Straight University.

The net state debt of Louisiana in 1894 amounted to \$11,262,164, and the estimated value of all property within the state for the purposes of taxation in 1893 was \$247,500,000. At the date mentioned the rate of taxation was six mills.

Jan. 1, 1899, there were 218 newspapers published in the state. Every parish of the 59 into which Louisiana is divided published a paper; and of the 95 towns in which periodicals were issued 57 were parish seats. Of the total number of papers, 22 were daily, 1 triweekly, 3 semiweekly, 178 weekly, 4 semimonthly, and 10 monthly.

The convicts of the state had been leased to contractors up to 1894, when the legislature abolished the system and placed the penitentiary at Baton Rouge in charge of a board of control. The number of convicts was about one thousand the average for several years. The insane asylum at Jackson reported 700 inmates, and an additional building is in course of erection, to accommodate 400 more. The school for deaf mutes at Baton Rouge had 60 pupils at the close of 1895, the cost to the state for the year being about fourteen thousand dollars. The state school for the blind located at Baton Rouge, was established in 1851, and has a large number of pupils.

There are about two thousand miles of railroad in operation in the state, the increase in mileage having been very rapid within the past 15 years. In 1850 there were but 80 miles; in 1860, 335; in 1870, 450; in 1880, 672; in 1890, 1,739.

The church organizations of Louisiana numbered 2,701 in 1890, and the edifices 2,520. The seating-capacity was 617,245, the number of communicants 399,991, and the value of all church property \$5,032,194. The leading denomination was the negro Baptist, with 876 organizations, all Baptist bodies numbering 1,441. Next in importance was the Methodist Episcopal South, numbering 316 organizations, followed by the Methodist Episcopal, with 218 organizations, all Methodist bodies numbering 810. The Roman Catholics numbered 206 organizations, their membership and value of property being greater, however, than those of any other religious body.

There are about sixty banks in the state, the number of national institutions being about twenty, with a capital of \$4,000,000. The state banks number about 25, their aggregate capital being near \$3,000,000. Private and miscellaneous banks

and investment companies make reports showing them to be in good financial condition.

The chief cities and towns, with their census populations in 1900, are: New Orleans, 287,104; Shreveport, 16,013; Baton Rouge, the capital, 11,269; New Iberia, 3,447; Lake Charles, 6,680; Gretna, 3,332; Monroe, 5,428; Plaquemine, 3,590; Donaldsonville, 4,105; Alexandria, 5,648; Morgan City, 2,332.

On May 12, 1898, a new state constitution was adopted.

The following is a list of the Governors of Louisiana from 1812, the date of the admission of the state to the Union, with their respective terms of office: William C. C. Claiborne, 1812-16; James Villere, 1816-20; Thomas B. Robertson, 1820-24; H. S. Thibodeaux (acting), 1824; Henry Johnson, 1824-28; Pierre Debingy, 1828-29; A. Beauvais, 1829-30; Jacques Dupré, 1830-31; Andre B. Roman, 1831-34; Edward D. White, 1834-38; Andre B. Roman, 1838-41; Alexander Mouton, 1841-45; Isaac Johnson, 1845-50; Joseph Walker, 1850-54; Paul O. Herbert, 1854-58; Robert C. Wickliffe, 1858-60; Thomas O. Moore, 1860-64; Michael Hahn, 1864 (a); Henry F. Allen 1864 (b); James M. Wells 1864-67 (c); B. F. Flanders 1867-68 (d); Henry C. Warmouth, 1868-72; William Pitt Kellogg, 1872; John McEnery, 1872-77 (c), Francis T. Nichols 1877-80; Louis Alfred Wiltz, 1880-81; Samuel D. McEnery, 1881-88; Francis T. Nichols, 1888-92; Murphy J. Foster, 1892. See LOUISIANA, Vol. XV, pp. 20-22.

LOUISIANA, a city of Pike County, north-eastern Missouri, on the Mississippi River, 98 miles above St. Louis, on the Chicago and Alton and the St. Louis, Keokuk and Northern railroads. It has gas-works, tobacco factories, steam flour, planing and lumber mills, machine-shops, nurseries, stone-quarries and lime-kilns, and the surrounding region produces lumber and fruit. It is the seat of McClure College (Baptist, opened in 1880); has a school library, and gas and electric lights. Population 1890, 5,090; 1900, 5,131.

LOUISVILLE, the largest city in Kentucky. Its rate of increase, however, during the last decade has not been sufficient (30.2 per cent) to keep its rank, and in 1890 it had sunk to twentieth in the Union. The census of 1890 gives the following summary of the industries of Louisville:

	1890.
Number of establishments reporting-----	1,622
Industries represented	161
Number of hands employed	24,807
Capital invested.....	\$30,542,947
Value of material	\$22,879,000
Value of products	\$45,452,209

The most important industries are iron-working, agricultural tool-making, tobacco, cigar and cigarette manufacturing, and sugar-curing hams. It is the largest leaf-tobacco and whisky market in the world, and has an extensive trade in corn, iron, pork and wheat. Louisville has several parks, aggregating about 1,000 acres. It had, in 1894, 176 churches, of which 41 were Baptist, 32 Methodist, 24 Roman Catholic, 17 Episcopalian

(a) New Orleans and vicinity (Federal). (b) Confederate portion. (c) Not recognized by Congress. (d) Military.

and 22 Presbyterian. Of these, the Warren Memorial, the Calvary and the Cathedral are fine specimens of ecclesiastical architecture. There are 42 public schools, attended by 25,000 pupils, for the support of which \$550,000 is annually appropriated. Besides these, there are numerous professional colleges and schools. The public library, being that of the Polytechnic Society, contains 50,000 volumes. There were between forty and fifty asylums, hospitals, homes, orphanages, etc. The city is supplied with sewer systems, water, gas (natural and manufactured), and electricity, and has a good fire department. There are 102 miles of street-railway, together with 24 miles of suburban and steam roads. The most important railroad lines which enter here are the Louisville and Nashville, the Southern, the Chesapeake, Ohio and Southwestern, and the Ohio River railroads. Population 1890, 161,129; increase since 1880, 37,371; 1900, 204,731. See LOUISVILLE, Vol. XV, pp. 22-24.

LOUNSBURY, THOMAS RAYNESFORD, an American soldier and author; born at Ovid, New York, Jan. 1, 1838; graduated at Yale (1859), and was engaged in literary work until the outbreak of the Civil War, when he joined the One Hundred and Twenty-sixth New York Volunteers as a lieutenant, remaining in the army until 1865. In 1871 he was appointed professor of English in the Sheffield Scientific School of Yale University. He wrote a *History of the English Language* (1879) and *Studies in Chaucer* (3 vols., 1892).

L'OUVERTURE, TOUSSAINT. See TOUSSAINT, Vol. XXIII, p. 492.

LOUVRE, the finest and largest public building in Paris, the more ancient portion of which was used as a palace by the kings of France up to the seventeenth century; now entirely devoted to superb collections of paintings, specimens of sculpture, antiquities and rare curios from all times and countries. A portion of the buildings also contain a large public library and national archives. For a description of the edifice see PARIS, Vol. XVIII, p. 276; also, SCHOOLS OF PAINTING, Vol. XXI, p. 445. Only works of artists who are dead are admitted in the Louvre galleries.

LOVEDALE, a town in the department of Victoria East, of Cape Colony, Southern Africa, founded in 1841 by Scotch missionaries; wholly given up to the education of natives, who are taught various industrial pursuits and fitted for missionary service. Bibles are printed here by natives, and extensively circulated.

LOVE FEASTS. See AGAPE, Vol. I, p. 274; and METHODISTS, Vol. XVI, p. 188.

LOVEJOY, ELIJAH PARISH, an American abolitionist; born in Albion, Maine, Nov. 9, 1802; assassinated in Alton, Illinois, Nov. 7, 1837. In 1827 he established a school in St. Louis, Missouri, contributed articles and poems to the press, and in 1829 became editor of a political paper that supported Henry Clay as a Presidential candidate. In 1833 he was licensed to preach by the Presbyterian church, and established a

religious paper called the *Observer*, in which he condemned slavery. Threats of violence compelled him to remove his paper to Alton, Illinois. Even there his press was destroyed three times by mobs, mostly composed of Missourians. At the fourth attack he and his friends defended the office, and thought they had compelled the mob to withdraw; but when Lovejoy opened the door he was instantly pierced by five bullets. His Memoir was published by his brothers, with a preface by J. Q. Adams. In 1894 the Illinois legislature appropriated \$25,000 to be used in the construction of a monument in honor of Elijah Parish Lovejoy, in the city of Alton, to be erected on a lot set apart in the cemetery and overlooking the Mississippi River.

LOVEJOY, OWEN, an American abolitionist, and a brother of the preceding; born in Albion, Maine, Jan. 6, 1811; died in Brooklyn, New York, March 25, 1864. He emigrated to Alton, Illinois, before completing his studies at Bowdoin, and soon entered the ministry. He was present at his brother's murder. In 1838 he became pastor of the Congregational church at Princeton, Illinois, and, in violation of the law then in force, held anti-slavery meetings in all parts of the state until 1854, when he was elected to the legislature. In 1856 he was sent to Congress, and re-elected in 1858, 1860 and 1862. In one of his fiery anti-slavery speeches delivered in Congress at the beginning of the Civil War, he related the circumstances of his martyred brother's death.

LOVELL, MANSFIELD, an American soldier; born in Washington, District of Columbia, Oct. 20, 1822. He graduated at West Point in 1842; served in Texas and Mexico, being wounded at Monterey and again at the assault on the City of Mexico. He resigned to accept the office of superintendent of street improvement of New York City. At the outbreak of the Civil War he entered the Confederate service, and in October, 1861, was commissioned major-general and given command of the defenses of New Orleans. He withdrew his troops when the forts were captured; afterward commanded a division at Corinth, and succeeded General L. Polk in 1864. Later he became assistant of General Newton in the work

SETH LOW.

removing obstructions from the East River, New York. He died in New York City, June 1, 1884.

LOW, SETH, an American educator; born in Brooklyn, New York, Jan. 18, 1850; graduated at Columbia College (1870), and immediately entered the mercantile house of his father, in which, in 1875, he became a partner. In 1881 he was elected mayor of Brooklyn, on an independent ticket, and served for two terms. During

his administration he accomplished much in purifying municipal politics, achieving for himself a national reputation. On leaving that office he returned to active business until his election in 1889 to the presidency of Columbia College, of which he was already a trustee. His fine influence and vigorous administration, no less than his signal liberality in the way of material aid, have greatly assisted the healthy development which Columbia College has enjoyed.

LOW, WILL HICOCK, American artist; born in Albany, N. Y., May 31, 1853; a pupil of Carolus-Duran, in Paris; has devoted himself specially to high-class illustrations, genre painting, decorative work, and designs for stained glass; received a second medal at the Paris Exposition, 1889; elected National Academician (1890); designed the diploma of awards for the Chicago Exposition, 1893. His drawings for Keat's *Lamia* and *Odes and Sonnets* were much admired.

WILLIAM HICOCK LOW.

Among his recent paintings are *Welcome* and *Parting*, in the rotunda of the Plaza Hotel, New York.

LOWE, SIR DRURY CURZON DRURY, a British soldier; born in 1830, in England; graduated at Oxford; entered the army in 1854; became a full colonel in 1871; served with the Seventeenth Lancers in the Crimea, and also in the Indian mutiny; commanded the cavalry of the Second division in the Zulu war, and led the charge at the conclusion of the battle of Ulundi, being wounded during a charge. In the Egyptian expedition of 1882 he commanded the cavalry brigade and took part in the battle of Tel-el-Kebir, immediately after which, by a forced march, he took possession of Cairo, its citadel, and captured the rebel Arabi Pasha. For his services he was created K. C. B., and received the thanks of Parliament and also the second class of the Osmanli; from 1885 to 1890 he was in command of the cavalry brigade at Aldershot, and inspector-general of cavalry with the rank of lieutenant-general.

LOWE, EDWARD JOSEPH, an English meteorologist and naturalist; born at Highfield, England, Nov. 11, 1825. In 1840 he began a valuable series of daily meteorological observations, which were continued to April, 1882. In 1848 he first indicated the radiation of meteors from a point in the heavens. He was one of the founders of the Royal Meteorological Society. He took part in the government expedition to Spain in 1860, for the purpose of observing a solar eclipse. Until 1882 he furnished the United States government with synchronous meteorological observations. He took also a great interest in natural history, especially botany and conchology, raising himself a number of curious species of British ferns. Among his many books are *A Treatise on Atmospheric Phenomena* (1846); *The Conchology of Nottinghamshire* (1853); *Natural His-*

tory of British and Exotic Ferns (1854); *British Grasses* (1858); *Chronology of the Seasons*.

LOWE, SIR HUDSON, a British soldier; born at Galway, Ireland, July 28, 1769. Entering the army in 1787, he served in various parts of the Mediterranean, aided in the conquest of the Ionian Islands and became their first governor; afterward for some time attached to the Prussian army under Blücher; in 1814 he carried to London the news of Napoleon's first abdication, and was knighted and promoted on that account; was quartermaster in Wellington's army (1815) until removed by the Iron Duke. In the spring of 1816 he became governor of St. Helena, with the custody of Napoleon, who had landed there in the previous October. The strictness of Lowe's watch of his charge brought upon him bitter attacks from Napoleon's friends and admirers. He published a defense of his conduct in a *Mémorial Relatif à la Captivité de Napoléon à Ste. Hélène* (2 vols., Paris, 1830). In 1825 Sir Hudson Lowe was appointed commander of the forces in Ceylon; he was made a lieutenant-general in 1830. In 1853 appeared from his pen *A History of the Captivity of Napoleon, from Lowe's Journal*, an important contribution to the Napoleonic bibliography. He died in London, July 10, 1844.

LOWE, ROBERT. See *SHERBROOKE, LORD*, in these Supplements.

LOWE, THADDEUS S. C., an American aeronaut, inventor and engineer; born in Jefferson, New Hampshire, Aug. 20, 1832; began to make high ascensions in 1858, and reached an altitude of 23,000 feet. During the Civil War he was placed in charge of a service of observation-balloons, but, although partially successful, met with such opposition on the part of the engineer corps that he had to abandon his position. He invented a portable apparatus for generating hydrogen gas for war-balloons, and also an ice-making machine; and he was the first to produce, in commercial quantities, illuminating gas made by the decomposition of water and the addition of crude petroleum, his system being widely employed. In 1890 he removed to Pasadena, California, and projected, planned and built the Mount Lowe railway, extending from Altadena, at the base of the Sierra Madre Mountains, to the summit of Mount Lowe, their highest peak, 6,300 feet above the sea.

LOWELL, a manufacturing city of northeastern Massachusetts. The site is uneven and hilly, and the river falls 33 feet, affording great hydraulic power, which is controlled by a chartered company. Steam-power, however, is now very largely used in the large mills and work shops. The manufactories of Lowell had, in 1890, a combined capital of \$40,000,000, employed over 28,000 hands and produced \$27,000,000 worth of merchandise annually. Unusual attention is paid to the well-being of the work-people. Lowell has a public library of 55,000 volumes, a system of water-works, owned by the city, costing \$2,400,000, and electric and gas lights. It has electric street-railways, which also connect it with the neighboring towns. Its valuation (1896) was \$68,782,042; tax rate, 1.8 per cent; net debt, \$3,000,000. Population 1890, 77,696; 1900, 94,-

969; rank among United States cities, 37. See *LOWELL*, Vol. XV, pp. 29, 30.

LOWELL, a post village of Kent County, southwestern Michigan, 17 miles E. of Grand Rapids, situated at the confluence of the Grand and Flat rivers, and on the Detroit, Grand Haven and Milwaukee and the Lowell and Hastings railroads. It is in a grain and fruit growing region, and has excellent water-power. It contains two flour-mills, a cutter factory turning out twenty thousand cutters a year, axe, woolen, furniture and numerous other factories. Population 1890, 1,829; 1900, 1,736.

LOWELL, CHARLES RUSSELL, an American soldier and the grandson of John Lowell, the statesman; born in Boston, Jan. 2, 1835. He graduated with highest honors from Harvard (1854); entered the iron-manufacturing business; at the outbreak of the Civil War he joined the United States cavalry as captain; after serving on McClellan's staff he organized and commanded the Second Massachusetts Cavalry (1863); served under Sheridan and engaged in the pursuit of Mosby's guerrillas; made brigadier-general of volunteers (1864); during his term of service he had twelve horses killed under him, but was wounded at Cedar Creek for the first time; he died from other wounds shortly afterward. His manly and chivalrous character was well expressed in his own motto, "A man has no right to himself, and until he knows and feels this, he can be of no service to others." He died near Middletown, Virginia, Oct. 20, 1864.—His wife, JOSEPHINE SHAW LOWELL, an American philanthropist, was born in West Roxbury, Massachusetts, Dec. 16, 1843. After her husband's death (they had been married only two years) she gave herself up to philanthropic work. In 1877 she was appointed upon the New York State Board of Charities, being one of its most efficient and untiring members until her resignation in 1889. She was gifted with a rare insight into the underlying principles which should govern the disbursement both of public relief and private charity, and her comprehensive grasp of economic details enabled her to dispense wisely the aid at her command. Her official reports, based upon personal observation and study, as well as occasional papers committed to public print, are among the most feeling, intelligent and practical contributions to applied social science.

LOWELL, JAMES RUSSELL, an American *littérateur*, poet and diplomatist, was born in Cambridge, Massachusetts, Feb. 22, 1819, and died at the same place, Aug. 12, 1891. His father was a Boston clergyman and friend of W. E. Channing. The son graduated at Harvard in the class of 1838, and two years afterward was admitted to the bar, but never practiced law. Literature from the first seemed his chosen calling, for so early as 1843

JAMES RUSSELL LOWELL.

he founded a magazine, *The Pioneer*, but it was short-lived. Previous to this (in 1841), his early poems, entitled *A Year's Life*, were published. At this period he actively espoused the anti-slavery side, and took a lively interest in various political and philanthropic questions of the time. In 1844-45 a further collection of his poems appeared, together with a series of literary criticisms, entitled *Conversations on Some of the Old Poets*. A third gathering of poems appeared in 1848, entitled *The Vision of Sir Launfal*, the chief poem being founded on the legend of the San Graal, and enshrining some beautiful and romantic verse. His reputation, however, was made by two notable volumes of literary and political satire: *A Fable for Critics*, in which he passes in review the *literati* of the time, and his *Biglow Papers*, in which the poet lashes, in Yankee vernacular, the policy of the pro-slavery faction and the attitude of the United States toward Mexico, with which country the nation was then at war. Mr. Lowell visited Europe in 1851 and again in 1855, returning in the latter year to fill the chair of modern languages at Harvard. In 1857 he became the first editor of the *Atlantic Monthly*, and, six years later, he commenced a ten-years' connection with the *North American Review*. To this latter periodical he contributed some graphic studies of Cambridge in the olden time, afterward published as *Fireside Travels* (1864), and two volumes of criticism of high and enduring value: *Among My Books* (1870); and *My Study Windows* (1871). In 1864 he brought out a second series of *The Biglow Papers*, and in the following year he recited, at Harvard, and afterward published, his magnificent *Commemoration Ode*, in honor of the alumni who had fallen in the Civil War. In 1877 he was appointed Minister to Spain, and in 1880 Minister to the court of St. James, London. In England he remained until 1885, and won the hearts and admiration of the English people with his fine literary and oratorical gifts. In 1869 Mr. Lowell published a new collection of verse, *Under the Willows*, and in the following year a thoughtful epic poem, *The Cathedral*, suggested by a visit to Chartres. *Three Memorial Poems* appeared in 1876; and in 1881 a new edition of his complete works, in five volumes, was issued. The *Memorial Poems* were odes, celebrating the hundredth anniversary of the Fourth of July, the battle at Concord, and apostrophizing the Washington elm-tree at Cambridge. In 1886 appeared *Democracy*, embracing his addresses delivered in England while ambassador there; and in 1888 a series of *Political Addresses* appeared, with *Heartcase and Rue*, a sheaf of later poems. The Riverside edition of his complete writings, in 12 volumes, was issued in 1890-92. His *Letters*, edited by C. E. Norton, were issued in 1893. Lowell was a man of strong mental fiber, and represents the highest type of culture in the New World and its sturdiest patriotism. He was a keen and appreciative critic, and his poems, though unequal, abound in many fine passages. He had a fine sense of humor, though sometimes tinged with rough speech. His literary instinct and sense of the beautiful impart a rich color to his work, while his learning gives it substance

and his satire adds spice.—His elder brother, ROBERT TRAILL SPENCE LOWELL, an American clergyman, was born in Boston, Oct. 8, 1816, and died Sept. 12, 1891, in Schenectady. He graduated at Harvard in 1833, and in 1842 was ordained priest in the Episcopal Church. For a time he acted as bishop's chaplain in the Bermuda Islands, and afterward was rector of a parish at Bay Roberts, Newfoundland, where, during the famine of 1846, he rendered humane service as a medical man and missionary. In 1847, owing to failing health, he returned to the United States and conducted a poor-union in Newark, New Jersey. From 1859 to 1869 he was rector of Christ Church, Duanesburg, New York, and later on was for four years headmaster at St. Mark's School, Southboro, Massachusetts. He afterward became Latin professor at Union College, and contributed considerably to current periodical literature. He wrote *Antony Brade*, a tale of school-boy life; a volume of poems, entitled *Fresh Hearts that Failed Three Thousand Years Ago*; and *A Story of Two from an Old Dutch Town*. His most meritorious work, however, is a novel of Newfoundland life, told with much ability and delicacy of thought and expression, and called *The New Priest of Conception Bay*.

G. MERCER ADAM.

LOWELL, JOHN, an American statesman; born in Newburyport, Massachusetts, June 17, 1743. He graduated from Harvard in 1760; was admitted to the Massachusetts bar in 1762, and was elected a member of the legislature from Boston in 1778. As a member of the convention that framed the Massachusetts constitution, he caused the words "all men are born free and equal" to be inserted in it, a first blow to the institution of slavery. As a consequence, in 1783, slavery was abolished in Massachusetts. In 1782-83 he was a member of the Continental Congress, and in 1784 was one of the commission to decide boundary disputes between New York and Massachusetts. In 1789 he was made United States judge for his state, and in 1801 became chief justice of the first circuit, including Maine, New Hampshire, Massachusetts and Rhode Island. He was one of the founders of the American Academy of Sciences and Art. He died in Roxbury, May 6, 1802.—Of his three sons, JOHN, FRANCIS CABOT and CHARLES, all were distinguished in their way. Francis Cabot's name has passed to posterity as that of the founder of the city of Lowell. He was born in Newburyport, April 7, 1775. He had visited England (1810-12) for the purpose of studying the cotton-manufacturing industry in the old country; he returned, convinced that New England could be made a center of cotton spinning and weaving. In 1816 he induced Congress to pass a law imposing a heavy duty upon imported cotton goods, and was soon ready to supply the demand of the trade with home-made fabrics. He died in Boston, Aug. 10, 1817.—His son, JOHN, an American philanthropist, was born in Boston, May 11, 1799. He spent most of his life traveling in various parts of the world and collecting a very fine library. In his will he bequeathed \$250,000 for the maintenance, in Boston, of courses of free lectures on religion, science and

the arts. These have been delivered yearly ever since, in what is called the Lowell Institute, Boston. He died in Bombay, India, March 4, 1836.

LOWELL, PERCIVAL, an American writer; born in Boston, March 13, 1855; graduated from Harvard University in 1876. He traveled much in the far East. While in Japan, in 1883, he was appointed Foreign Secretary and Counselor to the Korean Special Mission to the United States. He returned to Korea the same year, and spent the winter in Séoul, its capital. He devoted his wealth and time to the study of Mars, and for this purpose built an observatory 7,000 feet above the sea at Flagstaff, Arizona. He wrote *Choson, a Sketch of Korea* (1885); *The Soul of the Far East* (1888); *Noto, an Unexplored Corner of Japan* (1889); and a number of poems.

LOWTHER, JAMES, an English statesman; born near Leeds, England, in 1840; graduated at Trinity College, Cambridge, in 1862; called to the bar at the Inner Temple in 1864; elected a member of Parliament for York as a Conservative in 1865; continued to sit for that city until 1880; elected member for North Lincolnshire in 1881, which he represented until 1885. Under-Secretary of State for the colonies (1874-78); Chief Secretary of Ireland in 1874, which office he held until the resignation of Lord Beaconsfield's government in May, 1880. He failed to re-enter Parliament in 1885 and 1886, but was returned by a Kentish division in 1888 and 1892. He is well known as a successful sportsman and horse-breeder.

LOWVILLE, a post village and the capital of Lewis County, northern central New York, 25 miles S.E. of Watertown, on the Rome, Watertown and Ogdensburg railroad, and 1½ miles W. of the Black River, in a rich agricultural region producing cheese, butter, hops and lumber. The village contains a noted academy, founded in 1808, and also foundries and mills, water-works and electric lights. Population 1900, 2,352.

LOXA. See LOJA, Vol. XIV, p. 809.

LOYAL TEMPERANCE LEGION. See WOMAN'S CHRISTIAN TEMPERANCE UNION, in these Supplements.

LOYSON, CHARLES, a French divine, formerly known under the monastic name of Père Hyacinthe; born at Orleans, France, March 10, 1827. Studied theology at St. Sulpice, Paris, and in 1851 was ordained priest; taught philosophy and theology at Avignon and Nantes. Subsequently entering the order of Barefoot Carmelites, he became known as a powerful preacher, attracting crowded audiences of all ranks of society to the Madeleine and Notre Dame, in Paris. Almost as remarkable as his eloquence was the boldness with which he denounced existing abuses in the church, and in 1869 the general of his order imposed silence on him. Hyacinthe replied by a letter, in which he called for a thorough reform of the church, and was excommunicated by the pope. He then preached independently, resuming his family name, Loyson. In 1869 he visited the United States, and on his return married in London an American widow. He was afterward for a short time curé of a congregation of Liberal Catholics at Geneva, Switzerland, and in 1879 established an in-

dependent congregation in Paris under the name *L'Église Gallicane*. This attempt was kept alive by funds subscribed in England, America, and among French Protestants; but it never prospered, and is said to have been abandoned. He has published a number of sermons and lectures, the best known being *La Société Civile dans ses Rapports avec le Christianisme* (1867), signed Père Hyacinthe, and *Ni Cléricaux, Ni Athées* (1890).

LUALABA, a river of Africa. See AFRICA, Vol. I, p. 248.

LUAPULA, a river of Africa. See ZAIRE, Vol. XXIV, p. 763.

LUBBOCK, SIR JOHN, English banker, Parliamentarian and scientist, was born in London, April 30, 1834. He was the son

of Sir J. W. Lubbock (1803-65), the astronomer and mathematician, and when 14 years of age entered his father's banking-house, and in 1856 became a partner. He was chosen honorary secretary to the Association of London Bankers, first president of the Institute of Bankers, and served on the International Coinage Commission, as a member of the

SIR JOHN LUBBOCK.

Public School Commission, the Advancement of Science Commission, the Education Commission and the Gold and Silver Commission. In 1870 he was returned for Maidstone, and, on losing his seat in 1880, was returned for London University—since 1886 as a Liberal Unionist. As a politician he devoted himself chiefly to financial and educational subjects, and succeeded in passing more than a dozen important public measures, including the Bank Holidays Act, the Bills of Exchange Bill (which regulates the whole law relating to checks, bills and promissory notes), and the Shop-hours Bill. He was vice-chancellor of the University of London from 1872 to 1880; a trustee of the British Museum; in 1881 president of the British Association for the Advancement of Science; president of the London Chamber of Commerce, and chairman of the London County Council. He has written many original scientific works, which have had a phenomenal sale. Among them are *Prehistoric Times* (1865), as illustrated by ancient remains and the manners and customs of modern savages; *The Origin of Civilization and Primitive Condition of Man* (1870), dealing with the mental and social aspect of savages; *The Races of the British Isles* (1887), a reprint of letters to the *London Times*; *Scientific Lectures* (1879), a brochure on *Representation* (1885), in the Imperial Parliament Series; *Fifty Years of Science* (1881), a British Science Association address; *Addresses: Political and Educational* (1879); three volumes in the Nature Series: *On the Origin and Metamorphoses of Insects* (1873); *On British Wild Flowers in Relation to Insects* (1875); and *Flowers, Fruit and Leaves* (1886). In 1882 he published a volume in the International Scientific Series, on *Ants, Bees and Wasps*. An-

other volume, which also appeared in the International Scientific Series, is *On the Senses, Instincts and Intelligence of Animals, with Special Reference to Insects* (1889). He also wrote *A Contribution to the Knowledge of Seedlings* (2 vols., 1892). He published a series of essays of an entertaining character, the first of which, entitled *The Pleasures of Life* (1887), had myriads of readers. The others of the series, in the order of their appearing, are *The Beauties of Nature and the Wonders of the World We Live In* (1892), and *The Use of Life* (1895). To these he added *The Scenery of Switzerland* (1896).

LUBBOCK, SIR JOHN WILLIAM, BARONET, an English scientist, father of the preceding; born in London, England, April 26, 1803; died June 20, 1865; received the A.M. degree from Trinity, Cambridge, in 1825; elected a fellow of the Royal Society in 1829; was a very successful banker, although giving much of his time to astronomy and natural history. He wrote *Resarches on Physical Astronomy* (1830); *Classification of Branches of Human Knowledge* (1838); besides a number of papers on *Tides*; *Eclipses*; *Lunar and Planetary Perturbations*; etc.

LÜBECK, a free city and state of the German Empire. The official reports for 1895 give the area at 115 square miles and the population at 82,813, of whom 97.5 per cent were Protestants and 1.2 Catholics. The estimated revenue in 1895 amounted to 4,299,933 marks, and the expenditures to 4,616,194. Of the revenue, about one sixth is from public domains, chiefly forests; one fourth from interest, and the rest from taxation. One fourth of the expenditures is for interest on, and reduction of, the public debt, which was 19,597,621 marks. Population of the city of Lübeck in 1895, 69,874. See LÜBECK, Vol. XV, pp. 31-34.

LÜBKE, WILHELM VON, a German art historian; born at Dortmund, Westphalia, Jan. 17, 1826. After studying at Bonn and Berlin, he soon attracted attention by his articles on the history of art, published in the *Deutsche Kunstblatt*, which caused him to be appointed professor of the history of architecture in the Berlin School of Architecture. He made several journeys in Italy, France, and Belgium for the purpose of studying church architecture. In 1861 he became professor of archaeology and the history of art in the Polytechnic School at Zürich, and in 1866 at Stuttgart. Finally he settled at Carlsruhe as professor at the Superior Technical School and director of the Grand Duke of Baden's picture-gallery. Among his chief works are *Geschichte der Plastik* (2d ed., 1870); *Grundriss der Kunstgeschichte* (7th ed., 1875); *Geschichte der Architektur* (6th ed., 1884). His *History of Art* was translated into English and published in the United States in 1880. Died in Carlsruhe, April 5, 1893.

LUBRICATOR. The Holmes fiber-graphite lubricator was introduced in 1891, and was the first successful substitute for an oil-lubricant. It is composed of graphite and wet wood-pulp molded into form and used as a bearing with a metal support. The materials are united with a drying-oil, and the graphite does the lubricating, while the fiber of the wood-pulp serves to keep it in form. It does not heat readily, and the ratio of friction is less than

with the average well-oiled bearing. It has been found especially useful in spinning-machinery, where the spindles involve the use of a great number of bearings, the oiling of which requires much time and causes waste. A spindle may be rotated at a speed of 8,400 rotations a minute, without heating, with a bearing made of this lubricator.

Lubricators for steam-pipes commonly consist of an oil-chamber, into which a minute quantity of steam is allowed to pass, in order to force the oil out, drop by drop, through the connections into the steam-pipes. The best forms have a glass tube, called a sight-feed, through which the oil may be seen passing, a drop at a time, and the engineer is thus able to note and regulate the amount of oil supplied.

C. H. COCHRANE.

LUCAN, GEORGE CHARLES BINGHAM, EARL OF, a British general; born in London, April 16, 1800. He was educated at Westminster; entered the army in 1816; accompanied the Russian troops under General Diebitsch as a volunteer against the Turks in 1828; succeeded to a title and large estates in Ireland in 1839; as commander of a division of cavalry in the Crimea, fought at the Alma, Balaklava (where he led the "charge of the Light Brigade" Oct. 25, 1854) and at Inkermann. Appointed lieutenant-general in 1858 and G.C.B. in 1869, he became field-marshal in 1887. He died Nov. 10, 1888.

LUCARIS, CYRIL. See GREEK CHURCH, Vol. XI, p. 158.

LUCAS, JOHN SEYMOUR, an English artist; born in London, Dec. 21, 1849. Starting in his chosen profession at the age of 15, he spent three months in the studio of a sculptor, and nine months with Gerard Robinson, the wood-carver, from whom he received his first notions of composition. His uncle then placed him in the studio of his son, John Templeton Lucas, while the young pupil also attended the evening classes of the St. Martin's School of Art, in connection with South Kensington Museum. In 1871 he became a student of the Royal Academy, exhibiting his first picture there in 1872. In 1875 he had his first painting, entitled *By Hook or Crook*, exhibited at Burlington House. The following year he sent two pictures, *Fleeced*, and *For the King and the Cause*; and in 1877 *Intercepted Dispatches. An Ambuscade: Edge Hill* appeared in 1878. The technical merit of all this artist's work is of a high order, especially noticeable in *The Gordon Riots*, exhibited in 1879. In 1877 he was elected full member of the Institute of Painters in Water-Colors, and in 1886 was elected an associate royal academician. Others of his works are *The Armada in Sight* (1880); *Charles Before Gloucester* (1881); *The Favorite* (1882); *A Whip for Van Tromp* (1883); *After Culloden* (1884); *From the Field of Sedgemoor* (1885); and *Peter the Great at Deptford* (1886).

LUCAYAS, same as BAHAMAS, Vol. III, p. 236.

LUCCA, PAULINE. See WALLHOFEN, MADAME PAULINE, in these Supplements.

LUCE, AUGUSTE SIMÉON, a French historian; born at Bretteville, Manche, France, Dec. 29, 1833;

graduated as doctor of letters in 1860; recorder of the archives of Deux-Sèvres department, he became deeply interested in historical researches, for which he had prepared himself by graduating from the *École des Chartes*; appointed chief of the historical section of the national archives in 1866, and in 1885 professor of the authorities of French history at the *École des Chartes*; member of the Institute in 1882. He wrote *Histoire de la Jacquerie* (1859); *Histoire de Bertrand Duguesclin* (1876), which received from the Academy the first Gobert prize; *Jeanne d'Arc à Domrémy* (2d ed., 1887); *La France Pendant la Guerre de Cent-Ans* (1890). He also prepared several ancient books and manuscripts for publication, with notes. Died in Paris, Dec. 15, 1892.

LUCE, STEPHEN BLEECKER, an American sailor; born March 25, 1827; entered the United States navy as midshipman in 1841; commissioned lieutenant in 1855; lieutenant-commander, 1862; commander, 1866; captain, 1872; commodore, 1881; rear-admiral, 1885; retired 1889. During the Civil War he distinguished himself as commander of the *Nantucket* in 1863 and the *Pontiac* in 1864-65; president of the United States Naval College in 1884-86; founded the United States Naval War College, and aided in organizing the present United States naval training-system. He wrote *Seamanship* (1863) and *Naval Songs* (1883).

LUCERNE OR PURPLE MEDICK. See AGRICULTURE, Vol. I, p. 378.

LUCIGEN. An oil-lamp in which a large flame and consequent brilliancy is obtained by spraying the oil with air. It consists of a small tank with a drop-pipe to the burner. The latter has a superheating device, consisting of a small tube-coil, in which the oil flows around the burner, so that it is quite hot by the time it escapes. A compressed-air pipe supplies the draft for spraying, and a trap carries off the moisture.

LUCRETIA. The tragic death of this Roman matron formed the subject of Shakespeare's *Rape of Lucrece*. See TARQUINIUS SUPERBUS, Vol. XXIII.

LUCY, HENRY W., an English journalist; born near Liverpool, Dec. 5, 1845; joined the staff of the *Shrewsbury Chronicle* as chief reporter in 1864; in 1869 was a student at the Sorbonne, Paris; in 1870 returned to London to join the staff of *The Pall Mall Gazette*; and in 1873 joined *The Daily News* as special correspondent, chief of the gallery staff, and writer of the Parliamentary summary. He wrote *A Handbook of Parliamentary Procedure* and *Men and Manners in Parliament*. He contributed the weekly "Diary of Toby, M. P.," in the *London Punch*. In 1882 his first novel, *Gideon Fleyce*, was published, and in January, 1886, he became the editor of the *Daily News*.

LUDERS, ALEXANDER NICOLAJEVICH, COUNT, a Russian soldier; born Jan. 26, 1790, of a German family settled in Russia; entered the army in 1807; served in the war against Napoleon; became brigadier-general in 1826; distinguished himself during the Polish insurrection of 1831; defeated the Circassian leader Schamyl, 1843-45, and captured Dargo. Helped subdue the revolutions in Roumania in 1848, and Hungary in 1849; was commander-in-chief at Sebastopol when captured by the Franco-English troops; when lieutenant-general of Poland in 1861-62,

his rule was so harsh as to cause his recall, not, however, before he had been wounded in an attempt at assassination. He soon retired from service, and was made a count. Died in St. Petersburg, Feb. 13, 1874.

LUDINGTON, city, capital of Mason Co., Mich., on Lake Michigan, at the mouth of Père Marquette river; is connected with Milwaukee, 84 miles S. W., by a steamer line; is in a fruit-raising region; has a good harbor, manufactures shingles, woodwork, salt, iron-work, and carriages, and has a foundry and machine-shop. Population 1890, 7,517; 1900, 7,166.

LUDLOW, a post village in Windsor Co., Vt., on Black River, 25 miles S. S. E. of Rutland; has an academy, a foundry, and factories of woolen goods, carriages, toys, and machinery. Pop. 1900, 1,454.

LUDLOW, JAMES MEKER, an American clergyman and author; born in Elizabeth, N. J., March 15, 1841; graduated at Princeton College and Seminary; pastor of the First Presbyterian Church at Albany, N. Y. (1865-69); of the Collegiate Reformed Dutch Church at New York (1869-77); of the Westminster Presbyterian Church, Brooklyn, N. Y. (1877-86); and of the First Presbyterian Church, East Orange, N. J. (1886). Wrote *The Captain of the Janizaries* (1886); *A King of Tyre* (1891); *That Angelic Woman* (1891); and compiled a *Concentric Chart of History* (1885).

LUDLOW, WILLIAM, American officer of engineers, born in Oakdale, Long Island, Nov. 27, 1843. On July 1, 1860, he was appointed, from the state of New York, cadet at the Military Academy; and he graduated therefrom on June 13, 1864, on which date he entered the regular army as first lieutenant in the engineers, and later joined Sherman on his march to the sea. On July 20, 1864, he was made brevet captain for gallant services during the campaign in northern Georgia; on Dec. 21, 1864, he was made brevet major for meritorious services in the campaign through Georgia in Sept.-Dec., 1864; and on March 13, 1865, he was made brevet lieutenant-colonel for faithful conduct in the campaign in the Carolinas. He was promoted captain on March 7, 1867; major on June 30, 1887; and lieutenant-colonel on Aug. 13, 1895. In 1897 he was a member of the commission appointed by Congress to investigate and report on the construction of a Trans-Isthmian canal. After the war with Spain broke out in April, 1898, he was made brigadier-general of volunteers; and he was in command of the engineers at the siege and capture of Santiago de Cuba in June-July, 1898. On July 8 he was made major-general of volunteers, and in December he was appointed military governor of Havana.

LUDWIG, KARL FRIEDRICH WILHELM, a German physiologist; born at Witzenhausen, Hesse, Dec. 29, 1816; appointed professor of comparative anatomy at Marburg in 1846; professor of physiology at Zürich (1849-55); at Vienna (1855); and at Leipsic (1865). His investigations in anatomical physiology place him in the front rank of that department of science. His chief work is *Lehrbuch der Physiologie des Menschen* (1852-55); but his *Arbeiten aus der Physiologischen Anstalt zu Leipzig* and his essays contain valuable contributions to physiology. Died April 25, 1895.

LUDWIG, OTTO, a German playwright and Shakespearean scholar; born at Eislefeld, Saxe-Meiningen, Feb. 11, 1813. After beginning the study

of music and receiving instruction from Mendelssohn in Leipsic, his ill-health compelled him to devote himself solely to literature. The influence of his thorough study of Shakespeare was visible in his three powerful tragedies, *Der Erbförster* (1853); *Die Makkabäer* (1854); and *Agnes Bernauer* (1857), which were received enthusiastically. An excellent series of exhaustive Shakespearean criticisms is contained in his *Shakespeare Studien* (1871), and his novel *Zwischen Himmel und Erde* (1856) ranks high in German fiction. Died in Dresden, Feb. 25, 1865.

LUGARD, SIR EDWARD, an English soldier; born in Chelsea, England, in 1810. Having entered the army in 1828 from Sandhurst Military College, he joined the Indian Army. During the Afghan war of 1842 he was brigade-major of the fourth brigade; and during the Sikh war of 1845-46, assistant adjutant-general of the first division. Throughout the Punjab campaigns of 1848-49 he was adjutant-general. He was made K. C. B. for his services as chief of the staff in the Persian expedition of 1856-57, and adjutant-general in India in 1857. At the capture of Lucknow he commanded the second division of infantry, and was made major-general in 1858. In 1861-71 he was permanent Under-Secretary of War. He was made lieutenant-general in 1872, and was a Privy Councillor from 1871. Died Oct. 31, 1898.—His nephew, FREDERICK D.

LUGARD, an English soldier and writer, was born in Madras in 1858, and from Sandhurst entered the Indian Army in 1879. He distinguished himself as transport officer to the Ruby Mines column in Burma, succeeding in bringing troops, artillery, and supplies over mountains 8,000 feet high. Placed on sick-leave, he was appointed Uganda agent of the British East-African Company, and in 1893 published an admirable book, *The Rise of Our East-African Empire*. In 1894-95 he commanded an expedition to Borgu to negotiate treaties; and in 1896-97 an expedition to Lake Ngami.

LUGWORM. See ANNELIDA, Vol. II, p. 71.

LUITPOLD, PRINCE CHARLES JOSEPH WILLIAM, regent of Bavaria; born at Würzburg, Bavaria, March 12, 1821. He became general and inspector-general of the Bavarian army. He married April 15, 1844, the Princess Augusta, Archduchess of Austria. During the reign of King Louis II he was at the head of the ultra-Catholic and anti-Liberal party. When the king's eccentricities grew to outright insanity, Prince Luitpold was placed at the head of affairs as regent. On the death of King Louis II in June, 1886, Prince Luitpold continued to perform the functions of regent on account of the mental derangement of Otto, the succeeding titular king.

LUMBY, JOSEPH RAWSON, an English clergyman and writer of ecclesiastical history; born at Staningley, Yorkshire; graduated in the first class of the classical tripos from Magdalene College, Cambridge, in 1858; elected a fellow and soon after a lecturer in his own college; appointed Norrisonian professor of divinity at Cambridge in 1879, and was one of the founders of the early English Text Society. He published, for the Pitt Press, *Bacon's Life of Henry VII; More's Utopia*; and books 3

and 4 of *Beda's Ecclesiastical History*; wrote a *History of the Creeds*, and published, in 1893, the *Cambridge Companion to the Bible*. He contributed to this ENCYCLOPÆDIA. He died Nov. 21, 1895.

LUMMIS, CHARLES F., an American traveler and ethnologist; born in Massachusetts, and graduated at Harvard; settled in Ohio in 1882; walked from there to California (3,250 miles), and narrated his experiences during this novel kind of a pleasure-trip in his *Tramp Across the Continent*, a successful book of genuine adventure; settled in Los Angeles, California, as owner and editor of the *Los Angeles Times*; on account of ill health, he decided to live an open-air life among the Pueblo Indians, and explored thoroughly, first New Mexico, and later, in 1892, Peru and Bolivia. Among his books, well received by the public, are *A New Mexico David*; *Some Strange Corners of Our Country*; *The Land of Poco Tiempo*; *The Spanish Pioneers*; *The Man Who Married the Moon* (Pueblo Indian folk-lore); *The Gold Fish of Gran Chimú* (a Peruvian tale); and *Mexico To-day* (1898). In 1895 he became editor of a Los Angeles monthly, *The Land of Sunshine*.

LUMPKIN, a village and the capital of Stewart County, southwestern Georgia, 30 miles S.S.E. of Columbus, on Hoachookee Creek, and on the Georgia and Alabama railroad. It has a Masonic college for women. Vehicles and leather are manufactured, and flour, cotton, corn, sweet potatoes and pork are the principal products of the neighborhood. Population 1900, 1,470.

LUMPKIN, JOSEPH HENRY, an American jurist; born in Oglethorpe County, Georgia, Dec. 23, 1799. He graduated at Princeton in 1819, was admitted to the bar in 1820, and quickly gained prominence in his profession. In 1844 he retired on account of ill health, and traveled through Europe; on his return in 1845, he was elected successively justice and chief justice of the supreme court of Georgia; lectured as professor in the law school of Georgia University, where he founded the Lumpkin Law School, but declined all other offices, Federal and state. He was one of the compilers of the Penal Code of Georgia in 1833, and maintained the highest place on the bench of his state. He died in Athens, Georgia, June 4, 1867.

LUMSDEN, SIR PETER STARK, a British soldier; born at Aberdeen, Scotland, in 1829; entered the Indian army in 1847, and in 1857 he was employed in a difficult mission to Afghanistan, at the crisis of the Indian Mutiny, and discharged his perilous duties with credit. He accompanied the expedition to China in 1860, and was present in all the actions there, including the assault and capture of the Taku forts. He was adjutant-general to the commander-in-chief, Sir F. P. Haines, during the last Afghan war, and was appointed commissioner for the demarcation of the northwestern boundary of Afghanistan in 1884. He attained the rank of general in 1890, joined the Indian staff the same year; appointed a member of the Council of India, and was made a G. C. B. in 1885.

LUNA, ALVARO DE. See SPAIN, Vol. XXII, p. 321.

LUNACY. See INSANITY, Vol. XIII, p. 95.

LUNA-MOTH (*Actias luna*), a large moth, said to be the most beautiful North American insect. The wings are of a delicate green color, with beautiful eye-spots. The hind wings have a long tail. The full-grown caterpillar is bluish green, with yellow markings. The caterpillar known as the luna silkworm, feeds on the foliage of many native forest-trees. It produces silk of fine quality, but which cannot be reeled.

LUND, JOHANN REINHOLD, a German-American musician; born in Hamburg, Germany, Oct. 20, 1859; educated at the Leipsic Conservatory; emigrated to the United States in 1884, as assistant musical director of the German Opera Company, and directed the Orpheus Singing Society and the Symphony Orchestra in Buffalo, New York.

LUNDY, an island in the mouth of the Bristol Channel, nearly facing the center of Barnstaple Bay, and 12 miles N.N.W. of Hartland Point, Devonshire, England. It is 2½ miles long by 1 mile broad, and has an area of 1,200 acres. Precipitous granite cliffs allow but one landing-place, on the eastern side, and even here only in a smooth sea. The Trinity Board maintains a lighthouse at the south end of the island, in lat. 51° 10" N., long. 4° 40" W., with lights of the first-class order, 567 feet above the sea, and visible 31 and 28 miles. In early days Lundy was a bone of contention between England and Wales. Drayton (q.v., Vol. VII, p. 452) devotes two cantos of *Polyolbion* to the question—

"England and Wales strive in this song,
To whether Lundy doth belong."

Local tradition is rich in legends of the Danes. Hubba, the Danish invader, defeated at the battle of Kenwith Castle, near Appledore, in 894, is said to have been buried in Lundy,

"With shore and wave to share his corse,
A very Dane in death."

The ruins of Marisco's Castle, the stronghold of a pirate of the time of Henry III, are to be seen. This castle was held for King Charles I in the Civil War by Lord Say and Sele.

In colonial days, one Thomas Benson, who held the contract for the exportation of convicts to Virginia and Maryland, obtained possession of Lundy, and employed the convicts on the island until the government interfered and compelled him to transport them to the colonies.

Though part of the county of Devon, the island has been a parish to itself since 1225, and in monastic days boasted of a church dedicated to St. Helena, the ruins of which are still visible, and near which an iron church was erected in 1889. Its 53 inhabitants are tenants of the Rev. W. C. Heaven, the freeholder of the entire island, who acts as pastor, doctor, lawyer and policeman; for the island lacks these functionaries. There is excellent grazing for a small herd of cattle, and Lundy butter is as well known as the isle. Sea-birds, including the solan-goose, nest in myriads on its secluded cliffs, and many a human toiler, wearied of the rattle of the city, comes here for absolute repose. Lundy, hanging like a soft gray cloud on the horizon of the North Devon coast, has been celebrated in the stirring prose of the Rev. Charles Kingsley

(q.v., Vol. XIV, p. 88). On its dreaded Shutter Rock, still the Scylla to its Hen and Chickens' Reef, the unwieldy galleon of the Armada struck and sank. Seated on its majestic cliffs, blind Amy-as Leigh, the courtly hero of *Westward Ho!* brooded over his wrongs and found a nobler peace of mind. The island has been well described, also, in J. R. Chanter's *Lundy Island: A Monograph, Descriptive and Historical* (1877). It is reached by a sloop from Instow in fair weather, and is an important signal-station in the manœuvres of the Channel fleet.

LUNDY, BENJAMIN, an American philanthropist; born in Hardwich, New Jersey, Jan. 4, 1789, of a Quaker family. As a lad he was apprenticed to a saddler at Wheeling, Virginia, and the sight of the cruel treatment to which the slaves were subjected made him an abolitionist for life. In 1815 he organized an antislavery association at St. Clairsville, Ohio, which in a few months grew from five to five hundred members. In 1822 he began the publication of the Mount Pleasant *Genius of Universal Emancipation*, a monthly. In 1824 he removed his paper (now a weekly) to Baltimore, then to Washington, and finally to Philadelphia. He made several lecturing tours through the states, on foot, preaching indefatigably the doctrine of emancipation, and attempted to establish, in Hayti, colonies of freed slaves, from 1825 to 1829; several times he was assaulted by slave dealers and was nearly killed in 1828; all his belongings were burned in the destruction, by the hand of an incendiary, of Pennsylvania Hall, Philadelphia. He had but recently settled in Illinois when he died, so to speak, "in harness," in Lowell, Oct. 22, 1839.

LUNDY'S LANE, BATTLE OF, won by the American troops under General Jacob Brown over the British troops under General Riall, July 24, 1814. Brigadier-General Winfield Scott, in command of the left wing of Brown's army, while on the way to assail Queenston, near the Niagara frontier, came upon the British, posted along Lundy's Lane, and a conflict ensued that lasted from the middle of the afternoon till midnight, the British troops being everywhere repulsed. Generals Brown and Scott were wounded, and the command devolved upon General Ripley, who withdrew from the field, and the British recovered their position next day. The losses were about even, nine hundred men on each side.

LUNE. See MENSURATION, Vol. XVI, pp. 19, 25.

LUNEL, a town in central southern France, 14 miles N.E. of Montpellier, with a trade in Muscatel wine and brandy. Interesting human remains have been found in a cave at Pondres, six miles north of Lunel. Population, 6,460.

LUNG CHOW, a walled city of the province of Kwangsi, central southern China, on the Tso-Kiang, at the confluence of the Sungchi-Kiang and the Kooping-ho. It was opened to foreign commerce June 1, 1889, by treaty. Population, about 20,000.

LUNGS. See RESPIRATION, Vol. XX., pp. 475, 476.

LUNGWORT, a common name given to species of *Mertensia*, a genus of the family *Boraginaceæ*. They

are herbs, with tubular or trumpet-shaped flowers. The common species of the eastern United States is *M. Virginica*, a very smooth plant, with flowers purple in bud, but bright blue when open.

LUPULIN OR LUPULITE. See HOP, Vol. XII, p. 157.

LUPUS. See SKIN DISEASES, Vol. XXII, pp. 121, 122.

LUPUS SERVATUS. See LIBRARIES, Vol. XIV, p. 513.

LURAY, a village and the capital of Page County, northern Virginia, 78 miles W. of Washington, District of Columbia, on the Norfolk and Western railroad. It is in the picturesque valley of the south fork of the Shenandoah, and on this account, and because of the famous Luray Cavern (q.v., Vol. XV, pp. 67, 68) it has become a very popular summer and tourist resort. It has two girls' seminaries, an academy, woolen factories and a tannery. Population 1900, 1,147.

LUSHINGTON, STEPHEN, an English jurist; born in London, England, Jan. 14, 1782. He was educated at Eton, and graduated at Oxford; called to the bar in 1806, entered practice in the Doctors' Commons as an advocate in 1808; judge of the Consistory Court in 1828; judge of the Admiralty Court in 1838. He sat in Parliament at different times, as a Liberal, from 1807 to 1831; was one of the council for Queen Caroline in the famous divorce suit in 1820; took sides with Lady Byron against her husband. He retired from the bench in 1867 and died Jan. 19, 1873.

LUSITANIA. See PORTUGAL, Vol. XIX, p. 539.

LUSK, WILLIAM THOMPSON, an American physician and surgeon; born at Norwich, Connecticut, May 23, 1838; remained one year at Yale, and then went to Heidelberg and Berlin to study medicine (1858-61); served in the Union army from 1861 to 1863; received his M.D. from Bellevue Hospital Medical College in 1864; pursued post-graduate studies in Edinburgh, Paris, Vienna and Prague; returned to New York City in 1865 and began practicing, making a specialty of obstetrics and diseases of women; was lecturer on physiology at Harvard (1871); professor of obstetrics and diseases of women in Bellevue Hospital Medical College (1871); and visiting physician at the same hospital (1871); co-editor of the *New York Medical Journal* (1871-72). His most important book, *The Science and Art of Midwifery* (1882), has gone through many editions in several languages. Died June 12, 1897.

LUSSAN, RAVENEAU DE, a French buccaneer; born in Paris in 1663. He was of good family, and at the age of 14 entered on a military career. In 1679 he went to Santo Domingo in quest of adventure, and joined the buccaneers under the Dutch corsair, Cornelius Laurent. In the following year he formed a band of his own to act against the Spaniards, and pillaged the town of Realejo, in Guatemala. In 1686 his band set fire to Grenada, and later took part in the capture of Guayaquil. Afterward his band of about three hundred men captured Tehuantepec. At Nueva Segovia, his men, having made a journey overland, were surrounded and

hemmed in by the Spaniards, but, favored by fog, found their way to the rear of the intrenched Spaniards and put them to flight. This retreat of a handful of men over one thousand miles of wild country, and through dangers innumerable, is considered one of the most marvelous feats of that time. After much suffering and frequent hazards, Lussan reached France and published his *Journal du Voyage fait à la Mer du Sud avec les Flibustiers de l'Amérique* (Paris, 1688). It was dedicated to the Minister of the Navy, and by him and the nation at large was well received. He died in France about 1710.

LUSSIN, a long, narrow island in the Adriatic, belonging to the government of Dalmatia, Austria, 20 miles long and 3 broad. It is situated just to the southeast of the entrance of the Gulf of Quarnero. Its inhabitants are engaged in agriculture, fishing and commerce. The city of Lussin-Piccolo, on the east side, has a population of 4,975; a good harbor, capable of accommodating the largest vessels, and has a large trade in wheat, wine, olive-oil, fruit, etc. Population of the island, 11,848.

LUTHERAN CHURCH IN THE UNITED STATES. The earliest Lutheran immigrants to the United States came from Holland and settled in New Amsterdam about 1624, but it was not till 1664, when New York came under the control of the British, that they were allowed to call a minister or open a separate church. Congregations extended along the Hudson, and in New Jersey. The first actual Lutheran church in America was established in 1637, on the banks of the Delaware, by Swedish immigrants, who came over under the patronage of Axel Oxenstiern, the Prime Minister and successor of Gustavus Adolphus. Churches were erected at Christiana, Delaware, and at Wicaco, Philadelphia, where the "Old Swedes" Church is still in existence. Most of these early Swedish Lutherans, after the Revolutionary War, joined the Protestant Episcopal Church. German Lutherans first came to America about 1680, but not till 1708 did they begin to found congregations, first at Newburg, New York, and at Newberne, North Carolina, a couple of years later. German Lutheran emigration was encouraged by Queen Anne, who, in 1709, gave 2,100 acres of land in New York to some 3,000 German colonists "for the maintenance of Lutheran parish schools and ministers," and by William Penn, whose liberal policy induced many poor but pious Lutherans from Germany to settle in Pennsylvania. A body of Tyrolese (Swiss) Lutherans followed in 1734, and settled at Ebenezer, Georgia. The first pastor of the German Lutheran Church in America was Henry Melchior Muhlenberg, the "patriarch of the Lutheran Church in America," who came over in 1742. The early Lutherans settling in America were thoroughly imbued with the spirit of religious freedom then struggling for expression, and, while they held strictly to the general doctrine of the parent church, were liberal in its interpretation, and favored a broad ecclesiastical polity. According to the *Bibliotheca Sacra*, they "encouraged and practiced the most enlarged catholicity of spirit and action among evangelical churches. Most kindly

relations existed between Lutherans, Presbyterians, Episcopalians and others." Muhlenberg and Whitefield associated in church labors with fraternal comity. But the large influx of Lutheran immigrants, mainly from Germany and Scandinavia, which began in the early part of the nineteenth century, founding congregations often served by local pastors who lacked the broad training of the schools, developed a spirit of strict conformity and adherence to ancient liturgical uses. This policy resulted in disagreements, in separation of churches and districts, and in the founding of independent and non-affiliating bodies, each striving to embody its own ideas of true Lutheranism as it understood the symbols.

The first Lutheran synod was organized in Philadelphia, Aug. 14, 1748, and comprised both German and Swedish pastors. A second synod was organized in New York in 1785, these bodies being composed of the pastors of the district, together with an equal number of lay delegates appointed by the congregations. They form an ecclesiastical body which decides questions pertaining to church fellowship, etc. In 1820 most of the synods then existing united in the General Synod of the Evangelical Lutheran Church, as an ecclesiastical body having only advisory powers. At the outbreak of the Civil War a separate general synod for the South was organized, which, in 1886, became the United Synod, representing, in 1895, an aggregate of 40,639 communicants. The General Synod advocates a liberal adherence to the Augsburg Confession. It maintains seminaries at Gettysburg and Selingsgrove, Pennsylvania; Hartwick, New York; Springfield, Ohio; and Chicago. Its adherents number about one eighth of all the Lutherans in the United States, and are mostly in purely English Lutheran Churches. The First Synod of Philadelphia, which had changed its name to the Evangelical Lutheran Ministerium of Philadelphia and Adjacent States, and had withdrawn from the General Synod, together with the independent synods of Pittsburg, Texas, Detroit, Ohio, Swedish Augustana and Northwest Synod, formed, in 1866, the General Council. Their seminaries at Philadelphia and Rock Island, Illinois, teach the unaltered Augsburg Confession in its original sense, strictly interpreted, favor a church polity approaching Presbyterianism and advocate fellowship with all Lutheran churches. The various churches connected with the General Council had, in 1895, 322,708 communicants.

In 1871, delegates from the synods of Missouri and Wisconsin, and independent synods from Minnesota, Illinois and Ohio organized the Synodical Conference. They require subscription to the symbolical books of the church as well as to the Augsburg Confession; forbid ecclesiastical intercourse with other religious denominations, including those Lutheran bodies which differ from them on points of "cardinal doctrine," and favor a church polity approaching pure Congregationalism. The Ohio and the Norwegian synods withdrew in 1881, on account of a dispute over the doctrine of predestination, while the synods of Michigan and the English Evangelical Lutheran Synod of Missouri and other states

were added. About 2,500 congregations and 480,000 communicants are represented in the Synodical Conference.

The largest independent union of Lutheran churches is the Missouri Synod, which originated in a colony of Lutheran "Pietists" or "Mystics" from Saxony, who settled in Perry County, Missouri, in 1839, and who had separated from the mother church on account of its rationalistic tendencies. Their first leader, Martin Stephan, proving unworthy, was banished from the settlement, and C. F. W. Walther of St. Louis, became their theological leader and teacher, remaining as such for more than forty-five years, or until his death in 1887. In 1847 the German Evangelical Lutheran Synod of Missouri, Ohio, and other states, was organized. It was based upon acceptance of all the symbols of the church; abstinence from every kind of syncretism, from mixed congregations and services; the use of purely Lutheran books in churches and schools, etc. It comprises 13 districts, extending from Canada to Texas, and is one of the most influential Lutheran bodies in American. It had, in 1896, 1,346 pastors and 1,015 congregations, with 370,246 communicants. It maintains theological seminaries at St. Louis, Missouri, and at Springfield, Illinois, besides colleges at Fort Wayne, Indiana; Addison, Illinois; Milwaukee, Wisconsin; St. Paul, Minnesota; Seward, Nebraska; Neperau, New York; and Lafayette, Missouri.

The growth of the various Lutheran bodies has been rapid. In 1880 there were 5,865 congregations, with an aggregate membership of 838,302. In 1895 there were 9,915 churches, with a total membership of 1,387,764. They maintain 25 theological seminaries, having, in 1895, 1,307 students; and 33 colleges, with an aggregate of 4,470 students. They sustain 39 orphan asylums, 7 old people's homes, 10 hospitals, and a number of other special eleemosynary institutions.

Among the later literature bearing upon the Lutheran Church in the United States are *Life and Times of Muhlenberg* (1887); *Bibliotheca Lutherana* (1876); *Geschichte der Evangelisch-Lutherischen Missouri Synode* (1885); *Lutheran Year-Book and Lutherische Kalender*; *History of Lutheran Church in the United States* (Jacobs, 1893); and *Geschichte der Lutherischen Kirche in Amerika* (Graebner, 1895). See also LUTHER, Vol. XV, p. 71; and LUTHERANS, Vol. XV, p. 84.

D. O. KELLOGG.

LUTHER LEAGUE OF AMERICA, an organization formed for the purpose of linking together the various young people's societies of the Lutheran churches, and "to encourage the formation of young people's societies in all the Lutheran congregations in America, to urge their affiliation with their respective state or territorial leagues, to stimulate to greater Christian activity and to foster the spirit of loyalty to the church." The league was first organized in New York City, in April, 1888. The first national convention of the league was held at Pittsburg, Pennsylvania, Oct. 30-31, 1895. Twenty states were represented, five of which had permanent

state organizations. The enrolled membership aggregated over 50,000.

LUTKE, FEDOR PETROVITCH, a Russian explorer; born in 1797. He was educated for the navy; in 1817-19 circumnavigated the globe; made four expeditions to Nova Zembla during 1821-24, and published a description of that region; explored and published descriptions of Bering Strait and Sea of Kamchatka (1836); was made an admiral in 1835. He was the founder of the Russian Geographical Society, and succeeded to Benjamin Franklin's seat in the French Institute. He died Aug. 20, 1882.

LUTTERWORTH, a small town of Leicestershire, on the Swift, $6\frac{1}{2}$ miles N.N.E. of Rugby. The fine old church, restored by Scott in 1867-69, contains the pulpit and other relics of Wycliffe, who was rector from 1374 till his death, on Dec. 28, 1384. Population of parish, 1,965. See also WYCLIFFE, Vol. XXIV, pp. 709-711.

LÜTZEN, a small town of 3,501 inhabitants, in the Prussian province of Saxony, 12 miles S.W. of Leipzig; famous for two great battles fought in its vicinity. The first was a brilliant victory of the Swedes in the Thirty Years' War, which took place on Nov. 16, 1632, in which Gustavus Adolphus fell. The second battle was fought on May 2, 1813, somewhat farther to the south, at the village of Grossgörschen, and was the first great conflict of the united Russian and Prussian army with the army of Napoleon in that decisive campaign, the French remaining in possession of the field. See also FRANCE, Vol. IX, p. 617.

LÜTZOW, LUDWIG ADOLF WILHELM, FREIHERR VON, a German soldier; was born in Brandenburg, May 18, 1782. He was the organizer and leader of a celebrated corps of volunteers, called by his name, and recruited in Silesia during the German war of liberation of 1813. It included several celebrated men, as Jahn, Theodor Körner and others, and was renowned for its patriotism and courage. The men uniformed themselves, and were often sung and spoken of as the "Black Rifles" (*Schwarze Jäger*). He died in Berlin, Dec. 9, 1834.

LUVERNE, a village and the capital of Rock County, southwestern Minnesota, situated on Rock River, and on the Chicago, St. Paul, Minneapolis and Omaha and the Burlington, Cedar Rapids and Northern railroads. It is in an agricultural region, and has several building-stone quarries, several manufactories, and water and electric-light plants owned by the village. Population 1890, 1,466; 1900, 2,223.

LUXEMBURG, GRAND DUCHY OF, a state of Europe. In 1890, on the death of King William III, the grand duchy passed to Adolph, Duke of Nassau. It has a chamber of deputies of 45 members, elected directly by the cantons for six years, one-half being renewed every three years. It has an area of 998 square miles, and in 1890 had a population of 211,088, principally Roman Catholic. The capital, Luxemburg, has 18,187 inhabitants. The revenue for 1895 was 9,429,300 francs, and the expenditures were 8,837,765 francs. In 1893

the debt was 12,000,000 francs. For commercial purposes, Luxemburg is included in the German Zollverein. See also LUXEMBURG, Vol. XV, pp. 87, 88.

LUYNES, CHARLES D'ALBERT. See FRANCE, Vol. IX, pp. 567, 568.

LUYS JULES BERNARD, a French physician; born in Paris, Aug. 17, 1828; received his M.D. from the Paris School of Medicine in 1857; city hospital physician in 1862; physician-in-chief of the Ivry Sanatorium; elected a member of the Academy of Medicine in 1871. He made a speciality of the study and cure of nervous and brain diseases. His works include *Recherches sur le Système Nerveux Cérébro-Spinal* (1864, with 40 folio pages of drawings from life); *Iconographie Photographique des Centres Nerveux* (1872-74; illustrated); *Études de Physiologie et de Pathologie Cérébrale* (1874); *Le Cerveau et ses Fonctions* (3d ed., 1878; illustrated); *Traité Clinique et Pratique des Maladies Mentales*, received the Lallemand prize by the Academy of Medicine (1881); *Hypnotisme Expérimental* (1890). Died in Paris, Aug., 1897.

LUZERNE, ANNE CÉSAR, CHEVALIER DE LA, a French soldier and diplomatist; born in Paris in 1741; entered the army and distinguished himself during the Seven Years' War, in which he reached the rank of major-general in 1762, and was placed in command of the Royal Grenadiers. He entered diplomatic service as French minister, first to Bavaria, and in 1779 to the United States. In the latter capacity he spent four years in Philadelphia and never failed to show his sympathy for the young Republic. He even guaranteed a personal loan, much needed to furnish food for the troops in 1780; and in return he obtained, in 1782, the agreement that Congress should not ratify the treaty of peace with Great Britain until peace should be agreed upon between France and Great Britain. He returned to Europe in 1783, the bearer of many public testimonials of esteem. In 1789, the first Secretary of State of the Federal government was instructed by Washington to write to the Chevalier a letter of official thanks for services rendered. He was ambassador to the Court of St. James's, where he died Sept. 14, 1791.

LUZON. See PHILIPPINE ISLANDS, Vol. XVIII, pp. 748-751.

LUZULA, a genus of the family *Juncaceæ*, or rushes. The species are commonly known as wood-rushes, and are distinguished from the numerous species of *Juncus* by the one-celled and few-seeded pod, and the usually soft-hairy stems and leaves.

LUZZATTO, SAMUEL DAVID, a Hebrew scholar; born at Trieste, in Istria, Aug. 22, 1800. When only 15 years old he published a volume of Hebrew verses; in 1820 he was appointed professor of Biblical literature in the rabbinical college of Padua. Among the Hebrews in Italy, Luzzatto was celebrated for deep learning and wise judgment. He wrote against the Cabalists; published some volumes of Hebrew verse and several treatises and commentaries on Hebrew theology. He was preparing a version of the Old Testament in

Italian when he died, in Padua, Italy, Sept. 29, 1865.—His son, PHILOXENE LUZZATTO (1829-54), was distinguished as a linguist.

LYALL, EDNA. See BAYLY, ADA ELLEN, in these Supplements.

LYALL, SIR ALFRED COMYNS, an English statesman and writer; born at Coultston, Surrey, in 1835; educated at Eton; entered the Indian service; was successively Home Secretary in India in 1873; Foreign Secretary in 1878; Lieutenant-Governor of the Northwest Provinces in 1882; and member of the Council of India in 1888. He wrote *Asiatic Studies, Religious and Social* (1882); *Rise of the British Dominion in India* (1893); *Life of Warren Hastings*.

LYCEUM. See ATHENS, Vol. III, p. 2.

LYCHNIS. See HORTICULTURE, Vol. XII.

LYCON, a Greek philosopher and educator; born about 300 B. C.; a disciple of Strato, and succeeded him as principal of the Peripatetic School, where he taught for 44 years, being especially successful in the mental training of young boys. His eloquence was famous throughout Greece. He wrote a treatise on the boundaries of good and evil, known as *De Finibus*. He died in Athens, about 226 B. C.

LYDDA, the Greek form of the name which appears in the Old Testament as Lod, a town on the road from Jerusalem to Joppa, nine miles E. of the latter. It was the scene of the healing of Æneas by Peter, as told in Acts ix. 32-35, and the watercourse outside the town is said still to bear the name of Abi-Butrus (Peter) in memory of the apostle. It was destroyed by Vespasian and probably not rebuilt until the time of Hadrian, when it was called Diospolis and became the seat of a famous Jewish school of law. The modern town, under the name of Ludd, or El Ludd, is fairly prosperous.

LYDDITE, a high explosive, supposed to be picric acid, but its character and mode of manufacture is a secret of the British Ordnance Bureau. It received its name from Lydd, in Wales, where the explosive, cased in gun-shells, was first experimented with. Shells, filled with lyddite, were used by the British in the war of 1899-1900 with the Boers of South Africa. The explosive power of lyddite is very great, the projectile containing it, when exploded, scattering in destructive pieces, and doing immense destruction wherever the fragments fall. The suffocating effects of its fumes are also deadly. The naval guns used by the British during the siege at Ladysmith had shells filled with lyddite, which wrought great execution among the beleaguering Boers. Lyddite filled shells, it is understood, are now displacing the use of shrapnel shells in the British artillery.

LYDEKKER, RICHARD, an English scientist; born in 1849, in England; graduated at Trinity College, Cambridge, in 1871, being second in the first class of natural science tripos; appointed to the Geological Survey of India in 1874, and continued in this service till 1882, during which he covered nearly the whole of the territory of the Maharajah of Kashmir. He contributed to the

Palæontologica Indica his discovery of the large series of vertebrate fossils in the Siwalik Hills, at the foot of the Himalayas. He undertook the huge task of cataloguing the British Museum collections of fossil mamalia, birds, reptiles and amphibia. He published the results of a visit to the Rio de la Plata Museum, in the Argentine Republic (1893), where he had gone to study rare mammal fossils. He was elected a fellow of the Royal Society; became chief editor and part author of Frederick Warne and Company's *Royal Natural History*, the publication of which began in 1895. He published a number of monographs on geological, palæontological and zoological discoveries and mooted questions; and *Horses and Hoofs; Forms and Phases of Animal Life; Life and Rock*.

LYKENS, a borough of Dauphin County, southeastern Pennsylvania, 25 miles E. N. E. of Harrisburg, on the Northern Central and the Williams Valley railroads. It is a coal-mining center and shipping-point, and has foundries and lumber-mills. Pop. 1890, 2,450; 1900, 2,762.

LYMAN, CHESTER SMITH, an American educator and scientist; born at Manchester, Connecticut, Jan. 13, 1844. As early as 1830 and 1831, when a mere lad, he constructed with his own hand optical and astronomical contrivances, and computed, without help or tuition, complete almanacs; graduated from Yale in 1837; taught school from 1838 to 1840; studied theology at the Union Seminary, New York City, and at New Haven, from 1840 to 1842; pastor of a Congregational church in New Britain, Connecticut, in 1845; visited the Sandwich Islands, where he taught the royal children and explored the volcano Kilauea (1845-47); as surveyor in California, he sent out the first authentic news of the discovery of gold in 1849; settled in New Haven, and supplied scientific definitions for the 1864 revision of *Webster's Dictionary*; appointed professor of industrial mechanics and physics at the Sheffield Scientific School (Yale) in 1858-71; professor of astronomy and physics from 1871 to 1884; of astronomy alone from 1884 to 1890. He invented the combined zenith telescope for latitude, longitude and time in 1852, and patented an apparatus for describing acoustic curves in 1871; was president of the Connecticut Academy of Arts and Sciences from 1857 to 1877. His writings are found chiefly in the *American Journal of Science* and *The New Englander*. He died in New Haven, Jan. 20, 1890.

LYMAN, THEODORE, an American philanthropist; born in Boston, Massachusetts, Feb. 20, 1792. He graduated from Harvard in 1810; spent two years of post-graduate studies at the Edinburgh University; afterward traveled through Europe, Turkey, and Asia Minor with his friend Edward Everett; on his return, studied law and was called to the bar; interested himself in state military matters, and reached the rank of brigadier-general; was a member of the Massachusetts legislature from 1820 to 1824; of the state senate (1824-25); mayor of Boston (1834 and 1835), when he rescued William Lloyd Garrison from a mob at the peril of his own life. Much interested in the

Westboro State Reform School, he gave to it \$22,500 during his lifetime and \$50,000 in his will. He wrote several books of travels, and *The Diplomacy of the United States with Foreign Nations* (2 vols., 1828.) He died in Brookline, Massachusetts, July 18, 1849.—His son, THEODORE, an American naturalist, was born in Waltham, Massachusetts, Aug. 23, 1833; graduated at Harvard in 1855, and from the Lawrence Scientific School in 1858; studied in Europe until 1863, when he entered the Union army as aide-de-camp to Gen. G. G. Meade, with the rank of lieutenant-colonel; was present at the battles of the Wilderness, Spottsylvania Courthouse and Cold Harbor; was fish commissioner of Massachusetts from 1865 to 1882; elected a member of Congress on an independent ticket in 1883; an overseer of Harvard University in 1868–80 and 1881–87; a member of the National Academy of Sciences in 1872; gave much time to the study of radiata, and was assistant curator of the Harvard Museum of Zoölogy. He wrote a number of papers on the *Ophiurida* and *Astrophytida* (q.v.), and on the results of deep-sea dredgings during various scientific expeditions. Died at Nahant, Mass., Sept. 10, 1897.

LYMAN, THEODORE BENEDICT, an American divine; born in Brighton, Massachusetts, Nov. 27, 1815. He graduated at Hamilton in 1837, and at the General Theological Seminary, New York City, in 1840; was ordained a priest of the Protestant Episcopal Church in 1841; rector of St. John's Church, Hagerstown, Indiana, from 1841 to 1850; rector of Trinity Church, Pittsburg, Pennsylvania, from 1850 to 1860. Removed to Europe in 1860, and established American churches in Florence and Rome; was rector of Trinity Church, San Francisco, California, from 1870 to 1873; became assistant bishop of North Carolina in 1873, and succeeded Bishop Atkinson in 1881. He died in Raleigh, North Carolina, Dec. 13, 1893.

LYME REGIS, a seaport and favorite watering-place of Dorsetshire, England, at the mouth of the Lyme rivulet, five miles S. of Axminster. The Cobb breakwater, dating from the fourteenth century, was reconstructed in 1825–26. The town, noted for its salt-works before the Norman conquest, was one of the oldest Parliamentary boroughs in England, and was mentioned in the Domesday Book. The Duke of Monmouth set up his standard here in the abortive rising of 1685. The cliffs here are geologically interesting on account of the abundance and character of the fossils they contain. Population, 2,365.

LYMPH. See ANATOMY, Vol. I, pp. 846, 906.

LYMPHATICS. See ANATOMY, Vol. I, p. 906.

LYNCH, PATRICIO, a Chilean sailor; born at Valparaiso, Oct. 18, 1825; graduated from the Chilean Naval Academy. In obedience to orders from his government, he entered the British navy in 1840, and took part in the Anglo-Chinese War, retiring with the rank of lieutenant; served in the Chilean navy from 1847 to 1854; re-entered the service during the war against Spain in 1865, when he commanded a war-vessel; appointed

governor of the Peruvian territory of Tarapacá in 1879, he destroyed \$15,000,000 of property in northern Peru. Promoted to be a rear-admiral and commander-in-chief of the army, he suppressed the Calderon (Peruvian) government and sent the provisional president a prisoner to Chile. In 1883 he defeated Caceres, and placed Iglesias at the head of Chilean affairs. Having been raised to the highest rank in the Chilean navy, that of vice-admiral, he was sent to Spain as minister in 1885. He died near the Canary Islands, on his homeward passage, in May, 1886.

LYNCH, PATRICK WILSON, an American Roman Catholic bishop; born at Cheraw, North Carolina, March 10, 1817. He graduated in theology at the Charleston (South Carolina) Seminary and the College of the Propaganda at Rome. In 1840 he became assistant pastor at the cathedral of Charleston, South Carolina, and from 1844 to 1855 was pastor of St. Mary's Church of that city; became principal of the Charleston Collegiate institute and vicar-general of the diocese in 1850. In 1858 he was consecrated bishop. His articles on the *Vatican Council* (where he supported the dogma of infallibility) and *The Blood of St. Januarius* were published in book-form. He died in Charleston, South Carolina, Feb. 26, 1882.

LYNCH, THOMAS, JR., a signer of the Declaration of Independence; born in Prince George Parish, South Carolina, Aug. 5, 1749. On the organization of the first regiment of South Carolina provincials in 1775 he was commissioned a captain, and in 1776 was elected to a seat in the Continental Congress. On account of failing health he embarked in 1779 for the south of France, but the ship in which he sailed was seen for the last time when a few days out at sea, and probably was lost in a storm.

LYNCHBURG, a city of central Virginia. It is situated on the Chesapeake and Ohio, the Norfolk and Western and the Southern railroads. It is the seat of Randolph-Macon College, a Methodist institution founded in 1893 for the education of women, which had, in 1896, 15 instructors and 125 students, and productive funds of \$205,000. It is the distributing and trade center of a large region. Pop. 1890, 19,709; 1900, 18,891. See also LYNCHBURG, Vol. XV, p. 105.

LYNCHINGS, MOB RULE, AND NEGRO RACE RIOTS. Despite the enormous cost of police protection, not to speak of that of the State militias, the increase of lawlessness in many cities and states of the Union is alarming. Many of our important towns and municipalities are acquiring an evil reputation in consequence of outbreaks being permitted of lynchings and other oft-recurring acts of mob violence. However much passionate outbursts in communities may be excused, when incited by the perpetration of atrocious crimes, the brutalizing effect of lynchings and other unrestrained substitutions for the rule of justice cannot be ignored; while to tolerate them is to break down all respect for law and to dethrone and obliterate every semblance of orderly govern-

ment. Such illegal resorts, in defiance of law and justice, are the more to be deplored when they are directed against any class or condition in the community whose helplessness or misfortune claim consideration from the well-to-do and the strong, and especially in the case of the negro, who is peculiarly apt, at any time, on slight and even on groundless provocation, to be the victim of race and color prejudice, and the arrogant domination of caste feeling. Vicious, in some unfavorable environment, the negro no doubt is; but under like conditions, often vicious also is the white citizen. Both, unfortunately, are to be found among our city toughs and hoodlums; and when caught in disturbances of the public peace the police are not always scrupulously fair, far less merciful, in administering preliminary doses of club-admonition and repression. In the case of the negro, when there has been a disgusting crime committed, the law, we unfortunately find, is not usually left to do its own corrective work. Then is the time when every hot-head thinks he has the right to be the delinquent's Nemesis, and in the name of outraged decency to be himself as indecent and arbitrary as he may—becoming at once constable, judge, jury, and the erring fugitive's instantaneous executioner. Then it is that men act as madmen, throwing restraint and reason to the winds, and commit acts that, in their passionate excesses, would disgrace the age of Nero or the flogging era of the criminal code in the Old World countries.

The growth of this lawlessness and of the murderous work of infuriated mobs that take the law into their own unclean hands is, obviously, of the gravest menace to the State. How the tendency is to be corrected and suppressed should be the anxious thought of every patriotic and law-respecting citizen. Those who have watched recent manifestations of this trend towards anarchy and mob-rule know with what fell precipitance the evil is spreading over the country, and how increasingly it is setting at defiance the majesty as well as the machinery of law. Almost every locality is every now and then hearing, if it is not actually having instances brought more closely to its knowledge, of shootings, lynchings, or other defiant acts on the part of infuriated armed mobs, whose lawlessness is not only extremely demoralizing, but becoming a terror in every well-ordered community, as well as a shame and reproach to the nation. Nor are infractions of the law now confined to the "Wild West," or to sections in the South where race-conflicts and general lawlessness are apt to be looked for; they are also to be found North and East, and among communities that boast a higher type of civilization and a finer degree of culture.

In the past two years the list is an appalling one of the instances of mob violence on record in many parts of the country. There are but few regions exempt from outrages of the worst and most brutal description. Here are a few, selected almost at random during the latter half of the year 1899. At Alma, Kans., on July 9, a negro charged with the murder of two white men was

taken out of the sheriff's hands by a mob and hanged from a telegraph pole. In the same State, at Wier City, on Oct. 30, a colored miner, supposed to be the murderer of a bartender with whom he had quarreled, was taken from jail and hanged.

Kentucky is another State where a like lawlessness has for years been rampant, and where the civil authorities seem to be indifferent to the crying need for its suppression. In Clay County, on Sept. 7, one man was ambushed by a mob and hanged, and on the following day another fellow creature, whatever deserts he merited, met the same fate. On Dec. 6, a young negro of Kentucky, the confessed murderer of the wife of his employer, was at Maysville burned at the stake, after suffering torture at the hands of a mob.

In Louisiana, and especially at New Orleans, the same hideous tale of lynchings and other barbarities is told. In July, 1899, there were five Italians, at Tallulah, wrested from the hand of the law and lynched, the third outrage of the kind reported in the district within a comparatively recent period. On Oct. 15, near Wilson, in the same State, a man suspected of cattle stealing was hanged by a posse of men; while in the adjoining parish dozens of violent deaths had occurred, no one of the murderers having been brought to punishment.

In Mississippi, a like state of things had for some while prevailed, hardly a week passing without some hideous act of burning or hanging being disclosed. Early in the year 1899, a county judge in the State, in charging a jury, spoke of the many instances of crime that disgraced the community that went unpunished by the machinery of the law. So rife were murders and lynchings within the State, that he was moved to remark that "the only thing in Mississippi that was cheaper than four-cent mutton was human life." At Yazoo County, in March of the same year, a triple lynching occurred, two of the victims being taken by an armed and infuriated mob from the hand of the law. At Bolton, in December, two negroes accused of murdering an old white man, were taken from jail and hanged to a bridge by a posse of unmasked rowdies.

During the year 1900 there would seem to be no diminution in the chronicle of race-conflicts here and there in the Union, some of the instances, like those occurring in Alabama, where negroes were burned at the stake, being most revolting in their inhumanity. G. M. A.

LYNE, JOSEPH LEYCESTER, called "Father Ignatius," an English clergyman; born in London, Nov. 23, 1837; graduated at Trinity College, Glenalmond, Perth; was ordained in 1860; appointed to the curacy of St. Peter's, Plymouth; left it in 1862 to begin the attempt of restoring monasticism in the Church of England. After occupying provisional quarters in various parts of England, he finally purchased land in the Black Mountains of Wales and built a monastery which he called Llanthony Abbey. He had no difficulty in gathering a number of young men to become the original members of his community. He also

founded a Priory of Nuns. He was the author of many published sermons, poems and hymns; the *Tales of Llanthony*; *Brother Placidus*; *Leonard Morris*; *Tales of the Monastery*; and *Llanthony Monastery Tracts*. He and his monks claim to follow the ancient rule of St. Benedict, and use the Benedictine breviary for choir office and the Sarum missal of the ante-Reformation Church of England. They wear the old English Benedictine dress. "Father Ignatius of Jesus," as he called himself, conducted hundreds of meetings of "revival" character in Great Britain, Ireland and the United States. He headed an ardent campaign, by preaching and petitioning, against the opponents of strict orthodoxy, within the Church of England, and received much approval and assistance from the High Church wing of the Anglican establishment.

LYNN, a city of eastern Massachusetts, on the Boston and Maine and the Boston, Revere Beach and Lynn railroads. The Thomson-Houston electric factory is located here. It employs some fifteen hundred men and turns out machinery for many electric-lighting and power plants. In 1890, 1,343 establishments reported to the Census Bureau, which had an aggregate capital of \$13,000,000, and produced annually \$38,300,000 worth of goods. It is connected with Boston and neighboring towns by electric railroads. Valuation in 1896, \$49,696,356; tax rate, 1.72 per cent; net debt, \$2,887,771. It has a public library containing 51,000 volumes. Population 1890, 55,727; 1900, 68,513. See also LYNN, Vol. XV, p. 109.

LYNN, WILLIAM THYNNE, an English astronomer; born at Chelsea, England, Aug. 9, 1835. Having been trained at the Royal Observatory, Greenwich, he was appointed at the Cambridge Observatory as assistant of Professor Challis in 1855; returned in 1836 to Greenwich as member of the staff under George Airy, the Astronomer Royal; received his B.A. from the London University in 1862. On account of ill health, caused by constant night-exposure, he retired from the Royal Observatory in 1880, and was admitted as a lay reader in the diocese of Rochester. He published, in 1884, a popular volume, *Celestial Motions: A Handy Book of Astronomy*, which ran through a number of editions (8th ed. 1894); contributed constantly to the periodicals in his branch of work, and was elected a member of a number of scientific societies. He wrote *Brief Lessons on Astronomy* and *Remarkable Comets* (1893), another popular success. He was deeply interested in religion, and published *Bible Chronology*; *Brief Lessons on the Parables and Miracles of our Lord* (1889); *Eminent Scripture Characters* (1891); and *Short Catechism of English Church History* (1892).

LYON, DAVID GORDON, an American Orientalist; born at Benton, Alabama, May 24, 1852; studied at Howard College, Alabama, the Southern Baptist Theological Seminary and Leipsic University; appointed Hollis professor of divinity at Harvard in 1882. He gave his attention for many years to the language, history and antiqui-

ties of Assyria, and wrote *An Assyrian Manual for the use of Beginners in the Study of the Assyrian Language* (1886; 2d ed. 1892).

LYON, MARY, an American educator; born in Buckland, Massachusetts, Feb. 28, 1797. From 1814 to 1837 the most of her time was devoted to teaching in various schools, and in the latter year she founded Mount Holyoke Seminary, at South Hadley, Massachusetts. From that date to her death she served as its principal. A peculiarity of her system was, that the institution contained no servants, the whole of the domestic labor being performed according to a regular method by the teachers and pupils themselves. A number of her pupils became missionaries. She published *Tendencies of the Principles Embraced and the System Adopted in the Mount Holyoke Seminary* (1840) and *Missionary Offering* (1843). She died in South Hadley, Massachusetts, March 5, 1849.

LYON, MATTHEW, an American public man; born in County Wicklow, Ireland, in 1746. He emigrated to the United States when a boy; after working on a Connecticut farm, he settled in Vermont, where, in 1776, he became lieutenant of the "Green Mountain Boys"; later he was elected, successively, member of the legislature and assistant judge; was one of the founders of Fairhaven in 1783, where he built several factories and founded a newspaper called *The Scourge of Aristocracy and Repository of Important Political Truth*; elected to Congress in 1797; convicted the next year of libel against President Adams, he was sentenced to four months' imprisonment and a \$1,000 fine; in spite of that, he was re-elected to Congress; took part in several brawls on the floor of the House; settled in Kentucky in 1803; elected to the Kentucky legislature, and to Congress in 1803-11; in 1820 he was appointed United States factor among the Cherokees in Arkansas; elected delegate to Congress from Arkansas Territory, but soon after his election died at Spadra Bluff, Arkansas, Aug. 1, 1822.

LYON, NATHANIEL, an American soldier; born in Ashford, Connecticut, July 14, 1818. He graduated at West Point in 1841, and served as a lieutenant of infantry in Florida toward the close of the Seminole war. In the war with Mexico he was present at the siege of Vera Cruz and brevetted captain; at the assault on the Mexican capital he was wounded. At the close of hostilities he was ordered to California, where, in 1851, he was promoted captain. Returning to the East in 1853, he sympathized with the Free State Party. He was on duty in Kansas in 1859, and with General William S. Harney, in December, 1860, when the governor sent a brigade of militia to co-operate with the federal troops in arresting James

GENERAL LYON.

Montgomery, the Free State leader. In February he was ordered to St. Louis, Missouri. There he began to drill and organize the Home Guards, and had charge of the arsenal, where his ability and vigilance did much for the Union cause. On June 10, 1861, at the head of a body of German troops, he took possession of Camp Jackson, a secessionist rendezvous. A week later he was promoted to brigadier-general of volunteers, and soon afterward was placed in command of the department. He next dispersed the Confederate force at Potosi, and on June 17th defeated a body of Governor Jackson's state militia. On Aug. 2d he defeated General McCulloch at Dry Springs, and on Aug. 7th attacked a formidable force, under Generals McCulloch and Price, at Wilson's Creek, when he was defeated. Here, in the ardor of action, he was twice wounded; nevertheless, keeping his saddle, he led his men to renewed attacks, until his horse was killed and himself shot in the breast by a Minié rifle-ball, Aug. 7, 1861. His death was deeply lamented throughout the Union. He bequeathed his whole private fortune to the United States government to aid in the success of the Union cause. After his death some of his letters to political friends, at the time of the Kansas troubles, were published under the title of *The Last Political Writings of General Nathaniel Lyon*.

LYONS, a city of Clinton County, central eastern Iowa, situated on the Mississippi River, four miles above Clinton, on the Chicago, Milwaukee and St. Paul and the Chicago and North-Western railroads. It has extensive nurseries, several excellent schools and manufactories of wrapping-paper, flour, oil-cans, lumber, machinery and carriages. Population 1890, 5,799; has since been annexed by Clinton city.

LYONS, a city and the capital of Rice County, central Kansas, situated 26 miles N.E. of Hutchinson, on the Atchison, Topeka and Santa Fé, the Missouri Pacific and the St. Louis and San Francisco railroads. It is in a productive salt region, with beds said to be 268 feet thick. It has wagon and carriage works, elevators and flour-mills. Population 1890, 1,754; 1900, 1,736.

LYONS, a post village and the capital of Wayne County, northwestern central New York, 35 miles E. of Rochester, on the New York Central and Hudson River and the Western New York and Pennsylvania railroads, and on the Erie canal. It is a peppermint-oil market, manufactures fanning-mill machinery, silverware, tool-handles, iron goods and farm implements, and has splendid water-power. A musical academy is located here. Population 1900, 4,300.

LYRE-TURTLE, the common name of a very large tropical sea-turtle, which has the scientific name *Dermochelys coriacea*. The general outline is lyre-shaped, and the dorsal keels bear some fancied resemblance to the strings on a lyre. Unlike all other turtles, the carapace is not connected with the skeleton. The flesh is oily, and not edible. Specimens of this turtle weighing a thousand pounds are sometimes taken.

LYRIC POETRY. See POETRY, Vol. XIX, p. 264.

LYS, a river of France and Belgium, rising in the department of Pas-de-Calais and flowing generally northeast, joining the Schelde at Ghent. Length, 100 miles, of which 44 are canalized. It is connected with numerous other canals and has an active navigation.

LYSIAS OF SYRIA. See ISRAEL, Vol. XIII, p. 422.

LYSONS, DANIEL, an English antiquary; born at Rodmarton, England, April 28, 1762; received his A.M. from Oxford in 1785; entered the Church of England as curate of Putney in 1790, and became rector of Rodmarton in 1804. He gathered an enormous amount of material for antiquarian histories of the various counties in Great Britain. One of his works he completed and published in five volumes, under the title of *The Environs of London*, being an historical account of the towns, villages and hamlets within twelve miles of that capital (1792-1800). His more ambitious work, *Magna Britannia*, being a concise topographical account of the several counties of Great Britain (6 vols., 4to, 1806-22), only reached, in alphabetical order, the county of Derby; the documents collected are preserved in the British Museum, forming 64 huge manuscript volumes. He died at Rodmarton, Jan. 3, 1834.—His son, GENERAL SIR DANIEL LYSONS, was born at Rodmarton, Aug. 1, 1816, entered the army from Shrewsbury School in 1834, and served through the Canadian rebellion of 1838-39; became captain in a West India regiment in 1841; served throughout the Crimean War, and often was mentioned in dispatches; was wounded severely at the final assault on the Redan; commanded a brigade to the end of the war. In 1861, after the *Trent* affair, he was sent to Canada to reorganize the militia. After serving at Malta and at Aldershot, he was appointed quartermaster-general in 1876; grand cross of the Bath (1886); general (1879); constable of the Tower (1890). Died in London, January 29, 1898.—A brother of the first Daniel, SAMUEL LYSONS, was also a distinguished antiquary. He was born at Rodmarton, May 17, 1763. Besides assisting his brother in his work, he published works on British antiquities. He was called to the bar in 1798; was keeper of the records in the London Tower in 1803, and wrote *Reliquiæ Britannico-Romanæ*, with figures of Roman antiquities discovered in various parts of England (folio, with 156 colored plates, 1813-17); *The History and Antiquities of Devonshire* (2 vols., 4to, 1822). He died in London, June 29, 1819.

LYSTRA, an ancient city of Asia Minor, probably in Lycaonia. It was the native place of Timothy, and was visited by St. Paul in his missionary journeys; here he and Barnabas were taken for Jupiter and Mercury by the inhabitants, on account of the healing of the lame man, and they attempted to sacrifice to them. Later, Paul was driven out of the city with stones (Acts xiv). It has been located at the modern Zoldera.

LYTTELTON, THOMAS, LORD, son of George,

the first Baron Lyttelton, an English writer; born in 1744; as a boy of 16 he was considered a prodigy of intellectual development and a deep scholar; his later life was so dissolute that he lost most of his advantages, being even estranged from his father on account of an unwise marriage that terminated in a separation. Being elected to the House of Commons in 1768, he lost his seat on contest; entered the House of Lords at his father's death in 1773; was suspected strongly of being the author of the *Letters of Junius* in the *Public Advertiser*. He died in 1779.

LYTTELTON, MAJOR-GENERAL, THE HON. NEVILLE GERALD, C. B., recently in command of the 2nd Infantry brigade at Aldershot, and since the outbreak of the Boer war of 1899-1900 in command of the Fourth (British) Brigade in South Africa, was born in 1845 and educated at Eton. In 1865 he entered the Rifle Brigade and served with it in Canada and in India, seeing a good deal of active service. From 1868 to 1873 he acted as A. D. C. to Lord Spencer, viceroy of India, and was military secretary to the late Sir John Adye, governor of Gibraltar, and to Lord Reay, governor of Bombay. He was in the Egyptian campaign in 1882 and commanded a brigade in the Nile Expedition of 1898, being present at the battle of Khartum. During 1897-98 he was assistant military secretary at the war office in England, and in 1899 got the command of a brigade in South Africa.

LYTTON, EDWARD ROBERT BULWER-LYTTON, EARL OF, a British poet and diplomatist, and only son of the novelist, Bulwer-Lytton, was born in London, Nov. 18, 1831. He was educated at Harrow and afterward at Bonn, where he specially studied modern languages to fit himself for the English diplomatic service. In 1849 he became an *attaché* of the British legation at Washington, where his uncle, Sir Henry Bulwer, afterward Lord Dal-

ling and Bulwer, was minister. From Washington he was transferred to Florence, and thereafter he served at the embassy at Paris, at The Hague, at Constantinople and at Vienna. In 1863 he became secretary of legation at Copenhagen, where, later on, he acted as *chargé d'affaires*, subsequently discharging similar duties at Lisbon, Madrid and Paris. In 1873 he succeeded to his father's barony. In the following year he became ambassador at Lisbon and in 1876 Viceroy of India. On Jan. 1, 1877, his Indian viceroyalty was marked by the great ceremonial on the plains of Delhi, at which Queen Victoria was proclaimed Empress of India, and during his administration in the East a war with Afghanistan occurred. In 1880, on the fall of the Beaconsfield government, Lord Lytton resigned, when he was created earl. Seven years later he was appointed ambassador at Paris, where he died, Nov. 24, 1891.

Under the name of "Owen Meredith," Lord Lytton published a number of volumes of verse. He had no little mastery of the art of poetry, "especially that of turning a modern novel (as in *Lucile* [1860]) into a poetical narrative." This rhymed romance was preceded, in 1855 by *Clytemnestra, and Other Poems*, and followed by *Tannhauser, or, The Battle of the Bards* (1861); and *The Ring of Amasis* (1863). *Glenaveril* (1885) is a poem or rhymed narrative of much the same character as *Lucile*, though of higher and more serious purpose. In 1874 appeared *Fables in Song*, perhaps his best work; in 1887, *After Paradise; or, Legends of Exile*; and in 1892, *Marah and King Poppy*. His father's *Speeches* (with some of his political writings) he edited in 1874; and in 1883 he issued *The Life, Letters and Literary Remains of Edward Bulwer, Lord Lytton*. In 1890 a selection from "Owen Meredith's" poems appeared, edited by M. Betham-Edwards, enshrining much of Earl Lytton's choicest verse.

MABERY, CHARLES FREDERIC, an American scientist; born in Maine, Jan. 13, 1850; graduated from the Lawrence Scientific School at Harvard in 1876; was assistant in chemistry there (1875-83); was called to the chair of chemistry in the Case School of Applied Science, at Cleveland, Ohio (1883), and made many interesting experiments with regard to the production of aluminium by electricity.

MABIE, HAMILTON WRIGHT, an American editor and author; born at Cold Springs, New York, in 1846; graduated at Williams College in 1867, and at the Columbia Law School, New York City, in 1869. He preferred a literary career, and in 1879 became associated with Dr. Lyman Abbott on *The Christian Union* (changed to *The Outlook* in 1893). He edited Michaud's *History of the Crusades*, adding a supplementary chapter. He wrote *Norse Stories from the Eddas* (1882); *My Study Fire* (1890); *Our New England* (1890); *Under the Trees* (1891); *Short Studies in Literature* (1892); *My Study Fire: Second Series* (1894); *Books and Culture* (1897); *Work and Culture* (1898); *The Forest of Arden* (1898). In these studies and criticisms he exhibited a cultivated taste, a mature judgment, and a graceful diction.

MABINOION. See **CELTIC LITERATURE**, Vol. V, pp. 321-22.

MACABRE. See **DANCE OF DEATH**, *ante*, p. 984.

MACADAM, JOHN LOUDON, a British road-builder; born in Ayr, Scotland, Sept. 21, 1756; died Nov. 26, 1836. See also **ROADS**, Vol. XX, pp. 582, 583.

MACAHUBA PALM, the native name of *Acrocomia sclerocarpa*, the *macoya* or *great macawtree* of South America and the West Indies. The tall and prickly trunk bears at its summit a tuft of very large pinnate leaves. The fruit consists of a soft, sweetish pulp and an edible seed, from which is extracted a fragrant oil used in soap-making and as an ointment.

MACALESTER COLLEGE, a Presbyterian institution of learning, founded in 1885, at St. Paul, Minnesota. In 1895 it consisted of 8 instructors, 94 students and a library of 5,000 volumes. Since its organization 22 students have graduated there. It is a young but promising institution.

MACALISTER, JAMES, a Scotch-American educator; born in Glasgow, Scotland, April 26, 1840; studied at Glasgow University, and later at Brown University, Providence, Rhode Island;

received his degree in law at Albany in 1864; became superintendent of public schools, Milwaukee, Wisconsin, in 1873; regent of Wisconsin normal schools from 1878 to 1883; superintendent of public schools, Philadelphia, Pennsylvania, in 1887. He advocated the development and multiplication of the kindergarten, and of industrial and manual training. He wrote *Manual of Primary Instruction* (1884); *Manual of Instruction in United States History and Civil Government* (1887).

MCALLISTER, WARD, an American "society leader"; born in Savannah, Georgia, in 1830. He was admitted to the San Francisco bar in 1851, and practiced some time with his elder brother, **HALL**, a prominent lawyer; but having married, in 1855, Miss Gibbons, a Georgia belle, he retired from his profession and settled in New York. He soon was recognized as a leader and an arbiter in all matters concerning social functions, and, managed to retain his influence over what is called the New York four hundred until his death. He was a man of culture, very simple in dress and mode of living, and not in any way a Beau Brummel or a dandy of the new régime. He died in New York City, Jan. 31, 1895.

MCALL MISSION, the largest Protestant mission in France. It was started in 1871 by the Rev. Robert Whitaker McAll and his wife, and is there known as "Mission Populaire Evangélique de France." Mr. McAll was born in Macclesfield, England, Dec. 17, 1821. He was a Congregational pastor in Manchester and Birmingham for twenty years; shortly after the Paris Commune of 1871 he began his evangelizing work in the quarters of Paris inhabited by the laboring classes; his wife assisted him greatly, especially in the compiling of an excellent hymn-book; the value of his work as a civilizing agent was recognized by a gold medal from the Society for the Encouragement to Well-Doing and by the cross of the Legion of Honor. The mission possessed, in 1895, over 120 stations (forty in Paris alone), and is indorsed by the clergymen of all Protestant churches. Five sixths of the workers are French; the others English, American, etc. The United States contributes yearly \$50,000 to this work. He died May 11, 1893.

MCALPINE, WILLIAM JARVIS, an American civil engineer; born in New York City in 1812; educated in New York City as a civil engineer, he made a specialty of constructing canals and other hydraulic works; he had charge of the Erie canal improvements, and in 1846, of the building of a dry-dock in the United States navy-yard at Brooklyn; was state engineer of New York in 1851; state railroad commissioner in 1855-57; engineer of several railroad lines; constructor of the Albany, New York City and the Chicago

water-works, and planned those in Brooklyn, New Bedford, and elsewhere; presented plans for the improvement of navigation on the lower Danube approved by the International Commission; was superintendent of the new state capitol at Albany, New York, in 1873-74; engineer of the department of parks, New York City, in 1879-80; planned the One Hundred and Eighty-first Street Bridge and the Riverside Drive in New York; was president of the American Society of Civil Engineers in 1869. He died at New Brighton, Staten Island, Feb. 16, 1890.

MACAQUE. See APE, Vol. II, p. 152.

MACARONIC VERSE. See FOLENGO, Vol. IX, p. 355.

MCARTHUR, DUNCAN, an American pioneer and soldier; born in Dutchess County, New York, June 14, 1772. At the age of 18 he was a volunteer in General Josiah Harmar's expedition against the Miami Indians; took part in Indian warfare in Kentucky and Ohio; settled in Chillicothe in 1795 as a surveyor, and acquired wealth. He was elected member of the Ohio legislature in 1805; became major-general in command of the Ohio militia in 1808; commanded the First Ohio Volunteers during the War of 1812; was included in the surrender of General William Hull, at Detroit, but was freed from all responsibility and appointed brigadier-general in 1813; placed in command of the Western army in 1814, when General Harrison resigned; was elected member of Congress from Ohio in 1813, but declined to leave the army; was mustered out June 15, 1815; was commissioner to treat with the Indians in 1816-17; by this treaty, ratified in 1818, vast territories were transferred from the Indians to the government; was speaker of the house of representatives of Ohio in 1817-19; elected to Congress, as a Clay Democrat (1823-25); governor of Ohio (1830-32). He died near Chillicothe, Ohio, April 28, 1839.

MCARTHUR, ROBERT STUART, an American clergyman and author; born at Dalesville, Quebec, July 31, 1841; graduated at Rochester University and Rochester Theological Seminary; pastor of Calvary Baptist Church, New York City, in 1870; associate editor of *The Baptist Enquirer* and *The Baptist Quarterly Review*. He published, with Rev. Charles S. Robinson, *Calvary Selection of Spiritual Songs* (1878); and *Laudes Domini* (1891); also, with Miss Kate S. Chittenden, *The Calvary Hymnal* (1891).

MACASSAR. See CELEBES, Vol. V, p. 288.

MACAULAY, JAMES, a Scotch author; born in Edinburgh, May 22, 1817. In 1841 he graduated in arts and medicine from Edinburgh University, having also attended the classes in theology. He further studied in Paris, and traveled in Italy and Spain. In 1851 he became joint editor of the *Literary Gazette*, and in 1858 editor of the *Leisure Hour* and the *Sunday at Home*. From the same office was issued, in 1880, *The Boy's Own Paper*, destined to raise the average of young lads' habitual literature; it was soon followed by *The Girl's Own Paper*. Among his many books—juvenile and others—are *All True*; *Stirring Stories of Peace and*

War; *Wonderful Tales from Real Life*; *From Middy to Admiral of the Fleet*; *Across the Ferry*; *Notes of a Tour in the United States*; *The Truth About Ireland*; *Sea Pictures*; *Victoria R. I., Her Life and Reign* (1887); he was for thirty-five years editor-in-chief of the Religious Tract Society's periodicals.

MCCABE, CHARLES CARDWELL, an American Methodist clergyman; born in Athens, Ohio, Oct. 11, 1836; graduated at Ohio Wesleyan University in 1857; entered the ministry in the Ohio Conference in 1860. From 1860 to 1863 he was chaplain of the One Hundred and Twenty-second Ohio Regiment; captured by General Early, he spent four months in Libby Prison; on being exchanged, he lectured on behalf of the Christian Commission, raising over \$100,000 for that excellent

REV. C. C. MCCABE.

work among the sick and suffering. He returned to his regiment, and followed it to the end of the war, with short interruptions brought about by ill-health and overwork. In 1868 he was chosen as financial agent for the extension of the church, and during his 17 years of tenure of this office he traveled no less than 25,000 miles annually in the discharge of his duties. As corresponding secretary of the Methodist Episcopal Missionary Society, he raised the revenue of the society from \$750,000 to \$1,250,000 per annum. Known as a preacher of convincing power. In the army his musical talent gave him the title of "the Singing Chaplain."

MCCALL, GEORGE ARCHIBALD, an American soldier; born in Philadelphia, Pennsylvania, March 16, 1802. He graduated at the United States Military Academy in 1822; from 1831 to 1836 served as aide to Gen. E. P. Gaines, and then in the Florida and Mexican wars, receiving the brevets of major and lieutenant-colonel. From 1850 to 1853 he was inspector-general of the army. In 1861 he was made brigadier-general, and at the battle of Mechanicsville, June 26, 1862, being in command of all the federal troops, repelled greatly superior forces. Taken prisoner on the 30th, he was confined for several weeks in Libby Prison. His ill-health obliged him to resign from active service in 1863. He wrote *Letters from the Frontier* (1868). He died in West Chester, Pennsylvania, Feb. 26, 1868.

MACCALUBA, a remarkable mud volcano, 138 feet in height, situated six miles N. of Girgenti, in Sicily. The sides are studded with numerous small cones, which usually emit hydrogen and occasionally mud and stones, often sending them to a great height.

MACCARTHY, DENIS FLORENCE, an Irish poet and translator; born in Dublin in 1817. He first became known through his contributions to the *Nation*. His collected *Ballads, Poems and Lyrics*, founded upon the patriotic traditions of the Irish, appeared in 1850, and became quickly popular, especially his *Voyage of St. Brendan* and *The Foray*

of *Con O'Donnell*. In 1853 he published six of Calderon's dramas translated in the meters of the original. In 1872 appeared *Shelley's Early Life*, and in 1879 he wrote the ode for the Moore centenary. In recognition of his literary merit he received a pension in 1871, and in 1881 a medal from the Royal Academy of Spain. He died April 7, 1882.

MCCARTHY, JUSTIN, an Irish journalist, author and statesman; born in Cork, Nov. 22, 1830. He joined

JUSTIN M'CARTHY.

the staff of the *Northern Times*, Liverpool, in 1853, and in 1860 entered the reporters' gallery of the House of Commons for the *Morning Star*, becoming its foreign editor the following autumn, and chief editor three years later. He resigned in 1868, and devoted the next three years to a complete tour of the United States. Soon after his return he joined the staff of the London *Daily News*, contributing besides, among other magazines, to the *London*, the *Westminster* and the *Fortnightly Review*. He entered the House of Commons in 1879 as member for Longford, and identified himself throughout with the Home Rule party. In 1890 he was chosen leader of the Irish Parliamentary party in place of Mr. Parnell. McCarthy's novels, perhaps, have achieved for him a wider fame than his political triumphs. The more successful among them are *The Waterdale Neighbors* (1867); *My Enemy's Daughter* (1869); *Lady Judith* (1871); *A Fair Saxon* (1873); *Lindley Rochford* (1875); *Dear Lady Disdain* (1875); *Miss Misanthrope* (1877); *Donna Quixote* (1879); *The Comet of a Season* (1881); *A Maid of Athens* (1883); *The Dictator* (1893); *Red Diamonds* (1893); and, in collaboration with Mrs. Campbell-Praed, *The Right Honorable* (1886); *The Rebel Rose* (1887); and *The Ladies' Gallery* (1888). He also wrote *Con Amore*, a collection of essays; *Critical Notice of George Sand* (1870); *Prohibitory Legislation in the United States* (1872); *Modern Leaders* (1872); *A History of Our Own Times* (4 vols., 1879-80); *History of the Four Georges* (4 vols., 1889 et seq.);

GENERAL GEO. B. M'CLELLAN.

A Life of Sir Robert Peel (1891); and *The Story of Gladstone's Life* (1898).
MCCLELLAN, GEORGE BRINTON, an American general; born in Philadelphia, Pennsylvania, Dec. 3, 1826. He was educated by private tutors; studied for two years at the University of Pennsylvania, and in 1842 entered the United States Military Academy at West Point, graduating four years later. He was assigned to an engineer corps and served throughout the Mexican War, gaining the brevets of lieutenant and captain. In 1848 he was appointed assistant instructor in

practical engineering at West Point, and from 1852 to 1855 was employed on various engineering expeditions. In the latter year he was raised to the rank of captain of cavalry, and sent with Colonel Richard Delafield and Major Alfred Mordecai to the Crimea to observe the operations of the allied armies. McClellan's report, published by Congress with others, was republished in 1861 under the title, *The Armies of Europe*. In 1857 McClellan resigned from the army and became chief engineer and vice-president of the Illinois Central railroad.

When the Civil War broke out he was appointed major-general of Ohio volunteers and given command of the Department of the Ohio, which included the states of Ohio, Indiana, Illinois and part of Virginia and Pennsylvania. He immediately, and without orders, advanced into the western part of Virginia, which had been overrun by the Confederates under General Garnett, whom, after an eight-days' campaign, begun May 26, 1861, he forced to retreat with some loss. As a result of the move, the people in that part of the state called a convention, declared their loyalty, and were allowed to enter the Union as a separate state Dec. 31, 1862.

On May 14, 1861, McClellan had been made major-general in the United States army, and in July of the same year he was called to Washington, and in August given command of the Army of the Potomac, and upon the retirement of General Scott, in November, command of all the armies of the United States. He found the forces around Washington completely demoralized and dispirited by the result of the first battle of Bull Run, and set to work systematically to create and discipline an army before attempting any move against the enemy. The work of organization was done well but slowly, and this tardiness alienated from him the administration authorities, who were eager for immediate action. Moreover, there was a difference of opinion between him and the President as to how the campaign should be arranged. At last a compromise was reached, and on March 10, 1862, the army was set in motion, and the disastrous Peninsula campaign began. There seem to be four reasons to account for McClellan's failures: his too great cautiousness; his over-estimation of the enemy's strength in numbers; the lack of unanimity between himself and the administration; and lastly, his hesitation in altering his pre-arranged plans to meet the unexpected exigencies of a campaign. The first move was made on Manassas, but as the Confederates had been informed that the ultimate plan of the campaign was to transport the troops to the lower Chesapeake, and from thence march by land to Richmond, they had abandoned their position and retreated southward before the Union forces arrived. After this useless move, the real campaign was begun, by transporting the troops, by water, to Fortress Monroe. McClellan had scarcely left Washington when he was informed that he had been deprived of his command of all the armies. Besides this, he learned that twelve regiments of McDowell's corps, which he had counted upon as a reinforcement, had been detached from the main body for the defense of Washington. As it hap-

pened, none of McDowell's corps was allowed to take part in the campaign. McClellan protested, and on April 5th commenced the siege of Yorktown. Here he greatly over-estimated the strength of the enemy and regularly besieged the place for a month, much to the surprise of General Magruder, who held the works with a garrison of five thousand men and evacuated the town as soon as it was evident that a vigorous assault was to be made. The army was then moved up the peninsula to the Chickahominy River, Williamsburg being taken May 6th, after a struggle, the Confederates falling back as the Union troops advanced. On May 31st General Joseph E. Johnston attacked the Union left, on the Chickahominy, and the battle of Fair Oaks (q.v.), or Seven Pines, was fought. No farther advance, however, was made upon Richmond, but instead, McClellan determined upon a retreat to the James River, where, with that stream for a base of operations, a new attack upon Richmond could be arranged. Thereupon followed the Seven Days' battles, from June 25th to July 1st, which terminated when the Union forces reached Harrison's Landing, on the James. McClellan was now ready to make another move against Richmond, but the administration had lost confidence in him. On July 11th Halleck was made commander-in-chief of the Union forces, and on August 3d McClellan was ordered to evacuate the peninsula, and afterward deprived of his command, his forces being added to General Pope's army in northeastern Virginia. After the disastrous second battle of Bull Run he was given command of this army, Pope having resigned command of the Army of the Potomac. On September 17th he met the Confederate forces under Lee and Jackson, and the battle of Antietam (q.v.) was fought, the Confederates being forced to retreat from their position. McClellan was then urged to follow the enemy, but he hesitated to do so until his army should have recovered fully from the shock of the battle, and on that account he was relieved of his command, Nov. 7, 1862, and Burnside put in his place.

After this, McClellan took no further part in the war. In 1864 he was the Democratic nominee for President against Lincoln, and was defeated overwhelmingly. Immediately after the election he went to Europe, where he remained until 1868. Returning, he engaged in engineering pursuits, and in 1870-72 was engineer-in-chief of the department of docks of New York City. In 1877 he was elected governor of New Jersey. He was the author of *A Manual of Bayonet Exercise* (1852); *Report on the Organization and Campaigns of the Army of the Potomac* (1864); and *McClellan's Own Story* (1866). He contributed the article on NEW JERSEY, in this ENCYCLOPÆDIA. He died at Orange Mountain, New Jersey, Oct. 29, 1885.

McCLERNAND, JOHN ALEXANDER, an American lawyer and general; born in Breckenridge County, Kentucky, May 30, 1812. In 1832 he began the practice of law in Shawneetown, Illinois, and in 1835 established the Shawneetown *Democrat*. From 1836 to 1842 he was a member of the state legislature, and from 1843 to 1851 served in Congress. In

1859 he was again chosen to Congress, and served till the beginning of the Civil War, when he resigned and was appointed brigadier-general of volunteers in the Union army. He was made major-general in 1862, and took part in the attack on Fort Donelson, the battle of Shiloh and the capture of Vicksburg. He was relieved of his command of the Thirteenth Army Corps in July, 1863, and resigned from the army November, 1864.

McCLINTOCK, SIR FRANCIS LEOPOLD, a British explorer; born in Dundalk, Ireland, in 1819. At the age of 12 he entered the navy, and in 1845 was promoted to a lieutenancy. He was a member of an Arctic expedition sent in search of Sir John Franklin in 1848, and of another sent out in 1849. In 1851 he was promoted to the rank of commander, and put in charge of the *Intrepid*, one of the five vessels sent to the polar regions under Sir Edward Belcher. In 1857 Lady Franklin gave him the command of the expedition sent out by her, which resulted in solving the mystery of Sir John Franklin's fate. In 1860 he was knighted; in 1871 was made rear-admiral; in 1877, vice-admiral; and in 1884, full admiral. He was the author of *The Voyage of the "Fox" in the Arctic Seas* (1860).

McCLINTOCK, JOHN, an American educator; born in Philadelphia, Pennsylvania, Oct. 27, 1814. He graduated at the University of Pennsylvania in 1835, and was ordained in the Methodist Episcopal Church. He held the chairs of mathematics (1836-39) and Greek and Latin (1839-51) in Dickinson College; from 1848 to 1856 edited the *Methodist Quarterly Review*; was pastor of St. Paul's Methodist Episcopal Church, New York (1857-60); in 1860-64 was pastor of the American chapel in Paris; and in 1867 became the first president of Drew Theological Seminary at Madison, New Jersey. His great work was his *Cyclopadia of Biblical, Theological, and Ecclesiastical Literature* (10 vols., 1867-82). He wrote also *Sketches of Eminent Methodist Ministers* (1863), and translated Bungener's *History of the Council of Trent* (1855). His *Life and Letters* by Rev. George R. Crooks was published in 1876. He died in Madison, New Jersey, March 4, 1870.

McCLOSKEY, JOHN, an American Roman Catholic cardinal; born in Brooklyn, New York, March 20, 1810. He was educated at St. Mary's College, Emmittsburg, Maryland, and in 1834 was ordained priest. He studied in Rome for two years, and in 1837 was appointed pastor of St. Joseph's Church, New York City. In 1841 he became the first president of Fordham College, New York, but held the post only a year. In 1844 he was consecrated bishop, and made coadjutor of the diocese of New York. In 1847 he was appointed bishop of the new see of Albany, and while there he founded the theological seminary at Troy. In 1864 he was made

CARDINAL McCLOSKEY.

Archbishop of New York to succeed Archbishop Hughes, and in 1875 was created cardinal, being the first of that rank in the American church. He died in New York City, Oct. 10, 1885.

MCCLURE, ALEXANDER KELLY, an American journalist; born in Perry County, Pennsylvania, Jan. 9, 1828; edited the Mifflin (Pennsylvania) *Sentinel* (1846-50), and the Chambersburg *Repository* (1850-56); served in the Pennsylvania state legislature as a Republican. He supported Lincoln in 1860 and 1864, and Greeley in 1872; was an unsuccessful candidate for mayor of Philadelphia, and established the *Times* of that city in 1874, from which year he has been its editor.

MCCOLL, MALCOLM, a British ecclesiastic and author; born in Glenfinan, Inverness-shire, March 27, 1838. He was educated in Edinburgh, and in 1861 was appointed assistant-curate of St. Paul's, Knightsbridge; in 1862 was chaplain to the British Ambassador at St. Petersburg; curate of St. Paul's, 1864-67; traveled in Italy, 1867-69; in 1871, made rector of St. George, Botolph Lane, London; in 1884, canon of Ripon. He is the author of *Mr. Gladstone and Oxford* (2d ed., 1865); *Science and Prayer* (4th ed., 1866); *The Ober-Ammergau Passion Play* (6th ed., 1870); *The Eastern Question* (1877); and *Christianity in Relation to Science and Morals* (3d ed., 1890).

MCCOMB, a village of Hancock County, north-eastern Ohio, eight miles W.S.W. of Findlay, on the Cincinnati, Hamilton and Dayton and the New York, Chicago and St. Louis railroads. It is in a natural-gas belt, and has saw and grist mills, sash-and-blind factories, grain-elevators, furniture factories and tile-works. It is also in a rich farming region and oil-field. Population 1900, 1,195.

MCCOMB CITY, a town of Pike County, central southern Mississippi, 75 miles S. of Jackson, on the Illinois Central railroad. It is in a cotton and corn growing region, and is a supply-center for a large district. Population 1890, 2,383; 1900, 4,477.

MCCONNELSVILLE, a village and the capital of Morgan County, southeastern Ohio, 25 miles S.E. of Zanesville, on the Muskingum River and on the Zanesville and Ohio railroad. It is in an agricultural and natural-gas region, and manufactures flour, tobacco, agricultural implements, wagons, etc. There are extensive salt-works in the vicinity. Population 1890, 1,771; 1900, 1,825.

MCCOOK, a city of Red Willow County, central southern Nebraska, 90 miles W.S.W. of Kearney, on the Republican River and on the Burlington and Missouri Valley railroad. It is in a farming and stock-raising region, and has the division headquarters and repair-shops of the railroad. It has a large lumber-yard, a creamery, flour-mills and a brick-yard. Population 1890, 2,346; 1900, 2,445.

MCCOOK, the name of an American family of Scotch-Irish descent, remarkable for the number of its members who won distinction in the Union army during the Civil War, wherein they were known as the "Fighting McCooks." Of the ancestral stock:—DANIEL, born in Cannonsburg, Pennsylvania, June 20, 1798 was the son of an Irish refugee. Having been educated at Jef-

erson College, he removed to New Lisbon, and afterward to Carrollton, Ohio, and at the outbreak of the Civil War, although 63 years of age, enlisted in the Union army, and was commissioned major. He was killed near Buffington's Island, Ohio, July 21, 1863, while leading a party to oppose General Morgan's raid.—His son, GEORGE WYTHE, born at Cannonsburg, Pennsylvania, Nov. 21, 1821, fought in the Mexican War, and at the outbreak of the Civil War was made brigadier of Ohio volunteers, but owing to ill-health was able to assume command only for short periods. Died Dec. 28, 1877.—ROBERT LATIMER, another son, was born in New Lisbon, Ohio, Dec. 28, 1827; at the beginning of the Civil War he organized the Ninth Ohio Regiment; was promoted brigadier-general of volunteers, and was shot and killed while lying wounded in an ambulance near Salem, Alabama, Aug. 6, 1862.

—ALEXANDER MCDOWELL, another son; born in Columbiana County, Ohio, April 22, 1831; graduated at the United States Military Academy in 1852; entered the infantry, and served in New Mexico against the Apaches; was instructor at West Point (1858-61); and was promoted to the rank of first lieutenant in 1858. At the outbreak of the Civil War he was appointed colonel of the First Ohio Regiment, which he commanded in

GEN. ALEX. M. M'COOK.

the battle of Bull Run, gaining the brevet of brigadier-general of volunteers; commanded a division of the Army of the Ohio in the Tennessee and Mississippi campaigns, and received the brevet of colonel in the regular army after Shiloh; commanded the Twentieth army corps in the battles of Perryville, Murfreesboro and Chickamauga; in 1864 served in the middle military and in 1865 was in command of eastern Arkansas division. After the war he received the brevet of major-general in the United States army, and was mustered out of the volunteer service, being made lieutenant-colonel of the Twenty-sixth Infantry; raised to the rank of colonel in 1880; brigadier-general in 1890, and major-general in 1894. General McCook was one of the representatives of the President at the coronation of Czar Nicholas II of Russia.—DANIEL, a fourth son; born in Carrollton, July 22, 1834; graduated at the Alabama University in 1858; studied law, and removed to Leavenworth, Kansas, where he practiced as member of a law firm with William T. Sherman and Thomas Ewing. When the Civil War broke out he became captain in a local regiment; was made chief of staff of the First division of the Army of the Ohio; took part in the battle of Shiloh, and was raised to the rank of colonel. He commanded a brigade in General Sherman's army, and was chosen by Sherman to lead the assault against the Confederates at Kenesaw Mountain in the Atlanta campaign. Upon reach

ing the top of the enemy's works he was shot and mortally wounded. On July 16, 1864, he was promoted to the rank of brigadier-general in the United States Army, but died on the 21st of the same month.—EDWIN STANTON, another son; born in Carrollton, Ohio, March 26, 1837; educated at the United States Naval Academy; entered the Union army at the beginning of the Civil War as captain in an Illinois regiment, of which John A. Logan was the colonel; succeeded Logan in the command of his regiment, brigade and division in the campaign on the Mississippi, at Chattanooga and in Georgia; was brevetted major-general of volunteers in March, 1865; shot and killed in a public meeting in Yankton, South Dakota, Sept. 11, 1873.—CHARLES MORRIS, a sixth son; born in Carrollton, Ohio, Nov. 13, 1843; enlisted as a private, and was killed at Bull Run July 21, 1861.—JOHN JAMES, a seventh son; born in Carrollton, Ohio, May 12, 1845; was a student at Kenyon College at the outbreak of the Civil War; enlisted in the Sixth Ohio Cavalry, and served throughout the war, attaining the rank of captain with the brevet of colonel. After the war he took up the practice of law in New York City. He was consulting attorney for the prosecution in the trial of Dr. Charles F. Briggs for heresy.—JOHN, brother of the first Daniel, and uncle of the others mentioned above; born in Cannonsburg, Pennsylvania, Feb. 21, 1806; graduated at Jefferson College and at the Cincinnati Medical School; practiced medicine in New Lisbon and Steubenville, Ohio; served in the war as surgeon. Died in Washington, Oct. 11, 1865.—His son, EDWARD MOODY; born in Steubenville, Ohio, June 15, 1833, studied law, and went west to the region which is now Colorado, and began practice; enlisted in the Union army and was commissioned second lieutenant in 1861; served in the Mississippi, Chattanooga and Georgia campaigns; was commissioned brigadier of volunteers in 1864, and brevetted major-general in the following year. He resigned from the army in 1866, and was appointed minister to the Sandwich Islands; was selected by President Grant for the governorship of Colorado territory.—Another son, ANSON GEORGE, born in Steubenville, Ohio, Oct. 10, 1835; studied law, and was admitted to the bar; entered the Union army as captain in the Second Ohio Infantry in 1861; fought at Bull Run, in the campaigns of the Army of the Cumberland under Buell, Rosecrans and Thomas, in Sherman's Atlanta campaign, and in the Virginia valley, where he commanded a brigade. He was brevetted brigadier-general of volunteers; was assessor of United States revenue at Steubenville (1865-73); Republican member of Congress from New York (1877-83), and subsequently secretary of the Senate.—Another son, HENRY CHRISTOPHER, American minister and entomologist; born at New Lisbon, Ohio, July 3, 1837. He learned the printer's trade, taught, and afterward went to Jefferson College, Pennsylvania, graduating in 1859, studying theology at the Western Theological Seminary, Allegheny,

Pennsylvania. Enlisted in the Civil War, and served as lieutenant and chaplain, and later held pastorates at Clinton, Illinois (1862-63), in St. Louis, Missouri (1863-70), and in Philadelphia at the Tabernacle Presbyterian Church since 1870. He has been an active worker in the Entomological Society and in the Philadelphia Academy of Natural Sciences, and has published works on scientific subjects, mostly on ants and spiders, and also several religious works. Among them are *The Last Year of Christ's Ministry* (1871); *The Tercentenary Book* (1873); *Mound-Making Ants of the Alleghanies* (1877); *The Natural History of the Agricultural Ant of Texas* (1880); *Honey Ants and Occident Ants* (1882); *American Spiders and their Spinning Work* (2 vols., 1889-90).—Another son, RODERICK SHELDON, born in New Lisbon, Ohio, March 10, 1839; educated at the United States Naval Academy, graduating in 1859; during the Civil War took part in engagements off the coast of North Carolina; fought at both the Fort Fisher battles; retired from the service in 1885. He died Feb. 13, 1886.—Another son, JOHN JAMES, born in New Lisbon, Ohio, Feb. 4, 1843; graduated at Trinity College in Hartford, Connecticut; began the study of medicine, but gave it up for the theology and entered the Protestant Episcopal ministry; served for a short time with the Union army in West Virginia; held pastorates in Detroit, Michigan, and East Hartford, Connecticut, and in 1883 was made professor of modern languages in Trinity College. He interested himself in sociological questions, especially those relating to charity, and contributed frequently to the magazines.

MCCORMAC, SIR WILLIAM, a British surgeon, born at Belfast, Ireland, Jan. 17, 1836; was educated in the Belfast Institution, in Dublin and in Paris; saw service at Metz and Sedan during the Franco-German War, as surgeon-in-chief of the Anglo-American ambulance, and in the Turko-Servian War of 1876. He became the senior surgeon and lecturer on surgery at St. Thomas's Hospital, and President Royal College of Surgeons. In 1881 he acted as honorary secretary-general of the International Medical Congress, and was on special service as Consulting Surgeon in South Africa during the Boer war of 1899-1900. He is the author of *Work Under the Red Cross*, and treatises on *Antiseptic Surgery and Surgical Operations*; besides numerous papers contributed to medical journals.

MCCORMICK, CYRUS HALL, an American inventor, born at Walnut Grove, Virginia, Feb. 15, 1809. He was educated in common schools, and worked for his father on the farm and in the workshop. In 1831 he invented his reaper, patenting it in 1834. In 1847 he moved to Chicago and erected harvester-works. He gave \$100,000 to found the McCormick Theological Seminary (Presbyterian) in Chicago, and afterward endowed a chair in Washington and Lee University, Lexington, Virginia. For his invention he was made officer of the Legion of Honor and received other marks of distinction at home and abroad. He died in Chicago, May 13, 1884. See also HARVESTING MACHINERY, in these Supplements.

MCCORMICK'S MACHINES. See HARVESTING MACHINERY, in these Supplements.

MCCOSH, JAMES, a Scotch-American educator; born at Carskeoch, Ayrshire, April 1, 1811; son of

JAMES McCOSH.

a farmer, a graduate in arts of Glasgow University and in theology of the University of Edinburgh in 1834; ordained pastor of a congregation of the Scotch Kirk in Arbroath in 1835; accepted a call in 1839 to Brechin; joined the Free-Church movement in 1843; professor of metaphysics and logic in Queen's College, Belfast, Ireland, 1851-68; studied the higher educa-

tional systems of Germany and the United States in those countries; president of the College of New Jersey at Princeton, 1866-88; president emeritus until his death at Princeton, Nov. 6, 1894.

Among other academic honors, Dr. Cosh was made a doctor of laws by Aberdeen and Harvard universities. He was long known as a metaphysician, and he expounded with ability the philosophy of the common-sense school, giving development to the doctrines of Sir William Hamilton. His principal publications on this subject were *The Intuitions of the Mind Inductively Investigated* (1860, new edition 1875); *Examination of J. S. Mill's Philosophy: being a Defense of Fundamental Truth* (1866 and 1875); *Laws of Discursive Thought* (1869 and 1876); *The Scottish Philosophy* (1874), a historical study; *The Emotions* (1880); and his *Philosophical Series* (1882-86), in eight parts, the last of which is a critical examination of Herbert Spencer's philosophy, and Dr. McCosh developed it into two volumes and brought it out in 1887 as *Realistic Philosophy Defended*. His other publications were a sketch of his friend and teacher, Chalmers, sermons delivered on special occasions, and controversial articles in defense of intuitive philosophy and of fundamental Christian dogma.

As a teacher and director of a great college, he was greatly beloved and trusted. He inculcated a love of truth in a spirit hospitable to the ideas of scientific thinkers, and his example did much to end the senseless practice of denouncing evolution as hostile to a Christian creed. When he took charge of Princeton College it was suffering from the withdrawal of its Southern students caused by the Civil War. He saw the list of students and of instructors more than trebled, the college equipped with new and handsome buildings and its endowment increased to several million dollars.

MCCOY, SIR FREDERICK K., a British scientist; born in Dublin, in 1823. He was educated for the medical profession in Dublin and Cambridge. He made palæontological investigations for Sir Richard Griffith's geological map of Ireland, which were published in 1844 under the title *Synopsis of the Carboniferous Limestone Fossils of Ireland*; was appointed professor in Queen's University, Ireland; in 1852,

was made professor of natural science in the University of Melbourne, Australia. He established the National Museum of Natural History and Geology in Melbourne, and has published for the government of Victoria two works in installments, *Prodromus of the Zoology of Victoria* and *Prodromus of the Palæontology of Victoria*, and has been knighted by the Queen. He has published about one hundred papers on zoological and palæontological subjects.

MCCRARY, GEORGE W., an American jurist and statesman; born Aug. 29, 1835, in Evansville, Indiana. With his parents, in 1836, he went to that part of Wisconsin territory which afterward became the state of Iowa. He was admitted to the bar in 1856, and in 1857 was elected to the state legislature; from 1861 to 1865 was state senator from Keokuk, and chairman of the committee on military affairs. In 1868 he was elected to Congress, and served until March, 1877. In 1876 Judge McCrary introduced in Congress the Electoral Commission Bill, which resulted in the choice of Rutherford B. Hayes as President. When President Hayes formed his cabinet, McCrary was given the war portfolio, which he held two years. He resigned to accept the judgeship of the United States Circuit Court, to which he was appointed in December, 1879. In March, 1884, he resigned his judgeship to become general counsel for the Atchison, Topeka and Santa Fé Railroad Company. He published *The American Law of Elections* (1875). He died in St. Joseph, Missouri, June 23, 1890.

MCCULLOCH, HUGH, an American financier; born at Kennebunk, Maine, Dec. 7, 1808. He was

educated at Bowdoin College, studied law in Boston, and then went to Fort Wayne, Indiana, where in 1835 he became cashier of a branch of the State bank. From 1855 to 1863 he was president of the bank of the State of Indiana, and then became Comptroller of the Currency. In 1865 he was appointed Secretary of the Treasury, and held

HUGH McCULLOCH.

office till 1869. In 1871-78 he was engaged in banking in London; and in 1884 was again appointed Secretary of the Treasury, holding the post till the end of Arthur's administration. He published *Men and Measures of Half a Century* (1888). Died near Washington, D. C., May 24, 1895.

MCCULLOUGH, JOHN EDWARD, an Irish-American actor; born in Coleraine, Ireland, Nov. 2, 1837. In 1853 he went to the United States with his parents, settled in Philadelphia, and was apprenticed to a chair-maker. In 1855 he made his first appearance on the stage in *The Belle's Stratagem*, at the Arch-street theater, and soon afterward chose acting as his profession. In 1866 and 1868 he traveled with Edwin Forrest, acting the second parts in his plays, and when Forrest died in 1872 he left McCullough all his plays in manuscript, considering him as his successor on the stage. In 1869 McCul-

lough took the management, with Lawrence Barrett, of the Bush-street theater in San Francisco. His repertoire consisted of *Brutus*, *Jack Cade*, *The Gladiator*, *Virgilius*, etc. He died in an insane asylum, Nov. 8, 1885.

MACDONALD, MAJOR SIR CLAUDE MAXWELL, K. C. B., K. C. M. G., late British Minister at Pekin; was born in 1852, and is the son of the late Major-Gen. J. P. Macdonald. He studied at Sandhurst and entered the army as lieutenant in the 74th Highlanders in 1872. He became captain in 1881 and major in 1882, in which part he took part in the battle of Tel-el-Kebir. Was mentioned in despatches and decorated with the Khedive's Star; he also obtained Egyptian medal and clasp. Later on, he was attached to the Suakin expedition, and was in the battles of El-Teb and Tamai, and was wounded in the latter. For a time he was attached by the English war office to the agency at Cairo, and subsequently acted as Consul-General at Zanzibar, and as Commissioner on the West African coast. Later still, he acted as British commissioner on the Niger coast and was consul in the Kameroons. In 1892 he was created a K. C. M. G., and in 1898 a K. C. B. In 1896, he was appointed Minister to the Court of China at Pekin, where he was beleaguered during the Boxer uprising in 1900 within the British Legation at the capital.

MCCURDY, JAMES FREDERICK, an American oriental scholar; born at Chatham, New Brunswick, Feb. 18, 1847; educated at the University of New Brunswick and at Princeton Theological Seminary; instructor in Semitic languages at Princeton (1873-82); studied in Leipsic and Göttingen (1882-84); lecturer at Princeton (1885-86); afterward professor of oriental languages in the University of Toronto. He is the author of a *Commentary on Haggai* (for Lange-Schaff Commentary on the Bible, 1876); *Aryo-Semitic Speech* (1881); and *The Assyrian and Babylonian Inscriptions, with Special Reference to the Old Testament* (1886).

MACDONALD, FLORA, a Scotch girl who aided Charles Edward, the young Pretender, to escape after the battle of Culloden. She was born in 1722, at Milton, in South Uist, and adopted by Lady Clanranald, who educated her in Edinburgh. In 1746 she conducted Prince Charles, disguised as "Betty Burke, the Irish Woman," from Ormiclade, in Benbecula, to Monkstadt, in Skye, and thence to Portree; and in consequence was arrested by the English authorities and kept prisoner for a year in Leith Roads and in London. After her release she married Allan Macdonald of Kingsburgh, and in 1774 emigrated to North Carolina. Upon the outbreak of the Revolution her husband became a brigadier-general in the British Army, and later was captured by the colonial forces. Flora returned to Scotland in 1779, and two years later was joined by her husband and settled in Kingsburgh. She died March 5, 1790, and was buried at Kilmuir, where in 1880 an Iona cross of Aberdeen granite, 28½ feet high, was erected over her grave.

MACDONALD, GEORGE, a Scottish novelist and poet: was born at Huntly, Aberdeenshire, in 1824,

and educated at Aberdeen University and the Independent College, Highbury, London, where he studied for the ministry.

He preached for a time in Sussex and at Manchester, as a Congregationalist, but shortly afterward retired from the ministry and became a lay member of the Church of England.

His tastes from the first were literary, his work has always been deeply tinged by broad theological views, though he retained his early fervor and deep spiritual instincts. Many of his stories are strongly conceived, and abound in religious dialogue, cast in the mould of Scottish dialect but softened by the author's poetic moods and tender emotions. He is particularly happy in addressing or treating of children, both in his poems and prose allegories. Of these, perhaps the best are *Dealing With Fairies* (1867); *At the Back of the North Wind* (1873); and *The Princess and the Goblin* (1871). *The Disciples, and Other Poems* (1868) and the fuller collection of his *Poetical Works* (2 vols., 1893) contain much thoughtful and finely expressed verse. Not only as a novelist but as a lecturer, Mr. Macdonald is well known in the United States. In 1877 he received a pension of £100 sterling from the Civil List in acknowledgment of his services to literature. The more important of his novels are as follows: *David Elginbrod* (1862); *Alce Forbes* (1865); *Annals of a Quiet Neighborhood* (1866); *Scaboard Parish* (1867); *Robert Falconer* (1868); *Sir Gibbie* (1869); *Wilfred Cumbermede* (1871); *The Vicar's Daughter* (1872); *Malcolm* (1874); *St. George and St. Michael* (1875); *Thomas Wingfold, Curate* (1876); *Marquis of Lossie* (1877); *Paul Faber* (1878); *What's Mine is Mine* (1886); and *There and Back* (1891). Mr. Macdonald has also published three volumes of a religious character: *Unspoken Sermons* (1885); *The Miracles of our Lord* (1884); and *The Hope of the Gospel* (1892). He has also issued a collection of *Essays* (1893).

MACDONALD, SIR JOHN ALEXANDER, Canadian statesman, was born at Glasgow, Scotland, Jan. 11, 1815. His father, a Sutherlandshire man, brought him to Canada in 1820, and settled near Kingston, then the most important town in Upper Canada. Here young Macdonald was educated at the Royal Grammar School, and in his sixteenth year was articled to the law and in due course was admitted to the bar. During the rebellion of 1837 he brought himself into note by his defense of a Pole named Von Shoult, who had been con-

GEORGE MACDONALD.

SIR JOHN A. MACDONALD.

cerned in giving aid from the American side to the Canadian rebels. The era succeeding the rebellion is the turning-point in the political history of the Canadas. It is the era in which reform was to see its work crowned in the overthrow of the oligarchical "Family Compact," in the application of the elective principle to the irresponsible legislative council, and the full attainment of responsible government in the colony. It was at this period (1844) that Sir John Macdonald entered political life, and by his abilities and readiness in debate gained that commanding position in Canadian politics, at the head of the Conservative party, which secured him in later years a long lease of power. Macdonald attained office, first as Receiver-General and afterward as Commissioner of Crown Lands. Questions of grave moment were then agitating the country, including the cry for representation by population, for the secularization of the clergy reserves, for the abolition of seigniorial tenure, and compensation for rebellion losses. These were followed a little later by the agitation over the seat of government, which brought with it the episode of the Brown two-days administration and its Tory pendant, the "double-shuffle," an evasion of the constitutional rule which requires ministers on taking or resuming office to go to their constituencies for re-election. After an experience in opposition, Mr. Macdonald became Attorney-General in the coalition government of 1854, and two years later assumed the Premiership. His political fortunes varied considerably down to the period of confederation, which was brought about by a deadlock of parties, the contest being one of race and religion as well as of faction-strife. The chief credit in founding the new nation and knitting together under one federal government the various sections of what now forms the Canadian Dominion, is due to Sir John. Naturally, when the Union was consummated in 1867, he became Premier, and acted as Attorney-General and Minister of Justice, while the seat of government was permanently located at Ottawa. With confederation there passed away, in some measure, the enfeebling sectional rivalries which had so long retarded the progress of the country and exercised a baneful influence on politics. The area of the country was at this epoch largely extended by the accession of the vast territory that for two hundred years had been under the sway of the Hudson Bay Company. With the acquisition of the northwest and the entrance of British Columbia into the Confederation, there came the need of railway construction to connect the Pacific colony with its partners in the east. At first, political difficulties brought a crisis upon the country, in which Sir John Macdonald's administration fell, in 1873, owing to its being implicated in corrupt dealings with the proposed contractors for the railroad. In 1878, however, he regained power, and continued until his death in 1891 at the head of his own Liberal-Conservative administration. His return to office was brought about, in the main, by a change of economic policy and the

initiation of a system of protection to native industries. In the course of his premiership, Sir John Macdonald was repeatedly called upon by the Imperial country to take part at Washington in matters of state policy and in the settlement of international questions between England and the United States. In 1871 he acted as one of the high commissioners in the settlement of the Alabama Claims and the initiation of the Washington Treaty of that year. He was one of the delegates from Canada in 1866 who took part in the drafting of the British North America Act, and he visited London in 1880 to arrange with the Imperial authorities the terms for the construction of the Canadian Pacific Railroad. Four years later he also visited London to take part in the discussion of the question of Imperial Federation, in which he was a prime mover. In 1867 he was created a K.C.B.; in 1879 he was sworn a member of the Imperial Privy Council; and in 1884 received the decoration of the Grand Cross of the Bath. Sir John possessed in a remarkable degree the art of governing, and though his political methods were often open to criticism, he has left an indelible impress upon the country he loved. At his death Lady Macdonald was created a Baroness in consideration of her husband's distinguished services to the crown. He died in Ottawa, Canada, June 6, 1891.

G. MERCER ADAM.

MACDONALD, JOHN DENIS, a British physician; born Oct 26, 1826, and educated for the medical profession in the Cork School of Medicine and at King's College, London. In 1852 he was appointed to H. M. S. *Herald* in its exploring expedition in the Pacific; in 1859, to the *Icarus*; in 1880, inspector-general of hospitals; retired in 1886. Among his works are *Sound and Colour* (1869); *Guide to Microscopical Examinations of Drinking-Water* (1875); and *Outlines of Naval Hygiene* (1881).

MACDONALD, JOHN HAY ATHOLE, a Scotch jurist and author; born Dec. 27, 1836; educated at the Universities of Edinburgh and Basel; became advocate (1859); Queen's counsel. (1880); solicitor-general for Scotland and commissioner for northern light-houses (1876-80); and Lord Advocate of Scotland (1885-88); sat in Parliament for Edinburgh and St. Andrew's universities (1885-88). He was made member of the Institution of Electrical Engineers in 1886. He is an authority on criminal law and on infantry drill, and has published *Macdonald on Tactics*; *Treatise on the Criminal Law*; *Our Trip to Blunderland*; and *Common Sense on Parade*.

MCDONOGH, JOHN, an American philanthropist; born in Baltimore, Dec. 29, 1779. He engaged in mercantile business in Baltimore; in 1800 moved to New Orleans, where he soon accumulated a fortune in the commission and shipping business, and founded the town of McDonoghville, Louisiana. In 1822 he began paying his slaves wages, and allowed them, with the money thus received, to purchase their freedom for a moderate

sum. He also became vice-president of the American Colonization Society. At his death he left the bulk of his property, amounting to \$2,000,000, to the cities of New Orleans and Baltimore, for the purpose of founding free schools. In 1873, after many years of litigation, land was purchased near Baltimore and the McDonogh labor schools were established, at which seventy boys are instructed annually. In New Orleans the principal of the legacy was invested in schools, which are conducted, in connection with the public schools, by the city. He died Oct. 26, 1850, and his biography came from the pen of William Allan, under the title of *The Life and Work of John McDonogh* (1886).

MACDONOUGH, THOMAS, an American naval officer; was born in Newcastle, Delaware, Dec. 23, 1783. He entered the navy as midshipman in 1800; served in Tripoli under Decatur; was promoted lieutenant in 1807, and master-commander in 1813. In August, 1814, he gained a victory over a British fleet under Captain Downie, on Lake Champlain, for which he received a gold medal from Congress and numerous civic honors from cities and towns. The Mediterranean squadron was his last command. He died on his homeward voyage, Nov. 16, 1825.

MCDUGALL, WILLIAM, a Canadian statesman; born in Toronto, Jan. 25, 1822; was educated at Victoria College; studied law, and was admitted to the bar in 1847. In the following year he established the *Canada Farmer*, which later was changed to the *Canadian Agriculturist*; and in 1850 founded the *North American*, which was absorbed in the *Toronto Globe* in 1857, on the staff of which he was employed until 1859. He was a member of the Canadian Assembly from 1858 to 1867; of the Dominion Parliament from 1867 to 1872, and from 1878 to 1882. In the first Dominion government he was Minister of Public Works, holding the office until 1869, when he was appointed lieutenant-governor of the Northwest, but rebellion barred him from the territory.

MCDOWELL, IRVIN, an American general; born in Columbus, Ohio, Oct. 15, 1818. He was educated at the College of Troyes, France, and graduated at West Point in 1838, entering the artillery. He served on the Canadian frontier during the disturbances which occurred before the settlement of the northeast boundary dispute; was instructor at West Point (1841-45); in the Mexican War was on the staff of General

GEN. IRVIN MCDOWELL.

Wool, and became his acting adjutant-general; was made captain in 1847; after the war, was assistant adjutant-general in New York and Washington; promoted to major (1856); at the breaking out of the Civil War was aide-de-camp on Scott's staff; in May, 1861, was made brigadier-general

and given command of the Department of Northeastern Virginia. On May 29th he received command of the Army of the Potomac, consisting of 30,000 raw recruits. With these he advanced against the enemy under Beauregard, and the first battle of Manassas or Bull Run (q.v.) was fought July 21. In 1862 McDowell was placed in charge of the First Corps of the reorganized Army of the Potomac, afterward detached as the Army of the Rappahannock, and raised to the rank of major-general of volunteers, McClellan having the chief command. In the summer of 1862 his force was added to General Pope's Army of Virginia, and he participated in the campaign which followed in northern Virginia. After this he was retired from service in the field, and in 1864 was placed in command of the Department of the Pacific; in 1865, of the Department of California; and in the following year brevetted major-general in the United States Army; in 1868 he was placed in charge of the Department of the East; in 1872 made major-general, and afterward placed in charge, successively, of the Divisions of the South and West. He was retired in 1882, and died in San Francisco, May 4, 1885.

MCDUFF, JOHN ROSS, a Scotch minister and author; was born at Bonhard, Perthshire, in 1818; educated at the University of Edinburgh; ordained in 1843; held pastorates in Kittens, Forfarshire (1843-49); in St. Madoes, Perthshire, (1849-55); and in Glasgow, in the church of Sandyford, (1855-57). After the latter year he lived in retirement at Chiselhurst, Kent, until his death, April 30, 1895, and devoted himself to literary labors. His works were mainly on religious subjects, and have had a large circulation in England, Scotland and America. Among them were *The Wells of Baca* (1847); *Memories of Bethany* (1857); *The Parish of Taxwood* (1884); and *Knocking* (1872). In all, they numbered nearly one hundred.

MCDUFFIE, GEORGE, an American statesman; born in 1788, in Columbia (now Warren) County, Georgia. He was admitted to the bar in 1814, and in 1818 was sent to the South Carolina legislature. In 1821 he was chosen to Congress, and served until 1834. He then was elected governor of the state, which office he held till 1836, when he retired to private life. From 1842 to 1846 he was a United States Senator. He published, besides numerous addresses, a *Eulogy on Robert Y. Hayne* (1840). He died March 11, 1851.

MACE. See NUTMEG, Vol. XVII, p. 666; and OILS, Vol. XVII, p. 744.

MACÉ, JEAN, a French editor and *littérateur*; born in Paris, April 22, 1815. His parents were laborers, but he was sent to the College Stanislas, and in 1836 had charge of a class in history at that institution; served in the army (1842-45); was secretary to Théodose Burette, his former professor of history (1845-47); editor of *La République* in 1848. After the *coup d'état* he retired to Beblenheim, in Alsace, and taught school; in 1864 founded and edited, with M. Stahl, *Le Magasin d'Éducation et de Récréation*. In 1880 he was decorated with the cross of the Legion of Honor,

and in 1883 elected to the French Senate. M. Macé was the author of a number of books, mostly of an instructive sort, for children. Among them are *Histoire d'une Bouchée de Pain* (1861); *Contes du Petit-Château* (1862); *Arithmétique du Grand-Papa* (1863); *L'Anniversaire de Waterloo* (1868) and *La France Avant les Francs* (1881). He died Dec. 13, 1894.

MCENTEE, JERVIS, landscape-painter; born at Rondout, N. Y., July 14, 1828; began the study of art in New York, under F. E. Church, about 1850; in 1861 was elected member of the Academy; visited Europe in 1869. He endeavored to portray certain somber phases of nature, his work being tinged with melancholy. Among his best-known canvases are *Indian Summer*; *The Melancholy Day*, which led to his election to the Academy; *November*; *October Afternoon*; *The Kaatskills in Winter* (1884); *Christmas Eve* (1885); and *Shadows of Autumn* (1886). Died at Rondout, N. Y., Jan. 27, 1891.

MACEO, ANTONIO, a Cuban mulatto general; born near Barajagua, in Santiago de Cuba, July 14, 1848. He and his brother José, who was killed in battle, July 5, 1896, enlisted under Gomez, and fought through the ten years' war, 1868-78, attaining the rank of major-general of cavalry. In 1873 he defeated General Weyler at Guimaro. After the pacification of Zanjon he fought on until compelled to surrender. Escaping from Cuba, he took refuge in Costa Rica, whence he returned in 1888 to Santiago to foment a fresh insurrection. Failing in this he fled again, but on the outbreak of the revolt of February, 1895, he and his brother hastened to join the forces of his old commander, Gomez. He participated in the warfare, leading his troops into the province of Pinar del Rio, from which Weyler could not dislodge him. In a skirmish near Mariel, on Dec. 2, 1896, he received mortal wounds, and died on the field of battle.

MCFALL, MRS. FRANCES ELIZABETH (CLARKE), an English novelist, writing under the pseudonym, "Sarah Grand"; born at Donaghadee, in the North of Ireland, of English parents. After the death of her father, which occurred when she was very young, her mother settled in Yorkshire, and she was sent to school, first at Twickenham, and later in Holland Road, Kensington. At sixteen she married an army officer, and afterward accompanied him to Ceylon, China and Japan. She began writing when she was very young, her first published story appearing in *Aunt Judy*, a girls' magazine. After this she wrote the highly overstrained and rather improbable novel, *Singularly Deceived*, which was published by Messrs. Blackwood. In 1888 appeared her *Ideala*, a problem story, treating of the marriage question, and a sort of prelude to her *Heavenly Twins*, which appeared in 1893. *Ideala* was refused by the publishers, and printed at the author's own expense. The *Heavenly Twins* fared in the same manner; but, after it had already come from the press, the risk of its publication was assumed by the printer. The novel, despite its three volumes

and its didactic purpose, was immediately successful. The book, written in a desultory style, with much description and little continued action, is intended as a protest against the injustice of society which permits or ignores lapses from morality before marriage on the part of the man, but metes out its severest condemnation for such on the woman. She published in 1894 a collection of her shorter stories under the title, *Our Manifold Nature*.

MACFARREN, SIR GEORGE ALEXANDER, an English composer; born in London, March 2, 1813. He studied at the Royal Academy of Music, where he became professor of harmony in 1838. In 1875 he was appointed principal of the academy, and also professor of music at Cambridge University. He was knighted in 1883. During the greater part of his life Dr. MacFarren was blind, but continued to perform the duties of his various positions. His compositions were dictated to his wife. His first important work, a *Symphony in F Minor*, was produced in 1834. Two years later appeared his overture, *Chevy Chase*; and in 1838 his first work for the stage, *The Devil's Opera*. Among his best-known compositions are the cantatas *Leonora* (1851), and *May Day* (1856); *John the Baptist* (1873), and *The Resurrection* (1876), oratorios; the operas *Don Quixote* (1846), *Charles II* (1849), and *Robin Hood* (1860), besides a great number of songs, sacred and secular. He wrote much upon the theory of music, and published in 1860, *Rudiments of Harmony*. He died Oct. 31, 1887.

MACGAHAN, JANUARIUS ALOYSIUS, an American newspaper correspondent and author; born near New Lexington, Perry County, Ohio, June 12, 1844; worked on his father's farm, taught school, and in 1864 went to St. Louis, Missouri. Here he wrote news-letters to the *Huntington Democrat*. In 1869 he went to Europe, and in 1870 was engaged as the New York *Herald* special correspondent. As such he followed General Bourbaki on his retreat in the Franco-Prussian War, and accompanied the Russian expedition against Khiva in 1873, publishing his experiences under the title of *Campaigning on the Oxus and the Fall of Khiva* (1874). In 1874 he went to Spain to report the Carlist war, and in the following year accompanied Captain Allen Young on his voyage in the *Pandora* to the Arctic seas. In 1876 he became the correspondent of the *London Daily News*, and wrote, for that paper, accounts of the Turkish massacres in Bulgaria, and later the events of the Russo-Turkish War. He published, besides the work mentioned, *Under Northern Lights* (1876), an account of his Arctic voyage; and *Turkish Atrocities in Bulgaria* (1876). He died in Constantinople, June 10, 1878.

MCGEE, THOMAS D'ARCY, an Irish-Canadian politician; was born at Carlingford, Louth, Ireland, April 13, 1825. For a time he was editor of the Boston (Massachusetts) *Pilot*, and then went to Ireland, where he was employed on the staff of the *Dublin Freeman's Journal*, and later of *The Nation*. He became involved in the

"Young Ireland" movement, and was obliged to flee to America; in 1848 established *The American Celt*, and then *The Nation*. Subsequently his opinions changed, and he became an ardent Royalist, moved to Canada, and established a paper called the *New Era*. In 1857 he was chosen to the Canadian Parliament, and from 1864 to 1867 was president of the executive council. He made himself obnoxious to the members of the Fenian society, and on the evening of April 7, 1868, when returning from a night session of Parliament, he was assassinated at the door of his hotel. He published *Historical Sketches of O'Connell and His Friends* (1845); *Life of Edward McGinn* (1857); *Canadian Ballads* (1858); and *Popular History of Ireland* (1862).

MCGILL, JAMES, a Canadian philanthropist; born in Glasgow, Scotland, Oct. 6, 1744. He emigrated to Canada before the American Revolution, engaged for some time in the Northwest fur trade, and subsequently settling in Montreal, became a successful merchant there. He was for many years a member of the Lower Canada Assembly, and subsequently a member of the legislative and executive councils. He bequeathed to the college in Montreal, which bears his name, property valued at £30,000 and £10,000 in money. He died in Montreal, Canada, Dec. 19, 1813.

MCGILL UNIVERSITY, Montreal, Canada, was founded in 1821 with funds (\$50,000) bequeathed by James McGill, a Montreal merchant who was engaged in the Northwest fur trade, and for a time was under the control of the Royal Institution for the Advancement of Learning. In the year named it obtained a separate charter, of which repeated modifications and extensions have been made. Donations to McGill College and University, since its foundation, amounted in 1894 to \$2,184,961, of which \$447,424 was represented by grounds and buildings, and \$120,423 by other property, while \$1,501,291 was invested for revenue. During the year 1893-94 the fees amounted to \$25,614; the income from investments to \$72,478, and donations and subscriptions to \$12,197. The institution bears the relation to the English and Protestant population of the province of Quebec that the University of Toronto bears to the more homogeneous population of the Province of Ontario. Sir J. William Dawson, the geologist, was the principal of McGill from 1855 to 1893.

EDWARD M'GLYNN.

McGLYNN, EDWARD, an American clergyman; born in New York City, Sept. 27, 1837. In 1860 he was ordained to the Roman Catholic priesthood, and in 1866 became pastor of St. Stephen's Church in New York City. In 1886, on account of his ignoring the papal demands to

appear at the Vatican on a charge of supporting Henry George's single-tax theories and opposing the establishment of parochial schools, he was excommunicated. In 1887 Dr. McGlynn became president of the Anti-Poverty Society, and in behalf of his economic opinions he lectured widely. In the latter part of 1893 he was reinstated in his clerical functions. He died at Newburg, N. Y., Jan. 7, 1900.

MACGREGOR, a city of Clayton County, northeastern Iowa; on the Mississippi River, 55 miles above Dubuque, and on the Chicago, Milwaukee and St. Paul railroad. It has good schools and manufactories of wagons, carriages and windmills and railroad repair-shops. It has large grain and live-stock interests. It has a picturesque situation, and is near the highest point on the Mississippi River. Population 1890, 1,160; 1900, 1,498.

MACGREGOR, JOHN, an English canoe-traveler and author; born at Gravesend, Jan. 24, 1825. He was educated at Trinity College, Dublin, and at the college of the same name in Cambridge; traveled in Europe and the East; studied law, and was admitted to the bar in 1851. During the greater part of his life he traveled in Europe, Asia and America, making frequent canoeing expeditions. His books, written under the pseudonym "Rob Roy," are records of his experiences. Among them are *Our Brothers and Cousins: a Tour in Canada* (1859); *The "Rob Roy" on the Baltic* (1866); *A Thousand Miles in the "Rob Roy" Canoe* (1867); and *The "Rob Roy" on the Jordan, Nile and Red Sea* (1874). He died at Bournemouth, England, May 16, 1892.

MACHÆRODONT FOSSILS. See MAMMALIA, Vol. XV, p. 435.

MACHAON. See SURGERY, Vol. XXII, p. 674.

MACHIAS, a town and the capital of Washington County, southeastern Maine, on Machias River, at the head of navigation, 70 miles E. of Bangor. It is a port of entry, and contains a custom-house, foundry, sash-and-blind, factory and many good schools. Lumbering and ship-building are important industries. It has regular boat communication with Portland and Rockland. There is a stage line to Ellsworth. Population 1890, 2,035; 1900, 2,082.

MACHINE AND RAPID-FIRE GUNS. See GUNMAKING, Vol. XI, pp. 285-288; GUNNERY, and GUNMAKING, in these Supplements.

*MACHINE TOOLS.—SPECIAL FORMS. Machine-tools, in modern times, have assumed such innumerable forms, and are constructed for so many peculiar and special purposes, that it would be impossible here to describe, or even catalogue, so much as simple representative types. The inventiveness of the Anglo-Saxon, and especially of the American, mechanic has produced wonderfully efficient machines of these as of all other classes; and in spite of the high cost of labor and material in the United States, their perfection has become such, and their production so large, and at so small a cost—in consequence of the application

72" LATHE.—SCREW-CUTTING AND TURNING, WITH SCREW-FEED.

SELF-ACTING SLIDE-LATHE.—TURNING AND SCREW-CUTTING FEEDS.

of special tools to their manufacture, and in consequence, also, of the general employment of the piece-work and gauge-work systems—that American tools of these classes are sent into the markets of Europe and throughout the world. Although this exportation has only recently become important, the total exports in 1891 amounted to nearly \$20,000,000. The article on MACHINE-TOOLS, (Vol. XV, pp. 152-157), gives a very complete and symmetrical account of the general subject, and only special cases need be studied here,—such as illustrate that peculiar talent which only the born inventor and mechanic exhibits, and which now appears everywhere, thanks to a century of wise support of well-conceived patent laws in the United States, and in less degree, usually, in other countries, as well

as to the native genius for invention and the demand consequent upon the high price of labor.

In every branch of manufactures the man and his tool are to-day one, and the desirability of adapting a tool to every purpose in construction is constantly adding to the already enormous list of these special tools. New inventions bring in new wants; and, new wants satisfied, multiplied numbers of other desires arise, to be similarly met by still more ingenious and novel and useful devices. The gun-manufacture first illustrated these points; then the tool-makers supplied themselves with special tools for their own work; then sewing-machines were made on the piece-work system; then the larger machines came to be similarly built, and even locomotive and stationary engine manufacturers adopted the method of

12-FOOT BORING AND TURNING-MILL, WITH THREE SADDLES.

manufacturing in quantity, with all parts interchangeable, and of assembling complete machines as ordered, one or a dozen, as required, from the miscellaneous stock accumulated, all parts fitting accurately,—much more accurately, in fact, than was usual under the older system of making each machine complete by itself. Mechanics have become accustomed to working to gauge, and within limits measured by the thousandth or the ten-thousandth of an inch, and “tight fits” and “easy fits” are readily and certainly secured, where desired, varying the one from the other by the forty-thousandth of an inch. Every available form of natural power, and every possible method of application of mechanism, conspire to reduce costs of manufacture through the use of special tools. Meantime the value, and naturally the price, of skilled labor steadily rises. Steam, water, gas and electricity have more and more come to be substituted for simple manual strength, and more and more this leaves the brain at liberty to devote itself to its higher work.

The continually increasing employment of iron, and especially of steel, in constructions of every sort is stimulating improvement as constantly in the adaptation of the machine-tool to its tasks.

while the steady rise in value of labor is stimulating as continually the inventor and the designing engineer to greater and greater improvement.

The international jury of 1876, at Philadelphia, commenting on the work of one maker of these tools, said: “This exhibit, when considered in regard to its extent and value, its extraordinary variety, and its general excellence, and also for the large amount of ingenuity displayed in the numerous new devices that are introduced, is probably without a parallel in the past history of international exhibitions, and, taken as a whole, it is worthy of the highest honor that can be conferred. Every single machine-tool or piece of apparatus that is displayed in this vast offering would, for itself, command the strongest recommendation for an award, even if it stood alone as a unit; but here every unit is surrounded by thirty-three distinct machines, each one being of the highest standard in its particular class. All of these machines are characterized by extreme refinement in every detail, by the superior quality of the material employed in their construction, by first-class workmanship, both in regard to nicety of fitting and precision, and for the mathematical accuracy of all the parts, by the beautiful outlines that are imparted to each structure.

FIFTY-FOUR INCH RADIAL DRILLING MACHINE.

by the correct proportions that have been worked out in the determination of strength and form, and the disposal of material to take full share of duty."

Bolt and nut screwing machines are an humble but peculiarly important class of special tools. They are now built in such manner that, with dies revolving and bolt or nut stationary, the thread may be cut at a single operation; the work being chucked automatically in a precisely central line; the dies closing and opening automatically; the cutting-edge of the tool being automatically and continuously flooded with lard or other organic oil, which constantly circulates in great volume; the adjustments being arranged for fitting precisely to any standard thread, and stops, terminating the operation of cutting, at the desired instant. The attendant simply supplies the blanks and takes away the finished bolt or nut. Such tools, at speeds of 200 to 300 revolutions per minute, make 200 to 3,000 machine-bolts a day, according to size and length.

"Drill-presses" are made with automatic and variable feeds, automatically stopped when the work is complete, with smooth and easily adjust-

able speeds and feeds, positive and strong, yet delicate enough to permit the safe use of the smallest drills, and stiff enough to give absolute accuracy of operation, without loss of line by spring of parts or of frame. "Gang-drills" are made for cases in which a number of holes may be drilled at once, as in drilling rivet-holes, their pitch and size being readily and accurately adjustable to the requirements of the moment. "Radial drills" are among the most useful of these tools. They have a strong, and especially a stiff, upright, on which is swiveled an arm carrying the drill in a sliding and adjustable head, capable of being fed along the radial line, while the arm itself is capable of vertical motion the full height of the main column, and of swinging through a wide angle, thus permitting the setting of the drill upon any point within its field of operation with ease and exactness. Frequently, also, the drill may be set at any desired angle with the vertical, and thus be adjusted to reach out-of-the-way and inclined lines of proposed holes. The machine is fitted by the best makers with all the automatic and changeable speed and feed devices that are found on the common

DRILL-PRESS.

upright drill. Horizontal boring and drilling machines are made in great variety for special purposes, as are large boring-mills with a fixed boring-bar and horizontal revolving-table. The "Universal" drilling-machine is one which is capable of all the motions, and of taking every set of drill, vertical, inclined, even often inverted, that is required in the shop.

The "locomotive cylinder facing and boring machine," a tool of first rank among these tools of precision, performs all the work of boring, facing off the ends, and thus mainly finishing the locomotive steam-cylinder. As an international jury has said, "this grand tool is an embodiment of all the 'tool-virtues' that can be enumerated, resulting in the transmission of mathematical truth and accuracy to the work performed, combined with great rapidity of execution and consequent economy, thus realizing

the highest ideal conditions." Such machines perform this work on a single cylinder in three hours or less, where, formerly, it demanded, with standard general tools, nine to ten or even twelve hours. The heavier boring-mills of the horizontal class are often fitted with two, and sometimes with three, tool-holders on the great cross-head, and are used for simultaneous boring at the center and turning on the face or on the edge of the work revolving on the table of the mill. They take very heavy cuts on large work, and do an immense amount of work in a very short time. They are sometimes made with tables ten feet in diameter.

The special forms of turning and screw-cutting lathes are very numerous, and vary in size from the little watchmaker's lathe, turning pieces too small to be handled safely, except with the most sensitive and delicately trained touch, to the gun

TURRET LATHE.

LATHE FOR TURNING AND BORING 16-INCH RIFLES, WATERVLJET ARSENAL. TOTAL LENGTH 138 FEET; FINISHED WEIGHT, 560,000 LBS.

lathe for large ordnance, weighing 250 tons and measuring 125 feet or more in length. A good lathe produces true circles, accurate cylinders, and perfect meridional planes. It has smooth and widely adjustable ranges of speeds, automatic and accurate feeds similarly adjustable, and reliable driving and lubricating mechanisms.

The special forms of "milling-machine" now in use, and in constantly growing employment, are found, for the purposes of the piece-work and gauge-work systems of manufacture, perhaps the most useful of all machines of this department. They have the advantages, where applicable, that, unlike the planing-machine, their work is never intermitted; they cut with numerous tools at the same time; they may be adapted to the production of any right-lined and of some special forms; they hold their work firmly, and yet permit ready and rapid substitution of a new for a finished piece. With these tools, a very large proportion of work like that on guns, sewing-machines and large horological work is now performed with great economy, as compared with the costs of the same kinds of work on the planing-machine. By

thus adapting special tools to special work, the cost, for example, of an army rifle is reduced to one half that of the same gun made under the less efficient system of earlier times.

The power and work of such tools vary greatly. Iron and steel offer a resistance to cutting of from 100,000 pounds upward, sometimes reaching a half-million pounds, or even more; heavy planers remove 50 pounds of metal an hour per horse-power applied, some attaining a product of 1,000 pounds per hour. Speeds vary from a minimum of 6 feet a minute on steel tires, to 15 feet on common soft iron and steel, 20 feet on bronzes and brasses, and up to much higher figures with special provisions for lubrication of the tools, or with self-hardening or other peculiarly durable metal in the cutting-edge. From 40 to 60 feet represent maxima in various kinds of special work. Engine-lathes require from an eighth to a quarter of horse-power to drive them, in ordinary practice. Very large lathes may demand 2 to 5 horse-power, and heavy planers sometimes demand 10 or 15, or even 20, horse-power, although usual sizes and customary work absorb only from 1 to

3 or 5. Power and work are reduced, in many cases, by the use of tools having a capacity for the production of a number of effects without removal of the piece from its place in the machine. Thus the "turret-lathe" is made with a vertical cylindrical tool-holder, or "turret," in which a number of cutting-tools of various sizes and shapes can be set, and by revolution of the turret on its vertical axis each can be brought into play in due order to complete a series of operations, and sometimes to finish the piece. One tool and one workman thus perform a series of operations which otherwise would require as many tools and as many men, in sequence, thus saving enormously in cost of machinery, and of time as well.

MACHROCHIRES. See HUMMING-BIRD, Vol. XII, p. 357.

MACIEJOWSKY. See POLAND, Vol. XIX, p. 303.

MCINTOSH, MARIA JANE, an American authoress; born at Sunbury, Georgia, in 1803. She moved to New York in 1835, and having suffered financial loss in the panic of 1837, turned her attention to literature. Her first work was *Blind Alice*, published in 1841, after which followed four other juvenile tales, the five being published collectively under the title *Aunt Kitty's Tales* in 1847. Among her other books are *Conquest and Self-Conquest* (1844); *Woman in America* (1850); *Meta Gray* (1858). She died Feb. 25, 1878.

MACK VON LEIBERICH, KARL, an Austrian soldier; born at Neuslingen, Franconia, Aug. 24, 1752; entered the military service of Austria in 1770, was created field-marshal in 1797. In 1798 he commanded the Neapolitans against the French, was taken prisoner and carried to Paris, but escaped by a violation of his parole. In 1805 the Emperor put him at the head of 80,000 men and sent him to check the French advance along the line of the Iller. But the enemy outmaneuvered him, and shut him up in Ulm, and on October 17th he capitulated with his army.

MACKAY, CHARLES, a Scotch poet, born in Perth, March 27, 1814. In 1834 he became assistant editor of the *Morning Chronicle*; from 1844 to 1847 was editor of the *Glasgow Argus*; was on the staff of the *Illustrated London News* for a long time, and filled the post of New York correspondent for the *London Times* during the Civil War. In 1860 he established the *London Review*, a weekly journal, which was discontinued. He is best known by his songs, two of which, *There's A Good Time Coming* and *Cheer, Boys, Cheer*, were especially popular. Among his works are *Songs and Poems* (1834); *History of London* (1837); *Longbeard*, a romance (1840); *Town Lyrics* (1848); *Lost Beauties of the English Language* (1874); *The Founders of the American Republic* (1885); and several works on the language and literature of ancient Scotland. He died in London, Dec. 24, 1889.

McKEAN, THOMAS, a signer of the Declaration of Independence, was born at Londonderry, Pennsylvania, March 19, 1734. In 1765 he was elected

to the Stamp Act Congress; from 1774 to 1783 was member of the Continental Congress. He was chief justice of Pennsylvania (1777-99), and from 1799 to 1808 governor of Pennsylvania. Although a resident of Pennsylvania, he was president of Delaware in 1777, and drafted the constitution of that state, it is said, in a single night and with no book of reference. He died in Philadelphia, June 24, 1817.

McKEESPORT, a borough of Allegheny County, southwestern Pennsylvania, 10 miles E.S.E. of Pittsburg, on the Monongahela River, at the mouth of the Youghiogheny, and on the Pennsylvania, the Baltimore and Ohio and the Pittsburg and Lake Erie railroads. It is the center of a great bituminous coal-mining region, and also of the natural-gas field of the state. The principal manufactures are of iron products; the largest wrought-iron pipe-works in the world are located here, and employ six thousand hands. Locomotive, car, glass and lumber factories, saw and rolling mills, foundries, machine-shops and a distillery are among its industrial establishments. Those which reported in 1890 had a combined capital of \$11,000,000, and produced merchandise, annually, to the value of \$16,000,000. It has a considerable river trade. It has numerous schools, an academy and three national banks. Population 1870, 2,523; 1880, 8,212; 1890, 20,741; 1900, 34,227.

McKEE'S ROCKS, a village of Allegheny County, southwestern Pennsylvania, five miles below Pittsburg, on the Ohio River, and on the Pittsburg, Chartiers and Youghiogheny railroad. It contains iron-bridge works, iron and steel mills, planing-mills, a glass factory, railroad machine-shops, and ships coal and lumber. It has natural-gas fuel. Population 1890, 1,687; 1900, 6,352.

McKENDREE, WILLIAM, an American clergyman, the first Methodist Episcopal bishop in the United States; born in Virginia, July 6, 1757. During the Revolutionary War he served as adjutant and commissary. At the close of the war he studied theology, became a preacher in 1788, presiding elder in 1796, and bishop in 1808. He was largely instrumental in planting Methodism west of the Alleghenies and in founding McKendree College at Lebanon, Illinois, to which institution he bequeathed 480 acres of land. He died near Nashville, Tennessee, March 5, 1835.

McKENDREE COLLEGE, a co-educational institution for higher learning, located in Lebanon, Illinois, maintained and controlled by the Methodist Episcopal church. It was organized in 1828, and in 1895 had 276 students, 13 instructors, and a library of 8,000 volumes. Including 1895, the college had graduated 580.

McKENNA, JOSEPH, American jurist and statesman; born in Philadelphia, Pa., Aug. 10, 1843; removed with his parents to the Pacific Coast in 1855; was educated at St. Augustine Institute at Benicia, California; studied law under Prof. Abbot, and was admitted to the bar in 1865. He served as county prosecuting attorney in 1865-69; and in 1875 was elected to the State legislature. After having been twice defeated for Con-

gress he was elected in 1884 and reelected for every term thereafter until appointed United States Circuit Judge in California in 1892 by President Harrison. Judge McKenna's profound knowledge of law and extensive experience, no less than his admirable personal qualities, recommended him for a Cabinet position, and his appointment in 1897 to the Attorney-Generalship gave universal satisfaction throughout the West.

McKENZIE, a town of Carroll County, north-western Tennessee, 98 miles W. of Nashville, on the Louisville and Nashville and the Nashville, Chattanooga and St. Louis railroads. It is in a cotton, grain and live-stock raising region; has saw and grist mills and a cotton-gin. It is the seat of McTyeire Institute (Methodist, founded in 1882), and of Bethel College, a Cumberland Presbyterian co-educational school, opened in 1849, which in 1896 had 7 instructors, 200 students, and a library of 1,000 volumes. Population 1900, 1,266.

McKENZIE, ALEXANDER, Canadian statesman; born at Logierait, near Dunkeld, Perthshire, Scotland, Jan. 28, 1822; educated at Perth and at Dunkeld. Having emigrated to Canada he edited the *Lambton Shield*, entered Parliament in 1861, and in 1867 was returned to the Dominion Parliament. He was also in the Ontario legislature in 1871-72. In 1873, on the defeat of the Macdonald ministry, he was called upon to form an administration in the Dominion Parliament. He was Premier and Minister of Public Works until 1878. He wrote *Life and Speeches of Hon. George Brown* (1882). Died at Toronto, April 17, 1892.

McKENZIE, ALEXANDER CAMPBELL, a British musician, was born in Edinburgh, Aug. 22, 1847, and sent to Germany at the age of ten to study music, remaining till 1862 when he went to London to study the violin under M. Saindon. In 1865 he returned to Edinburgh as a teacher of the pianoforte. The composition which made him famous was his opera *Colomba*, based upon Mérimée's celebrated story. He was elected principal of the Royal Academy of Music in Feb. 1888, and in 1893 became conductor of the Philharmonic Society. Among his later compositions are the opera *The Troubadour* (1886); the cantatas, *The Bride* (1880) and *Jason* (1882); two Scotch rhapsodies; *Jubilee Ode* (1887); *The Cottar's Saturday Night* (1890); and *Bethlehem* (1894).

McKENZIE, ALEXANDER SLIDELL, an American naval officer; born in New York City, April 6, 1803. His original name was Slidell, he being the brother of the United States Senator of that name, but he adopted his uncle's name, Mackenzie, at the request of the latter, in 1837. He entered the navy in 1815 as midshipman; was made lieutenant in 1825; commander in 1841. In 1842 he was put in command of the brig *Somers*, manned by naval cadets, and on its passage from Africa discovered a plot among the crew to mutiny. After a council of officers had been called, he ordered the hanging of three of the conspirators, among whom was the son of John C. Spencer, the Secretary of War. The order was carried out, and upon the arrival of the brig in America a court of inquiry was instituted,

which, however, upheld Mackenzie's action. He also was acquitted by a court-martial held at his own request. The criticisms of his accusers, however, could not be silenced, and they embittered the remainder of his life. During the Mexican War he took part in the siege of Vera Cruz and the storming of Tabasco. Mackenzie devoted considerable time to authorship, and published, among other works, *A Year in Spain* (1829); *Popular Essays on Naval Subjects* (1833); *Life of John Paul Jones* (1841); and *Life of Decatur*, in Jared Sparks's Library of American Biography (1846). He died at Tarrytown, New York, Sept. 13, 1848.

McKENZIE, MARIAN. See SMITH-WILLIAM, MRS., in these Supplements.

McKENZIE, SIR MORELL, an English physician and specialist on throat diseases; born at Leytonstone, Essex, July 7, 1837, and educated at the London University, in Paris, and in Budapest, where he met Czermak, the Bohemian physiologist, who showed him the use of the laryngoscope, which Mackenzie later introduced in London. He returned to England, and in 1863 founded the Hospital for Diseases of the Throat, Golden Square; in the same year he obtained the Jacksonian prize from the Royal College of Sur-

SIR MORELL MACKENZIE.

geons for his essay on diseases of the larynx. He was soon afterward elected assistant physician to the London Hospital, becoming, in 1873, head physician, and was appointed lecturer on diseases of the throat, which position he held until his death. He was a corresponding member of the Imperial Royal Society of Physicians of Vienna, and of the Medical Society of Prague, and an honorary fellow of the American Laryngological Association. Dr. Mackenzie was the author of numerous publications on laryngological subjects; among them, a systematic treatise, in two volumes, on *Diseases of the Throat and Nose* (1880) and *The Hygiene of the Vocal Organs* (1886). He was knighted in 1887 by Queen Victoria for his services in prolonging the life of the late Emperor Frederick of Germany. Died in London, Feb. 3, 1892.

McKENZIE RIVER, in North America, has its origin as the Athabasca, in the Rocky Mountains, in British Columbia, flows over 600 miles to Lake Athabasca, and 240 as the Slave River to Great Slave Lake, conveying the waters of the Great Slave Lake to the Arctic Ocean at Mackenzie Bay, after a final course which is reckoned at 1,045 miles, making a total river system of nearly 2,000 miles. It drains an area of little less than 600,000 square miles. The Mackenzie received its name from Sir Alexander Mackenzie, by whom it was discovered and first navigated in 1789. See also ATHABASCA, Vol. II, p. 827.

MACKEREL-GULL, a popular name of the

terns (*Sterna*), given because of their habit of hovering over schools of mackerel. Some authors think that the name refers to the forked tail, resembling that of the fish. The name is particularly applied to a New Zealand gull with habits similar to the jaeger-gull.

MACKEY, ALBERT GALLATIN, an American writer on Freemasonry; born at Charleston, South Carolina, March 12, 1807. In 1838 he became demonstrator of anatomy in the Medical College of South Carolina. In 1844 he gave himself up to the pursuit of literature. He founded, in 1849, and edited the *Southern and Western Masonic Miscellany*, and in 1858 to 1860 a *Masonic Quarterly*. Among his works, which are considered authoritative, are *Book of the Chapter* (1858); *A History of Freemasonry in South Carolina* (1861); *Masonic Parliamentary Law* (1875), and *The Encyclopedia of Freemasonry* (1874), his most important work. He died June 20, 1881.

MACKIE'S TYPE-SETTING MACHINE.
See TYPE-COMPOSITION, in these Supplements.

MACKINAC, an island three miles long by two broad, in the Strait of Mackinac, which connects Lakes Huron and Michigan, three miles E. of Point St. Ignace. It forms a part of Mackinac County, Michigan. On the island is the village of Mackinac, and on an eminence 300 feet above is Fort Mackinac, now abandoned as a military post. This point was of considerable importance in colonial times; settled by the French, and was for a time a Jesuit missionary station; captured by Pontiac and its inhabitants massacred in 1669; captured by the British in 1812. The island has a good harbor, and is a popular summer resort. Fish are abundant. Population 1894, of island, 705; of village, 448.

MCKINLAY, MRS. JOHN (ANTOINETTE STERLING), an American contralto; born at Sterlingville, New York, Jan. 23, 1850. She studied music in America and afterward in Cologne under Mme. Marchesi, and in London under Manuel Garcia. She first intended to sing in opera, but abandoned the idea and returned to America in 1871, singing in the choir of Dr. Beecher's church in Brooklyn. On Nov. 5, 1873, she made her first appearance before a London audience at one of the Covent Garden concerts. Her success was immediate, and for the next twenty years she remained abroad, with the exception of a single visit to America, when she sang in concerts under Theodore Thomas. In 1875 she married John McKinlay. Her repertoire was largely of Scotch ballads and German *lieder*, the latter of which she was the first to sing before American audiences. In 1896 Mrs. McKinlay made a second visit to the United States. She possessed a contralto of great richness and volume, with a compass from E_♭ in the bass to F in the treble staff.

MCKINLEY, WILLIAM, an American statesman; born at Niles, Ohio, Jan. 29, 1843. When he was nine years old his parents moved to Poland, in the same state, and he received his early education at the Poland Seminary. In 1860 he entered Allegheny College, Meadville, Pennsylvania, but was obliged to leave in the first year on account of ill health. For a while he taught school in Poland, and in June, 1861, he enlisted in the Twenty-third

Ohio Volunteers, commanded by Colonel (afterward General) Rosecrans, and served throughout the war, attaining the rank of captain, with the brevet of major. He resigned his commission in 1865, returned to Poland, began the study of law, and after a year in the Albany Law School, was admitted to the bar in 1867. He began the practice of law in Canton, Ohio, entered politics at once, and became one of the best stump speakers for the Republican party in the state.

WILLIAM MCKINLEY.

In 1869 he was chosen prosecuting-attorney for Stark County, Ohio. In 1876 he was elected to Congress, and re-elected for each successive term until 1882. In that year his election was contested, but he was allowed to retain his seat until late in the last session. He was returned to the House again in 1884, and continued to hold the office until the election of 1890, when he was defeated by the antagonism aroused by his tariff measure of the preceding session. From his first entrance into Congress, Mr. McKinley was a firm supporter of the doctrine of protective tariff, making it the leading tenet of his political activity. He was placed upon the Committee of Ways and Means in 1881, and, when made chairman of that committee in 1889, introduced the tariff measure since known as the McKinley Law, which passed the House May 21, 1890, and the Senate on the 30th of the following September. After his defeat in the next Congressional election, he was chosen governor of Ohio, November, 1891, by a majority of 21,000, after a campaign fought almost exclusively on the tariff issue. In 1893 he was re-elected governor of Ohio by a majority of 80,000. In June, 1896, Governor McKinley was nominated for the Presidency on the first ballot by the Republican national convention held in St. Louis. During the election campaign he daily addressed delegations visiting Canton with great candor and tact. When the election occurred in the following November Mr. McKinley carried twenty-three states and won a large majority in the electoral college as well as in the popular vote. In the Presidential elections, November, 1900, Mr. McKinley again carried the country for his party, his Administration receiving the hearty endorsement of the Nation. While attending the Pan-American Exposition at Buffalo, N. Y., Sept. 6, 1901, President McKinley was twice shot by Leon Czolgosz a miscreant of Polish descent, who had imbibed anarchist doctrines. The hideous attempt on the life of the estimable president had its fatal issue early in the morning of Sept. 14th, and evoked world-wide grief and sympathy. On the 16th inst., the body was taken to Washington, where a funeral service was held at the Capitol, after which the remains were taken to the president's home at Canton, Ohio, and interred with every mark of a nation's esteem and affection on Thursday, Sept. 19th. The

dastardly crime which deprived the country of its beloved chief executive, necessitated the succession of the vice-president, Theodore Roosevelt, to the presidency. The formal installation into office of President Roosevelt took place at Buffalo, on the afternoon of his predecessor's lamented death (Sept. 14, 1901).

McLACHLAN, ALEXANDER, a Scottish "weaver of rhymes," and known as the "Canadian Burns," was born in Johnstone, Renfrewshire, Scotland, in 1818. His family emigrated to Canada when the poet was but two years old, and settled on a farm in western Canada. Here the Canadian bard received his humble education and grew to manhood, nursing the poetic faculty and drawing inspiration for his backwoods muse from rural sights and sounds. Most of his poems belong peculiarly to Canadian life. Two features of the poet's character which reveal themselves in his verse are his religious seriousness, relieved by quiet touches of humor. He died at Orangeville, Ontario, March 20, 1896.

McLACHLAN, ROBERT, an English entomologist; born in London, April 10, 1837. He was educated at Ilford, in Essex, and early in life showed a taste for natural history, for botany at first, but later especial interest in the study of insects. In 1855-56 he went to China and Australia, and made a collection of plants from the latter place. In 1858 he was elected member of the Entomological Society of London, and was its president in 1885-86. He also was elected to the Linnæan and Royal societies. In 1864 the *Entomologist's Monthly Magazine* was founded, and Mr. McLachlan remained permanently on its staff. He is the author of *Revision and Synopsis of the Trichoptera (or Caddis-flies) of the European Fauna* (1880), the first work of its kind published, and an authority on that order. Mr. McLachlan wrote the article on INSECTS in this ENCYCLOPEDIA.

MACLAGAN, WILLIAM DALRYMPLE, archbishop of York and primate of England; born at Edinburgh in 1826. He served in the English army in India, and retired with the rank of lieutenant in 1852. He entered St. Peter's College, Cambridge, graduating B.A. (1856); M.A. (1860); was ordained deacon (1856); priest (1857); was curate in Paddington and Marylebone until 1860; secretary of the Church Building Society from 1860 to 1865; curate at Enfield from 1865 to 1869; became rector at Newington in 1869, and later vicar of St. Mary Abbots, Kensington; bishop of Lichfield in 1878; in 1891 archbishop of York. He edited, with Dr. Weir, *The Church and the Age* (1870); and published his *Pastoral Letters and Synodal Charges* (1891).

McLANE, LOUIS, an American statesman; born in Smyrna, Delaware, May 28, 1786. He entered the navy at 12 and for a year was midshipman under Decatur on the *Philadelphia*; left the navy in 1801, attended Newark College, Delaware, studied law and was admitted to the bar in 1807; was elected to Congress in 1817 and served until 1827. In 1827-29 he was United States Senator; from 1829 to 1831 minister to England, and then Secretary of the Treasury. In 1834 he retired from political life. In 1845-46 he was again minister to England. Died in Baltimore, Md., Oct. 7, 1857.

McLANE, ROBERT MILLIGAN, diplomatist, son of the preceding; born in Wilmington, Delaware, June 23, 1815. He was educated at St. Mary's College, Baltimore; at the Collège Bourbon, in Paris, and at West Point. He graduated at the latter place in 1837, entered the United States army and took an active part in the Seminole war. In 1839 he was sent on a military survey of the northern lakes and in 1841 went to Europe to examine the system of dykes and drainage in Holland and Italy. In 1843 he resigned his commission and began the practice of law at the Delaware bar, and in 1845, 1847 and 1849 was elected to Congress. From 1854 to 1856 he was United States commissioner to China, and in 1859 was appointed minister to Mexico. In 1877 he was elected to the Maryland senate, and in 1878 Representative to Congress, receiving a re-election in 1880. In 1883 he became governor of Maryland, and in 1885 minister to France, serving until 1889, when he resigned. Died in Paris, April 16, 1898.

MACLAREN, IAN. See WATSON, JOHN, in these Supplements.

McLAREN, WILLIAM EDWARD, an American bishop; born in Geneva, New York, Dec. 13, 1831, graduated at Washington and Jefferson College, Pennsylvania, in 1851, and at the Allegheny Presbyterian Theological Seminary in 1860. For three years he served as a missionary in South America. On his return he became pastor of the Second Presbyterian Church of Peoria, Illinois; in 1866 of the Westminster Church, Detroit, Michigan. Later he decided to enter the Protestant Episcopal ministry, was ordained in 1872, and became rector of Trinity Church, Cleveland, Ohio. In September, 1875, he was elected bishop of Illinois. When, two years later, two dioceses were set apart from his own, he retained that part of the state now included in the diocese of Chicago, over which he continued to preside. Bishop McLaren published *Catholic Dogma, the Antidote of Doubt* (1894).

McLAWS, LAFAYETTE, an American Confederate soldier; born in Augusta, Georgia, Jan. 15, 1821. He graduated at the United States Military Academy in 1842, and entered the United States army. He served in the Mexican War, in the expeditions against the Mormons in 1858, and against the Navajo Indians in 1859-60. In 1861 he resigned his commission and became a colonel in the Confederate army. A little later he was commissioned a brigadier-general, and in 1862 was promoted major-general. He participated in nearly all the important battles of the Civil War in the East, and on the conclusion of hostilities went into business at Savannah, Ga. Died there July 24, 1897.

McLEAN, JOHN, an American jurist; born in Morris County, New Jersey, March 11, 1785. He worked on a farm until 16 years of age, then went to Cincinnati, obtained a clerkship in the office of the county clerk, and studied law. He was admitted to the bar in 1807, and began practice in Lebanon, Ohio. In 1812 he was elected to Congress and re-elected in 1814; in 1816 was elected judge of the Ohio supreme court; in 1822 was appointed commissioner of the general land-office

In July, 1823, President Monroe made him Postmaster-General, and on account of his efficiency he was given the same position in John Quincy Adams's Cabinet. He refused the same portfolio in Jackson's administration, and also declined the departments of the War and the Navy, and was appointed by Jackson associate justice of the United States supreme court in 1830. In this position he became noted for his charges to grand juries. In 1838 he delivered the charge in regard to aiding or favoring "unlawful military combinations by our citizens against any foreign government with which we are at peace," which had reference to the aid given the Canadian rebels by American citizens. In the case of Dred Scott, Justice McLean dissented from the opinion of the court as given by Chief Justice Taney, maintaining that slavery had its origin in force, not right, and was contrary to the principles of general law, and only upheld by local law. In the Free-soil convention in 1848 and in the Republican conventions of 1856 and 1860 he was a candidate for Presidential nomination. He published *Reports of the United States Circuit Court* (1829-55); and a *Eulogy on James Monroe* (1831). He died in Cincinnati, Ohio, April 1, 1861.

MACLEAN, LETITIA ELIZABETH (Landon). See LONDON, Vol. XIV, p. 278.

MACLEANSBORO, a village and the capital of Hamilton County, southeastern Illinois, situated in the center of the county and 50 miles S.E. of Centralia, on the Louisville and Nashville railroad. It is the trade center of a prosperous farming, lumbering and stock-raising district. It has flour, woolen and saw mills. Population 1890, 1,355; 1900, 1,758.

MACMAHON, MARIE EDME PATRICE MAURICE, COMTE DE, DUC DE MAGENTA, a marshal of France, and second President of the French Republic; born at Sully, Saône-et-Loire, June 13, 1808. He came from an Irish Catholic family settled in France at the time of James II's exile. He was educated at the Military School of St. Cyr, and took part in the expedition to Algiers. He distinguished himself in the assault on Constantine in 1837. In 1845 he rose to be colonel; in 1848 general of brigade, and in 1852 general of division.

MARSHAL MACMAHON.

During the Crimean War he captured, by a spirited assault, the Malakoff tower, which was the key to the defenses of Sebastopol, and held his position despite an order to retreat received from his superior officer, to whom he made the reply, "*J'y suis; J'y reste*" (I am here; I remain here), which has become historic. For this achievement he was made a Senator in 1856. He distinguished himself in the Italian campaign of 1859, commanding the Second Corps of the army of the Alps. At the battle of Magenta, on June 4th, he led the left and won

the day by his timely support of the Emperor, who commanded the center. For this service he was created Duke of Magenta and marshal of France.

In 1870, when the Franco-Prussian war broke out, MacMahon commanded the First Army Corps in the defense of Alsace. On Aug. 4, 1870, his advance guard, under Douay, was defeated at Weissenbourg by the Crown Prince of Prussia, and two days later the Marshal himself was defeated in the battle of Wörth (called by the French Reichshoffen) and his army routed. A retreat was made to Châlons and a new army formed, mostly of raw recruits, the command of which was given to MacMahon. He was ordered by the War Department at Paris to march to Metz and relieve Bazaine. MacMahon did not favor this plan, but, after repeated remonstrances, obeyed. His march was very slow, and at Sedan, on the Meuse, he met a German army of 180,000 men, his own force numbering 120,000. On September 1st the battle of Sedan was begun. Early in the day MacMahon was wounded, and the chief command fell upon General Ducrot. The result of the battle was a victory for the Germans, the Emperor and MacMahon being taken prisoners. This virtually decided the war. After the peace, in 1871, MacMahon assumed command of the army of Versailles and put down the insurrection of the Commune. On May 24, 1873, upon the overthrow of Thiers, he accepted the Presidency of the republic. Although monarchical at heart, he kept faithfully his oath to preserve the Republic, but the ministers he chose in the last year of his Presidency having tried to govern without a majority in the Chambers, the general elections that followed compelled the Marshal to resign, Jan. 30, 1879. After his resignation he lived in retirement on his estate at Montcresson until his death, Oct. 17, 1893.—His son, PATRICE MACMAHON, married Princesse, Marguerite d'Orléans, daughter of the Duc de Chartres, in April, 1896.

MCMASTER, JOHN BACH, an American historian; born in Brooklyn, New York, June 29, 1852; graduated at the College of the City of New York in 1872; in 1877 became instructor in civil-engineering at Princeton College, and in 1883 professor of American history in the University of Pennsylvania. He wrote a *History of the People of the United States from the Revolution to the Civil War*; a *Life of Benjamin Franklin*; and, with F. D. Stone, *Pennsylvania and the Federal Constitution*. He contributed the series of articles on the various political parties in the United States, and the article on the Monroe doctrine, in these Supplements.

MCMASTER UNIVERSITY, Toronto, Canada, an arts and theological training college in the interest of the Baptist denomination. Its chief promoter, after whom the institution is called, was Senator William McMaster, who contributed nearly a million dollars toward its endowment. The university received its legal incorporation in 1887, when it absorbed the separate institutions of Woodstock College and Toronto Baptist College. It is under the control of a board of governors and a senate, which are ultimately responsible to the Baptist Convention of Ontario and Quebec. The teaching

faculty in theology is required to be of the Baptist communion, but those in the arts course are required only to be of good standing in an evangelical Christian church. Of students, other than theological, of the university, no compulsory religious qualification is insisted upon.

MACMILLAN, ALEXANDER, an English publisher; born at Upper Carrie, island of Arran, Scotland, Oct. 3, 1818. His father was a farmer. Like his brothers, who all became clerks in bookshops or teachers. Alexander early showed a love for books. He was for a time teacher at Nitshill, near Paisley, and in 1839 entered the publishing house of L. and G. Seeley in London. Four years later he and his brother Daniel (who died in 1859) opened a bookstore in Aldersgate Street, and in the same year published their first book, Craig's *Philosophy of Training*. Soon, however, the business was removed to Cambridge and a partner taken into the firm, which became known as Macmillan, Barclay and Macmillan until the retirement of Mr. Barclay in 1850, when the name was changed to Macmillan and Company. In 1863 the headquarters of the firm were removed again to London. In the same year Alexander Macmillan was appointed publisher to the University of Oxford, a position which he retained until 1880, when the university established its own printing-office. In 1869 Macmillan visited America and established a branch office in New York city. Died in London, Jan. 25, 1896.

MACMILLAN, CONWAY, an American botanist; born in Hillsdale, Michigan, Aug. 26, 1867; educated in the University of Nebraska and at Johns Hopkins and Harvard; appointed assistant in geology at the University of Nebraska in 1886; entomologist at the agricultural experiment station in Nebraska in the following year; in 1888 instructor in botany in the University of Minnesota; professor of botany in 1891. He published *Twenty-two Common Insects of Nebraska* (1888) and *The Metaspermæ of the Minnesota Valley* (1892).

MACMILLAN, HUGH, a Scotch minister and author; born at Aberfeldy, Perthshire, Sept. 17, 1833. He was educated in Edinburgh University, and held pastorates at Kirkmichael (1859-64); in Glasgow, of Free St. Peter's (1864-78); and later, of the Free West Church at Greenock. Among his works, some of which have been translated into several languages, are *First Forms of Vegetation* (1861); *Bible Teachings in Nature* (1867); *Holidays on High Lands* (1873); *The True Vine* (1884); *The Olive Leaf* (1886); and *Roman Mosaics* (1888).

McMILLAN, SAMUEL J. R., an American statesman and jurist; born in Brownsville, Pennsylvania, Feb. 22, 1826; died in St. Paul, Minnesota, Oct. 3, 1897. In 1874 he was chosen Chief Justice of the Minnesota Supreme Court, and was elected to the United States Senate after a noted and prolonged contest. On his re-election in 1881 he succeeded Roscoe Conkling as chairman of the commerce committee. He was a prominent member of the Presbyterian Church, and in 1890 was appointed one of a committee to revise the Confession of Faith of that denomination.

MACMINNVILLE, a town and the capital of Warren County, central Tennessee, 65 miles S.E. of Nashville, on the Nashville, Chattanooga and St. Louis railroad. It contains woolen and cotton mills, a spoke and handle factory, an iron foundry and the MacMinville Female Academy. Population 1890, 1,677; 1900, 1,980.

MACMONNIES, FREDERICK, an American sculptor; born in Brooklyn, New York, Sept. 28, 1863; began his studies in sculpture in the studio of Augustus St. Gaudens in 1880, working at night, meanwhile, in the Academy of Design and the Art Students' League. In 1884, he went to Paris, where he studied with Falguière and Antonin Mercié, the sculptor of the *Vae Victis*. While abroad he sent a *Diana* to the Salon of 1889, which brought him an honorable mention. He also exhibited three life-sized angels, which were destined for St. Paul's Church, in New York City, and a statue of Nathan Hale, which is in City Hall Park, in the same city. To the Salon of 1891 he sent a statue of James S. T. Stranahan, where it received a second medal, the first and only time an American sculptor has been honored in that manner by the Salon judges. The statue has since been placed in Prospect Park, Brooklyn. Some of his ideal works have been *Pan of Rohalion* and *Faun with Heron*, followed by his fine colossal *Fountain* at the World's Columbian Exhibition. His *Sir Harry Vane*, for the Boston Public Library, and *Victory*, for the Battle Monument at West Point, are other works displaying decided genius. His *Shakespeare*, for the Congressional Library at Washington, is full of a scholarly feeling. In 1894 he finished, for the Boston Public Library, a *Bacchante with Infant Faun*, which represents the Bacchante dancing forward in a spirited manner, holding a bunch of grapes in her right hand, thrown aloft, while sitting on her left arm is the infant faun, apparently about to spring forward to grasp the grapes, upon which his eyes are set longingly. The figures were entirely nude, and are modeled with exquisite grace and freedom. When this group was shown in Paris it created so much enthusiasm that the French government offered to purchase it, but as it was a commission from the Boston Public Library, a replica finally was accepted in lieu of purchase. Notwithstanding its artistic excellence, however, the work was rejected by the Boston judges, and was secured by Brooklyn, N. Y. In 1898 he finished a group typifying *War*, for the Memorial Arch, Brooklyn, N. Y.

McMURROUGH. See IRELAND, Vol. XIII, p. 258.

MCNAB, ALAN NAPIER, a Canadian soldier and statesman; born at Newark (now Niagara), Canada, Feb. 19, 1798. At the outbreak of the War of 1812 he entered the Canadian army and was transferred to the navy, but afterward returned to the army and took part in the capture of Fort Niagara and in the battle of Plattsburg; resigned his commission at the end of the war, began the study of law, and was admitted to the bar in 1826; began practice in Hamilton; was elected to the Upper Canadian assembly in 1830; speaker (1837-41); in the Upper Canadian rebellion of 1837-38 was put at the head

of a band of volunteers, with the rank of colonel, and routed the rebels on the Niagara frontier; became Parliamentary leader of the Conservative party after the union of Upper and Lower Canada; in 1856 retired from political life and was made baronet; visited England in 1857, and was made honorary colonel and aide-de-camp to the Queen; returned to Canada in 1860, and was re-elected to Parliament. He died in Toronto, Aug. 8, 1862.

McNALLY, ANDREW, an American publisher; born in the north of Ireland, in 1836, of Scotch descent; was apprenticed to John McWatters, a printer of Armagh, Ireland, for whom he worked for seven years, acquiring in that time an intimate knowledge of the detail of the printing and publishing business; removed to America in 1858, and in 1860 started a printing-office in Chicago, but soon after sold it and took charge of the *Tribune* job-office; in 1864 became associated with W. H. Rand in the formation of the Rand-McNally Company. The first noteworthy publication of the firm was the *Rand-McNally Railway Guide*, which appeared in 1869; since then they have been engaged in railroad-printing, map-engraving, and general publishing of all kinds. Mr. McNally was a director of the World's Columbian Exposition, a vice-president of the Chicago National Bank, and president of the stock company which owned the *Prairie Farmer*, an agricultural paper having a large circulation in the West.

MACOMB, a city and the capital of McDonough County, central western Illinois, 185 miles S.W. of Chicago, on the Chicago, Burlington and Quincy railroad. It is in an agricultural and fire-clay region, and produces pottery, tile, sewer-pipe, etc. It contains a foundry, a public library, excellent schools, and is the seat of McDonough Normal College. Population 1890, 4,052; 1900, 5,375.

MACOMB, ALEXANDER, an American soldier; born in Detroit, Michigan, April 13, 1782; died in Washington, June 25, 1841. He entered the army, and at the beginning of the War of 1812 held the commission of lieutenant-colonel of engineers, and in 1813 served as colonel at Niagara and Fort George; was promoted brigadier-general of volunteers in 1814, on September 11th of which year he repulsed a superior force under General Prevost at Plattsburg, on Lake Champlain, and was made major-general for his conduct. After the war he remained in the army as colonel of engineers, and in 1828 became major-general and commander-in-chief of the army. During the Florida war in 1835 he was in the field for a short time. He published *A Treatise on Martial Law* (1806) and *A Treatise on the Practice of Court-Martials* (1840). *A Memoir of Alexander Macomb* was written by G. H. Richards (1833).—His son, WILLIAM HENRY MACOMB, born in Detroit, June 16, 1818, entered the navy in 1834, became commander in 1862, captain in 1866, and commodore in 1870. He was distinguished for courage and good judgment. He died in Philadelphia, Aug. 12, 1872.

MACON, a city of central Georgia. Nine railroads meet here and give excellent connections in all directions. The main lines are the

Southern and the Georgia Southern and Florida railroads. The average annual product of Macon's factories is valued at \$5,000,000; the aggregate capital, \$3,600,000. Number of employees, 3,142. The city's wholesale trade is estimated at \$50,000,000 annually. Its educational and charitable institutions include 45 public schools, a public library, the Alexander Free School, the Jones Home for Indigent Women, two orphans' homes, the State Academy for the Blind, and an academy of music. The city is supplied with spring water from a reservoir on a hill near by. It holds a large fair annually. Population 1890, 22,746; 1900, 23,272. See also MACON, Vol. XV, p. 166.

MACON, a town and the capital of Noxubee County, central eastern Mississippi, 198 miles N. of Mobile, on the Oakanoxubee Creek. The Mobile and Ohio railroad passes through the town and has its shops located here. It is the shipping-point of a large agricultural and cotton-growing region. Pop. 1890, 1,565; 1900, 2,057.

MACON, a city and the capital of Macon County, northeastern Missouri, 140 miles N.W. of St. Louis, on the Hannibal and St. Joseph and the Wabash railroads. It has manufactories of farming-implements and wagons, and an extensive foundry and machine-shop. It is in a stock-raising and fruit-growing district. Coal and timber are abundant. It contains St. Agnes Hall for girls and St. James Military Academy, both Protestant Episcopal schools. Population 1890, 3,371; 1900, 4,068.

MACOYA. See MACAHUBA PALM, in these Supplements.

McPHERSON, a city and the capital of McPherson County, central Kansas, 36 miles S. of Salina, on the Atchison, Topeka and Santa Fé, the Chicago, Rock Island and Pacific, the Missouri Pacific and the Union Pacific railroads. It has flour-mills, and the chief industries of the region are sheep-raising, dairying and agriculture, especially corn and wheat raising. Of this region McPherson is the trading and shipping center. It is supplied with electric lights, city water and a street-railway. McPherson (Dunkard) College is located here. Population 1890, 3,172; 1900, 2,996.

McPHERSON, EDWARD, an American journalist; born in Gettysburg, Pennsylvania, July 31, 1830; graduated at the University of Pennsylvania in 1848, and studied law, but abandoned its practice for journalism. In 1858 and 1860 he was elected to Congress; was clerk in the House of Representatives (1863-73, 1881-83, and 1889-91). From 1877 to 1880 he was editor-in-chief of the *Philadelphia Press*; and in 1880 became editor of a paper in Gettysburg, Pennsylvania. From 1877 till his death he edited the *New-York Tribune Almanac*; was the American editor of the *Almanach de Gotha*; published every second year *Handbook of Politics*; and was the author of *Political History of the United States During the Great Rebellion* (1865) and *Political History of the United States During the Period of*

Reconstruction (1871). He died in Gettysburg, Dec. 14, 1895.

MCPHERSON, JAMES BIRDSEY, an American soldier; born Nov. 14, 1828, in Sandusky County, Ohio. He graduated at the head of his class, July 1, 1853, and was employed as instructor at the Military Academy; served afterward in the engineer corps in New York harbor and at Fort Delaware. When the Civil War broke out he was stationed in California, but at his own request was transferred to the active service and placed on the staff of

GENERAL M'PHERSON.

General Halleck, with the rank of lieutenant-colonel. He took part in the expeditions against Forts Henry and Donelson, in the battle of Shiloh and in the operations around Corinth. In May, 1862, he was made brigadier-general of volunteers; in September placed on the staff of General Grant; in October made major-general. He remained with Grant during the Vicksburg campaign, and upon the recommendation of the latter was given the commission of brigadier-general in the United States army. After Sherman took command of the Western armies, McPherson became commander of the army of the Tennessee and accompanied Sherman on his Atlanta campaign. In the battle before Atlanta he was shot, and died almost instantly, July 22, 1864, while personally superintending the disposition of his troops.

MCPHERSON, JOHN RODERIC, an American public man; born in York, N. Y., May 9, 1833; was educated at Geneseo academy, and engaged in farming and stock-raising; removed to New Jersey in 1858, and settled at Hudson, where he established a stock-yard; was a member of the state senate of New Jersey in 1871-74; elected to the United States Senate in 1877; reelected in 1883 and again in 1889. Died in Jersey City, N. J., Oct. 8, 1897.

MACQUOID, MRS. KATHERINE S., an English authoress; born in Kentish Town, London, 1835. She wrote numerous works, mostly novels, some of which have been very popular; among them, *A Bad Beginning*, her first work, published anonymously in 1862; *Patty* (1871); *My Story* (1874); *Through Normandy and Through Brittany*, travels illustrated by her husband, Thomas R. Macquoid (1877); *Little Fifi*, and *Other Tales* (1881); *At the Red Glove* (1885); *Appledore Farm* (1895); and *The Story of Lois* (1898).

MACRINUS, M. OPELIUS. See HELIOGABALUS, Vol. XI, p. 632.

MACROPODIDÆ. See KANGAROO, Vol. XIII, pp. 838-841.

MACROSPORANGIUM, a botanical term applied to the spore-case which develops macrospores. The term is used only in cases of hetero-

ospory (q.v., in these Supplements), and distinguishes the sporangium containing macrospores from that one (microsporangium) which contains microspores. As heterospory occurs only in certain fern-plants and in the seed-plants, the term macrosporangium is similarly restricted. In seed-plants the macrosporangium is the ovule, which usually matures but a single macrospore (the "embryo-sac").

MACROSPORE, a botanical term used in heterosporous plants to designate the spore which produces the female gametophyte, as opposed to the microspore, which produces the male gametophyte. See REPRODUCTION, Vol. XX, p. 424, and in these Supplements.

MACRURIDÆ. See ICHTHYOLOGY, Vol. XII, p. 692.

MCTYEIRE, HOLLAND NIMMONS, an American bishop of the Methodist Episcopal Church South, born in Barnwell County, South Carolina, July 25, 1824; was educated at Randolph-Macon College and joined the Virginia Conference in 1845; held pastorates in Mobile, Alabama, Columbus, Mississippi, New Orleans, Louisiana, and Montgomery, Alabama. In 1854 he became editor of the New Orleans *Christian Advocate*, in 1858 of the Nashville *Christian Advocate*, and in 1866 was elected to the episcopate. In 1873 he became president of the board of Vanderbilt University. He is the author of *Manual of Discipline* and *A History of Methodism*. He died at Nashville, Feb. 15, 1889.

MCVEAGH, WAYNE, an American lawyer; born in Phoenixville, Pa., April 19, 1833; educated at Yale, and admitted to the bar in 1856; captain of cavalry, 1862, at the time of the threatened invasion of Pennsylvania; Minister to Constantinople, 1872; member of the commission known as the "McVeagh Commission," appointed to investigate the affairs of Louisiana in 1877; Attorney-General of the United States in 1881, resigning the same year; Ambassador to Italy in 1893.

MACWHIRTER, JOHN, a Scotch painter, born in 1839, near Edinburgh, Scotland. He studied under R. S. Lauder, and opened a studio in Edinburgh; was elected an associate of the Royal Scottish Academy in 1863. In 1869 he went to London, and was elected an associate of the Royal Academy in 1879. He was elected an honorary member of the Royal Scottish Academy in 1882; elected member of the Royal Institute of Painters in Water Colors the same year, and in 1893 member of the Royal Academy. Among his paintings, which are largely Scotch landscapes, are *The Windings of the Forth* (1884); *Edinburgh from Salisbury Craig* (1887); and *Nature's Archway* (1894).

MADAGASCAR. The area of the island is estimated at 227,750 square miles; total length, 975 miles; breadth at widest point, 358 miles. Population, about 3,500,000.

By a treaty signed at Tamatave, Dec. 12, 1885, a French resident-general, with a small military escort, lived at the capital, Antananarivo, a well-built town of 100,000 population, 200 miles in-

land, and controlled foreign relations. By the Anglo-French agreement of Aug. 5, 1890, Great Britain recognized the French protectorate, but the Malagasy, or Hovas Government, refused to recognize any foreign interference, and in May, 1895, after two years of continual trouble between the French officers and the natives, a military expedition was dispatched to enforce the claims of France, the capital was occupied Oct. 1, and a treaty was signed whereby the Queen Rànavàlona III accepted the protectorate. All foreign relations and internal administration were put in the hands of a French resident-general, the Queen nominally retaining her office. On Jan. 18, 1896, the island was formally annexed to France.

The principal exports (average value about \$500,000 per annum) are cattle, hides, gum-copal, india-rubber, and rice, and more recently ebony and other valuable woods; coffee, sugar and vanilla are also being cultivated by Creole settlers. The chief imports (averaging about \$800,000 in value per annum) are cotton-goods, ironmongery, crockery and rum. The principal trade is from the Eastern ports to Mauritius, Réunion, Great Britain, France and the United States. The fertile soil of the coast plains can supply large quantities of all tropical productions. Iron is abundant, especially as magnetite, and also as hæmatite and ironstone, and the Malagasy are skillful in the smelting and working of this as well as other metals. Copper apparently exists in certain districts, and also tin is said to be found. Galena is found abundantly near Mount Ankaratra. Gold of excellent quality has recently been found in many parts of the interior, and is being worked by foreign capitalists as well as by the native government. Sulphur occurs in beds near some of the extinct volcanoes. There are few roads or wheeled vehicles in Madagascar, although there is no lack of manual skill among the people, who excel in weaving, in straw-work and in carpentry, as well as in the working of gold and silver.

Very recently, younger and more enlightened governors and other officers have been placed at all the principal ports and chief towns of the interior. Three-fourths of Madagascar is still heathen, but European and native missionaries are every year advancing steadily into the unenlightened regions, and Christianity is recognized and supported by the native government, although there is no state church. Queen Rànavàlona III, born in 1861, succeeded in 1883. See also MADAGASCAR, Vol. XV, pp. 168-176.

MADDER, a red dye, formerly much in use, but replaced now by the aniline dyes, and obtained from the roots and root-stalks of *Rubia tinctorum*, a plant of southern Europe and the Orient, belonging to the family *Rubiaceæ*. The name madder is also used as the common name of the genus *Rubia*, and the family *Rubiaceæ* is styled the Madder family.

MADDERN, MINNIE. See FISKE, M. M., in these Supplements.

MADEIRA, a river of Brazil, the most important affluent of the Amazon. It is formed by

the union of the Guaporé and Mamoré rivers near lat. 12° 5' S., long. 64° 30' W., on the Bolivian frontier. It flows generally northeast, and after a course of 935 miles joins the Amazon at long. 58° 45' W., 100 miles below Mamnaos. The Mamoré may be considered its chief head-water. This rises in the Bolivian Andes, in the department of Cochabama, and flows northward to its junction with the Guaporé. The Madeira, soon after this junction, is increased by the great Beni river. It then flows through a long series of rapids, about two hundred and thirty miles in extent, which render navigation impossible. The fall of the river is 270 feet. The lowest of these cataracts is the São Antonio Falls, 715 miles above its mouth. During the period of high water, from November to July, ocean steamers can ascend to this point, river-boats during the entire year. The valley of the Madeira and its tributaries is good agricultural country, but is neglected. A few wild Indians live there, and rubber-gatherers have settlements near its banks, as this is one of the most productive rubber regions in the world. The banks are low, and subject to annual inundations. The climate of these regions is malarious. A railroad around the falls has long been projected, but very little has been done toward its construction. This river drains an area of 480,000 square miles; its total length, to the head of the Mamoré, is 3,100 miles; average width, 2,700 feet, though it often exceeds a mile. The average discharge of water at its mouth is 517,000 cubic feet per second; maximum, 1,381,000 cubic feet per second. See also BOLIVIA, Vol. IV, pp. 11, 12.

MADEIRA NUT, a name sometimes given to the well-known English walnut, the fruit of *Juglans regia*.

MADÉLIA, a village and the capital of Watonwan County, central-southern Minnesota, 23 miles W.S.W. of Mankato, on the Chicago, St. Paul, Minneapolis and Omaha railroad, and on the Watonwan River; the trade and shipping-center of a farming district. Population 1890, 852; 1900, 1,272.

MADERNA, STEFANO. See SCULPTURE, Vol. XXI, p. 570.

MADISON, a city and the capital of Morgan County, northern-central Georgia, 55 miles E.S.E. of Atlanta, on the Georgia and the Macon and Northern railroads. The cotton trade is the chief business, and granite and iron-ore are found here. It has steam cotton-gins, steam saw-mills and a cotton compress. Situated here is Madison Male and Female Institute. Population 1890, 2,131; 1900, 1,992.

MADISON, a city of southeastern Indiana. It has manufactories of steamboats, engines, boilers, furniture and cotton and woolen goods. Population 1900, 7,835. See Vol. XV, p. 181.

MADISON, a village, and the capital of Madison County, northeastern Nebraska, 90 miles W.N.W. of Omaha, on a branch of the Elkhorn River, and on the Union Pacific railroad. It has an extensive creamery and flour-mills, and ships

large quantities of fruit, cattle and hogs raised in the vicinity. It is the seat of the North Nebraska Normal College. Population 1900, 1,479.

MADISON, a borough of Morris County, northern New Jersey, $4\frac{1}{2}$ miles S.E. of Morristown, on the Delaware, Lackawanna and Western railroad. The principal industry is the growing of roses for the New York flower market. It is a residence locality for many New York business men. Situated here is the Drew Theological Seminary, a Methodist Episcopal institution, founded in 1866. It had in 1896, 7 instructors, 142 students and a library of 3,300 volumes. Population 1890, 2,469; 1900, 3,754.

MADISON, a city, and the capital of Lake County, central-eastern South Dakota, 38 miles W.N.W. of Sioux Falls, on the Chicago, Milwaukee and St. Paul railroad. It is in a farming and stock-raising region, where blooded horses are raised. It is the seat of a state normal school. Population 1890, 1,736; 1900, 2,550.

MADISON, a city of Wisconsin. This has lately become quite a popular summer resort on account of its picturesque environment. On the lake beach are fine summer hotels, and on Lake Monona meets the Monona Assembly, modeled after the Chautauqua Assembly. The city is supplied with city water, gas, electric lights and electric street-railways. It is the seat of Wisconsin University (q.v.). Population 1890, 13,426; 1900, 19,164. See MADISON, Vol. XV, pp. 181, 182.

MADISON, JAMES, an American bishop and educator, cousin of the President of that name; born in Augusta County, Virginia, Aug. 27, 1749. He graduated at William and Mary College in 1772, and studied law, but abandoned it for the study of theology; was made professor at William and Mary College in 1773; two years later was ordained priest of the Episcopal church in London; returned, and continued his work at the college, and became its president in 1777, an office which he held till his death. He was president of the first Episcopal convention in Virginia in 1785, and in 1790 was made first bishop of Virginia. Bishop Madison published *Eulogy on Washington* and a large map of Virginia. He died in Williamsburg, Virginia, March 5, 1812.

MADISON BARRACKS (Department of the East), a United States military post located at Sackett's Harbor (q.v. in these Supplements). It is garrisoned by a regiment of infantry.

MADISONVILLE, a town and the capital of Hopkins County, central western Kentucky, 35 miles south of Henderson, on the Louisville and Nashville railroad. It is situated in a tobacco-growing region, and contains tobacco-stemmeries, a pearlsh and potash factory, flour and planing mills, a cotton-gin and wagon and carriage manufactories. Coal-fields are in the vicinity. Population 1890 2,212; 1900, 3,628.

MADISONVILLE, a village of Hamilton County, southwestern Ohio, eight miles N.E. of Cincinnati, on the Baltimore and Ohio, Southwestern, and the Pittsburg, Cincinnati, Chicago and St.

Louis railroads. It has some trade with the surrounding vicinity, and has lumber and carriage factories and a tannery. Population 1900, 3,140.

MÄDLER, JOHANN HEINRICH, a German astronomer; born in Berlin, May 29, 1794. While a teacher in the normal school at Berlin, in company with Wilhelm Beer he constructed the finest map of the moon yet made, published in 1836. After this he became successively director of the observatory at Berlin and at Dorpat, Russia. He published *Populäre Astronomie* (1841); *Allgemeine Selenographie*; and *Geschichte der Himmelskunde* (1873). In his work *Die Zentralsonne* he presented the hypothesis of a central sun, around which the whole stellar universe revolves. He named the star Alcyone as the central sun. He died in Hanover, March 14, 1874.

MAETERLINCK, MAURICE or MOORIS, a Belgian playwright; born in Ghent in 1864. His works, which consist of dramas and poems, are weird and unhealthy, and resemble to a certain extent the writings of Verlaine and the French décadents. In 1895 *Pelléas et Mélisande* and the *Intruder* (L'Intruse) were produced in London under the poet's own supervision. Among his other dramas are *Les Aveugles*; *La Princesse Maleine*; *La Quenouille et la Besace*; *Les Sept Princesses* (1891); and *Aglavaine et Selysette* (1897). He has also written a volume of poems, *Serres Chaudes*; an introduction to a French translation of Emerson's *Essays*; *Ruysbroeck and the Mystics* (1894); *The Treasure of the Humble* (essays, 1897); and *Wisdom and Destiny* (essays, 1898). Several of his plays were translated into English by Richard Hovey (1895).

MAFEKING, a station in the northeastern corner of British Bechuanaland, South Africa, on the Transvaal border. Here and at Pitsani Pitlogo, in Dec., 1895, Dr. L. S. Jameson (q.v., ante, p. 1731) collected the troopers for his raid to Johannesburg, 150 miles to the eastward. A railroad to Mafeking from Cape Town extends northward to Bulawayo. The little town, which is situate on a flat plain on the banks of the Molopopo River, just inside Bechuanaland, eight miles from the Transvaal frontier, withstood a lengthened siege during the Boer war of 1899-1900. The siege began Oct. 16, 1899, six days after Mr. Kruger's government issued its ultimatum. Mafeking, though a bustling business centre, has no pretensions in the way of a city, the houses, for the most part, being built merely of corrugated iron and mud; and when war broke out it had absolutely no defences. Fortunately, the forethought of Lord Edward Cecil, a young officer, son of Lord Salisbury, had provided a quantity of stores in the place, and to this youth, and to the pluck, energy, and resource of Colonel (now Major-General) Robert S. S. Baden-Powell, the town was enabled to maintain a stirring defence for the period of seven months. The defending force at the outset consisted of 450 irregular cavalry, 250 Cape mounted police, 200 of the British South African Company's mounted police, about 100 local volunteers, with two 7-pounders and six machine guns. With this force, cheered by the undaunted courage

and animated by the patriotic spirit and tireless energy of Colonel Baden-Powell, the town withstood not only a protracted siege, but the repeated sorties and constant bombardment of a large body of environing Boers, together with the inroads of disease and the increasing menace of starvation. Repeated efforts were made, chiefly by Colonel Plumer, operating in the Buluwayo district, to relieve the gallant garrison, but without success until a junction was effected, in the middle of May, 1900, between Plumer's troops and the flying column, advancing from Vryburg and the south, under the command of Colonel B. T. Mahon. This latter column started on May 4 from Barkly West, 20 miles N. W. of Kimberley, and marching 200 miles in 12 days reached Janmassibi, 20 miles west of Mafeking, on May 15, there forming a junction with Colonel Plumer's column from the north. The combined force now moved upon Mafeking under Colonel Mahon. On May 17 it reached and attacked the beleaguering Boers, and aided by a brilliant sally on the part of Colonel Baden-Powell, the burghers were forced to raise the siege and withdraw from the long invested town. Mafeking was entered at 4 a. m. on the morning of May 18, to the relief of the emaciated garrison, and with the cheers of the troops and populace. Thus ended a long and spirited siege, and a defence as heroic and romantic as any that has occurred in the annals of modern war.

MAFIA OR MAFFIA, a secret Italian organization, formed in Sicily over six hundred years ago, and having for its present object the enforcement of private vengeance, or the substitution of its own authority for that of the law. In southern Italy, and especially in Sicily, its membership is made up largely of murderers and assassins. Its ramifications extended into some cities and towns of the United States; and in New Orleans, where a large Italian population has gathered during several years past, the murderous work of the Mafia in 1888, 1889 and 1890 was increasing constantly, and in June, 1890, culminated in a desperate fight between two factions on the streets of New Orleans. This determined the municipal authorities to break up the organization. In order to prevent this, it is alleged that the Mafia, in October of that year, murdered Hennessy, chief of police. Arrests were made, but a jury failed to convict. In March, 1891, six of the arrested men had escaped conviction, and ten were in jail with the prospect also of a similar verdict. The people of New Orleans believed the men to be guilty, and a mob broke into the jail and shot 11 of the prisoners, including those who had been acquitted. The incident led to a controversy between the Italian government and the United States, and to the temporary withdrawal of the Italian minister; but an amicable agreement was reached, by the terms of which the United States indemnified the relatives of the victims.

MAGALLANES, a territory of southern Chile, extending from lat. 47° S. southward to Cape Horn. It is very mountainous, and the coasts are broken by thousands of deep inlets. The land is good for

very little, but pasturage is found in places. The area of the territory is 75,292 square miles. Population 1894, 3,624; 1895, 5,170. Capital, Punta Arenas, on the Straits of Magellan. Both coal and gold are found in its vicinity. Population of the capital, Punta Arenas, by the census of 1895, was 3,227.

MAGAZINE RIFLES. See GUNMAKING, in these Supplements.

MAGAZINES, AMERICAN. The reading public of America more than that of any other country derives its intellectual sustenance from the newspaper and magazine, and the development of the American periodical press has excelled that of any other country, with the possible exception of England. According to the latest edition of *Rowell's Newspaper Directory*, in 1883 there were 1,034 American monthlies, 12 bi-monthlies and 59 quarterlies. In 1896 there were 2,723 monthlies, 58 bi-monthlies, and 162 quarterlies. And this extraordinary increase in the number of periodicals is even more than equalled in the growth of the editions issued. But this astonishing development of American periodical literature, gratifying as it is in the light of progress and practical achievement, is not yet altogether satisfactory in its general results, for it is not possible to escape the fact that, admirable as are some of the established American magazines, the more recent ones owe their success not so much to serious literary effort as to the facile skill of the artists and illustrators. With the introduction of the various processes of photo and metal engraving—the sharp outlines of the zinc etching and the softer effects of the half-tone—the pictorial art, to a great degree, has crowded out the literary charm. On the other hand, and by way at least of a partial compensation, it is the popular periodical, aided by the cheap processes of engraving, that has furnished to the artist his surest means of reaching the public, with the result that in America illustrative work has attracted to it a very high order of talent.

A general survey of the American magazines during the last 15 years does not disclose any marked change in the relative position, as regards literary excellence, of the older publications. While it still remains true that America is lacking in any review comparable with the great English monthlies, a standard not greatly inferior is maintained by a few of them. The *Forum*, established in 1886, is a dignified publication; and were its articles more exhaustive and its political subjects less predominant, it would rank well as a general review. The *Classical Review* and *The Arena*, both of which were established in 1889, also belong to the better class of reviews, though the last-named is given to extravagance as a journal of reform. Between the review proper and the magazine, *The Atlantic Monthly*, one of the older publications, established in 1857, stands more distinctly for culture than any other American periodical. It has refused persistently to submit to dictates of public opinion, and has shaped its own course intelligently, without losing sight of its high ideal. The foremost illustrated magazines, *Harper's New Monthly* (1849), *Scribner's* (1887), and the *Century Magazine* (1870), are

admirable productions. In point of illustration they have no superiors anywhere, but much of their text appears to exist for the sake of the pictures, which is unfortunate from the literary standpoint. If what has just been said applies to the older and more important of the American illustrated monthlies, how much more does it characterize the later ones, whose large constituency almost forces their contents into the world of mediocrity!

One of the most remarkable features of the growth of periodical literature in America is the introduction of the popular low-priced magazines. Until the illustrated *Cosmopolitan* appeared, in 1885, the minimum price of the monthly magazine was twenty-five cents, the foremost periodicals of the older class, as *Harper's Monthly* and the *Century Magazine*, being thirty-five cents, which price they still maintain. The *Cosmopolitan*, under the management of J. Brisben Walker, came out as a fifteen-cent publication, and later reduced its price to ten cents. The result was to create an enormous demand for the magazine; and this success, from a commercial view at least, caused *Munsey's Magazine* (established in 1886), to reduce its price also, and with almost equally successful results so far as circulation is concerned. In 1893 *McClure's Magazine* appeared, based upon the same lines as the two earlier ten-cent monthlies already referred to. In all of these cheap magazines the illustrations are admirable, often artistic. But so far as the literary contents are concerned, the result is a sort of *bric-à-brac* collection, diverting enough, but too often lacking in the virile elements of culture and the higher lines of intellectual effort.

The magazines already referred to are produced in the East. In the *Overland Monthly*, established in San Francisco in 1861, the far West has an admirable literary representative. Its first editor was Bret Harte, and many of that writer's successful productions appeared first in its pages.

While the Eastern magazines have widened their horizon so as to take cognizance of the whole country, there is still a place for publications largely devoted to sectional interests. Such a place is filled in the East by the admirable *New England Magazine*, which was established in Boston in 1889. A new American periodical of some pretensions appeared in Chicago in August, 1896. It is the *International Magazine*, and aims largely to present English translations of a good class of literature from the French and German.

Another remarkable feature in the recent growth of periodical literature in America is the springing up of a large number of miniature magazines devoted to light reading of sensational character. Of these are *Short Stories* (1890), the *Black Cat* (1895), and *The Autocrat* (1896), the last-named appearing in Atlanta, Ga. Aside from the suggestive titles and sensational contents, the small price (five cents) of these periodicals in some instances has enabled them to secure a considerable circulation.

It is pleasant to turn again from the class of ephemeral literature to another and more elevating kind, which is but little short of the supremacy of literary art. With regard to its reviews having charge of special interests, America has reason for complacency. The interests of literature are well represented by such publications as the *Literary World* (1870); the *Bookman* (1895); *Current Literature* (1888); and *Good Literature* (1892). Economic and political science are represented worthily by *The Quarterly Journal of Economics* (1886) and the *Political Science Quarterly* (1886), emanating respectively from Harvard and Columbia Universities. A similar review, the *Journal of Political Economy*, was established in 1893 by the University of Chicago. *Guntton's Magazine*, established by George Guntton in 1896, is also an admirable periodical of this class. Advanced philosophy has the *Quarterly Monist* (1890), a Chicago publication, while conservatism and scholastic philosophy is represented by the *Philosophical Review* (1892). The interests of education are looked after by the *Educational Review* (1890); *Education* (1880); the *Boston Academy* (1886); the *American University Magazine*; the *American Teacher* (1876), and many others in the rapidly extending list of school and educational

periodicals. The magazine *Self Culture* (1894), a Chicago publication, may also be classed among the admirable periodicals devoted to the spread of broad education and popular enlightenment.

Religious periodicals have multiplied with almost marvellous rapidity in America. The latest edition of *Rowell's Newspaper Directory* credits this branch of current literature with 1,123 publications, inclusive of the different denominations and the various lines of esoteric investigation and so-called progressive thought. Among the periodicals representing conservative theology may be mentioned the *Andover Review*; *Christian Literature* (1889); the *Preachers' Magazine* (1890); *Church Union* (1873); *Missionary Review of the World* (1887); and *Church Building Quarterly* (1883). Progressive theology is represented by a number of well-written periodicals, among which may be named the *New World* (1892); *New Church Review* (1876); and the *Homiletic Review* (1876). Occult literature finds place in a number of recent periodicals, among which are *Occultism* (1893); *Metaphysical Magazine* (1895); and the *Rostrum* (1889). The *International Journal of Ethics* discusses its special theme with force and dignity; and of the same class is the *Conservator* (1890). Among historical periodicals of recent origin may be named the *Colonial Magazine* (1895); *Spirit of '76* (1894); *Magazine of the Daughters of the Revolution* (1893); *Putnam's Historical Magazine* (1890); *Current History*, a quarterly established in 1891 in Buffalo, N. Y.; and the *American Historical Register* (1894), of Philadelphia. A unique contribution to this class, also, is *Historia*, a monthly juvenile magazine, established in 1892 in Chicago.

In 1817 America possessed but a single scientific periodical. To-day every department of science and art has its special organs. Among the periodicals devoted to the higher branches may be mentioned the *Art Amateur*, established in New York (1879) by Montague Marks. The *Art Interchange* (1864) also discusses the various themes within its province with cleverness. Music is looked after ably by *The Étude*, established by Theodore Presser (1883) in Philadelphia, and by W. S. B. Mathew's *Music*, established in Chicago in 1891. Medicine and hygiene have the *American Medical Review* (1895); the *North American Practitioner* (1888); the *Medical Tribune* (1888); the *Polyclinic* (1893); and a host of others. Electricity is discussed intelligently by a number of periodicals, among which may be named *Electric Power* (1889); *Electrical Engineering* (1892); and *Electrical Progress* (1881). Among the eclectic magazines which have attained wide circulation is the *Review of Reviews*, of which an American edition was established in New York by Albert Shaw in 1889. One feature of this magazine is the index to current periodicals.

The number and excellence of the special publications devoted to America's rapidly developing industrial and commercial interests is one of the marked features of the recent periodical literature. Every department of business has a number of organs which are conducted with creditable dignity and intelligence. Among the magazines of this character may be mentioned the *American Silk Journal* (1882); *Business Journal* (1895); the *Leather Manufacturer* (1890); *Lumber* (1883); *Machinery* (1894); *Street Railway Journal* (1884); *Trade Mark Record* (1882); *Stone* (1888); *Shoe Budget* (1895); *Textile World* (1888); *American Jeweller* (1882); *Furniture* (1889); the *Inland Printer* (1883); and the *Horseless Age* (1895) in the interest of motor vehicles. These publications are representative of a class of trade-journals which have attained much influence in commercial circles, and which cover numerous branches of human industry.

The number of periodicals specially designed for women has kept full pace with other light literature. The *Ladies' Home Journal* (1883); *The Ladies' World* (1879); the *Ladies' Home Companion* (1873); *Womankind* (1878); and *House and Home* (1884) are among these. Among the juvenile periodicals may be named *Babyhood* (1884); *St. Nicholas* (1873); the *Argosy* (1882); *Pansy* (1873); and the *Knapsack* (1892).

In the foregoing consideration of recent American periodicals only monthlies or quarterlies have been included. The rapid movement of the times has reduced the weeklies to the plane of the newspaper press, so far as literary

merit or dignified treatment of subjects is concerned, as to place them outside the limit of serious literary work. And even if the weeklies were free from the defects of the ephemeral press, their number is so vast, and their scope so great, that they could not be considered here.

C. A. DANIELL.

MAGDALENA RIVER. See COLUMBIA, Vol. VI, p. 153.

MAGDALENE, MARY, a woman of the town of Magdala, near Tiberias (hence her name), out of whom Jesus cast seven devils. She first appears (Luke viii: 2) among the women who "ministered unto him of their substance." She was present at the crucifixion, and was one of those who went on the first Easter morning to the sepulcher with sweet spices. To her Christ first showed himself after His resurrection. For some unknown reason she has generally been considered the same as the woman who anointed our Lord's feet with ointment and wiped them with her hair (Luke vii: 36-50), but there is no evidence to substantiate the assumption. A popular, though probably erroneous impression, ascribes to her an immoral life previous to her meeting Jesus; hence the name Magdalene has been given to penitent profligate women as a class. As such she figured in the art and traditions of the middle ages. According to the mediæval legend, after the Ascension, the Virgin Mary, Salome and Mary Magdalene embarked in a small boat on the Mediterranean Sea to escape persecution in Judæa, and, after a miraculous voyage, landed in southern France. The Magdalene retired to St. Baume, and there spent the remainder of her life in prayer and penance. This story led to the search for her body, which was found, it was claimed, by the monks of Vezelai. The result was that Vezelai became a place of pilgrimage and very rich, the King, St. Louis, himself paying homage at the shrine; but, unfortunately for Vezelai, the search was prosecuted with equal zeal and success by Prince Charles of Salerno at St. Baume. Vezelai in consequence lost much of its credit, although its claim was upheld by the Pope.

MAGDEBURG CENTURIES. See CHURCH HISTORY, Vol. V, p. 765.

MAGDEBURG HEMISPHERES. See HYDRO-MECHANICS, Vol. XII, p. 444.

MAGEE, WILLIAM CONNOR, archbishop of York; born in Cork, Ireland, Dec. 17, 1821. He graduated from Trinity College, Dublin, and in 1844 took orders. In 1850 he was appointed joint incumbent, and shortly after sole incumbent, of the Octagon Chapel, Bath. In 1860 he succeeded Dean Goulburn as minister of Quebec Chapel, London; and in Feb., 1861, he was appointed to the rectory of Enniskillen by the University of Dublin. In 1864 he was appointed dean of Cork; in 1868 Bishop of Peterborough; and in March, 1891, Archbishop of York. He took an active part in the House of Lords in opposing the disestablishment of the Irish Church. Died in London, May 5, 1891. See *Life* by Canon MacDonell (2 vols., 1896).

MAGELLANIC CLOUDS. See ASTRONOMY, Vol. II, p. 821.

MAGENDIE, FRANÇOIS, a French physiologist; born at Bordeaux, Oct. 15, 1783. He studied at Paris; in 1819 he became a member of the Academy of Sciences, and in 1831 professor of anatomy in the Collège de France. He was the founder, and for ten years editor of the *Journal of Experimental Physiology*. He practiced vivisection extensively, and by this and other means of observation made important additions to the knowledge of nerve physiology, the veins and the physiology of food. Among his works are *Elements of Physiology* (1816-17); *Lessons on the Physical Phenomena of Life* (1836-42); *Lessons on the Functions and Maladies of the Nervous System* (1839); and *Lessons on the Blood* (1839). He died in Paris, Oct. 7, 1855.

MAGENTA, BATTLE OF. See AUSTRIA, Vol. III, pp. 138, 139.

MAGERÖ, an island off the north coast of and belonging to Norway, on which is the most northerly point of land in Europe. This is not the so-called North Cape, but a point a little to the west, and about a quarter of a mile further north, called Knioskjörrade. Magerö is 22 miles long and 15 broad, and is deeply indented by bays. A few Norwegians and Laplanders live there.

MAGGOTS. See DIPTERA, Vol. VII, pp. 256, 257.

MAGI. See PERSIA, Vol. XVIII, p. 564; EPIPHANY, Vol. VIII, p. 483.

MAGILUS, a remarkable gasteropod of the family *Tubulibranchiata*, found on the coral reefs of warm eastern seas. The young animal settles on the growing madrepores at the obvious risk of being gradually surrounded and smothered. This is avoided, however, by an entire change in the form of the shell, which is diverted from its original spiral type, and grows by constant accretions into a long, irregular tube, the growth of which keeps pace with that of the coral.

MAGINN, WILLIAM, an Irish author, born at Cork, Nov. 11, 1793. He was educated at Trinity College, Dublin, where he won a brilliant reputation for precocious scholarship; taught in Cork for ten years; and in 1823 removed to London to pursue a life of letters. His first contributions to *Blackwood's Magazine* appeared in 1819, and from that date, for nine years, scarcely a number appeared without an article from his pen. In 1824 Murray started the short-lived *Representative*, a daily newspaper, and Maginn was sent to Paris to act as foreign correspondent. In 1828 he joined the staff of the *Standard*, and was one of the originators of *Fraser's Magazine* in 1830. He also contributed numerous papers to the *Quarterly Review*, to *Bentley's Miscellany*, and to *Punch*. His writings were characterized by learning and wit. They consist of two forgotten romances; his *Shakespeare Papers*; *Homeric Ballads* (1849); and numerous other works. His critical and miscellaneous essays were collected in the United States and edited by Dr. R. S. Mackenzie (1855-57.) Maginn had great ability, but was extravagant and intemperate, and during the latter

part of his life was frequently imprisoned for debt. He died in poverty at Walton-on-Thames, Aug. 21, 1842.

MAGNA CHARTA. See ENGLAND, Vol. VIII, pp. 306-308.

MAGNETO-MOTIVE FORCE. See ELECTRICITY, § 65, in these Supplements.

MAGNETS. See MAGNETISM, Vol. XV, pp. 274, 275.

MAGNOLIA, a town and the capital of Columbia County, southwestern Arkansas, 32 miles S.W. of Camden, on the St. Louis Southwestern railroad. It is in a well timbered and watered region. It is a cotton-shipping point, and has saw and grist mills. Population 1890, 1,486; 1900, 1,614.

MAGNUSEN, FINN, an Icelandic archæologist; born at Skalholt, Iceland, Aug. 27, 1781. After being educated at the University of Copenhagen, he became a lawyer in Iceland in 1803, but in 1815 was appointed professor of northern antiquities, and afterward keeper of the archives in Copenhagen. He prepared a dictionary of Scandinavian mythology, and a full exposition of its system. But his chief work is a translation of the older *Edda*, which he published with abundant commentaries in 1821-23. All his writings indicate excellent judgment and extensive learning. He died in Copenhagen, Dec. 24, 1847.

MAGOG. See GOG AND MAGOG, Vol. X, p. 738.

MAGRUDER, JOHN BANKHEAD, an American Confederate general; born Aug. 15, 1810, in Winchester, Virginia. He graduated at West Point in 1830; served in the Mexican War as captain, and obtained the brevets of major and lieutenant-colonel. When the Civil War broke out he resigned his commission and joined the rebel army, obtaining the rank of brigadier-general. When McClellan landed his forces on the peninsula, he found Magruder in defense of the fortifications at Yorktown with but 5,000 men. McClellan with 58,000 men besieged the place. When works had been constructed, and a general attack was about to be made, Magruder withdrew with all his men and munitions. This delay (it was almost a month) probably saved Richmond, for in the interval Johnston had been able to concentrate his troops. Magruder afterward served in almost all the battles of the peninsula campaign, and was raised to the rank of major-general. In 1862 he took command of the department of Texas, and in 1863 recaptured Galveston, and raised for a time the blockade of the port. At the end of the war he went to Mexico and

served in the imperial army until the overthrow of Maximilian, and afterward lectured in the United States on *Mexico*. He died at Houston, Texas, Feb. 19, 1871.

MAGYARS, a race. See HUNGARY, Vol. XII, pp. 365-367.

MAHĀBHĀRATA. See SANSKRIT, Vol. XXI, pp. 281-283.

MAHAFFY, JOHN PENTLAND, an Irish educator; born near Vevay, Switzerland, Feb. 26, 1839. He was educated in Germany and at the University of Dublin, graduating at the latter institution in 1859; was appointed precentor of the university chapel in 1867; professor of ancient history in 1871; Donnellan lecturer in 1873. He was decorated with the gold cross of the Order of the Saviour by the King of Greece in 1877. Professor Mahaffy published a great number of works on philosophy and ancient history. Among them are *Kant's Critical Philosophy for English Readers* (1872-74); *Social Life in Greece* (1874); *Rambles and Studies in Greece* (1877); *A History of Classical Greek Literature* (1880); *Descartes* (1880); and *Alexander's Empire in the Story of the Nations* series (1887). He edited Duruy's *Roman History*, and translated Kuno Fischer's *Commentary on Kant*.

MAHAN, ASA, an American clergyman and educator; born in Vernon, New York, Nov. 9, 1800. He graduated at Hamilton College in 1824, and at Andover Theological Seminary in 1827; held pastorates in Pittsford, New York (1829-31), and in Cincinnati (1831-35); president of Oberlin College (1835-50), of Cleveland University (1850-55); pastor at Jackson, Michigan (1855-57), at Adrian, Michigan (1857-60); president Adrian College (1860-71); after the latter year resided in England until his death. He advocated the religious doctrine known as "Perfectionism," and published on the subject, *Scripture Doctrine of Christian Perfection* (1839). He was also the author of *Doctrine of the Will* (1846); *Moral Philosophy* (1848); *Logic* (1857); *Theism and Anti-Theism* (1872); *Critical History of Philosophy* (1883); and other philosophical works. He died in Eastbourne, England, April 4, 1889.

MAHAN, ALFRED THAYER, an American naval officer, son of DENNIS HART MAHAN (q. v., below); born at West Point, N. Y., Sept. 27, 1840; graduated at the United States Naval Academy (1859); during the Civil War served in the South Atlantic and Gulf squadrons; professor at the naval academy (1877-80); president of the naval college at Newport (1886-89 and 1890-93); commander of the *Chicago* in the European squadron in 1893. He wrote *The Influence of Sea Power upon History*,

CAPTAIN A. T. MAHAN.

1660-1783 (1890); *The Life of Admiral Farragut* (1892); *Influence of Sea Power upon the French Revolution and Empire* (2 vols., 1894), extensive works, accepted generally as authoritative and exhaustive; also a *Life of Nelson* (2 vols., 1897); and *The Interest of the United States in Sea Power* (1898). He was retired at his own request, Nov. 17, 1896; but was a member of the Naval Advisory Board during the war with Spain in 1898. At present (1899) he is writing a history of the War of 1812-14.

MAHAN, DENNIS HART, an American soldier and instructor; born in New York city, April 2, 1802; moved with his parents to Virginia in 1820; graduated with honors at West Point in 1824; assistant professor of mathematics and engineering at the academy (1824-26); spent four years (1826-30) in the study of military science abroad; in 1832-71 professor of civil and military engineering at the United States Military Academy. Among his works are *An Elementary Course of Military Engineering* (1847); *Industrial Drawing* (1853); and *Fortification-drawing and Stereotomy* (1865). He also edited *Moseley's Mechanical Principles of Engineering and Architecture* (1856-69). He drowned himself in the Hudson near Stony Point, Sept. 16, 1871, while suffering from an attack of temporary insanity.

MAHANNOY CITY, a borough of Pennsylvania, is in the anthracite-coal region, and has about twenty collieries and an active trade with the other coal-mines in the neighborhood. Population 1900, 13,504. See MAHANNOY CITY, Vol. XV, p. 285.

MAHAYANA. See LAMAISM, Vol. XIV, p. 229.

MAHDI, EL, the title assumed by the pretender Mohammed Ahmed of the Soudan, in Egypt, who, instigated by the brotherhood of Sid-es-Senoussi, of which he was a member, proclaimed a holy war in 1880. Mohammed Ahmed was born in Dongola, Nubia, in 1842. He studied Mohammedan theology, was for a time connected with the Egyptian civil service, later a slave-trader and merchant and finally a dervish or monk. In 1882 he proclaimed himself El Mahdi (the Messiah), raised an army in Soudan, where Egyptian misrule had caused considerable ill-feeling, and in September, 1883, seized El Obeid, the chief city of Kordofan, and made it his capital. On Nov. 5, 1883, he totally annihilated the Egyptian army of ten thousand sent against him under Hicks Pasha, and in 1885 took Khartoum, where General Gordon, whom the British government had sent to effect the pacification of the Soudan, was killed. El Mahdi died of smallpox June 25, the same year. For the origin and meaning of the title, see Vol. XV, p. 285.

MAHE. See SEYCHELES, Vol. XXI, p. 725.

MAHOMET. See MOHAMMEDANISM, Vol. XVI, pp. 545-561.

MAHONE, WILLIAM, an American public man and soldier; born in Southampton, Virginia, Dec. 1, 1826; graduated at the Virginia Military Institution in 1847, and engaged in civil engineering. In 1861 he joined the Confederate army, took part in the capture of Norfolk navy-yard, and engaged in

nearly every battle of the peninsula campaign, on the Rappahannock, and in the campaign around Petersburg, where his bravery in repelling the Union attack after the mine explosion, won for him the sobriquet of "The Hero of the Crater." He won the reputation of a fearless fighter, became brigadier and major-general, and commanded a division in A. P. Hill's corps. After the war he returned to engineering, and became president of the Norfolk and Tennessee railroad. He entered politics about

GEN. WILLIAM MAHONE.

1878, and became the leader of the party which aimed at the "readjustment" (a mild equivalent for repudiation) of the state debt of Virginia. In 1880 he was elected United States Senator, and served from March, 1881, to 1887, but was defeated for re-election. Died in Washington, District of Columbia, Oct. 8, 1895.

MAHOPAC, a village and summer resort of Putnam County, southeastern New York, 48 miles N. of New York City, on the New York Central and Hudson River railroad and on Mahopac Lake. Situated here are a dozen large hotels and boarding-houses, which in summer are crowded with visitors. Mahopac Lake is about three miles in diameter, incloses some picturesque islands and is surrounded by beautiful hilly scenery. Permanent population 1890, 409.

MAIDENHAIR OR GINGKO TREE. See ARBORICULTURE, Vol. II, p. 320.

MAID OF KENT. See BARTON, ELIZABETH, Vol. III, p. 404.

MAIGNAN, ALBERT, a French painter; born Dec. 15, 1844, in Beaumont, Sarthe. He studied art under J. Noël and Luminais; in the salon of 1879 received a first-class medal; was decorated with the ribbon of the Legion of Honor in 1883. At Philadelphia in 1876 he exhibited *Helen at the Fountain* and the *Sentinel*, and received a medal. His *Departure of the Norman Fleet for the Conquest of England* (1874) and *Dante Meeting the Countess Matilda* are in the Luxembourg. *Louis IX Consoling a Leper* was exhibited in 1878; in the Metropolitan Museum at New York is his *Assault on Pope Boniface VIII at Agani*.

MAIGRE-FISH (*Sciæna aquila*), a large fish common in the Mediterranean and along the eastern coasts of the Atlantic. It reaches a length of six feet, and is valuable as a food-fish. The ear-bones are often worn as charms and lucky-stones by superstitious people. There is an American species.

MAIKOFF, APOLLON NIKOLÆVITCH. See RUSSIA, Vol. XXI, p. 109.

MAILING-MACHINE. The machines used for addressing newspapers or periodicals for mailing are popularly known by this name, though more

properly called addressing-machines. Two types are in common use, one of which prints on the paper or periodical itself, while the other pastes on prepared printed slips or labels bearing the addresses. The direct-printing machine is mounted on a form of printer's galley, bearing the type set for a number of addresses, a short, blank space being left between each address. The type on the galley is inked by hand first, and a newspaper, folded or wrapped ready for delivery, is inserted. A lever being depressed, the first address on the galley is printed on the newspaper, while a ratchet mechanism moves the printing-device to the next address, which is printed on the next newspaper in the same manner. There has also been manufactured a mailing-machine of the direct-printing type, which prints from wooden blocks, the addresses appearing on the paper in white letters, surrounded by a black background.

Machines of the label-sticking type are made very small, and are hung on the left arm of the user. A strip of addresses, having been printed previously, is fed into the machine and run over a roller, which covers the back of the strip with wet paste. The mailing-machine is rested upon the top paper of a pile of newspapers and the address-slip being projected a short distance, the pressing of a small lever cuts off one address and pushes it down on to the newspaper, where it adheres in the form of a label. The machine is then raised, the addressed paper removed, and the next paper can be addressed in the same manner. With this machine several thousand papers have been addressed in an hour.

C. H. COCHRANE.

MAINE. The population of Maine, according to the census of 1900, was 694,466, that of 1890

SEAL OF THE STATE OF MAINE.

was 661,086, the percentage of increase being 5.0. The relative position of the state was 30, a loss of three since 1880. The density of population in 1890 was 22.11 to the square mile, the smallest of any of the North Atlantic division of states; 130,346 of the population resided in the eight cities of the state, constituting 19.72 per cent of the entire number of people. The number of males was 332,590, the number of females 328,496. The percentage of native-born citizens was 88.06; of foreign-born 11.94. The number of negroes in the state was 1,190, a decrease of 261 within the preceding ten years. In 1889 the state had 171,777 acres devoted to the cereals, on which were produced 4,888,734 bushels. The greatest area of this was in oats, over 70 per cent of the entire amount being given up to that cereal, 121,612 acres having been cultivated, on which 3,668,909 bushels were raised. The total number of farms in Maine was

62,013, a decrease of almost 2,000 since 1880. The average size was given at 100 acres, the total acreage being 6,179,125. Of this, 50.73 per cent was unimproved, the area of improved lands in farms also having decreased in the decade. The total valuation of lands, fences, buildings, machinery, implements and live-stock was estimated at \$122,347,283, the value of farm products at \$22,049,220. The number of horses was 109,156; mules, 278; neat cattle, including 157,278 milch cows, 299,110; swine, 91,297; and sheep, 370,484, from which 1,864,009 pounds of wool were sheared.

The assessors' returns for 1894 show the number of polls in the state to have been 178,676; the value of the real estate, \$232,038,232; the value of personal property, \$74,848,812; the value of all property in the state subject to taxation, \$324,478,321. The rate of taxation for the year named was $2\frac{1}{2}$ mills on the dollar; the total receipts from all sources was \$1,650,972; the total expenditures,

STATE CAPITOL, AUGUSTA.

\$1,528,493. The liabilities of the state in 1895 were as follows: Bonded debt, \$2,253,000; trust funds held by the state on which no interest is paid, \$748,331. The bonded indebtedness was reduced during the year by \$50,000. The total value of the live-stock of the state was \$14,020,398. The railroads of the state paid in taxes for the year named, \$182,890; the telegraph and telephone companies, \$12,037; the express companies, \$5,358; the loan and building associations, \$942; the savings banks, \$398,208.

The chief cities of the state are Portland (50,145), Lewiston (23,761), Bangor (21,850), Biddeford (16,145), Auburn (12,951), Augusta (11,683), Bath (10,477), Waterville (9,477), Rockland (8,150), Calais (7,655), and Westbrook (7,283). The area of the state is, approximately, 29,895 square miles, the average number of persons to the square mile being in 1900 23.2. Portland is the only town in the state which has a population exceeding 25,000.

The school report for 1894 shows the number of persons of school age, 4 to 21, to have been 206,504, of whom 135,815 attended school during the year. The average length of the school year was 24 weeks and one day. The number of teachers employed

was 7,421, the amount of whose wages was \$1,067,-482. The whole number of schools was 4,706; the estimated value of all school property, \$3,917,120. The amount expended for free text-books was \$56,-682; the total expenditures in behalf of the schools, \$1,557,862. State normal schools were maintained at Farmington, Castine and Gorham, the average attendance per term being 167, 126 and 88 respectively. The institutions of higher education are mentioned at length in Vol. XV, pp. 297-302. The Baptist Church controls Colby University, at Waterville; the Free Baptist Church, Bates College, at Lewiston; and the Congregational Church, Bowdoin College, at Brunswick. The Westbrook Seminary for Women, a Universalist institution, at Deering, and Maine Wesleyan Female College, controlled by the Methodist Episcopal Church, located at Kent's Hill, are both flourishing, and have libraries of 3,000 and 7,000 volumes, respectively.

The report of the state librarian for 1894 shows 34 free public libraries, with more than 140,000 volumes; 21 state, county and college libraries, with more than 150,000 volumes; and 44 libraries at which a fee is charged for the use of books, which had about 135,000 volumes. The report states that nearly 100 libraries failed to send in returns and are not included in the above.

The state prison, located at Thomaston, in 1894 had 146 as an average daily number of convicts, the whole number since the establishment of the prison being 3,233. The bulletin of the Department of Labor, issued in July, 1896, showed the value and kinds of labor performed by the convicts of the Maine state prison to have been as follows for the year 1895: Carriages, wagons and sleighs, \$14,590; harnesses, \$9,572; brooms and brushes, \$18,764; and furniture, \$900. The work was done under the public-account system. The reports from the jails of the state for 1895 show that 6,176 persons were confined during the year.

At the close of 1894 the Maine Insane Hospital, located at Augusta, had 680 patients under treatment. The disbursements were about \$180,000, and the patients produced farm products during the year amounting in value to more than \$15,000.

Nov. 30, 1894, there were 140 boys in the state reform school at Cape Elizabeth, the cost of whose maintenance for the year had amounted to \$27,000. The school was established over forty years ago, and has been conducted as a "school for the instruction, employment and reform of juvenile offenders," and as such it has proved successful.

For 1894 the state bank examiner reported 51 savings banks in Maine, which held deposits to the amount of \$54,531,223, their total resources being more than \$3,000,000 in excess of their deposits. The number of national banks was 84, with combined capital of more than \$12,000,000, and surplus of about \$5,000,000. There were 15 trust and banking companies, whose combined capital stock was \$1,205,400, and their total liabilities and resources amounted to \$5,835,807; 30 building and loan associations reported 7,894 shareholders, 2,332 borrowers, 2,711 loans and dividends during the year of \$130,537.

The report of the railroad commissioner for 1895 showed 1,626 miles of operated track, a gain for the year of 110 miles. The gross transportation earnings for the year were \$155,042, the gross operating expenses \$109,633, leaving an income from operation of \$45,408.

The report of the Commissioner of Fisheries for 1895 showed that there were enrolled in the customs districts of the state 437 vessels, which are engaged exclusively in the fisheries, and in addition there are employed in the shore fisheries more than 6,000 fishing-boats, with a valuation of not less than \$500,000. The sea and shore fisheries of the state give employment to upward of ten thousand people, and involve an investment in apparatus and cash capital of \$3,000,000.

Below are given the appropriations made by the legislature of 1895 for benevolent and educational institutions:

For pensions, \$140,000; Eastern Insane Hospital, \$150,000; General Hospital, \$15,000; Eye and Ear Infirmary, \$10,000; Bangor General Hospital, \$10,000; Central General Hospital (conditionally), \$20,000; Penobscot Indians, \$16,164; Passamaquoddy Indians, \$16,080; Cattle Commission, \$10,000; State Library, \$8,000; Maine Insane Hospital, \$14,000; State College, \$40,000; Farmington Normal School, \$20,000; Reform School, \$50,500; Military and Naval Orphan Asylum, \$19,500; State Prison, \$19,000; School for the Deaf, \$16,000; Industrial School, \$14,000; Children's Aid Society, Belfast, \$3,000.

The granite product of the state for 1893 was estimated at \$1,274,594, the value of the slate at \$139,-200 and the limestone at \$1,474,695.

In 1894 there were 493 Passamaquoddy Indians in Maine, the members of the Penobscot tribe numbering 390. They are engaged largely in agricultural pursuits and in the business of guiding tourists and summer visitors, who were estimated to number 175,881 for the year mentioned, and to have expended within the state the sum of \$2,731,-431.

The following is a full list of the governors of Maine, with the dates of service of each: William King, 1820-21; William D. Williamson, 1821-22; Albion K. Paris, 1822-27; Enoch Lincoln, 1827-29; Nathan Cutler, 1829-30; Jonathan D. Hutton, 1830-31; Samuel E. Smith, 1831-34; Robert P. Dunlap, 1834-38; Edward Kent, 1838-39; John Fairfield, 1839-40; Edward Kent, 1840-41; John Fairfield, 1841-43; Edward Kavanaugh, 1843-44; Hugh J. Anderson, 1844-47; John W. Dana, 1847-50; John Hubbard, 1850-53; William G. Crosby, 1853-55; Anson P. Morrill, 1855-56; Samuel Wells, 1856-57; Hannibal Hamlin, 1857; Joseph H. Williams, 1857-58; Lot M. Morrill, 1858-61; Israel Washburn, Jr., 1861-62; Abner Coburn, 1862-64; Samuel Corey, 1864-67; Joseph L. Chamberlain, 1867-71; Sidney Perham, 1871-74; Nelson Dingley, Jr., 1874-76; Selden Connor, 1876-79; Alonzo Garelton, 1879-80; Daniel F. Davis, 1880-81; Harris M. Plaisted, 1881-83; Frederick Robie, 1883-87; Joseph R. Bodwell, 1887; Sebastian S. Marble, 1887-89; Edwin C. Burley, 1889-93; Henry B. Cleaves, 1893-97; L. Powers, 1897. See also MAINE, Vol. XV, pp. 297-302.

MAINE, SIR HENRY JAMES SUMNER, an English jurist; born Aug. 15, 1822. After graduating at

Pembroke College, Cambridge, in 1844, he became professor of civil law there; was afterward reader on jurisprudence at the Middle Temple, London, until 1862, when he went to India as law member of the council. In 1870 he became professor of comparative jurisprudence at Oxford, and in 1877 master of Trinity Hall, Cambridge. His most important works are *Ancient Law: Its Connection with the Early History of Society* (1861); *Village Communities in the East and West* (1871); *The Early History of Institutions* (1875); and *Popular Government* (1885). One of the fundamental ideas in Sir Henry Maine's theory of the rise of institutions is that patriarchal power was the germ from which society developed. He died in Cannes, Feb. 3, 1888.

"MAINE," THE, a battleship of the second class, of the United States navy, built at Brooklyn Navy Yard, and launched in 1890. She was of 6,648 tons displacement; had engines of 9,000 indicated horse-power; carried four 10-inch, six 6-inch, twelve 6-pounder, and four 1-pounder rapid-fire, and four Gatling guns, and cost \$2,500,000. On the 24th of January, 1898, under command of Captain Charles D. Sigsbee, she was ordered to Havana (see UNITED STATES, *post*, pp. 3000d-3000e), where at 9:40 P. M. on the 15th of February, she was blown into fragments by an explosion. Most of her crew were below, and 266 of them were killed or drowned outright, or received injuries from which they died later. Of this number two were officers. Assistance in saving the survivors was immediately rendered by the Spanish warship *Alfonso XII*, and by other ships in the harbor, while the three remaining boats of the *Maine* landed as many as they could pick up. A naval court of inquiry commenced an investigation at Havana on February 26th, and after twenty-three days' labor transmitted its report to the President, who communicated the same to Congress on the 28th of March. The report in substance found that the explosion was caused by a submarine mine, which in turn caused the partial explosion of two or more of the magazines; that no fault, negligence, or lack of discipline on the part of the ship's company contributed to the disaster; and that the court was unable to fix the responsibility for the explosion on anyone. The Spanish authorities also held an inquiry, and reported that the explosion was manifestly from internal causes. The Spanish proposal to settle the question by arbitration was rejected by the United States, and in all probability the truth will forever remain a secret. The war which ensued between the United States and Spain, while not actually brought about by this occurrence, was undoubtedly hastened and embittered by it.

MAINE STATE UNIVERSITY was founded in 1865 by act of the legislature, and located at Orono, 8 miles N. of Bangor. It is non-sectarian, and offers eight courses of study, each requiring four years; viz., scientific, agricultural, civil engineering, mechanical engineering, electrical engineering, chemical, pharmaceutical, and a preparatory medical course. The ancient languages are not taught. Tuition fee, \$30 a year; room-rent free. Military drill is required. There are 17 buildings in all, the principal

of which are Wingate Hall, Oak Hall, Chemical Laboratory, and Coburn Hall. An agricultural experiment station is connected with the institution, which receives \$15,000 annually from the U. S. government. The endowment is \$230,817. In 1898 the income was \$89,443, and there were 43 instructors and 320 students. The library has 14,000 vols.

MAINOTES. See GREECE, Vol. XI, p. 84.

MAINTENANCE, in law, is an officious intermeddling in a suit by one having no interest therein, for the purpose of stirring up strife and prolonging litigation. The relations of master and servant or landlord and tenant between the maintainer and the plaintiff avoids the offense. Aid may also be rendered from motives of charity or to a relative. In most of the states of the Union, contracts growing out of maintenance are void, and the act is a misdemeanor punishable by fine or imprisonment, or both. In England the maintenance of the suit of another on a corrupt agreement to divide the fruits of the action is called champerty, and the contract is void.

MAIO ISLAND. See CAPE VERD ISLANDS, Vol. V, pp. 50, 52.

MAIPO OR MAIPU, a river of Chile, rising in the Andes, a little north of lat. 34° S., and flowing almost directly westward to the Pacific Ocean. Length, 155 miles. On a plain a little to the north of this river was fought the battle of Maipó, in which San Martín, at the head of the republican forces, completely defeated the Spaniards, April 5, 1818, a victory that secured Chilean independence.

MAIT OR MAT, the Egyptian goddess of truth. See EGYPT, Vol. VII, p. 718.

MAIZE OR INDIAN CORN. See MAIZE, Vol. XV, pp. 309-10; and AGRICULTURE, in these Supplements.

MAJOLICA. See POTTERY, Vol. XIX, p. 624.

MAJOR, in music. See TONE, in these Supplements; and MUSICAL SCALES, Vol. XVII, p. 80.

MAJOR, GEORGE (1502-74). See LUTHERANS, Vol. XV, p. 85; REFORMATION, Vol. XX, p. 336.

MAJOR, RICHARD HENRY, an English historian; born in London, Oct. 3, 1818. He was placed in charge of the maps and charts in the British Museum in January, 1844. He was honorary secretary of the Hakluyt Society from 1849 to 1858, and vice-president of the Royal Geographical Society from 1881 to 1884. He made valuable researches in the history and bibliography of the Columbian era of American history, and published works and edited maps and documents relating to that period. He died in Kensington, June 25, 1891.

MAJORCA. See BALEARIC ISLANDS, Vol. III, p. 227.

MAJORISTS. See MAJOR, GEORGE, *supra*.

MAKART, HANS, an Austrian painter, born in Salzburg, May 29, 1840. He studied under Piloty, at Munich. In 1879 he became professor of painting in the Vienna Academy. In 1876 his large picture of *Venice Doing Homage to Catherine Cornaro* was exhibited at the Centennial Exhibition in Philadelphia; now in the Berlin National Gallery. All his large canvases are brilliant in coloring, and some of his themes are sensuous. His *Diana's Chase* is in the Museum of Art, New York. Died Oct. 3, 1884.
